Abstract

Apache Camel has over 100 components and each component is highly configurable. This guide describes the settings for each of the components.

Table of Contents

CHAPTER 1. COMPONENTS OVERVIEW	90
1.1. CONTAINER TYPES	90
1.2. SUPPORTED COMPONENTS	90
CHAPTER 2. ACTIVEMQ	108
ACTIVEMQ COMPONENT	108
URI FORMAT	108
OPTIONS	108
CAMEL ON EAP DEPLOYMENT	108
CONFIGURING THE CONNECTION FACTORY	109
CONFIGURING THE CONNECTION FACTORY USING SPRING XML	109
USING CONNECTION POOLING	109
INVOKING MESSAGELISTENER POJOS IN A ROUTE	110
USING ACTIVEMQ DESTINATION OPTIONS	110
CONSUMING ADVISORY MESSAGES	111
GETTING COMPONENT JAR	112
CHAPTER 3. AHC COMPONENT	113
3.1. URI FORMAT	113
3.2. AHCENDPOINT OPTIONS	113
3.2.1. Path Parameters (1 parameters):	113
3.2.2. Query Parameters (13 parameters):	113
3.3. SPRING BOOT AUTO-CONFIGURATION	115
3.4. AHCCOMPONENT OPTIONS	116
3.5. MESSAGE HEADERS	117
3.6. MESSAGE BODY	118
3.7. RESPONSE CODE	118
3.8. AHCOPERATIONFAILEDEXCEPTION	119
3.9. CALLING USING GET OR POST	119
3.10. CONFIGURING URI TO CALL	119
3.11. CONFIGURING URI PARAMETERS	120
3.12. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER	120
3.13. CONFIGURING CHARSET	120
3.13.1. URI Parameters from the endpoint URI	120
3.13.2. URI Parameters from the Message	121
3.13.3. Getting the Response Code	121
3.14. CONFIGURING ASYNCHTTPCLIENT	121
3.15. SSL SUPPORT (HTTPS)	122
3.16. SEE ALSO	122
CHAPTER 4. AHC WEBSOCKET COMPONENT	124
4.1. URI FORMAT	124
4.2. AHC-WS OPTIONS	124
4.2.1. Path Parameters (1 parameters):	125
4.2.2. Query Parameters (18 parameters):	125
4.3. SPRING BOOT AUTO-CONFIGURATION	127
4.4. WRITING AND READING DATA OVER WEBSOCKET	129
4.5. CONFIGURING URI TO WRITE OR READ DATA	129
4.6. SEE ALSO	129
CHAPTER 5. AMQP COMPONENT	130
5.1. URI FORMAT	130

5.2. AMQP OPTIONS	130
5.2.1. Path Parameters (2 parameters):	142
5.2.2. Query Parameters (92 parameters):	143
5.3. SPRING BOOT AUTO-CONFIGURATION	157
5.4. USAGE	170
5.5. CONFIGURING AMQP COMPONENT	170
5.6. USING TOPICS	172
5.7. SEE ALSO	172
CHAPTER 6. APNS COMPONENT	173
6.1. URI FORMAT	173
6.2. OPTIONS	173
6.2.1. Path Parameters (1 parameters):	174
6.2.2. Query Parameters (20 parameters):	174
6.3. SPRING BOOT AUTO-CONFIGURATION	176
6.3.1. Component	176
6.3.1.1. SSL Setting	176
6.4. EXCHANGE DATA FORMAT	177
6.5. MESSAGE HEADERS	177
6.6. APNSSERVICEFACTORY BUILDER CALLBACK	177
6.7. SAMPLES	177
6.7.1. Camel Xml route	178
6.7.2. Camel Java route	179
6.8. SEE ALSO	180
CHAPTER 7. ASN.1 FILE DATAFORMAT	181
7.1. ASN.1 DATA FORMAT OPTIONS	181
7.2. SPRING BOOT AUTO-CONFIGURATION	181
7.3. UNMARSHAL	182
7.4. DEPENDENCIES	183
CHAPTER 8. AS2 COMPONENT	184
8.1. URI FORMAT	184
8.2. AS2 OPTIONS	184
8.2.1. Path Parameters (1 parameters):	185
8.2.2. Query Parameters (30 parameters):	185
8.3. SPRING BOOT AUTO-CONFIGURATION	188
8.4. CLIENT ENDPOINTS:	191
8.5. SERVER ENDPOINTS:	193
CHAPTER 9. ASTERISK COMPONENT	195
9.1. URI FORMAT	195
9.2. OPTIONS	195
9.2.1. Path Parameters (1 parameters):	195
9.2.2. Query Parameters (8 parameters):	195
9.3. SPRING BOOT AUTO-CONFIGURATION	196
9.4. ACTION	196
CHAPTER 10. ATMOS COMPONENT	198
10.1. OPTIONS	198
10.1.1. Path Parameters (2 parameters):	198
10.1.2. Query Parameters (12 parameters):	199
10.2. SPRING BOOT AUTO-CONFIGURATION	200
10.3. DEPENDENCIES	200

10.4. INTEGRATIONS	200
10.5. EXAMPLES	201
10.6. SEE ALSO	201
CHAPTER 11. ATMOSPHERE WEBSOCKET COMPONENT	202
11.1. ATMOSPHERE-WEBSOCKET OPTIONS	202
11.1.1. Path Parameters (1 parameters):	203
11.1.2. Query Parameters (38 parameters):	203
11.2. SPRING BOOT AUTO-CONFIGURATION	207
11.3. URI FORMAT	209
11.4. READING AND WRITING DATA OVER WEBSOCKET	209
11.5. CONFIGURING URI TO READ OR WRITE DATA	209
11.6. SEE ALSO	210
CHAPTER 12. ATOM COMPONENT	211
12.1. URI FORMAT	211
12.2. OPTIONS	211
12.2.1. Path Parameters (1 parameters):	211
12.2.2. Query Parameters (27 parameters):	211
12.3. SPRING BOOT AUTO-CONFIGURATION	214
12.4. EXCHANGE DATA FORMAT	214
12.5. MESSAGE HEADERS	215
12.6. SAMPLES	215
12.7. SEE ALSO	215
CHAPTER 13. ATOMIX MAP COMPONENT	216
13.1. URI FORMAT	216
13.2. OPTIONS	216
13.2.1. Path Parameters (1 parameters):	216
13.2.2. Query Parameters (18 parameters):	217
13.3. SPRING BOOT AUTO-CONFIGURATION	218
13.4. HEADERS	219
13.5. CONFIGURING THE COMPONENT TO CONNECT TO AN ATOMIX CLUSTER	221
13.6. USAGE EXAMPLES:	221
CHAPTER 14. ATOMIX MESSAGING COMPONENT	223
14.1. URI FORMAT	223
14.1.1. Path Parameters (1 parameters):	223
14.1.2. Query Parameters (19 parameters):	224
14.2. SPRING BOOT AUTO-CONFIGURATION	225
CHAPTER 15. ATOMIX MULTIMAP COMPONENT	228
15.1. URI FORMAT	228
15.1.1. Path Parameters (1 parameters):	228
15.1.2. Query Parameters (18 parameters):	229
15.2. SPRING BOOT AUTO-CONFIGURATION	230
CHAPTER 16. ATOMIX QUEUE COMPONENT	232
16.1. URI FORMAT	232
16.1.1. Path Parameters (1 parameters):	232
16.1.2. Query Parameters (16 parameters):	233
16.2. SPRING BOOT AUTO-CONFIGURATION	234
CHAPTER 17. ATOMIX SET COMPONENT	236
17.1. URI FORMAT	236

17.1.1. Path Parameters (1 parameters):	236
17.1.2. Query Parameters (17 parameters):	237
17.2. SPRING BOOT AUTO-CONFIGURATION	238
CHAPTER 18. ATOMIX VALUE COMPONENT	240
18.1. URI FORMAT	240
18.1.1. Path Parameters (1 parameters):	240
18.1.2. Query Parameters (17 parameters):	241
18.2. SPRING BOOT AUTO-CONFIGURATION	242
CHAPTER 19. AVRO COMPONENT	244
19.1. APACHE AVRO OVERVIEW	244
19.2. USING THE AVRO DATA FORMAT	245
19.3. USING AVRO RPC IN CAMEL	245
19.4. AVRO RPC URI OPTIONS	246
19.4.1. Path Parameters (4 parameters):	246
19.4.2. Query Parameters (10 parameters):	247
19.5. SPRING BOOT AUTO-CONFIGURATION	248
19.6. AVRO RPC HEADERS	249
19.7. EXAMPLES	250
CHAPTER 20. AVRO DATAFORMAT	252
20.1. APACHE AVRO OVERVIEW	252
20.2. USING THE AVRO DATA FORMAT	253
20.3. AVRO DATAFORMAT OPTIONS	253
20.4. SPRING BOOT AUTO-CONFIGURATION	254
CHAPTER 21. AWS CLOUDWATCH COMPONENT	256
21.1. URI FORMAT	256
21.2. URI OPTIONS	256
21.2.1. Path Parameters (1 parameters):	256
21.2.2. Query Parameters (11 parameters):	257
21.3. SPRING BOOT AUTO-CONFIGURATION	257
21.4. USAGE	259
21.4.1. Message headers evaluated by the CW producer	259
21.4.2. Advanced AmazonCloudWatch configuration	261
21.5. DEPENDENCIES	261
21.6. SEE ALSO	261
CHAPTER 22. AWS DYNAMODB COMPONENT	262
22.1. URI FORMAT	262
22.2. URI OPTIONS	262
22.2.1. Path Parameters (1 parameters):	262
22.2.2. Query Parameters (13 parameters):	263
22.3. SPRING BOOT AUTO-CONFIGURATION	264
22.4. USAGE	266
22.4.1. Message headers evaluated by the DDB producer	266
22.4.2. Message headers set during BatchGetItems operation	268
22.4.3. Message headers set during DeleteItem operation	269
22.4.4. Message headers set during DeleteTable operation	269
22.4.5. Message headers set during DescribeTable operation	270
22.4.6. Message headers set during GetItem operation	271
22.4.7. Message headers set during PutItem operation	272
22.4.8. Message headers set during Query operation	272

22.4.9. Message headers set during Scan operation	273
22.4.10. Message headers set during UpdateItem operation	273
22.4.11. Advanced AmazonDynamoDB configuration	274
22.5. DEPENDENCIES	274
22.6. SEE ALSO	274
CHAPTER 23. AWS DYNAMODB STREAMS COMPONENT	276
23.1. URI FORMAT	276
23.2. URI OPTIONS	276
23.2.1. Path Parameters (1 parameters):	276
23.2.2. Query Parameters (28 parameters):	277
23.3. SPRING BOOT AUTO-CONFIGURATION	279
23.4. SEQUENCE NUMBERS	281
23.5. BATCH CONSUMER	282
23.6. USAGE	282
23.6.1. AmazonDynamoDBStreamsClient configuration	282
23.6.2. Providing AWS Credentials	282
23.7. COPING WITH DOWNTIME	282
23.7.1. AWS DynamoDB Streams outage of less than 24 hours	282
23.7.2. AWS DynamoDB Streams outage of more than 24 hours	282
23.8. DEPENDENCIES	282
23.9. SEE ALSO	283
CHAPTER 24. AWS EC2 COMPONENT	284
24.1. URI FORMAT	284
24.2. URI OPTIONS	284
24.2.1. Path Parameters (1 parameters):	284
24.2.2. Query Parameters (8 parameters):	285
24.3. SPRING BOOT AUTO-CONFIGURATION	285
24.4. USAGE	287
24.4.1. Message headers evaluated by the EC2 producer	287
24.5. SEE ALSO	288
CHAPTER 25. AWS IAM COMPONENT	290
25.1. URI FORMAT	290
25.2. URI OPTIONS	290
25.2.1. Path Parameters (1 parameters):	290
25.2.2. Query Parameters (8 parameters):	291
25.3. SPRING BOOT AUTO-CONFIGURATION	291
25.4. USAGE	293
25.4.1. Message headers evaluated by the IAM producer	293
25.4.2. IAM Producer operations	293
25.5. SEE ALSO	294
CHAPTER 26. AWS KINESIS COMPONENT	295
26.1. URI FORMAT	295
26.2. URI OPTIONS	295
26.2.1. Path Parameters (1 parameters):	295
26.2.2. Query Parameters (30 parameters):	296
26.3. SPRING BOOT AUTO-CONFIGURATION	299
26.4. BATCH CONSUMER	301
26.5. USAGE	301
26.5.1. Message headers set by the Kinesis consumer	301
26.5.2. AmazonKinesis configuration	301

26.5.3. Providing AWS Credentials	302
26.5.4. Message headers used by the Kinesis producer to write to Kinesis. The producer expects that the message body is a byte[].	302
26.5.5. Message headers set by the Kinesis producer on successful storage of a Record	302
26.6. DEPENDENCIES	303
26.7. SEE ALSO	303
CHAPTER 27. AWS KINESIS FIREHOSE COMPONENT	304
27.1. URI FORMAT	304
27.2. URI OPTIONS	304
27.2.1. Path Parameters (1 parameters):	304
27.2.2. Query Parameters (7 parameters):	305
27.3. SPRING BOOT AUTO-CONFIGURATION	305
27.4. USAGE	307
27.4.1. Amazon Kinesis Firehose configuration	307
27.4.2. Providing AWS Credentials	307
27.4.3. Message headers set by the Kinesis producer on successful storage of a Record	307
27.5. DEPENDENCIES	308
27.6. SEE ALSO	308
CHAPTER 28. AWS KMS COMPONENT	309
28.1. URI FORMAT	309
28.2. URI OPTIONS	309
28.2.1. Path Parameters (1 parameters):	309
28.2.2. Query Parameters (8 parameters):	310
28.3. SPRING BOOT AUTO-CONFIGURATION	310
28.4. USAGE	312
28.4.1. Message headers evaluated by the MQ producer	312
28.4.2. KMS Producer operations	312
28.5. SEE ALSO	313
CHAPTER 29. AWS LAMBDA COMPONENT	314
29.1. URI FORMAT	314
29.2. URI OPTIONS	314
29.2.1. Path Parameters (1 parameters):	315
29.2.2. Query Parameters (8 parameters):	315
29.3. SPRING BOOT AUTO-CONFIGURATION	315
29.4. USAGE	317
29.4.1. Message headers evaluated by the Lambda producer	317
29.5. LIST OF AVAILABLE OPERATIONS	329
29.6. EXAMPLE	329
29.7. DEPENDENCIES	330
29.8. SEE ALSO	330
CHAPTER 30. AWS MQ COMPONENT	331
30.1. URI FORMAT	331
30.2. URI OPTIONS	331
30.2.1. Path Parameters (1 parameters):	331
30.2.2. Query Parameters (8 parameters):	332
30.3. SPRING BOOT AUTO-CONFIGURATION	332
30.4. USAGE	334
30.4.1. Message headers evaluated by the MQ producer	334
30.5. SEE ALSO	335

CHAPTER 31. AWS S3 STORAGE SERVICE COMPONENT	337
31.1. URI FORMAT	337
31.2. URI OPTIONS	337
31.2.1. Path Parameters (1 parameters):	338
31.2.2. Query Parameters (50 parameters):	338
31.3. SPRING BOOT AUTO-CONFIGURATION	342
31.4. BATCH CONSUMER	347
31.5. USAGE	347
31.5.1. Message headers evaluated by the S3 producer	347
31.5.2. Message headers set by the S3 producer	349
31.5.3. Message headers set by the S3 consumer	350
31.5.4. S3 Producer operations	351
31.5.5. Advanced AmazonS3 configuration	352
31.5.6. Use KMS with the S3 component	352
31.5.7. Use "useIAMCredentials" with the s3 component	352
31.6. DEPENDENCIES	353
31.7. SEE ALSO	353
CHAPTER 32. AWS SIMPLEDB COMPONENT	354
32.1. URI FORMAT	354
32.2. URI OPTIONS	354
32.2.1. Path Parameters (1 parameters):	354
32.2.2. Query Parameters (10 parameters):	354
32.3. SPRING BOOT AUTO-CONFIGURATION	355
32.4. USAGE	355
32.4.1. Message headers evaluated by the SDB producer	355
32.4.2. Message headers set during DomainMetadata operation	357
32.4.3. Message headers set during GetAttributes operation	358
32.4.4. Message headers set during ListDomains operation	359
32.4.5. Message headers set during Select operation	359
32.4.6. Advanced AmazonSimpleDB configuration	359
32.5. DEPENDENCIES	360
32.6. SEE ALSO	360
CHAPTER 33. AWS SIMPLE EMAIL SERVICE COMPONENT	361
33.1. URI FORMAT	361
33.2. URI OPTIONS	361
33.2.1. Path Parameters (1 parameters):	361
33.2.2. Query Parameters (11 parameters):	362
33.3. SPRING BOOT AUTO-CONFIGURATION	362
33.4. USAGE	364
33.4.1. Message headers evaluated by the SES producer	364
33.4.2. Message headers set by the SES producer	365
33.4.3. Advanced AmazonSimpleEmailService configuration	365
33.5. DEPENDENCIES	366
33.6. SEE ALSO	366
CHAPTER 34. AWS SIMPLE NOTIFICATION SYSTEM COMPONENT	367
34.1. URI FORMAT	367
34.2. URI OPTIONS	367
34.2.1. Path Parameters (1 parameters):	368
34.2.2. Query Parameters (11 parameters):	368
34.3. SPRING BOOT AUTO-CONFIGURATION	368
34.4. USAGE	370

34.4.1. Message headers evaluated by the SNS producer	370
34.4.2. Message headers set by the SNS producer	371
34.4.3. Advanced AmazonSNS configuration	371
34.5. DEPENDENCIES	371
34.6. SEE ALSO	371
CHAPTER 35. AWS SIMPLE QUEUE SERVICE COMPONENT	373
35.1. URI FORMAT	373
35.2. URI OPTIONS	373
35.2.1. Path Parameters (1 parameters):	373
35.2.2. Query Parameters (48 parameters):	374
35.3. SPRING BOOT AUTO-CONFIGURATION	378
35.4. BATCH CONSUMER	382
35.5. USAGE	382
35.5.1. Message headers set by the SQS producer	382
35.5.2. Message headers set by the SQS consumer	383
35.5.3. Advanced AmazonSQS configuration	383
35.5.4. Creating or updating an SQS Queue	384
35.5.5. DelayQueue VS Delay for Single message	384
35.6. DEPENDENCIES	384
35.7. JMS-STYLE SELECTORS	385
35.8. SEE ALSO	385
CHAPTER 36. AWS SIMPLE WORKFLOW COMPONENT	386
36.1. URI FORMAT	386
36.2. URI OPTIONS	386
36.2.1. Path Parameters (1 parameters):	386
36.2.2. Query Parameters (30 parameters):	387
36.3. SPRING BOOT AUTO-CONFIGURATION	389
36.4. USAGE	393
36.4.1. Message headers evaluated by the SWF Workflow Producer	393
36.4.2. Message headers set by the SWF Workflow Producer	394
36.4.3. Message headers set by the SWF Workflow Consumer	395
36.4.4. Message headers set by the SWF Activity Producer	395
36.4.5. Message headers set by the SWF Activity Consumer	396
36.4.6. Advanced amazonSWClient configuration	396
36.5. DEPENDENCIES	396
36.6. SEE ALSO	396
CHAPTER 37. AWS XRAY COMPONENT	398
37.1. DEPENDENCY	398
37.2. CONFIGURATION	398
37.2.1. Explicit	399
37.2.2. Tracking of comprehensive route execution	399
37.3. EXAMPLE	400
CHAPTER 38. CAMEL COMPONENTS FOR WINDOWS AZURE SERVICES	401
CHAPTER 39. AZURE STORAGE BLOB SERVICE COMPONENT	402
39.1. URI FORMAT	402
39.2. URI OPTIONS	402
39.2.1. Path Parameters (1 parameters):	402
39.2.2. Query Parameters (19 parameters):	402
39.3. SPRING BOOT AUTO-CONFIGURATION	404

39.4. USAGE	405
39.4.1. Message headers evaluated by the Azure Storage Blob Service producer	405
39.4.2. Message headers set by the Azure Storage Blob Service producer	405
39.4.3. Message headers set by the Azure Storage Blob Service producer consumer	405
39.4.4. Azure Blob Service operations	405
39.4.5. Azure Blob Client configuration	406
39.5. DEPENDENCIES	407
39.6. SEE ALSO	407
CHAPTER 40. AZURE STORAGE QUEUE SERVICE COMPONENT	408
40.1. URI FORMAT	408
40.2. URI OPTIONS	408
40.2.1. Path Parameters (1 parameters):	408
40.2.2. Query Parameters (10 parameters):	408
40.3. SPRING BOOT AUTO-CONFIGURATION	409
40.4. USAGE	410
40.4.1. Message headers evaluated by the Azure Storage Queue Service producer	410
40.4.2. Message headers set by the Azure Storage Queue Service producer	410
40.4.3. Message headers set by the Azure Storage Queue Service producer consumer	410
40.4.4. Azure Queue Service operations	410
40.4.5. Azure Queue Client configuration	411
40.5. DEPENDENCIES	411
40.6. SEE ALSO	411
CHAPTER 41. BARCODE DATAFORMAT	413
41.1. DEPENDENCIES	413
41.2. BARCODE OPTIONS	413
41.3. SPRING BOOT AUTO-CONFIGURATION	413
41.4. USING THE JAVA DSL	414
41.4.1. Marshalling	415
41.4.2. Unmarshalling	415
CHAPTER 42. BASE64 DATAFORMAT	417
42.1. OPTIONS	417
42.2. SPRING BOOT AUTO-CONFIGURATION	417
42.3. MARSHAL	418
42.4. UNMARSHAL	419
42.5. DEPENDENCIES	419
CHAPTER 43. BEAN COMPONENT	420
43.1. URI FORMAT	420
43.2. OPTIONS	420
43.2.1. Path Parameters (1 parameters):	420
43.2.2. Query Parameters (5 parameters):	420
43.3. USING	421
43.4. BEAN AS ENDPOINT	422
43.5. JAVA DSL BEAN SYNTAX	422
43.6. BEAN BINDING	422
43.7. SEE ALSO	422
CHAPTER 44. BEANIO DATAFORMAT	424
44.1. OPTIONS	424
44.2. SPRING BOOT AUTO-CONFIGURATION	425
44.3. USAGE	426

44.3.1. Using Java DSL	426
44.3.2. Using XML DSL	426
44.4. DEPENDENCIES	427
CHAPTER 45. BEANSTALK COMPONENT	428
45.1. DEPENDENCIES	428
45.2. URI FORMAT	428
45.3. BEANSTALK OPTIONS	428
45.3.1. Path Parameters (1 parameters):	429
45.3.2. Query Parameters (26 parameters):	429
45.4. SPRING BOOT AUTO-CONFIGURATION	432
45.5. CONSUMER HEADERS	432
45.6. EXAMPLES	433
45.7. SEE ALSO	434
CHAPTER 46. BEAN VALIDATOR COMPONENT	435
46.1. URI FORMAT	435
46.2. URI OPTIONS	435

86.2. GENERAL OPTIONS	755
86.2.1. Path Parameters (1 parameters):	755
86.2.2. Query Parameters (20 parameters):	755
86.3. SPRING BOOT AUTO-CONFIGURATION	757
86.4. HEADER STRATEGY	759
86.5. EXAMPLES	760
86.6. DEPENDENCIES	760

CHAPTER 87. DOZER COMPONENT	761
87.1. URI FORMAT	761
87.2. OPTIONS	761
87.2.1. Path Parameters (1 parameters):	761
87.2.2. Query Parameters (7 parameters):	762
87.3. SPRING BOOT AUTO-CONFIGURATION	762
87.4. USING DATA FORMATS WITH DOZER	763
87.5. CONFIGURING DOZER	763
87.6. MAPPING EXTENSIONS	764
87.6.1. Variable Mappings	764
87.6.2. Custom Mappings	764
87.6.3. Expression Mappings	765
CHAPTER 88. DRILL COMPONENT	766
88.1. URI FORMAT	766
88.2. DRILL PRODUCER	766
88.3. OPTIONS	766
88.3.1. Path Parameters (1 parameters):	766
88.3.2. Query Parameters (5 parameters):	766
88.4. SPRING BOOT AUTO-CONFIGURATION	767
88.5. SEE ALSO	767
CHAPTER 89. DROPBOX COMPONENT	768
89.1. URI FORMAT	768
89.2. OPERATIONS	768
89.3. OPTIONS	768
89.3.1. Path Parameters (1 parameters):	769
89.3.2. Query Parameters (12 parameters):	769
89.4. SPRING BOOT AUTO-CONFIGURATION	770
89.5. DEL OPERATION	770
89.5.1. Samples	771
89.5.2. Result Message Headers	771
89.5.3. Result Message Body	771
89.6. GET (DOWNLOAD) OPERATION	771
89.6.1. Samples	771
89.6.2. Result Message Headers	772
89.6.3. Result Message Body	772
89.7. MOVE OPERATION	772
89.7.1. Samples	773
89.7.2. Result Message Headers	773
89.7.3. Result Message Body	773
89.8. PUT (UPLOAD) OPERATION	773
89.8.1. Samples	774
89.8.2. Result Message Headers	774
89.8.3. Result Message Body	774
89.9. SEARCH OPERATION	775
89.9.1. Samples	775
89.9.2. Result Message Headers	775
89.9.3. Result Message Body	775
CHAPTER 90. EHCACHE COMPONENT	777
90.1. URI FORMAT	777
90.2. OPTIONS	777
90.2.1. Path Parameters (1 parameters):	778

90.2.2. Query Parameters (17 parameters):	778
90.3. SPRING BOOT AUTO-CONFIGURATION	780
90.3.1. Message Headers Camel	783
90.4. EHCACHE BASED IDEMPOTENT REPOSITORY EXAMPLE:	784
90.5. EHCACHE BASED AGGREGATION REPOSITORY EXAMPLE:	784
CHAPTER 91. EJB COMPONENT	786
91.1. URI FORMAT	786
91.2. OPTIONS	786
91.2.1. Path Parameters (1 parameters):	787
91.2.2. Query Parameters (5 parameters):	787
91.3. BEAN BINDING	787
91.4. EXAMPLES	787
91.4.1. Using Java DSL	788
91.4.2. Using Spring XML	789
91.5. SEE ALSO	789
CHAPTER 92. ELASTICSEARCH COMPONENT (DEPRECATED)	790
92.1. URI FORMAT	790
92.2. ENDPOINT OPTIONS	790
92.2.1. Path Parameters (1 parameters):	790
92.2.2. Query Parameters (11 parameters):	790
92.3. SPRING BOOT AUTO-CONFIGURATION	791
92.4. LOCAL TESTING	792
92.5. MESSAGE OPERATIONS	792
92.6. INDEX EXAMPLE	794
92.7. FOR MORE INFORMATION, SEE THESE RESOURCES	795
92.8. SEE ALSO	795
CHAPTER 93. ELASTICSEARCH5 COMPONENT (DEPRECATED)	796
93.1. URI FORMAT	796
93.2. ENDPOINT OPTIONS	796
93.2.1. Path Parameters (1 parameters):	796
93.2.2. Query Parameters (16 parameters):	797
93.3. SPRING BOOT AUTO-CONFIGURATION	798
93.4. MESSAGE OPERATIONS	798
93.5. INDEX EXAMPLE	801
93.6. FOR MORE INFORMATION, SEE THESE RESOURCES	801
93.7. SEE ALSO	802
CHAPTER 94. ELASTICSEARCH REST COMPONENT	803
94.1. URI FORMAT	803
94.2. ENDPOINT OPTIONS	803
94.2.1. Path Parameters (1 parameters):	804
94.2.2. Query Parameters (11 parameters):	804
94.3. SPRING BOOT AUTO-CONFIGURATION	805
94.4. MESSAGE OPERATIONS	807
94.5. CONFIGURE THE COMPONENT AND ENABLE BASIC AUTHENTICATION	810
94.6. INDEX EXAMPLE	810
94.7. SEARCH EXAMPLE	811
94.8. MULTISEARCH EXAMPLE	811
CHAPTER 95. ELSQL COMPONENT	813
95.1. OPTIONS	813

95.1.1. Path Parameters (2 parameters):	814
95.1.2. Query Parameters (47 parameters):	814
95.2. SPRING BOOT AUTO-CONFIGURATION	819
95.3. RESULT OF THE QUERY	820
95.4. HEADER VALUES	820
95.4.1. Sample	820
95.5. USING EXPRESSION PARAMETERS IN PRODUCERS	821
95.5.1. Using expression parameters in consumers	821
CHAPTER 96. ETCD COMPONENT	823
96.1. URI FORMAT	823
96.2. URI OPTIONS	823
96.2.1. Path Parameters (2 parameters):	823
96.2.2. Query Parameters (29 parameters):	824
96.3. SPRING BOOT AUTO-CONFIGURATION	826
CHAPTER 97. OSGI EVENTADMIN COMPONENT	829
97.1. DEPENDENCIES	829
97.2. URI FORMAT	829
97.3. URI OPTIONS	829
97.3.1. Path Parameters (1 parameters):	829
97.3.2. Query Parameters (5 parameters):	830
97.4. MESSAGE HEADERS	830
97.5. MESSAGE BODY	830
97.6. EXAMPLE USAGE	831
CHAPTER 98. EXEC COMPONENT	832
98.1. DEPENDENCIES	832
98.2. URI FORMAT	832
98.3. URI OPTIONS	832
98.3.1. Path Parameters (1 parameters):	832
98.3.2. Query Parameters (8 parameters):	832
98.4. SPRING BOOT AUTO-CONFIGURATION	833
98.5. MESSAGE HEADERS	834
98.6. MESSAGE BODY	835
98.7. USAGE EXAMPLES	836
98.7.1. Executing word count (Linux)	836
98.7.2. Executing java	836
98.7.3. Executing Ant scripts	837
98.7.4. Executing echo (Windows)	837
98.8. SEE ALSO	837
CHAPTER 99. FACEBOOK COMPONENT	838
99.1. URI FORMAT	838
99.2. FACEBOOKCOMPONENT	838
99.2.1. Path Parameters (1 parameters):	839
99.2.2. Query Parameters (102 parameters):	839
99.3. SPRING BOOT AUTO-CONFIGURATION	846
99.4. PRODUCER ENDPOINTS:	849
99.5. CONSUMER ENDPOINTS:	850
99.6. READING OPTIONS	850
99.7. MESSAGE HEADER	850
99.8. MESSAGE BODY	850
99.9. USE CASES	850

CHAPTER 100. FHIR COMPONENT	852
100.1. URI FORMAT	852
100.1.1. Path Parameters (2 parameters):	853
100.1.2. Query Parameters (26 parameters):	853
100.2. SPRING BOOT AUTO-CONFIGURATION	855
CHAPTER 101. FHIR JSON DATAFORMAT	858
101.1. FHIR JSON FORMAT OPTIONS	858
101.2. SPRING BOOT AUTO-CONFIGURATION	860
CHAPTER 102. FHIR XML DATAFORMAT	863
102.1. FHIR XML FORMAT OPTIONS	863
102.2. SPRING BOOT AUTO-CONFIGURATION	865
CHAPTER 103. FILE COMPONENT	868
103.1. URI FORMAT	868
103.2. URI OPTIONS	868
103.2.1. Path Parameters (1 parameters):	869
103.2.2. Query Parameters (87 parameters):	869
103.3. MOVE AND DELETE OPERATIONS	884
103.4. FINE GRAINED CONTROL OVER MOVE AND PREMOVE OPTION	885
103.5. ABOUT MOVEFAILED	885
103.6. MESSAGE HEADERS	885
103.6.1. File producer only	885
103.6.2. File consumer only	886
103.7. BATCH CONSUMER	886
103.8. EXCHANGE PROPERTIES, FILE CONSUMER ONLY	886
103.9. USING CHARSET	887
103.10. COMMON GOTCHAS WITH FOLDER AND FILENAMES	888
103.11. FILENAME EXPRESSION	889
103.12. CONSUMING FILES FROM FOLDERS WHERE OTHERS DROP FILES DIRECTLY	889
103.13. USING DONE FILES	889
103.14. WRITING DONE FILES	890
103.15. SAMPLES	890
103.15.1. Read from a directory and write to another directory using a overrule dynamic name	890
103.15.2. Reading recursively from a directory and writing to another	890
103.16. USING FLATTEN	891
103.17. READING FROM A DIRECTORY AND THE DEFAULT MOVE OPERATION	891
103.18. READ FROM A DIRECTORY AND PROCESS THE MESSAGE IN JAVA	891
103.19. WRITING TO FILES	892
103.19.1. Write to subdirectory using Exchange.FILE_NAME	892
103.19.2. Writing file through the temporary directory relative to the final destination	892
103.20. USING EXPRESSION FOR FILENAMES	892
103.21. AVOIDING READING THE SAME FILE MORE THAN ONCE (IDEMPOTENT CONSUMER)	893
103.22. USING A FILE BASED IDEMPOTENT REPOSITORY	893
103.23. USING A JPA BASED IDEMPOTENT REPOSITORY	893
103.24. FILTER USING ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER	894
103.25. FILTERING USING ANT PATH MATCHER	895
103.25.1. Sorting using Comparator	895
103.25.2. Sorting using sortBy	895
103.26. USING GENERICFILEPROCESSSTRATEGY	896
103.27. USING FILTER	897
103.28. USING CONSUMER.BRIDGEERRORHANDLER	897
103.29. DEBUG LOGGING	898

103.30. SEE ALSO	898

128.2.2. Query Parameters (6 parameters):	1061
128.3. SPRING BOOT AUTO-CONFIGURATION	1062
128.4. USAGE	1062
128.5. DEADEVENT CONSIDERATIONS	1063
128.6. CONSUMING MULTIPLE TYPE OF EVENTS	1064
CHAPTER 129. HAWTDB (DEPRECATED)	1065
129.1. USING HAWTDBAGGREGATIONREPOSITORY	1065
129.1.1. What is preserved when persisting	1067
129.1.2. Recovery	1067
129.1.2.1. Using HawtDBAggregationRepository in Java DSL	1067
129.1.2.2. Using HawtDBAggregationRepository in Spring XML	1067
129.1.3. Dependencies	1067
129.1.4. See Also	1068
CHAPTER 130. HAZELCAST COMPONENT	1069
130.1. HAZELCAST COMPONENTS	1069
130.2. USING HAZELCAST REFERENCE	1069
130.2.1. By its name	1069
130.2.2. By instance	1070
130.3. PUBLISHING HAZELCAST INSTANCE AS AN OSGI SERVICE	1070
130.3.1. Bundle A create an instance and publishes it as an OSGI service	1070
130.3.2. Bundle B uses the instance	1071
CHAPTER 131. HAZELCAST ATOMIC NUMBER COMPONENT	1072
131.1. OPTIONS	1072
131.1.1. Path Parameters (1 parameters):	1072
131.1.2. Query Parameters (10 parameters):	1072
131.2. SPRING BOOT AUTO-CONFIGURATION	1073
131.3. ATOMIC NUMBER PRODUCER - TO("HAZELCAST-ATOMICVALUE:FOO")	1074
131.3.1. Sample for set:	1075
131.3.2. Sample for get:	1075
131.3.3. Sample for increment:	1076
131.3.4. Sample for decrement:	1076
131.3.5. Sample for destroy	1076
CHAPTER 132. HAZELCAST INSTANCE COMPONENT	1078
132.1. OPTIONS	1078
132.1.1. Path Parameters (1 parameters):	1078
132.1.2. Query Parameters (16 parameters):	1078
132.2. SPRING BOOT AUTO-CONFIGURATION	1080
132.3. INSTANCE CONSUMER - FROM("HAZELCAST-INSTANCE:FOO")	1084
CHAPTER 133. HAZELCAST LIST COMPONENT	1085
133.1. OPTIONS	1085
133.1.1. Path Parameters (1 parameters):	1085
133.1.2. Query Parameters (16 parameters):	1085
133.2. SPRING BOOT AUTO-CONFIGURATION	1087

133.3. LIST PRODUCER – TO("HAZELCAST-LIST:FOO")	1088
133.3.1. Sample for add:	1088
133.3.2. Sample for get:	1088
133.3.3. Sample for setvalue:	1088
133.3.4. Sample for removevalue:	1088
133.4. LIST CONSUMER – FROM("HAZELCAST-LIST:FOO")	1089
CHAPTER 134. HAZELCAST MAP COMPONENT	1090
134.1. OPTIONS	1090
134.1.1. Path Parameters (1 parameters):	1090
134.1.2. Query Parameters (16 parameters):	1090
134.2. SPRING BOOT AUTO-CONFIGURATION	1092
134.3. MAP CACHE PRODUCER – TO("HAZELCAST-MAP:FOO")	1093
134.3.1. Sample for put:	1094
134.3.2. Sample for get:	1095
134.3.3. Sample for update:	1096
134.3.4. Sample for delete:	1096
134.3.5. Sample for query	1096
134.4. MAP CACHE CONSUMER – FROM("HAZELCAST-MAP:FOO")	1097
CHAPTER 135. HAZELCAST MULTIMAP COMPONENT	1099
135.1. OPTIONS	1099
135.1.1. Path Parameters (1 parameters):	1099
135.1.2. Query Parameters (16 parameters):	1099
135.2. SPRING BOOT AUTO-CONFIGURATION	1101
135.3. MULTIMAP CACHE PRODUCER – TO("HAZELCAST-MULTIMAP:FOO")	1102
135.3.1. Sample for put:	1102
135.3.2. Sample for removevalue:	1103
135.3.3. Sample for get:	1103
135.3.4. Sample for delete:	1104
135.4. MULTIMAP CACHE CONSUMER – FROM("HAZELCAST-MULTIMAP:FOO")	1104
CHAPTER 136. HAZELCAST QUEUE COMPONENT	1106
136.1. OPTIONS	1106
136.1.1. Path Parameters (1 parameters):	1106
136.1.2. Query Parameters (16 parameters):	1106
136.2. SPRING BOOT AUTO-CONFIGURATION	1108
136.3. QUEUE PRODUCER – TO("HAZELCAST-QUEUE:FOO")	1109
136.3.1. Sample for add:	1109
136.3.2. Sample for put:	1109
136.3.3. Sample for poll:	1109
136.3.4. Sample for peek:	1109
136.3.5. Sample for offer:	1110
136.3.6. Sample for removevalue:	1110
136.3.7. Sample for remaining capacity:	1110
136.3.8. Sample for remove all:	1110
136.3.9. Sample for remove if:	1110
136.3.10. Sample for drain to:	1110
136.3.11. Sample for take:	1110
136.3.12. Sample for retain all:	1110
136.4. QUEUE CONSUMER – FROM("HAZELCAST-QUEUE:FOO")	1111
CHAPTER 137. HAZELCAST REPLICATED MAP COMPONENT	1112
137.1. OPTIONS	1112

137.1.1. Path Parameters (1 parameters):	1112
137.1.2. Query Parameters (16 parameters):	1112
137.2. SPRING BOOT AUTO-CONFIGURATION	1114
137.3. REPLICATEDMAP CACHE PRODUCER	1115
137.3.1. Sample for put:	1115
137.3.2. Sample for get:	1116
137.3.3. Sample for delete:	1116
137.4. REPLICATEDMAP CACHE CONSUMER	1117
CHAPTER 138. HAZELCAST RINGBUFFER COMPONENT	1119
138.1. OPTIONS	1119
138.1.1. Path Parameters (1 parameters):	1119
138.1.2. Query Parameters (10 parameters):	1119
138.2. SPRING BOOT AUTO-CONFIGURATION	1120
138.3. RINGBUFFER CACHE PRODUCER	1121
138.3.1. Sample for put:	1122
138.3.2. Sample for readonce from head:	1122
CHAPTER 139. HAZELCAST SEDA COMPONENT	1123
139.1. OPTIONS	1123
139.1.1. Path Parameters (1 parameters):	1123
139.1.2. Query Parameters (16 parameters):	1123
139.2. SPRING BOOT AUTO-CONFIGURATION	1125
139.3. SEDA PRODUCER – TO(“HAZELCAST-SEDA:FOO”)	1126
139.4. SEDA CONSUMER – FROM(“HAZELCAST-SEDA:FOO”)	1126
CHAPTER 140. HAZELCAST SET COMPONENT	1128
140.1. OPTIONS	1128
140.1.1. Path Parameters (1 parameters):	1128
140.1.2. Query Parameters (16 parameters):	1128
140.2. SPRING BOOT AUTO-CONFIGURATION	1130
CHAPTER 141. HAZELCAST TOPIC COMPONENT	1132
141.1. OPTIONS	1132
141.1.1. Path Parameters (1 parameters):	1132
141.1.2. Query Parameters (16 parameters):	1132
141.2. SPRING BOOT AUTO-CONFIGURATION	1134
141.3. TOPIC PRODUCER – TO(“HAZELCAST-TOPIC:FOO”)	1135
141.3.1. Sample for publish:	1135
141.4. TOPIC CONSUMER – FROM(“HAZELCAST-TOPIC:FOO”)	1135
CHAPTER 142. HBASE COMPONENT	1137
142.1. APACHE HBASE OVERVIEW	1137
142.2. CAMEL AND HBASE	1137
142.3. CONFIGURING THE COMPONENT	1137
142.4. HBASE PRODUCER	1138
142.4.1. Supported URI options	1138
142.4.2. Path Parameters (1 parameters):	1139
142.4.3. Query Parameters (16 parameters):	1139
142.5. SPRING BOOT AUTO-CONFIGURATION	1140
142.5.1. Put Operations.	1141
142.5.2. Get Operations.	1142
142.5.3. Delete Operations.	1142
142.5.4. Scan Operations.	1143

142.6. HBASE CONSUMER	1144
142.7. HBASE IDEMPOTENT REPOSITORY	1144
142.8. HBASE MAPPING	1145
142.8.1. HBase Header mapping Examples	1145
142.8.2. Body mapping Examples	1146
142.9. SEE ALSO	1147
CHAPTER 143. HDFS COMPONENT (DEPRECATED)	1148
143.1. URI FORMAT	1148
143.2. OPTIONS	1148
143.2.1. Path Parameters (3 parameters):	1149
143.2.2. Query Parameters (38 parameters):	1149
143.3. SPRING BOOT AUTO-CONFIGURATION	1153
143.3.1. KeyType and ValueType	1153
143.4. SPLITTING STRATEGY	1154
143.5. MESSAGE HEADERS	1154
143.5.1. Producer only	1155
143.6. CONTROLLING TO CLOSE FILE STREAM	1155
143.7. USING THIS COMPONENT IN OSGI	1155
CHAPTER 144. HDFS2 COMPONENT	1156
144.1. URI FORMAT	1156
144.2. OPTIONS	1156
144.2.1. Path Parameters (3 parameters):	1157
144.2.2. Query Parameters (38 parameters):	1157
144.3. SPRING BOOT AUTO-CONFIGURATION	1160
144.3.1. KeyType and ValueType	1161
144.4. SPLITTING STRATEGY	1161
144.5. MESSAGE HEADERS	1162
144.5.1. Producer only	1162
144.6. CONTROLLING TO CLOSE FILE STREAM	1162
144.7. USING THIS COMPONENT IN OSGI	1162
144.7.1. Using this component with manually defined routes	1163
144.7.2. Using this component with Blueprint container	1163
CHAPTER 145. HEADERSMAP	1164
145.1. AUTO DETECTION FROM CLASSPATH	1164
145.2. MANUAL ENABLING	1164
CHAPTER 146. HESSIAN DATAFORMAT (DEPRECATED)	1165
146.1. OPTIONS	1165
146.2. SPRING BOOT AUTO-CONFIGURATION	1165
146.3. USING THE HESSIAN DATA FORMAT IN JAVA DSL	1166
146.4. USING THE HESSIAN DATA FORMAT IN SPRING DSL	1166
CHAPTER 147. HIPCHAT COMPONENT	1167
147.1. URI FORMAT	1167
147.2. URI OPTIONS	1167
147.2.1. Path Parameters (3 parameters):	1167
147.2.2. Query Parameters (22 parameters):	1167
147.3. SPRING BOOT AUTO-CONFIGURATION	1170
147.4. SCHEDULED POLL CONSUMER	1170
147.4.1. Message headers set by the Hipchat consumer	1170
147.5. HIPCHAT PRODUCER	1171

147.5.1. Message headers evaluated by the Hipchat producer	1171
147.5.2. Message headers set by the Hipchat producer	1172
147.5.3. Configuring Http Client	1172
147.5.4. Dependencies	1173
CHAPTER 148. HL7 DATAFORMAT	1174
148.1. HL7 MLLP PROTOCOL	1174
148.1.1. Exposing an HL7 listener using Mina	1175
148.1.2. Exposing an HL7 listener using Netty (available from Camel 2.15 onwards)	1176
148.2. HL7 MODEL USING JAVA.LANG.STRING OR BYTE[]	1176
148.3. HL7V2 MODEL USING HAPI	1176
148.4. HL7 DATAFORMAT	1177
148.5. SPRING BOOT AUTO-CONFIGURATION	1177
148.5.1. Serializable messages	1178
148.5.2. Segment separators	1178
148.5.3. Charset	1178
148.6. MESSAGE HEADERS	1179
148.7. OPTIONS	1180
148.8. DEPENDENCIES	1181
148.9. TERSER LANGUAGE	1182
148.10. HL7 VALIDATION PREDICATE	1182
148.11. HL7 VALIDATION PREDICATE USING THE HAPICONTEXT (CAMEL 2.14)	1183
148.12. HL7 ACKNOWLEDGEMENT EXPRESSION	1183
CHAPTER 149. HTTP COMPONENT (DEPRECATED)	1185
149.1. URI FORMAT	1185
149.2. EXAMPLES	1185
149.3. HTTP OPTIONS	1186
149.3.1. Path Parameters (1 parameters):	1187
149.3.2. Query Parameters (38 parameters):	1187
149.4. SPRING BOOT AUTO-CONFIGURATION	1191
149.5. MESSAGE HEADERS	1192
149.6. MESSAGE BODY	1194
149.7. RESPONSE CODE	1194
149.8. HTTPOPERATIONFAILEDEXCEPTION	1195
149.9. WHICH HTTP METHOD WILL BE USED	1195
149.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE	1195
149.11. USING CLIENT TIMEOUT - SO_TIMEOUT	1195
149.12. MORE EXAMPLES	1195
149.12.1. Configuring a Proxy	1195
149.12.2. Using proxy settings outside of URI	1196
149.13. CONFIGURING CHARSET	1196
149.14. SAMPLE WITH SCHEDULED POLL	1196
149.15. GETTING THE RESPONSE CODE	1196
149.16. USING THROWEXCEPTIONONFAILURE=FALSE TO GET ANY RESPONSE BACK	1196
149.17. DISABLING COOKIES	1197
149.18. ADVANCED USAGE	1197
149.18.1. Setting MaxConnectionsPerHost	1197
149.18.2. Using preemptive authentication	1197
149.18.3. Accepting self signed certificates from remote server	1197
149.18.4. Setting up SSL for HTTP Client	1197
149.19. SEE ALSO	1199
CHAPTER 150. HTTP4 COMPONENT	1200

150.1. URI FORMAT	1200
150.2. HTTP4 COMPONENT OPTIONS	1200
150.2.1. Path Parameters (1 parameters):	1202
150.2.2. Query Parameters (49 parameters):	1203
150.3. SPRING BOOT AUTO-CONFIGURATION	1207
150.4. MESSAGE HEADERS	1210
150.5. MESSAGE BODY	1211
150.6. USING SYSTEM PROPERTIES	1211
150.7. RESPONSE CODE	1212
150.8. HTTPOPERATIONFAILEDEXCEPTION	1212
150.9. WHICH HTTP METHOD WILL BE USED	1212
150.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE	1213
150.11. CONFIGURING URI TO CALL	1213
150.12. CONFIGURING URI PARAMETERS	1213
150.13. HOW TO SET THE HTTP METHOD (GET/PATCH/POST/PUT/DELETE/HEAD/OPTIONS/TRACE) TO THE HTTP PRODUCER	1214
150.14. USING CLIENT TIMEOUT - SO_TIMEOUT	1214
150.15. CONFIGURING A PROXY	1214
150.15.1. Using proxy settings outside of URI	1215
150.16. CONFIGURING CHARSET	1215
150.16.1. Sample with scheduled poll	1215
150.16.2. URI Parameters from the endpoint URI	1215
150.16.3. URI Parameters from the Message	1216
150.16.4. Getting the Response Code	1216
150.17. DISABLING COOKIES	1216
150.18. ADVANCED USAGE	1216
150.18.1. Setting up SSL for HTTP Client	1216
CHAPTER 151. HYSTRIX COMPONENT	1220
151.1. SPRING BOOT AUTO-CONFIGURATION	1220
CHAPTER 152. ICAL DATAFORMAT	1221
152.1. OPTIONS	1221
152.2. SPRING BOOT AUTO-CONFIGURATION	1221
152.3. BASIC USAGE	1222
152.4. SEE ALSO	1222
CHAPTER 153. IEC 60870 CLIENT COMPONENT	1223
153.1. URI FORMAT	1223
153.2. URI OPTIONS	1223
153.2.1. Path Parameters (1 parameters):	1223
153.2.2. Query Parameters (19 parameters):	1224
153.3. SPRING BOOT AUTO-CONFIGURATION	1225
CHAPTER 154. IEC 60870 SERVER COMPONENT	1227
154.1. URI FORMAT	1227
154.2. URI OPTIONS	1227
154.2.1. Path Parameters (1 parameters):	1227
154.2.2. Query Parameters (20 parameters):	1228
154.3. SPRING BOOT AUTO-CONFIGURATION	1229
CHAPTER 155. IGNITE CACHE COMPONENT	1231
155.1. OPTIONS	1231
155.1.1. Path Parameters (1 parameters):	1231

155.1.2. Query Parameters (16 parameters):	1231
155.2. SPRING BOOT AUTO-CONFIGURATION	1233
155.2.1. Headers used	1234
CHAPTER 156. IGNITE COMPUTE COMPONENT	1236
156.1. OPTIONS	1236
156.1.1. Path Parameters (1 parameters):	1236
156.1.2. Query Parameters (8 parameters):	1237
156.2. SPRING BOOT AUTO-CONFIGURATION	1237
156.2.1. Expected payload types	1238
156.2.2. Headers used	1238
CHAPTER 157. IGNITE EVENTS COMPONENT	1240
157.1. OPTIONS	1240
157.1.1. Path Parameters (1 parameters):	1240
157.1.2. Query Parameters (8 parameters):	1240
157.2. SPRING BOOT AUTO-CONFIGURATION	1241
CHAPTER 158. IGNITE ID GENERATOR COMPONENT	1243
158.1. OPTIONS	1243
158.1.1. Path Parameters (1 parameters):	1243
158.1.2. Query Parameters (6 parameters):	1243
158.2. SPRING BOOT AUTO-CONFIGURATION	1244
CHAPTER 159. IGNITE MESSAGING COMPONENT	1246
159.1. OPTIONS	1246
159.1.1. Path Parameters (1 parameters):	1246
159.1.2. Query Parameters (9 parameters):	1246
159.2. SPRING BOOT AUTO-CONFIGURATION	1247
159.2.1. Headers used	1248
CHAPTER 160. IGNITE QUEUES COMPONENT	1249
160.1. OPTIONS	1249
160.1.1. Path Parameters (1 parameters):	1249
160.1.2. Query Parameters (7 parameters):	1249
160.2. SPRING BOOT AUTO-CONFIGURATION	1250
160.2.1. Headers used	1251
CHAPTER 161. IGNITE SETS COMPONENT	1253
161.1. OPTIONS	1253
161.1.1. Path Parameters (1 parameters):	1253
161.1.2. Query Parameters (5 parameters):	1253
161.2. SPRING BOOT AUTO-CONFIGURATION	1254
161.2.1. Headers used	1255
CHAPTER 162. INFINISPAN COMPONENT	1256
162.1. URI FORMAT	1256
162.2. URI OPTIONS	1256
162.2.1. Path Parameters (1 parameters):	1257
162.2.2. Query Parameters (18 parameters):	1257
162.3. SPRING BOOT AUTO-CONFIGURATION	1259
162.4. MESSAGE HEADERS	1262
162.5. EXAMPLES	1263
162.6. USING THE INFINISPAN BASED IDEMPOTENT REPOSITORY	1264
162.7. USING THE INFINISPAN BASED ROUTE POLICY	1265

162.8. SEE ALSO	1265
CHAPTER 163. INFLUXDB COMPONENT	1266
163.1. URI FORMAT	1266
163.2. URI OPTIONS	1266
163.2.1. Path Parameters (1 parameters):	1266
163.2.2. Query Parameters (6 parameters):	1266
163.3. SPRING BOOT AUTO-CONFIGURATION	1267

168.12. SCHEMA LOCATION	1298
168.13. MARSHAL DATA THAT IS ALREADY XML	1298
168.14. DEPENDENCIES	1299
CHAPTER 169. JCACHE COMPONENT	1300
169.1. URI FORMAT	1300
169.2. URI OPTIONS	1300
169.2.1. Path Parameters (1 parameters):	1300
169.2.2. Query Parameters (22 parameters):	1300
169.3. SPRING BOOT AUTO-CONFIGURATION	1302
CHAPTER 170. JCLOUDS COMPONENT	1304
170.1. CONFIGURING THE COMPONENT	1304
170.2. JCLOUDS OPTIONS	1305
170.3. BLOBSTORE URI OPTIONS	1305
170.3.1. Path Parameters (2 parameters):	1306
170.3.2. Query Parameters (15 parameters):	1306
170.3.3. Message Headers for blobstore	1307
170.4. BLOBSTORE USAGE SAMPLES	1308
170.4.1. Example 1: Putting to the blob	1308
170.4.2. Example 2: Getting/Reading from a blob	1308
170.4.3. Example 3: Consuming a blob	1308
170.5. COMPUTE USAGE SAMPLES	1309
170.5.1. Example 1: Listing the available images.	1309
170.5.2. Example 2: Create a new node.	1309
170.5.3. Example 3: Run a shell script on running node.	1310
170.5.4. See also	1310
CHAPTER 171. JCR COMPONENT	1311
171.1. URI FORMAT	1311
171.2. USAGE	1311
171.2.1. JCR Options	1311
171.2.2. Path Parameters (2 parameters):	1311
171.2.3. Query Parameters (14 parameters):	1312
171.3. SPRING BOOT AUTO-CONFIGURATION	1313
171.4. EXAMPLE	1313
171.5. SEE ALSO	1314

CHAPTER 172. JDBC COMPONENT	1315
172.1. URI FORMAT	1315
172.2. OPTIONS	1315
172.2.1. Path Parameters (1 parameters):	1316
172.2.2. Query Parameters (13 parameters):	1316
172.3. SPRING BOOT AUTO-CONFIGURATION	1318
172.4. RESULT	1318
172.4.1. Message Headers	1318
172.5. GENERATED KEYS	1319
172.6. USING NAMED PARAMETERS	1319
172.7. SAMPLES	1320
172.8. SAMPLE - POLLING THE DATABASE EVERY MINUTE	1320
172.9. SAMPLE - MOVE DATA BETWEEN DATA SOURCES	1320
CHAPTER 173. JETTY 9 COMPONENT	1322
173.1. URI FORMAT	1322
173.2. OPTIONS	1322
173.2.1. Path Parameters (1 parameters):	1325
173.2.2. Query Parameters (54 parameters):	1326
173.3. SPRING BOOT AUTO-CONFIGURATION	1332
173.4. MESSAGE HEADERS	1335
173.5. USAGE	1335
173.6. PRODUCER EXAMPLE	1336
173.7. CONSUMER EXAMPLE	1336
173.8. SESSION SUPPORT	1337
173.9. SSL SUPPORT (HTTPS)	1337
173.9.1. Configuring camel-jetty9 with TLS security on IBM Java	1340
173.9.2. Configuring general SSL properties	1340
173.9.3. How to obtain reference to the X509Certificate	1340
173.9.4. Configuring general HTTP properties	1341
173.9.5. Obtaining X-Forwarded-For header with HttpServletRequest.getRemoteAddr()	1341
173.10. DEFAULT BEHAVIOR FOR RETURNING HTTP STATUS CODES	1341
173.11. CUSTOMIZING HTTPBINDING	1342
173.12. JETTY HANDLERS AND SECURITY CONFIGURATION	1342
173.13. HOW TO RETURN A CUSTOM HTTP 500 REPLY MESSAGE	1343
173.14. MULTI-PART FORM SUPPORT	1343
173.15. JETTY JMX SUPPORT	1344
CHAPTER 174. JGROUPS COMPONENT	1345
174.1. URI FORMAT	1345
174.2. OPTIONS	1345
174.2.1. Path Parameters (1 parameters):	1346
174.2.2. Query Parameters (6 parameters):	1346
174.3. SPRING BOOT AUTO-CONFIGURATION	1347
174.4. HEADERS	1348
174.5. PREDEFINED FILTERS	1349
174.6. PREDEFINED EXPRESSIONS	1349
174.7. EXAMPLES	1350
174.7.1. Sending (receiving) messages to (from) the JGroups cluster	1350
174.7.2. Receive cluster view change notifications	1350
174.7.3. Keeping singleton route within the cluster	1351
CHAPTER 175. JIBX DATAFORMAT	1352
175.1. OPTIONS	1352

175.2. SPRING BOOT AUTO-CONFIGURATION	1352
175.3. JIBX SPRING DSL	1353
175.4. DEPENDENCIES	1353
CHAPTER 176. JING COMPONENT	1355
176.1. URI FORMAT CAMEL 2.16	1355
176.2. OPTIONS	1355
176.2.1. Path Parameters (1 parameters):	1355
176.2.2. Query Parameters (2 parameters):	1355
176.3. SPRING BOOT AUTO-CONFIGURATION	1356
176.4. EXAMPLE	1356
176.5. SEE ALSO	1356
CHAPTER 177. JIRA COMPONENT (DEPRECATED)	1357
177.1. URI FORMAT	1357
177.2. JIRA OPTIONS	1357
177.2.1. Path Parameters (1 parameters):	1357
177.2.2. Query Parameters (9 parameters):	1357
177.3. SPRING BOOT AUTO-CONFIGURATION	1358
177.4. JQL:	1359
CHAPTER 178. JMS COMPONENT	1360
178.1. JMS COMPONENT	1360
178.2. URI FORMAT	1360
178.3. NOTES	1361
178.3.1. Using ActiveMQ	1361
178.3.2. Transactions and Cache Levels	1361
178.3.3. Durable Subscriptions	1361
178.3.4. Message Header Mapping	1361
178.4. OPTIONS	1362
178.4.1. Component options	1362
178.4.2. Endpoint options	1374
178.4.3. Path Parameters (2 parameters):	1374
178.4.4. Query Parameters (92 parameters):	1375
178.5. SPRING BOOT AUTO-CONFIGURATION	1388
178.6. SAMPLES	1416
178.6.1. Receiving from JMS	1416
178.6.2. Sending to JMS	1416
178.6.3. Using Annotations	1417
178.6.4. Spring DSL sample	1417
178.6.5. Other samples	1417
178.6.6. Using JMS as a Dead Letter Queue storing Exchange	1417
178.6.7. Using JMS as a Dead Letter Channel storing error only	1417
178.7. MESSAGE MAPPING BETWEEN JMS AND CAMEL	1418
178.7.1. Disabling auto-mapping of JMS messages	1419
178.7.2. Using a custom MessageConverter	1419
178.7.3. Controlling the mapping strategy selected	1420
178.8. MESSAGE FORMAT WHEN SENDING	1420
178.9. MESSAGE FORMAT WHEN RECEIVING	1421
178.10. ABOUT USING CAMEL TO SEND AND RECEIVE MESSAGES AND JMSREPLYTO	1422
178.10.1. JmsProducer	1422
178.10.2. JmsConsumer	1423
178.11. REUSE ENDPOINT AND SEND TO DIFFERENT DESTINATIONS COMPUTED AT RUNTIME	1424
178.12. CONFIGURING DIFFERENT JMS PROVIDERS	1424

178.12.1. Using JNDI to find the ConnectionFactory	1425
178.13. CONCURRENT CONSUMING	1425
178.13.1. Concurrent Consuming with async consumer	1425
178.14. REQUEST-REPLY OVER JMS	1426
178.14.1. Request-reply over JMS and using a shared fixed reply queue	1427
178.14.2. Request-reply over JMS and using an exclusive fixed reply queue	1428
178.15. SYNCHRONIZING CLOCKS BETWEEN SENDERS AND RECEIVERS	1428
178.16. ABOUT TIME TO LIVE	1429
178.17. ENABLING TRANSACTED CONSUMPTION	1429
178.18. USING JMSREPLYTO FOR LATE REPLIES	1430
178.19. USING A REQUEST TIMEOUT	1431
178.20. SAMPLES	1431
178.20.1. Receiving from JMS	1431
178.20.2. Sending to JMS	1431
178.20.3. Using Annotations	1431
178.20.4. Spring DSL sample	1431
178.20.5. Other samples	1432
178.20.6. Using JMS as a Dead Letter Queue storing Exchange	1432
178.20.7. Using JMS as a Dead Letter Channel storing error only	1432
178.21. SENDING AN INONLY MESSAGE AND KEEPING THE JMSREPLYTO HEADER	1433
178.22. SETTING JMS PROVIDER OPTIONS ON THE DESTINATION	1433
178.23. SEE ALSO	1434
CHAPTER 179. JMX COMPONENT	1435
179.1. CAMEL JMX	1435
179.2. OPTIONS	1435
179.2.1. Path Parameters (1 parameters):	1435
179.2.2. Query Parameters (30 parameters):	1435
179.3. SPRING BOOT AUTO-CONFIGURATION	1438
179.4. ACTIVATING JMX IN CAMEL	1438
179.4.1. Using JMX to manage Apache Camel	1438
179.4.2. Disabling JMX instrumentation agent in Camel	1439
179.4.3. Locating a MBeanServer in the Java VM	1439
179.4.4. The System Properties for Camel JMX support	1440
179.4.5. How to use authentication with JMX	1440
179.4.6. JMX inside an Application Server	1441
179.4.6.1. Tomcat 6	1441
179.4.6.2. JBoss AS 4	1441
179.4.6.3. WebSphere	1441
179.4.6.4. Oracle OC4j	1441
179.4.7. Advanced JMX Configuration	1442
179.4.8. Example:	1442
179.4.9. jmxAgent Properties Reference	1442
179.4.10. Configuring whether to register MBeans always, for new routes or just by default	1444
179.5. MONITORING CAMEL USING JMX	1445
179.5.1. Using JConsole to monitor Camel	1445
179.5.2. Which endpoints are registered	1446
179.5.3. Which processors are registered	1446
179.5.4. How to use the JMX NotificationListener to listen the camel events?	1446
179.5.5. Using the Tracer MBean to get fine grained tracing	1447
179.6. USING JMX FOR YOUR OWN CAMEL CODE	1448
179.6.1. Registering your own Managed Endpoints	1448
179.6.2. Programming your own Managed Services	1449

179.6.3. ManagementNamingStrategy	1450
179.6.4. Management naming pattern	1450
179.6.5. ManagementStrategy	1452
179.6.6. Configuring level of granularity for performance statistics	1452
179.7. HIDING SENSITIVE INFORMATION	1453
179.7.1. Declaring which JMX attributes and operations to mask	1454
179.8. SEE ALSO	1454
CHAPTER 180. JOLT COMPONENT	1455
180.1. URI FORMAT	1455
180.2. OPTIONS	1455
180.2.1. Path Parameters (1 parameters):	1456
180.2.2. Query Parameters (7 parameters):	1456
180.3. SPRING BOOT AUTO-CONFIGURATION	1457
180.4. SAMPLES	1458
180.5. SEE ALSO	1458
CHAPTER 181. JPA COMPONENT	1459
181.1. SENDING TO THE ENDPOINT	1459
181.2. CONSUMING FROM THE ENDPOINT	1459
181.3. URI FORMAT	1460
181.4. OPTIONS	1460
181.4.1. Path Parameters (1 parameters):	1460
181.4.2. Query Parameters (42 parameters):	1461
181.5. SPRING BOOT AUTO-CONFIGURATION	1465
181.6. MESSAGE HEADERS	1466
181.7. CONFIGURING ENTITYMANAGERFACTORY	1466
181.8. CONFIGURING TRANSACTIONMANAGER	1466
181.9. USING A CONSUMER WITH A NAMED QUERY	1467
181.10. USING A CONSUMER WITH A QUERY	1467
181.11. USING A CONSUMER WITH A NATIVE QUERY	1467
181.12. USING A PRODUCER WITH A NAMED QUERY	1468
181.13. USING A PRODUCER WITH A QUERY	1468
181.14. USING A PRODUCER WITH A NATIVE QUERY	1468
181.15. EXAMPLE	1468
181.16. USING THE JPA-BASED IDEMPOTENT REPOSITORY	1468
181.17. SEE ALSO	1470
CHAPTER 182. JSON FASTJSON DATAFORMAT	1471
182.1. FASTJSON OPTIONS	1471
182.2. SPRING BOOT AUTO-CONFIGURATION	1473
182.3. DEPENDENCIES	1475
CHAPTER 183. JSON GSON DATAFORMAT	1477
183.1. GSON OPTIONS	1477
183.2. SPRING BOOT AUTO-CONFIGURATION	1479
183.3. DEPENDENCIES	1481
CHAPTER 184. JSON JACKSON DATAFORMAT	1483
184.1. JACKSON OPTIONS	1483
184.2. SPRING BOOT AUTO-CONFIGURATION	1485
184.3. USING CUSTOM OBJECTMAPPER	1487
184.4. DEPENDENCIES	1488
184.5. JACKSON OBJECTMAPPER	1488

184.5.1. What is object mapping?	1488
184.5.2. What is polymorphic object mapping?	1488
184.5.3. How to enable polymorphic object mapping	1489
184.5.4. Default mapping for polymorphic deserialization	1490
184.5.5. Security risk from polymorphic deserialization	1491
CHAPTER 185. JSON JOHNSON DATAFORMAT	1492
185.1. JOHNSON OPTIONS	1492
185.2. SPRING BOOT AUTO-CONFIGURATION	1494
185.3. DEPENDENCIES	1496
CHAPTER 186. JSON SCHEMA VALIDATOR COMPONENT	1498
186.1. URI FORMAT	1498
186.2. URI OPTIONS	1498
186.2.1. Path Parameters (1 parameters):	1498
186.2.2. Query Parameters (7 parameters):	1498
186.3. SPRING BOOT AUTO-CONFIGURATION	1499
186.4. EXAMPLE	1499
CHAPTER 187. JSON XSTREAM DATAFORMAT	1501
187.1. OPTIONS	1501
187.2. USING THE JAVA DSL	1503
187.3. XMLINPUTFACTORY AND XMLOUTPUTFACTORY	1504
187.4. HOW TO SET THE XML ENCODING IN XSTREAM DATAFORMAT?	1504
187.5. SETTING THE TYPE PERMISSIONS OF XSTREAM DATAFORMAT	1504
CHAPTER 188. JSONPATH LANGUAGE	1505
188.1. JSONPATH OPTIONS	1505
188.2. SPRING BOOT AUTO-CONFIGURATION	1505
188.3. USING XML CONFIGURATION	1506
188.4. SYNTAX	1507
188.5. EASY SYNTAX	1507
188.6. SUPPORTED MESSAGE BODY TYPES	1507
188.7. SUPPRESS EXCEPTIONS	1508
188.8. INLINE SIMPLE EXCEPTIONS	1508
188.9. JSONPATH INJECTION	1509
188.10. ENCODING DETECTION	1510
188.11. SPLIT JSON DATA INTO SUB ROWS AS JSON	1510
188.12. USING HEADER AS INPUT	1510
188.13. DEPENDENCIES	1511
CHAPTER 189. JT400 COMPONENT	1512
189.1. URI FORMAT	1512
189.2. JT400 OPTIONS	1512
189.2.1. Path Parameters (5 parameters):	1512
189.2.2. Query Parameters (30 parameters):	1513
189.3. SPRING BOOT AUTO-CONFIGURATION	1516
189.4. USAGE	1516
189.5. CONNECTION POOL	1516
189.5.1. Remote program call (Camel 2.7)	1516
189.6. EXAMPLE	1516
189.6.1. Remote program call example (Camel 2.7)	1517
189.6.2. Writing to keyed data queues	1517
189.6.3. Reading from keyed data queues	1517

189.7. SEE ALSO	1517
CHAPTER 190. KAFKA COMPONENT	1518
190.1. URI FORMAT	1518
190.2. OPTIONS	1518
190.2.1. Path Parameters (1 parameters):	1519
190.2.2. Query Parameters (93 parameters):	1519
190.3. SPRING BOOT AUTO-CONFIGURATION	1532
190.4. MESSAGE HEADERS	1548
190.4.1. Consumer headers	1548
190.4.2. Producer headers	1549
190.5. SAMPLES	1549
190.5.1. Consuming messages from Kafka	1549
190.5.2. Producing messages to Kafka	1550
190.6. SSL CONFIGURATION	1550
190.7. USING THE KAFKA IDEMPOTENT REPOSITORY	1551
190.8. USING MANUAL COMMIT WITH KAFKA CONSUMER	1553
190.9. KAFKA HEADERS PROPAGATION	1554
CHAPTER 191. KESTREL COMPONENT (DEPRECATED)	1555
191.1. URI FORMAT	1555
191.2. OPTIONS	1555
191.2.1. Path Parameters (2 parameters):	1556
191.2.2. Query Parameters (6 parameters):	1556
191.3. SPRING BOOT AUTO-CONFIGURATION	1557
191.4. CONFIGURING THE KESTREL COMPONENT USING SPRING XML	1557
191.5. USAGE EXAMPLES	1558
191.5.1. Example 1: Consuming	1558
191.5.2. Example 2: Producing	1559
191.5.3. Example 3: Spring XML Configuration	1559
191.6. DEPENDENCIES	1559
191.6.1. spymemcached	1559

193.5.1. See also	1567
CHAPTER 194. KUBERNETES COMPONENTS	1568
194.1. HEADERS	1568
194.2. USAGE	1574

194.2.1. Producer examples	1574
194.2.2. Create a pod	1574
194.2.3. Delete a pod	1574
CHAPTER 195. KUBERNETES COMPONENT (DEPRECATED)	1575
195.1. URI FORMAT	1575
195.2. OPTIONS	1576
195.2.1. Path Parameters (1 parameters):	1576
195.2.2. Query Parameters (29 parameters):	1576
195.3. SPRING BOOT AUTO-CONFIGURATION	1578
195.4. HEADERS	1580
195.5. CATEGORIES	1586
195.6. USAGE	1586
195.6.1. Producer examples	1586
195.6.2. Create a pod	1586
195.6.3. Delete a pod	1586
CHAPTER 196. KUBERNETES CONFIGMAP COMPONENT	1587
196.1. COMPONENT OPTIONS	1587
196.2. ENDPOINT OPTIONS	1587
196.2.1. Path Parameters (1 parameters):	1587
196.2.2. Query Parameters (20 parameters):	1587
196.3. SPRING BOOT AUTO-CONFIGURATION	1588
CHAPTER 197. KUBERNETES DEPLOYMENTS COMPONENT	1590
197.1. COMPONENT OPTIONS	1590
197.2. ENDPOINT OPTIONS	1590
197.2.1. Path Parameters (1 parameters):	1590
197.2.2. Query Parameters (28 parameters):	1590
197.3. SPRING BOOT AUTO-CONFIGURATION	1592
CHAPTER 198. KUBERNETES HPA COMPONENT	1594
198.1. COMPONENT OPTIONS	1594
198.2. ENDPOINT OPTIONS	1594
198.2.1. Path Parameters (1 parameters):	1594
198.2.2. Query Parameters (28 parameters):	1594
198.3. SPRING BOOT AUTO-CONFIGURATION	1596
CHAPTER 199. KUBERNETES JOB COMPONENT	1598
199.1. COMPONENT OPTIONS	1598
199.2. ENDPOINT OPTIONS	1598
199.2.1. Path Parameters (1 parameters):	1598
199.2.2. Query Parameters (28 parameters):	1598
199.3. SPRING BOOT AUTO-CONFIGURATION	1600
CHAPTER 200. KUBERNETES NAMESPACES COMPONENT	1602
200.1. COMPONENT OPTIONS	1602
200.2. ENDPOINT OPTIONS	1602
200.2.1. Path Parameters (1 parameters):	1602
200.2.2. Query Parameters (28 parameters):	1602
200.3. SPRING BOOT AUTO-CONFIGURATION	1604
CHAPTER 201. KUBERNETES NODES COMPONENT	1606
201.1. COMPONENT OPTIONS	1606
201.2. ENDPOINT OPTIONS	1606

201.2.1. Path Parameters (1 parameters):	1606
201.2.2. Query Parameters (28 parameters):	1606
201.3. SPRING BOOT AUTO-CONFIGURATION	1608
CHAPTER 202. KUBERNETES PERSISTENT VOLUME CLAIM COMPONENT	1610
202.1. COMPONENT OPTIONS	1610
202.2. ENDPOINT OPTIONS	1610
202.2.1. Path Parameters (1 parameters):	1610
202.2.2. Query Parameters (20 parameters):	1610
202.3. SPRING BOOT AUTO-CONFIGURATION	1612
CHAPTER 203. KUBERNETES PERSISTENT VOLUME COMPONENT	1613
203.1. COMPONENT OPTIONS	1613
203.2. ENDPOINT OPTIONS	1613
203.2.1. Path Parameters (1 parameters):	1613
203.2.2. Query Parameters (20 parameters):	1613
203.3. SPRING BOOT AUTO-CONFIGURATION	1615
CHAPTER 204. KUBERNETES PODS COMPONENT	1616
204.1. COMPONENT OPTIONS	1616
204.2. ENDPOINT OPTIONS	1616
204.2.1. Path Parameters (1 parameters):	1616
204.2.2. Query Parameters (28 parameters):	1616
204.3. SPRING BOOT AUTO-CONFIGURATION	1618
CHAPTER 205. KUBERNETES REPLICATION CONTROLLER COMPONENT	1620
205.1. COMPONENT OPTIONS	1620
205.2. ENDPOINT OPTIONS	1620
205.2.1. Path Parameters (1 parameters):	1620
205.2.2. Query Parameters (28 parameters):	1620
205.3. SPRING BOOT AUTO-CONFIGURATION	1622
CHAPTER 206. KUBERNETES RESOURCES QUOTA COMPONENT	1624
206.1. COMPONENT OPTIONS	1624
206.2. ENDPOINT OPTIONS	1624
206.2.1. Path Parameters (1 parameters):	1624
206.2.2. Query Parameters (20 parameters):	1624
206.3. SPRING BOOT AUTO-CONFIGURATION	1626
CHAPTER 207. KUBERNETES SECRETS COMPONENT	1627
207.1. COMPONENT OPTIONS	1627
207.2. ENDPOINT OPTIONS	1627
207.2.1. Path Parameters (1 parameters):	1627
207.2.2. Query Parameters (20 parameters):	1627
207.3. SPRING BOOT AUTO-CONFIGURATION	1628
CHAPTER 208. KUBERNETES SERVICE ACCOUNT COMPONENT	1630
208.1. COMPONENT OPTIONS	1630
208.2. ENDPOINT OPTIONS	1630
208.2.1. Path Parameters (1 parameters):	1630
208.2.2. Query Parameters (20 parameters):	1630
208.3. SPRING BOOT AUTO-CONFIGURATION	1632
CHAPTER 209. KUBERNETES SERVICES COMPONENT	1633
209.1. COMPONENT OPTIONS	1633

209.2. ENDPOINT OPTIONS	1633
209.2.1. Path Parameters (1 parameters):	1633
209.2.2. Query Parameters (28 parameters):	1633
209.3. SPRING BOOT AUTO-CONFIGURATION	1635
209.4. ECLIPSE KURA COMPONENT	1636
209.4.1. KuraRouter activator	1636
209.4.2. Deploying KuraRouter	1636
209.4.3. KuraRouter utilities	1637
209.4.3.1. SLF4J logger	1637
209.4.3.2. BundleContext	1637
209.4.3.3. CamelContext	1638
209.4.3.4. ProducerTemplate	1638
209.4.3.5. ConsumerTemplate	1638
209.4.3.6. OSGi service resolver	1639
209.4.4. KuraRouter activator callbacks	1639
209.4.5. Loading XML routes from ConfigurationAdmin	1639
209.4.6. Deploying Kura router as a declarative OSGi service	1640
209.4.7. See Also	1640
CHAPTER 210. LANGUAGE COMPONENT	1641
210.1. URI FORMAT	1641
210.2. URI OPTIONS	1641
210.2.1. Path Parameters (2 parameters):	1641
210.2.2. Query Parameters (6 parameters):	1641
210.3. MESSAGE HEADERS	1642
210.4. EXAMPLES	1642
210.5. LOADING SCRIPTS FROM RESOURCES	1643
CHAPTER 211. LDAP COMPONENT	1644
211.1. URI FORMAT	1644
211.2. OPTIONS	1644
211.2.1. Path Parameters (1 parameters):	1644
211.2.2. Query Parameters (5 parameters):	1645
211.3. SPRING BOOT AUTO-CONFIGURATION	1645
211.4. RESULT	1646
211.5. DIRCONTEXT	1646
211.6. SAMPLES	1646
211.6.1. Binding using credentials	1647
211.7. CONFIGURING SSL	1648
211.8. SEE ALSO	1650
CHAPTER 212. LDIF COMPONENT	1651
212.1. URI FORMAT	1651
212.2. OPTIONS	1651
212.2.1. Path Parameters (1 parameters):	1651
212.2.2. Query Parameters (1 parameters):	1652
212.3. SPRING BOOT AUTO-CONFIGURATION	1652
212.4. BODY TYPES:	1652
212.5. RESULT	1652
212.6. LDAPCONNECTION	1652
212.7. SAMPLES	1653
212.8. LEVELDB	1654
212.8.1. Using LevelDBAggregationRepository	1654
212.8.2. What is preserved when persisting	1655

212.8.3. Recovery	1655
212.8.3.1. Using LevelDBAggregationRepository in Java DSL	1656
212.8.3.2. Using LevelDBAggregationRepository in Spring XML	1656
212.8.4. Dependencies	1656
212.8.5. See Also	1656
CHAPTER 213. LOG COMPONENT	1658
213.1. URI FORMAT	1658
213.2. OPTIONS	1658
213.2.1. Path Parameters (1 parameters):	1659
213.2.2. Query Parameters (26 parameters):	1659
213.3. REGULAR LOGGER SAMPLE	1661
213.4. REGULAR LOGGER WITH FORMATTER SAMPLE	1661
213.5. THROUGHPUT LOGGER WITH GROUPSIZE SAMPLE	1661
213.6. THROUGHPUT LOGGER WITH GROUPINTERVAL SAMPLE	1661
213.7. MASKING SENSITIVE INFORMATION LIKE PASSWORD	1662
213.8. FULL CUSTOMIZATION OF THE LOGGING OUTPUT	1662
213.8.1. Convention over configuration:*	1663
213.9. USING LOG COMPONENT IN OSGI	1664
213.10. SEE ALSO	1664
CHAPTER 214. LUCENE COMPONENT	1665
214.1. URI FORMAT	1665
214.2. INSERT OPTIONS	1665
214.2.1. Path Parameters (2 parameters):	1666
214.2.2. Query Parameters (5 parameters):	1666
214.3. SPRING BOOT AUTO-CONFIGURATION	1666
214.4. SENDING/RECEIVING MESSAGES TO/FROM THE CACHE	1667
214.4.1. Message Headers	1668
214.4.2. Lucene Producers	1668
214.4.3. Lucene Processor	1668
214.5. LUCENE USAGE SAMPLES	1668
214.5.1. Example 1: Creating a Lucene index	1668
214.5.2. Example 2: Loading properties into the JNDI registry in the Camel Context	1668
214.5.3. Example 2: Performing searches using a Query Producer	1669
214.5.4. Example 3: Performing searches using a Query Processor	1669
CHAPTER 215. LUMBERJACK COMPONENT	1671
215.1. URI FORMAT	1671
215.2. OPTIONS	1671
215.2.1. Path Parameters (2 parameters):	1672
215.2.2. Query Parameters (5 parameters):	1672
215.3. SPRING BOOT AUTO-CONFIGURATION	1672
215.4. RESULT	1673
215.5. LUMBERJACK USAGE SAMPLES	1673
215.5.1. Example 1: Streaming the log messages	1673
CHAPTER 216. LZF DEFLATE COMPRESSION DATAFORMAT	1674
216.1. OPTIONS	1674
216.2. SPRING BOOT AUTO-CONFIGURATION	1674
216.3. MARSHAL	1675
216.4. UNMARSHAL	1675
216.5. DEPENDENCIES	1675

CHAPTER 217. MAIL COMPONENT	1676
217.1. URI FORMAT	1676
217.2.	1677
217.3.	1677
217.3.1. Path Parameters (2 parameters):	1677
217.3.2. Query Parameters (62 parameters):	1678
217.4. SPRING BOOT AUTO-CONFIGURATION	1684
217.4.1. Sample endpoints	1690
217.5. COMPONENTS	1690
217.5.1. Default ports	1690
217.6. SSL SUPPORT	1691
217.6.1. Using the JSSE Configuration Utility	1691
217.6.2. Configuring JavaMail Directly	1691
217.7. MAIL MESSAGE CONTENT	1691
217.8. HEADERS TAKE PRECEDENCE OVER PRE-CONFIGURED RECIPIENTS	1692
217.9. MULTIPLE RECIPIENTS FOR EASIER CONFIGURATION	1692
217.10. SETTING SENDER NAME AND EMAIL	1692
217.11. JAVAMAIL API (EX SUN JAVAMAIL)	1693
217.12. SAMPLES	1693
217.13. SENDING MAIL WITH ATTACHMENT SAMPLE	1693
217.14. SSL SAMPLE	1693
217.15. CONSUMING MAILS WITH ATTACHMENT SAMPLE	1694
217.16. HOW TO SPLIT A MAIL MESSAGE WITH ATTACHMENTS	1695
217.17. USING CUSTOM SEARCHTERM	1695
217.18. SEE ALSO	1696
CHAPTER 218. MASTER COMPONENT	1698
218.1. USING THE MASTER ENDPOINT	1698
218.2. URI FORMAT	1698
218.3. OPTIONS	1698
218.3.1. Path Parameters (2 parameters):	1699
218.3.2. Query Parameters (4 parameters):	1699
218.4. SPRING BOOT AUTO-CONFIGURATION	1699
218.5. EXAMPLE	1700
218.6. IMPLEMENTATIONS	1701
218.7. SEE ALSO	1701
CHAPTER 219. METRICS COMPONENT	1702
219.1. METRICS COMPONENT	1702
219.2. URI FORMAT	1702
219.3. OPTIONS	1702
219.3.1. Path Parameters (2 parameters):	1702
219.3.2. Query Parameters (7 parameters):	1703
219.4. SPRING BOOT AUTO-CONFIGURATION	1703
219.5. METRIC REGISTRY	1704
219.6. USAGE	1705
219.6.1. Headers	1705
219.7. METRICS TYPE COUNTER	1705
219.7.1. Options	1705
219.7.2. Headers	1706
219.8. METRIC TYPE HISTOGRAM	1706
219.8.1. Options	1706
219.8.2. Headers	1707

219.9. METRIC TYPE METER	1707
219.9.1. Options	1707
219.9.2. Headers	1708
219.10. METRICS TYPE TIMER	1708
219.10.1. Options	1708
219.10.2. Headers	1709
219.11. METRIC TYPE GAUGE	1709
219.11.1. Options	1709
219.11.2. Headers	1710
219.12. METRICSROUTEPOLICYFACTORY	1710
219.13. METRICSMESSAGEHISTORYFACTORY	1711
219.14. INSTRUMENTEDTHREADPOOLFACTORY	1713
219.15. SEE ALSO	1713
CHAPTER 220. MICROMETER COMPONENT	1714
220.1. MICROMETER COMPONENT	1714
220.2. URI FORMAT	1714
220.3. OPTIONS	1714
220.3.1. Path Parameters (3 parameters):	1714
220.3.2. Query Parameters (5 parameters):	1715
220.4. SPRING BOOT AUTO-CONFIGURATION	1715
220.5. METER REGISTRY	1716
220.6. USAGE OF PRODUCERS	1717
220.6.1. Headers	1717
220.7. COUNTER	1717
220.7.1. Options	1717
220.7.2. Headers	1718
220.8. DISTRIBUTION SUMMARY	1719
220.8.1. Options	1719
220.8.2. Headers	1719
220.9. TIMER	1720
220.9.1. Options	1720
220.9.2. Headers	1720
220.10. MICROMETERROUTEPOLICYFACTORY	1721
220.11. MICROMETERMESSAGEHISTORYFACTORY	1721
220.12. MICROMETEREVENTNOTIFIERS	1722
220.13. INSTRUMENTEDTHREADPOOLFACTORY	1723
220.14. EXPOSING MICROMETER STATISTICS IN JMX	1723
220.15. EXAMPLE	1723
CHAPTER 221. OPC UA CLIENT COMPONENT	1724
221.1. URI FORMAT	1724
221.2. URI OPTIONS	1725
221.2.1. Path Parameters (1 parameters):	1725
221.2.2. Query Parameters (27 parameters):	1725
221.3. SPRING BOOT AUTO-CONFIGURATION	1727
221.3.1. Discovery	1731
221.3.2. Overriding the host name	1731
221.3.3. Node ID	1731
221.3.4. Method ID	1732
221.3.5. Security policies	1732
221.4. SEE ALSO	1732
CHAPTER 222. OPC UA SERVER COMPONENT	1733

222.1. URI FORMAT	1734
222.2. URI OPTIONS	1735
222.2.1. Path Parameters (1 parameters):	1735
222.2.2. Query Parameters (4 parameters):	1735
222.3. SPRING BOOT AUTO-CONFIGURATION	1735
222.4. SEE ALSO	1738
CHAPTER 223. MIME MULTIPART DATAFORMAT	1739
223.1. OPTIONS	1739
223.2. MESSAGE HEADERS (MARSHAL)	1740
223.3. MESSAGE HEADERS (UNMARSHAL)	1740
223.4. EXAMPLES	1741
223.5. DEPENDENCIES	1742
CHAPTER 224. MINA2 COMPONENT	1743
224.1. URI FORMAT	1743
224.2. OPTIONS	1743
224.2.1. Path Parameters (3 parameters):	1744
224.2.2. Query Parameters (27 parameters):	1744
224.3. SPRING BOOT AUTO-CONFIGURATION	1747
224.4. USING A CUSTOM CODEC	1750
224.5. SAMPLE WITH SYNC=FALSE	1750
224.6. SAMPLE WITH SYNC=TRUE	1751
224.7. SAMPLE WITH SPRING DSL	1751
224.8. CLOSING SESSION WHEN COMPLETE	1751
224.9. GET THE IOSESSION FOR MESSAGE	1752
224.10. CONFIGURING MINA FILTERS	1752
224.11. SEE ALSO	1752
CHAPTER 225. MLLP COMPONENT	1753
225.1. MLLP OPTIONS	1753
225.1.1. Path Parameters (2 parameters):	1754
225.1.2. Query Parameters (27 parameters):	1754
225.2. SPRING BOOT AUTO-CONFIGURATION	1757
225.3. MLLP CONSUMER	1760
225.4. MESSAGE HEADERS	1760
225.5. EXCHANGE PROPERTIES	1761
225.6. MLLP PRODUCER	1762
225.7. MESSAGE HEADERS	1762
225.8. EXCHANGE PROPERTIES	1763
CHAPTER 226. MOCK COMPONENT	1764
226.1. URI FORMAT	1764
226.2. OPTIONS	1765
226.2.1. Path Parameters (1 parameters):	1765
226.2.2. Query Parameters (10 parameters):	1765
226.3. SIMPLE EXAMPLE	1767
226.4. USING ASSERTPERIOD	1767
226.5. SETTING EXPECTATIONS	1768
226.6. ADDING EXPECTATIONS TO SPECIFIC MESSAGES	1768
226.7. MOCKING EXISTING ENDPOINTS	1769
226.8. MOCKING EXISTING ENDPOINTS USING THE CAMEL-TEST COMPONENT	1771
226.9. MOCKING EXISTING ENDPOINTS WITH XML DSL	1772
226.10. MOCKING ENDPOINTS AND SKIP SENDING TO ORIGINAL ENDPOINT	1773

226.11. LIMITING THE NUMBER OF MESSAGES TO KEEP	1774
226.12. TESTING WITH ARRIVAL TIMES	1775
226.13. SEE ALSO	1776
CHAPTER 227. MONGODB COMPONENT (DEPRECATED)	1777
227.1. URI FORMAT	1777
227.2. MONGODB OPTIONS	1777
227.2.1. Path Parameters (1 parameters):	1777
227.2.2. Query Parameters (23 parameters):	1778
227.3. SPRING BOOT AUTO-CONFIGURATION	1780
227.4. CONFIGURATION OF DATABASE IN SPRING XML	1781
227.5. SAMPLE ROUTE	1781
227.6. MONGODB OPERATIONS - PRODUCER ENDPOINTS	1781
227.6.1. Query operations	1781
227.6.1.1. findById	1781
227.6.1.2. findOneByQuery	1782
227.6.1.3. findAll	1782
227.6.1.4. count	1787
227.6.1.5. Specifying a fields filter (projection)	1788
227.6.1.6. Specifying a sort clause	1788
227.6.2. Create/update operations	1789
227.6.2.1. insert	1789
227.6.2.2. save	1789
227.6.2.3. update	1790
227.6.3. Delete operations	1791
227.6.3.1. remove	1791
227.6.4. Bulk Write Operations	1791
227.6.4.1. bulkWrite	1792
227.6.5. Other operations	1792
227.6.5.1. aggregate	1792
227.6.5.2. getDbStats	1794
227.6.5.3. getColStats	1794
227.6.5.4. command	1795
227.6.6. Dynamic operations	1795
227.7. TAILABLE CURSOR CONSUMER	1796
227.8. HOW THE TAILABLE CURSOR CONSUMER WORKS	1796
227.9. PERSISTENT TAIL TRACKING	1797
227.10. ENABLING PERSISTENT TAIL TRACKING	1797
227.11. OPLOG TAIL TRACKING	1798
227.12. TYPE CONVERSIONS	1800
227.13. SEE ALSO	1800
CHAPTER 228. MONGODB GRIDFS COMPONENT	1801
228.1. URI FORMAT	1801
228.2. MONGODB GRIDFS OPTIONS	1801
228.2.1. Path Parameters (1 parameters):	1801
228.2.2. Query Parameters (17 parameters):	1801
228.3. SPRING BOOT AUTO-CONFIGURATION	1803
228.4. CONFIGURATION OF DATABASE IN SPRING XML	1803
228.5. SAMPLE ROUTE	1804
228.6. GRIDFS OPERATIONS - PRODUCER ENDPOINT	1804
228.6.1. count	1804
228.6.2. listAll	1804

228.6.3. findOne	1805
228.6.4. create	1805
228.6.5. remove	1805
228.7. GRIDFS CONSUMER	1805
CHAPTER 229. MONGODB COMPONENT	1806
229.1. URI FORMAT	1806
229.2. MONGODB OPTIONS	1806
229.2.1. Path Parameters (1 parameters):	1806
229.2.2. Query Parameters (19 parameters):	1807
229.3. SPRING BOOT AUTO-CONFIGURATION	1809
229.4. CONFIGURATION OF DATABASE IN SPRING XML	1810
229.5. SAMPLE ROUTE	1810
229.6. MONGODB OPERATIONS - PRODUCER ENDPOINTS	1810
229.6.1. Query operations	1810
229.6.1.1. findById	1810
229.6.1.2. findOneByQuery	1811
229.6.1.3. findAll	1811
229.6.1.4. count	1813
229.6.1.5. Specifying a fields filter (projection)	1813
229.6.1.6. Specifying a sort clause	1814
229.6.2. Create/update operations	1814
229.6.2.1. insert	1814
229.6.2.2. save	1815
229.6.2.3. update	1816
229.6.3. Delete operations	1818
229.6.3.1. remove	1818
229.6.4. Bulk Write Operations	1818
229.6.4.1. bulkWrite	1818
229.6.5. Other operations	1819
229.6.5.1. aggregate	1819
229.6.5.2. getDbStats	1821
229.6.5.3. getColStats	1821

284.1. THE NEED FOR A CAMEL ROUTEBOX ENDPOINT	2207
284.2. URI FORMAT	2208
284.3. OPTIONS	2208
284.3.1. Path Parameters (1 parameters):	2208
284.3.2. Query Parameters (17 parameters):	2208
284.4. SPRING BOOT AUTO-CONFIGURATION	2210
284.5. SENDING/RECEIVING MESSAGES TO/FROM THE ROUTEBOX	2211
284.5.1. Step 1: Loading inner route details into the Registry	2211
284.5.2. Step 2: Optionally using a Dispatch Strategy instead of a Dispatch Map	2212
284.5.3. Step 2: Launching a routebox consumer	2212
284.5.4. Step 3: Using a routebox producer	2213
CHAPTER 285. RSS COMPONENT	2214
285.1. URI FORMAT	2214
285.2. OPTIONS	2214
285.2.1. Path Parameters (1 parameters):	2214
285.2.2. Query Parameters (27 parameters):	2214
285.3. SPRING BOOT AUTO-CONFIGURATION	2217
285.4. EXCHANGE DATA TYPES	2218
285.5. MESSAGE HEADERS	2218
285.6. RSS DATAFORMAT	2218
285.7. FILTERING ENTRIES	2219
285.8. SEE ALSO	2219
CHAPTER 286. RSS DATAFORMAT	2220
286.1. OPTIONS	2220
286.2. SPRING BOOT AUTO-CONFIGURATION	2220
CHAPTER 287. RXJAVA2 COMPONENT	2222
CHAPTER 288. SALESFORCE COMPONENT	2223
288.1. AUTHENTICATING TO SALESFORCE	2223
288.2. URI FORMAT	2224
288.3. PASSING IN SALESFORCE HEADERS AND FETCHING SALESFORCE RESPONSE HEADERS	2224
288.4. SUPPORTED SALESFORCE APIS	2225
288.4.1. Rest API	2225
288.4.2. Rest Bulk API	2226
288.4.3. Rest Streaming API	2227
288.4.4. Platform events	2227
288.5. EXAMPLES	2228
288.5.1. Uploading a document to a ContentWorkspace	2228
288.6. USING SALESFORCE LIMITS API	2229
288.7. WORKING WITH APPROVALS	2229
288.8. USING SALESFORCE RECENT ITEMS API	2230
288.9. WORKING WITH APPROVALS	2230
288.10. USING SALESFORCE COMPOSITE API TO SUBMIT SUBJECT TREE	2231
288.11. USING SALESFORCE COMPOSITE API TO SUBMIT MULTIPLE REQUESTS IN A BATCH	2232
288.12. USING SALESFORCE COMPOSITE API TO SUBMIT MULTIPLE CHAINED REQUESTS	2233
288.13. GENERATING SOQL QUERY STRINGS	2234
288.14. CAMEL SALESFORCE MAVEN PLUGIN	2234
288.15. OPTIONS	2234
288.15.1. Path Parameters (2 parameters):	2238
288.15.2. Query Parameters (44 parameters):	2238
288.16. SPRING BOOT AUTO-CONFIGURATION	2241

CHAPTER 289. SAP COMPONENT	2251
289.1. OVERVIEW	2251
Dependencies	2251
Additional platform restrictions for the SAP component	2251
SAP JCo and SAP IDoc libraries	2251
Deploying in a Fuse OSGi Container	2251
Deploying in a JBoss EAP container	2252
URI format	2253
Options for RFC destination endpoints	2254
Options for RFC server endpoints	2255
Options for the IDoc List Server endpoint	2255
Summary of the RFC and IDoc endpoints	2255
SAP RFC destination endpoint	2257
SAP RFC server endpoint	2257
SAP IDoc and IDoc list destination endpoints	2258
SAP IDoc list server endpoint	2258
Meta-data repositories	2258
289.2. CONFIGURATION	2259
289.2.1. Configuration Overview	2259
Overview	2259
Example	2259
289.2.2. Destination Configuration	2260
Overview	2260
Sample destination configuration	2260
Interceptor for tRFC and qRFC destinations	2261
Logon and authentication options	2261
Connection options	2263
Connection pool options	2264
Secure network connection options	2265
Repository options	2265
Trace configuration options	2267
289.2.3. Server Configuration	2267
Overview	2267
Sample server configuration	2267
Required options	2268
Secure network connection options	2269
Other options	2269
289.2.4. Repository Configuration	2270
Overview	2270
Repository data example	2270
Function template properties	2271
Function template example	2272
List field meta-data properties	2273
Elementary list field meta-data example	2274
Complex list field meta-data example	2274
Record meta-data properties	2274
Record meta-data example	2275
Record field meta-data properties	2275
Elementary record field meta-data example	2277
Complex record field meta-data example	2277
289.3. MESSAGE HEADERS	2277
289.4. EXCHANGE PROPERTIES	2278
289.5. MESSAGE BODY FOR RFC	2279

Request and response objects	2279
Structure objects	2279
Field types	2280
Elementary field types	2280
Character field types	2281
Numeric field types	2282
Hexadecimal field types	2283
String field types	2283
Complex field types	2283
Structure field types	2284
Table field types	2284
Table objects	2284
289.6. MESSAGE BODY FOR IDOC	2285
IDoc message type	2285
The IDoc document model	2285
How an IDoc is related to a Document object	2287
Example of creating a Document instance	2287
Document attributes	2288
Setting document attributes in Java	2290
Setting document attributes in XML	2291
289.7. TRANSACTION SUPPORT	2291
BAPI transaction model	2291
RFC transaction model	2291
Which transaction model to use?	2291
Transactional RFC destination endpoints	2292
Transactional RFC server endpoints	2292
289.8. XML SERIALIZATION FOR RFC	2292
Overview	2292
XML namespace	2292
Request and response XML documents	2293
Structure fields	2293
Table fields	2293
Elementary fields	2294
Date and time formats	2295
289.9. XML SERIALIZATION FOR IDOC	2295
Overview	2295
XML namespace	2295
Built-in type converter	2295
Sample IDoc message body in XML format	2296
289.10. EXAMPLE 1: READING DATA FROM SAP	2297
Overview	2297
Java DSL for route	2297
XML DSL for route	2297
createFlightCustomerGetListRequest bean	2297
returnFlightCustomerInfo bean	2298
289.11. EXAMPLE 2: WRITING DATA TO SAP	2299
Overview	2299
Java DSL for route	2299
XML DSL for route	2299
Transaction support	2299
Populating request parameters	2299
289.12. EXAMPLE 3: HANDLING REQUESTS FROM SAP	2299
Overview	2300

Java DSL for route	2300
XML DSL for route	2300
BookFlightRequest bean	2300
BookFlightResponse bean	2301
FlightInfo bean	2302
ConnectionInfoTable bean	2303
ConnectionInfo bean	2303
CHAPTER 290. SAP NETWEAVER COMPONENT	2305
290.1. URI FORMAT	2305
290.2. PREREQUISITES	2305
290.3. SAPNETWEAVER OPTIONS	2305
290.3.1. Path Parameters (1 parameters):	2305
290.3.2. Query Parameters (6 parameters):	2305
290.4. SPRING BOOT AUTO-CONFIGURATION	2306
290.5. MESSAGE HEADERS	2306
290.6. EXAMPLES	2307
290.7. SEE ALSO	2308
CHAPTER 291. SCHEDULER COMPONENT	2309
291.1. URI FORMAT	2309
291.2. OPTIONS	2309
291.2.1. Path Parameters (1 parameters):	2309
291.2.2. Query Parameters (20 parameters):	2310
291.3. MORE INFORMATION	2312
291.4. EXCHANGE PROPERTIES	2312
291.5. SAMPLE	2313
291.6. FORCING THE SCHEDULER TO TRIGGER IMMEDIATELY WHEN COMPLETED	2313
291.7. FORCING THE SCHEDULER TO BE IDLE	2313
291.8. SEE ALSO	2313
CHAPTER 292. SCHEMATRON COMPONENT	2314
292.1. URI FORMAT	2314
292.2. URI OPTIONS	2314
292.2.1. Path Parameters (1 parameters):	2314
292.2.2. Query Parameters (4 parameters):	2314
292.3. SPRING BOOT AUTO-CONFIGURATION	2315
292.4. HEADERS	2315
292.5. URI AND PATH SYNTAX	2316
292.6. SCHEMATRON RULES AND REPORT SAMPLES	2316
CHAPTER 293. SCP COMPONENT	2318
293.1. URI FORMAT	2318
293.2. OPTIONS	2318
293.2.1. Path Parameters (3 parameters):	2318
293.2.2. Query Parameters (22 parameters):	2319
293.3. SPRING BOOT AUTO-CONFIGURATION	2322
293.4. LIMITATIONS	2322
293.5. SEE ALSO	2322
CHAPTER 294. CAMEL SCR (DEPRECATED)	2323
294.1. CAMEL SCR SUPPORT	2323
294.2. ABSTRACTCAMELRUNNER'S LIFECYCLE IN SCR	2327
294.3. USING CAMEL-ARCHETYPE-SCR	2328

294.4. UNIT TESTING CAMEL ROUTES	2329
294.5. RUNNING THE BUNDLE IN APACHE KARAF	2331
294.5.1. Overriding the default configuration	2332
294.5.2. Using Camel SCR bundle as a template	2332
294.6. NOTES	2333
CHAPTER 295. XML SECURITY DATAFORMAT	2334
295.1. XMLSECURITY OPTIONS	2334
295.1.1. Key Cipher Algorithm	2336
295.2. MARSHAL	2336
295.3. UNMARSHAL	2336
295.4. EXAMPLES	2336
295.4.1. Full Payload encryption/decryption	2336
295.4.2. Partial Payload Content Only encryption/decryption	2336
295.4.3. Partial Multi Node Payload Content Only encryption/decryption	2336
295.4.4. Partial Payload Content Only encryption/decryption with choice of passPhrase(password)	2337
295.4.5. Partial Payload Content Only encryption/decryption with passPhrase(password) and Algorithm	2337
295.4.6. Partial Payload Content with Namespace support	2337
295.4.7. Asymmetric Key Encryption	2338
295.5. DEPENDENCIES	2339
CHAPTER 296. SEDA COMPONENT	2340
296.1. URI FORMAT	2340
296.2. OPTIONS	2340
296.2.1. Path Parameters (1 parameters):	2341
296.2.2. Query Parameters (17 parameters):	2341
296.3. CHOOSING BLOCKINGQUEUE IMPLEMENTATION	2343
296.4. USE OF REQUEST REPLY	2344
296.5. CONCURRENT CONSUMERS	2344
296.6. THREAD POOLS	2344
296.7. SAMPLE	2345
296.8. USING MULTIPLECONSUMERS	2345
296.9. EXTRACTING QUEUE INFORMATION.	2345
296.10. SEE ALSO	2345
CHAPTER 297. JAVA OBJECT SERIALIZATION DATAFORMAT	2346
297.1. OPTIONS	2346
297.2. DEPENDENCIES	2346
CHAPTER 298. SERVICE COMPONENT	2347
298.1. USING THE SERVICE ENDPOINT	2347
298.2. URI FORMAT	2347
298.3. OPTIONS	2347
298.3.1. Path Parameters (1 parameters):	2347
298.3.2. Query Parameters (4 parameters):	2347
298.4. SPRING BOOT AUTO-CONFIGURATION	2348
298.5. IMPLEMENTATIONS	2349
298.6. SEE ALSO	2349
CHAPTER 299. SERVICENOW COMPONENT	2350
299.1. URI FORMAT	2350
299.2. OPTIONS	2350
299.2.1. Path Parameters (1 parameters):	2351
299.2.2. Query Parameters (44 parameters):	2351

299.3. SPRING BOOT AUTO-CONFIGURATION	2355
299.4. HEADERS	2361
299.5. USAGE EXAMPLES:	2373
CHAPTER 300. SERVLET COMPONENT	2374
300.1. URI FORMAT	2374
300.2. OPTIONS	2374
300.2.1. Path Parameters (1 parameters):	2375
300.2.2. Query Parameters (22 parameters):	2376
300.3. SPRING BOOT AUTO-CONFIGURATION	2378
300.4. MESSAGE HEADERS	2380
300.5. USAGE	2380
300.6. PUTTING CAMEL JARS IN THE APP SERVER BOOT CLASSPATH	2380
300.7. SAMPLE	2381
300.7.1. Sample when using Spring 3.x	2382
300.7.2. Sample when using Spring 2.x	2382
300.7.3. Sample when using OSGi	2383
300.7.4. Usage with Spring-Boot	2385
300.8. SEE ALSO	2386
300.9. SERVLETLISTENER COMPONENT	2386
300.9.1. Using	2387
300.9.2. Options	2387
300.9.3. Examples	2388
300.9.4. Accessing the created CamelContext	2388
300.9.5. Configuring routes	2389
300.9.5.1. Using a RouteBuilder class	2389
300.9.5.2. Using package scanning	2389
300.9.5.3. Using a XML file	2389
300.9.5.4. Configuring propert placeholders	2390
300.9.5.5. Configuring JMX	2391
300.9.5.6. Using custom CamelContextLifecycle	2391
300.9.6. See Also	2391
CHAPTER 301. SFTP COMPONENT	2393
301.1. URI OPTIONS	2393
301.1.1. Path Parameters (3 parameters):	2393
301.1.2. Query Parameters (117 parameters):	2393
CHAPTER 302. SHIRO SECURITY COMPONENT	2412
302.1. SHIRO SECURITY BASICS	2412
302.2. INSTANTIATING A SHIROSECURITYPOLICY OBJECT	2413
302.3. SHIROSECURITYPOLICY OPTIONS	2413
302.4. APPLYING SHIRO AUTHENTICATION ON A CAMEL ROUTE	2414
302.5. APPLYING SHIRO AUTHORIZATION ON A CAMEL ROUTE	2415
302.6. CREATING A SHIROSECURITYTOKEN AND INJECTING IT INTO A MESSAGE EXCHANGE	2416
302.7. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY	2416
302.8. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY (MUCH EASIER FROM CAMEL 2.12 ONWARDS)	2416
302.8.1. Using ShiroSecurityToken	2416
CHAPTER 303. SIMPLE LANGUAGE	2418
303.1. SIMPLE LANGUAGE CHANGES IN CAMEL 2.9 ONWARDS	2418
303.2. SIMPLE LANGUAGE OPTIONS	2419
303.3. VARIABLES	2419

303.4. OGNL EXPRESSION SUPPORT	2424
303.5. OPERATOR SUPPORT	2426
303.5.1. Comparing with different types	2429
303.5.2. Using Spring XML	2431
303.6. USING AND / OR	2431
303.7. SAMPLES	2431
303.8. REFERRING TO CONSTANTS OR ENUMS	2433
303.9. USING NEW LINES OR TABS IN XML DSLS	2433
303.10. LEADING AND TRAILING WHITESPACE HANDLING	2433
303.11. SETTING RESULT TYPE	2434
303.12. CHANGING FUNCTION START AND END TOKENS	2434
303.13. LOADING SCRIPT FROM EXTERNAL RESOURCE	2434
303.14. SETTING SPRING BEANS TO EXCHANGE PROPERTIES	2435
303.15. DEPENDENCIES	2435
CHAPTER 304. SIP COMPONENT	2436
304.1. URI FORMAT	2436
304.2. OPTIONS	2436
304.2.1. Path Parameters (1 parameters):	2437
304.2.2. Query Parameters (44 parameters):	2437
304.3. SPRING BOOT AUTO-CONFIGURATION	2441
304.4. SENDING MESSAGES TO/FROM A SIP ENDPOINT	2441
304.4.1. Creating a Camel SIP Publisher	2441
304.4.2. Creating a Camel SIP Subscriber	2442
CHAPTER 305. SIMPLE JMS BATCH COMPONENT	2443
305.1. URI FORMAT	2444
305.2. COMPONENT OPTIONS AND CONFIGURATIONS	2444
305.2.1. Path Parameters (1 parameters):	2445
305.2.2. Query Parameters (23 parameters):	2445
305.3. SPRING BOOT AUTO-CONFIGURATION	2448
CHAPTER 306. SIMPLE JMS COMPONENT	2450
306.1. URI FORMAT	2450
306.2. COMPONENT OPTIONS AND CONFIGURATIONS	2451
306.2.1. Path Parameters (2 parameters):	2453
306.2.2. Query Parameters (34 parameters):	2453
306.3. SPRING BOOT AUTO-CONFIGURATION	2456
306.4. PRODUCER USAGE	2459
306.4.1. InOnly Producer - (Default)	2459
306.4.2. InOut Producer	2459
306.5. CONSUMER USAGE	2459
306.5.1. InOnly Consumer - (Default)	2459
306.5.2. InOut Consumer	2459
306.6. ADVANCED USAGE NOTES	2459
306.6.1. Pluggable Connection Resource Management	2459
306.6.2. Batch Message Support	2461
306.6.3. Customizable Transaction Commit Strategies (Local JMS Transactions only)	2461
306.6.4. Transacted Batch Consumers & Producers	2461
306.7. ADDITIONAL NOTES	2462
306.7.1. Message Header Format	2462
306.7.2. Message Content	2463
306.7.3. Clustering	2463
306.8. TRANSACTION SUPPORT	2463

306.8.1. Does Springless Mean I Can't Use Spring?	2463
CHAPTER 307. SIMPLE JMS2 COMPONENT	2464
307.1. URI FORMAT	2464
307.2. COMPONENT OPTIONS AND CONFIGURATIONS	2465
307.2.1. Path Parameters (2 parameters):	2467
307.2.2. Query Parameters (37 parameters):	2467
307.3. SPRING BOOT AUTO-CONFIGURATION	2470
307.4. PRODUCER USAGE	2473
307.4.1. InOnly Producer - (Default)	2473
307.4.2. InOut Producer	2473
307.5. CONSUMER USAGE	2473
307.5.1. Durable Shared Subscription	2473
307.5.2. InOnly Consumer - (Default)	2473
307.5.3. InOut Consumer	2474
307.6. ADVANCED USAGE NOTES	2474
307.6.1. Pluggable Connection Resource Management	2474
307.6.2. Session, Consumer, & Producer Pooling & Caching Management	2475
307.6.3. Batch Message Support	2475
307.6.4. Customizable Transaction Commit Strategies (Local JMS Transactions only)	2475
307.6.5. Transacted Batch Consumers & Producers	2476
307.7. ADDITIONAL NOTES	2477
307.7.1. Message Header Format	2477
307.7.2. Message Content	2477
307.7.3. Clustering	2477
307.8. TRANSACTION SUPPORT	2477
307.8.1. Does Springless Mean I Can't Use Spring?	2477
CHAPTER 308. SLACK COMPONENT	2479
308.1. URI FORMAT	2479
308.2. OPTIONS	2479
308.2.1. Path Parameters (1 parameters):	2479
308.2.2. Query Parameters (26 parameters):	2480
308.3. SPRING BOOT AUTO-CONFIGURATION	2482
308.4. SLACKCOMPONENT	2482
308.5. EXAMPLE	2483
308.6. CONSUMER	2483
308.7. SEE ALSO	2483
CHAPTER 309. SMPP COMPONENT	2484
309.1. SMS LIMITATIONS	2484
309.2. DATA CODING, ALPHABET AND INTERNATIONAL CHARACTER SETS	2484
309.3. MESSAGE SPLITTING AND THROTTLING	2485
309.4. URI FORMAT	2486
309.5. URI OPTIONS	2486
309.5.1. Path Parameters (2 parameters):	2486
309.5.2. Query Parameters (38 parameters):	2487
309.6. SPRING BOOT AUTO-CONFIGURATION	2491
309.7. PRODUCER MESSAGE HEADERS	2496
309.8. CONSUMER MESSAGE HEADERS	2500
309.9. EXCEPTION HANDLING	2503
309.10. SAMPLES	2504
309.11. DEBUG LOGGING	2504
309.12. SEE ALSO	2505

CHAPTER 310. SNMP COMPONENT	2506
310.1. URI FORMAT	2506
310.2. SNMP PRODUCER	2506
310.3. OPTIONS	2506
310.3.1. Path Parameters (2 parameters):	2506
310.3.2. Query Parameters (35 parameters):	2507
310.4. SPRING BOOT AUTO-CONFIGURATION	2510
310.5. THE RESULT OF A POLL	2510
310.6. EXAMPLES	2511
310.7. SEE ALSO	2512
CHAPTER 311. SOAP DATAFORMAT	2513
311.1. SOAP OPTIONS	2513
311.2. SPRING BOOT AUTO-CONFIGURATION	2514
311.3. ELEMENTNAMESTRATEGY	2516
311.4. USING THE JAVA DSL	2516
311.4.1. Using SOAP 1.2	2516
311.5. MULTI-PART MESSAGES	2517
311.5.1. Multi-part Request	2517
311.5.2. Multi-part Response	2518
311.5.3. Holder Object mapping	2518
311.6. EXAMPLES	2518
311.6.1. Webservice client	2518
311.6.2. Webservice Server	2519
311.7. DEPENDENCIES	2519
CHAPTER 312. SOLR COMPONENT	2520
312.1. URI FORMAT	2520
312.2. SOLR OPTIONS	2520
312.2.1. Path Parameters (1 parameters):	2520
312.2.2. Query Parameters (13 parameters):	2520
312.3. SPRING BOOT AUTO-CONFIGURATION	2521
312.4. MESSAGE OPERATIONS	2522
312.5. EXAMPLE	2523
312.6. QUERYING SOLR	2524
312.7. SEE ALSO	2524
CHAPTER 313. APACHE SPARK COMPONENT	2526
313.1. SUPPORTED ARCHITECTURAL STYLES	2526
313.2. RUNNING SPARK IN OSGI SERVERS	2527
313.3. URI FORMAT	2527
313.3.1. Spark options	2527
313.3.2. Path Parameters (1 parameters):	2527
313.3.3. Query Parameters (6 parameters):	2527
313.4. SPRING BOOT AUTO-CONFIGURATION	2528
313.4.1. Void RDD callbacks	2529
313.4.2. Converting RDD callbacks	2530
313.4.3. Annotated RDD callbacks	2530
313.5. DATAFRAME JOBS	2531
313.6. HIVE JOBS	2532
313.7. SEE ALSO	2533
CHAPTER 314. SPARK REST COMPONENT	2534
314.1. URI FORMAT	2534

314.2. URI OPTIONS	2534
314.2.1. Path Parameters (2 parameters):	2535
314.2.2. Query Parameters (11 parameters):	2535
314.3. PATH USING SPARK SYNTAX	2537
314.4. MAPPING TO CAMEL MESSAGE	2537
314.5. REST DSL	2538
314.6. MORE EXAMPLES	2538
CHAPTER 315. SPEL LANGUAGE	2539
315.1. VARIABLES	2539
315.2. OPTIONS	2540
315.3. SAMPLES	2540
315.3.1. Expression templating	2540
315.3.2. Bean integration	2541
315.3.3. SpEL in enterprise integration patterns	2541
315.4. LOADING SCRIPT FROM EXTERNAL RESOURCE	2541
CHAPTER 316. SPLUNK COMPONENT	2542
316.1. URI FORMAT	2542
316.2. PRODUCER ENDPOINTS:	2542
316.3. CONSUMER ENDPOINTS:	2542
316.4. URI OPTIONS	2543
316.4.1. Path Parameters (1 parameters):	2543
316.4.2. Query Parameters (42 parameters):	2543
316.5. SPRING BOOT AUTO-CONFIGURATION	2547
316.6. MESSAGE BODY	2547
316.7. USE CASES	2547
316.8. OTHER COMMENTS	2548
316.9. SEE ALSO	2548
CHAPTER 317. SPRING SUPPORT	2550
317.1. USING SPRING TO CONFIGURE THE CAMELCONTEXT	2550
317.2. ADDING CAMEL SCHEMA	2550
317.2.1. Using camel: namespace	2551
317.2.2. Advanced configuration using Spring	2551
317.2.3. Using <package>	2551
317.2.4. Using <packageScan>	2552
317.2.5. Using contextScan	2553
317.3. HOW DO I IMPORT ROUTES FROM OTHER XML FILES	2553
317.3.1. Test time exclusion.	2554
317.4. USING SPRING XML	2554
317.5. CONFIGURING COMPONENTS AND ENDPOINTS	2554
317.6. CAMELCONTEXTAWARE	2555
317.7. INTEGRATION TESTING	2555
317.8. SEE ALSO	2555
CHAPTER 318. SPRING BATCH COMPONENT	2556
318.1. URI FORMAT	2556
318.2. OPTIONS	2556
318.2.1. Path Parameters (1 parameters):	2557
318.2.2. Query Parameters (4 parameters):	2557
318.3. SPRING BOOT AUTO-CONFIGURATION	2557
318.4. USAGE	2558
318.5. EXAMPLES	2558

318.6. SUPPORT CLASSES	2559
318.6.1. CamelItemReader	2559
318.6.2. CamelItemWriter	2559
318.6.3. CamelItemProcessor	2559
318.6.4. CamelJobExecutionListener	2560
318.7. SPRING CLOUD	2561
318.7.1. Camel Spring Cloud Starter	2561
318.8. SPRING CLOUD CONSUL	2561
318.9. SPRING CLOUD ZOOKEEPER	2561
318.10. SPRING CLOUD NETFLIX	2561
318.11. SPRING CLOUD NETFLIX STARTER	2562
CHAPTER 319. SPRING EVENT COMPONENT	2563
319.1. URI FORMAT	2563
319.2. SPRING EVENT OPTIONS	2563
319.2.1. Path Parameters (1 parameters):	2563
319.2.2. Query Parameters (4 parameters):	2563
319.3. SPRING BOOT AUTO-CONFIGURATION	2564
319.4. SEE ALSO	2564
CHAPTER 320. SPRING INTEGRATION COMPONENT	2565
320.1. URI FORMAT	2565
320.2. OPTIONS	2565
320.2.1. Path Parameters (1 parameters):	2565
320.2.2. Query Parameters (7 parameters):	2565
320.3. SPRING BOOT AUTO-CONFIGURATION	2566
320.4. USAGE	2567
320.5. EXAMPLES	2567
320.5.1. Using the Spring integration endpoint	2567
320.5.2. The Source and Target adapter	2567
320.6. SEE ALSO	2567
320.7. SPRING JAVA CONFIG	2567
320.7.1. Using Spring Java Config	2568
320.7.2. Configuration	2568
320.7.3. Testing	2568
CHAPTER 321. SPRING LDAP COMPONENT	2570
321.1. URI FORMAT	2570
321.2. OPTIONS	2570
321.2.1. Path Parameters (1 parameters):	2570
321.2.2. Query Parameters (3 parameters):	2570
321.3. SPRING BOOT AUTO-CONFIGURATION	2571
321.4. USAGE	2571
321.4.1. Search	2571
321.4.2. Bind	2571
321.4.3. Unbind	2571
321.4.4. Authenticate	2572
321.4.5. Modify Attributes	2572
321.4.6. Function-Driven	2572
CHAPTER 322. SPRING REDIS COMPONENT	2573
322.1. URI FORMAT	2573
322.2. URI OPTIONS	2573
322.2.1. Path Parameters (2 parameters):	2573

322.2.2. Query Parameters (10 parameters):	2573
322.3. SPRING BOOT AUTO-CONFIGURATION	2574
322.4. USAGE	2575
322.4.1. Message headers evaluated by the Redis producer	2575
322.5. DEPENDENCIES	2588
322.6. SEE ALSO	2588
CHAPTER 323. SPRING SECURITY	2589
323.1. CREATING AUTHORIZATION POLICIES	2589
323.2. CONTROLLING ACCESS TO CAMEL ROUTES	2590
323.3. AUTHENTICATION	2590
323.4. HANDLING AUTHENTICATION AND AUTHORIZATION ERRORS	2591
323.5. DEPENDENCIES	2592
323.6. SEE ALSO	2592
CHAPTER 324. SPRING WEBSERVICE COMPONENT	2593
324.1. URI FORMAT	2593
324.2. OPTIONS	2594
324.2.1. Path Parameters (3 parameters):	2594
324.2.2. Query Parameters (22 parameters):	2595
324.3. SPRING BOOT AUTO-CONFIGURATION	2598
324.3.1. Message headers	2598
324.4. ACCESSING WEB SERVICES	2600
324.5. SENDING SOAP AND WS-ADDRESSING ACTION HEADERS	2600
324.6. USING SOAP HEADERS	2600
324.7. THE HEADER AND ATTACHMENT PROPAGATION	2601
324.8. HOW TO TRANSFORM THE SOAP HEADER USING A STYLESHEET	2601
324.9. HOW TO USE MTOM ATTACHMENTS	2602
324.10. THE CUSTOM HEADER AND ATTACHMENT FILTERING	2602
324.11. USING A CUSTOM MESSAGESENDER AND MESSAGEFACTORY	2603
324.12. EXPOSING WEB SERVICES	2604
324.13. ENDPOINT MAPPING IN ROUTES	2604
324.14. ALTERNATIVE CONFIGURATION, USING EXISTING ENDPOINT MAPPINGS	2605
324.15. POJO (UN)MARSHALLING	2606
324.16. SEE ALSO	2606
CHAPTER 325. SQL COMPONENT	2607
325.1. URI FORMAT	2607
325.2. OPTIONS	2608
325.2.1. Path Parameters (1 parameters):	2608
325.2.2. Query Parameters (45 parameters):	2609
325.3. SPRING BOOT AUTO-CONFIGURATION	2613
325.4. TREATMENT OF THE MESSAGE BODY	2614
325.5. RESULT OF THE QUERY	2614
325.6. USING STREAMLIST	2615
325.7. HEADER VALUES	2615
325.8. GENERATED KEYS	2616
325.9. DATASOURCE	2616
325.10. SAMPLE	2616
325.10.1. Using named parameters	2617
325.11. USING EXPRESSION PARAMETERS IN PRODUCERS	2617
325.11.1. Using expression parameters in consumers	2617
325.12. USING IN QUERIES WITH DYNAMIC VALUES	2618
325.13. USING THE JDBC-BASED IDEMPOTENT REPOSITORY	2619

325.14. USING THE JDBC-BASED AGGREGATION REPOSITORY	2621
325.14.1. Database	2622
325.15. STORING BODY AND HEADERS AS TEXT	2622
325.15.1. Codec (Serialization)	2623
325.15.2. Transaction	2623
325.15.2.1. Service (Start/Stop)	2623
325.15.3. Aggregator configuration	2623
325.16. PROPAGATION BEHAVIOR	2625
325.17. POSTGRES SQL CASE	2625
325.18. CAMEL SQL STARTER	2625
CHAPTER 326. SQL STORED PROCEDURE COMPONENT	2627
326.1. URI FORMAT	2627
326.2. OPTIONS	2627
326.2.1. Path Parameters (1 parameters):	2628
326.2.2. Query Parameters (7 parameters):	2628
326.3. SPRING BOOT AUTO-CONFIGURATION	2629
326.4. DECLARING THE STORED PROCEDURE TEMPLATE	2629
326.4.1. IN Parameters	2630
326.4.2. OUT Parameters	2630
326.4.3. INOUT Parameters	2631

CHAPTER 1. COMPONENTS OVERVIEW

This chapter provides a summary of all the components available for Apache Camel.

1.1. CONTAINER TYPES

Red Hat Fuse provides a variety of container types, into which you can deploy your Camel applications:

- Spring Boot
- Apache Karaf
- JBoss Enterprise Application Platform (JBoss EAP)

In addition, a Camel application can run as *containerless*: that is, where a Camel application runs directly in the JVM, without any special container.

In some cases, Fuse might support a Camel component in one container, but not in the others. There are various reasons for this, but in some cases a component is not suitable for all container types. For example, the **camel-ejb** component is designed specifically for Java EE (that is, JBoss EAP), and cannot be supported in the other container types.

1.2. SUPPORTED COMPONENTS

Note the following key:

Symbol	Description
✓	Supported
■	Unsupported or not yet supported
<i>Deprecated</i>	Likely to be removed in a future release

[Table 1.1, “Apache Camel Component Support Matrix”](#) provides comprehensive details about which Camel components are supported in which containers.

CHAPTER 2. ACTIVEMQ

ACTIVEMQ COMPONENT

The ActiveMQ component allows messages to be sent to a [JMS Queue](#) or [Topic](#); or messages to be consumed from a [JMS Queue](#) or [Topic](#) using [Apache ActiveMQ](#).

This component is based on the [Chapter 178, JMS Component](#) and uses Spring's JMS support for declarative transactions, using Spring's **JmsTemplate** for sending and a **MessageListenerContainer** for consuming. All the options from the [Chapter 178, JMS Component](#) component also apply for this component.

To use this component, make sure you have the **activemq.jar** or **activemq-core.jar** on your classpath along with any Apache Camel dependencies such as **camel-core.jar**, **camel-spring.jar** and **camel-jms.jar**.

TRANSACTIONED AND CACHING

See section **Transactions and Cache Levels** below on JMS page if you are using transactions with JMS as it can impact performance.

URI FORMAT

```
activemq:[queue:|topic:]destinationName
```

Where **destinationName** is an ActiveMQ queue or topic name. By default, the **destinationName** is interpreted as a queue name. For example, to connect to the queue, **FOO.BAR**, use:

```
activemq:FOO.BAR
```

You can include the optional **queue:** prefix, if you prefer:

```
activemq:queue:FOO.BAR
```

To connect to a topic, you must include the **topic:** prefix. For example, to connect to the topic, **Stocks.Prices**, use:

```
activemq:topic:Stocks.Prices
```

OPTIONS

See Options on the [Chapter 178, JMS Component](#) component as all these options also apply for this component.

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

You can configure the ActiveMQ Camel component to work either with an embedded broker or an external broker. To embed a broker in the JBoss EAP container, configure the ActiveMQ Resource

Adapter in the EAP container configuration file – for details, see [ActiveMQ Resource Adapter Configuration](#).

CONFIGURING THE CONNECTION FACTORY

The following [test case](#) shows how to add an `ActiveMQComponent` to the `CamelContext` using the `activeMQComponent()` method while specifying the `brokerURL` used to connect to ActiveMQ.

```
camelContext.addComponent("activemq", activeMQComponent("vm://localhost?
broker.persistent=false"));
```

CONFIGURING THE CONNECTION FACTORY USING SPRING XML

You can configure the ActiveMQ broker URL on the `ActiveMQComponent` as follows

```
<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-
    spring.xsd">

  <camelContext xmlns="http://camel.apache.org/schema/spring">
  </camelContext>

  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="brokerURL" value="tcp://somehost:61616"/>
  </bean>

</beans>
```

USING CONNECTION POOLING

When sending to an ActiveMQ broker using Camel it's recommended to use a pooled connection factory to handle efficient pooling of JMS connections, sessions and producers. This is documented in the page [ActiveMQ Spring Support](#).

You can grab Jencks AMQ pool with Maven:

```
<dependency>
  <groupId>org.apache.activemq</groupId>
  <artifactId>activemq-pool</artifactId>
  <version>5.3.2</version>
</dependency>
```

And then setup the `activemq` component as follows:

```
<bean id="jmsConnectionFactory" class="org.apache.activemq.ActiveMQConnectionFactory">
  <property name="brokerURL" value="tcp://localhost:61616" />
</bean>
```

```

<bean id="pooledConnectionFactory"
class="org.apache.activemq.pool.PooledConnectionFactory" init-method="start" destroy-
method="stop">
  <property name="maxConnections" value="8" />
  <property name="connectionFactory" ref="jmsConnectionFactory" />
</bean>

<bean id="jmsConfig" class="org.apache.camel.component.jms.JmsConfiguration">
  <property name="connectionFactory" ref="pooledConnectionFactory"/>
  <property name="concurrentConsumers" value="10"/>
</bean>

<bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
  <property name="configuration" ref="jmsConfig"/>
</bean>

```

NOTE

Notice the **init** and **destroy** methods on the pooled connection factory. This is important to ensure the connection pool is properly started and shutdown.

The **PooledConnectionFactory** will then create a connection pool with up to 8 connections in use at the same time. Each connection can be shared by many sessions. There is an option named **maxActive** you can use to configure the maximum number of sessions per connection; the default value is **500**. From **ActiveMQ 5.7** onwards the option has been renamed to better reflect its purpose, being named as **maxActiveSessionPerConnection**. Notice the **concurrentConsumers** is set to a higher value than **maxConnections** is. This is okay, as each consumer is using a session, and as a session can share the same connection, we are in the safe. In this example we can have $8 * 500 = 4000$ active sessions at the same time.

INVOKING MESSAGELISTENER POJOS IN A ROUTE

The ActiveMQ component also provides a helper [Type Converter](#) from a JMS MessageListener to a [Processor](#). This means that the [Chapter 43, Bean Component](#) component is capable of invoking any JMS MessageListener bean directly inside any route.

So for example you can create a MessageListener in JMS as follows:

```

public class MyListener implements MessageListener {
  public void onMessage(Message jmsMessage) {
    // ...
  }
}

```

Then use it in your route as follows

```

from("file://foo/bar").
  bean(MyListener.class);

```

That is, you can reuse any of the Apache Camel components and easily integrate them into your JMS **MessageListener** POJO!

USING ACTIVEMQ DESTINATION OPTIONS

Available as of ActiveMQ 5.6

You can configure the [Destination Options](#) in the endpoint uri, using the "destination." prefix. For example to mark a consumer as exclusive, and set its prefetch size to 50, you can do as follows:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="file://src/test/data?noop=true"/>
    <to uri="activemq:queue:foo"/>
  </route>
  <route>
    <!-- use consumer.exclusive ActiveMQ destination option, notice we have to prefix with destination.
-->
    <from uri="activemq:foo?
destination.consumer.exclusive=true&destination.consumer.prefetchSize=50"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

CONSUMING ADVISORY MESSAGES

ActiveMQ can generate [Advisory messages](#) which are put in topics that you can consume. Such messages can help you send alerts in case you detect slow consumers or to build statistics (number of messages/produced per day, etc.) The following Spring DSL example shows you how to read messages from a topic.

```
<route>
  <from uri="activemq:topic:ActiveMQ.Advisory.Connection?mapJmsMessage=false" />
  <convertBodyTo type="java.lang.String"/>
  <transform>
    <simple>${in.body}&#13;</simple>
  </transform>
  <to uri="file://data/activemq/?fileExist=Append&fileName=advisoryConnection-
${date:now:yyyyMMdd}.txt" />
</route>
```

If you consume a message on a queue, you should see the following files under data/activemq folder :

advisoryConnection-20100312.txt advisoryProducer-20100312.txt

and containing string:

```
ActiveMQMessage {commandId = 0, responseRequired = false, messageId = ID:dell-charles-
3258-1268399815140
-1:0:0:0:221, originalDestination = null, originalTransactionId = null, producerId = ID:dell-charles-
3258-1268399815140-1:0:0:0, destination = topic://ActiveMQ.Advisory.Connection, transactionId
= null,
  expiration = 0, timestamp = 0, arrival = 0, brokerInTime = 1268403383468, brokerOutTime =
1268403383468,
  correlationId = null, replyTo = null, persistent = false, type = Advisory, priority = 0, groupId = null,
groupSequence = 0, targetConsumerId = null, compressed = false, userId = null, content = null,
marshalledProperties = org.apache.activemq.util.ByteSequence@17e2705, dataStructure =
ConnectionInfo
{commandId = 1, responseRequired = true, connectionId = ID:dell-charles-3258-1268399815140-
```

```
2:50,
  clientId = ID:dell-charles-3258-1268399815140-14:0, userName = , password = *****,
  brokerPath = null, brokerMasterConnector = false, manageable = true, clientMaster = true},
  redeliveryCounter = 0, size = 0, properties = {originBrokerName=master, originBrokerId=ID:dell-
charles-
3258-1268399815140-0:0, originBrokerURL=vm://master}, readOnlyProperties = true,
readOnlyBody = true,
  droppable = false}
```

GETTING COMPONENT JAR

You need this dependency:

- **activemq-camel**

ActiveMQ is an extension of the [Chapter 178, JMS Component](#) component released with the [ActiveMQ project](#).

```
<dependency>
  <groupId>org.apache.activemq</groupId>
  <artifactId>activemq-camel</artifactId>
  <version>5.6.0</version>
</dependency>
```

CHAPTER 3. AHC COMPONENT

Available as of Camel version 2.8

The **ahc**: component provides HTTP based endpoints for consuming external HTTP resources (as a client to call external servers using HTTP).

The component uses the [Async Http Client](#) library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ahc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

3.1. URI FORMAT

```
ahc:http://hostname[:port][/resourceUri][?options]
ahc:https://hostname[:port][/resourceUri][?options]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

You can append query options to the URI in the following format, **?option=value&option=value&...**

3.2. AHCENDPOINT OPTIONS

The AHC endpoint is configured using URI syntax:

```
ahc:httpUri
```

with the following path and query parameters:

3.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
httpUri	Required The URI to use such as http://hostname:port/path		URI

3.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
------	-------------	---------	------

Name	Description	Default	Type
bridgeEndpoint (producer)	If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint's URI for request. You may also set the <code>throwExceptionOnFailure</code> to be false to let the <code>AhcProducer</code> send all the fault response back.	false	boolean
bufferSize (producer)	The initial in-memory buffer size used when transferring data between Camel and AHC Client.	4096	int
connectionClose (producer)	Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default	false	boolean
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
headerFilterStrategy (producer)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
throwExceptionOnFailure (producer)	Option to disable throwing the <code>AhcOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean
transferException (producer)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a <code>application/x-java-serialized-object</code> content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the <code>AhcOperationFailedException</code> . The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
binding (advanced)	To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel.		AhcBinding
clientConfig (advanced)	To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance.		AsyncHttpClientConfig
clientConfigOptions (advanced)	To configure the <code>AsyncHttpClientConfig</code> using the key/values from the Map.		Map

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
clientConfigRealmOptions (security)	To configure the AsyncHttpClientConfig Realm using the key/values from the Map.		Map
sslContextParameters (security)	Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. This reference overrides any configured <code>SSLContextParameters</code> at the component level. See Using the JSSE Configuration Utility . Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level.		<code>SSLContextParameters</code>

3.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
camel.component. .ahc.allow-java- serialized-object	Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean
camel.component. .ahc.binding	To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel. The option is a <code>org.apache.camel.component.ahc.AhcBinding</code> type.		String
camel.component. .ahc.client	To use a custom <code>AsyncHttpClient</code> . The option is a <code>org.asynchttpclient.AsyncHttpClient</code> type.		String
camel.component. .ahc.client-config	To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. The option is a <code>org.asynchttpclient.AsyncHttpClientConfig</code> type.		String

Name	Description	Default	Type
<code>camel.component.ahc.enabled</code>	Enable ahc component	true	Boolean
<code>camel.component.ahc.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
<code>camel.component.ahc.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.ahc.ssl-context-parameters</code>	Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type.		String
<code>camel.component.ahc.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

3.4. AHCCOMPONENT OPTIONS

The AHC component supports 8 options, which are listed below.

Name	Description	Default	Type
<code>client</code> (advanced)	To use a custom <code>AsyncHttpClient</code>		<code>AsyncHttpClient</code>
<code>binding</code> (advanced)	To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel.		<code>AhcBinding</code>
<code>clientConfig</code> (advanced)	To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance.		<code>AsyncHttpClientConfig</code>

Name	Description	Default	Type
sslContextParameters (security)	Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level.		<code>SSLContextParameters</code>
allowJavaSerialized Object (advanced)	Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
useGlobalSslContext Parameters (security)	Enable usage of global SSL context parameters.	false	boolean
headerFilterStrategy (filter)	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message.		<code>HeaderFilterStrategy</code>
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

Notice that setting any of the options on the **AhcComponent** will propagate those options to **AhcEndpoints** being created. However the **AhcEndpoint** can also configure/override a custom option. Options set on endpoints will always take precedence over options from the **AhcComponent**.

3.5. MESSAGE HEADERS

Name	Type	Description
Exchange.HTTP_URI	String	URI to call. Will override existing URI set directly on the endpoint.
Exchange.HTTP_PATH	String	Request URI's path, the header will be used to build the request URI with the <code>HTTP_URI</code> . If the path is start with <code>"/"</code> , http producer will try to find the relative path based on the <code>Exchange.HTTP_BASE_URI</code> header or the <code>exchange.getFromEndpoint().getEndpointUri();</code>

Name	Type	Description
Exchange.HTTP_QUERY	String	Camel 2.11 onwards: URI parameters. Will override existing URI parameters set directly on the endpoint.
Exchange.HTTP_RESPONSE_CODE	int	The HTTP response code from the external server. Is 200 for OK.
Exchange.HTTP_CHARACTER_ENCODING	String	Character encoding.
Exchange.CONTENT_TYPE	String	The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html .
Exchange.CONTENT_ENCODING	String	The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as gzip .

3.6. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

3.7. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a **AhcOperationFailedException** with the information.

- Response code is 400+, Camel regards it as an external server failure and will throw a **AhcOperationFailedException** with the information.
throwExceptionOnFailure

The option, **throwExceptionOnFailure**, can be set to **false** to prevent the **AhcOperationFailedException** from being thrown for failed response codes. This allows you to get any response from the remote server.

3.8. AHCOPERATIONFAILEDEXCEPTION

This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a **java.lang.String**, if server provided a body as response

3.9. CALLING USING GET OR POST

The following algorithm is used to determine if either **GET** or **POST** HTTP method should be used:

1. Use method provided in header.
2. **GET** if query string is provided in header.
3. **GET** if endpoint is configured with a query string.
4. **POST** if there is data to send (body is not null).
5. **GET** otherwise.

3.10. CONFIGURING URI TO CALL

You can set the HTTP producer's URI directly from the endpoint URI. In the route below, Camel will call out to the external server, **oldhost**, using HTTP.

```
from("direct:start")
    .to("ahc:http://oldhost");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc:http://oldhost"/>
  </route>
</camelContext>
```

You can override the HTTP endpoint URI by adding a header with the key, **Exchange.HTTP_URI**, on the message.

```
from("direct:start")
    .setHeader(Exchange.HTTP_URI, constant("http://newhost"))
    .to("ahc:http://oldhost");
```

3.11. CONFIGURING URI PARAMETERS

The **ahc** producer supports URI parameters to be sent to the HTTP server. The URI parameters can either be set directly on the endpoint URI or as a header with the key **Exchange.HTTP_QUERY** on the message.

```
from("direct:start")
    .to("ahc:http://oldhost?order=123&detail=short");
```

Or options provided in a header:

```
from("direct:start")
    .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
    .to("ahc:http://oldhost");
```

3.12. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER

The HTTP component provides a way to set the HTTP request method by setting the message header. Here is an example;

```
from("direct:start")
    .setHeader(Exchange.HTTP_METHOD, constant("POST"))
    .to("ahc:http://www.google.com")
    .to("mock:results");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <setHeader headerName="CamelHttpMethod">
      <constant>POST</constant>
    </setHeader>
    <to uri="ahc:http://www.google.com"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

3.13. CONFIGURING CHARSET

If you are using **POST** to send data you can configure the **charset** using the **Exchange** property:

```
exchange.setProperty(Exchange.CHARSET_NAME, "iso-8859-1");
```

3.13.1. URI Parameters from the endpoint URI

In this sample we have the complete URI endpoint that is just what you would have typed in a web browser. Multiple URI parameters can of course be set using the **&** character as separator, just as you would in the web browser. Camel does no tricks here.

```
// we query for Camel at the Google page
template.sendBody("ahc:http://www.google.com/search?q=Camel", null);
```

3.13.2. URI Parameters from the Message

```
Map headers = new HashMap();
headers.put(Exchange.HTTP_QUERY, "q=Camel&lr=lang_en");
// we query for Camel and English language at Google
template.sendBody("ahc:http://www.google.com/search", null, headers);
```

In the header value above notice that it should **not** be prefixed with **?** and you can separate parameters as usual with the **&** char.

3.13.3. Getting the Response Code

You can get the HTTP response code from the AHC component by getting the value from the Out message header with **Exchange.HTTP_RESPONSE_CODE**.

```
Exchange exchange = template.send("ahc:http://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq"));
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);
```

3.14. CONFIGURING ASYNCHTTPCLIENT

The **AsyncHttpClient** client uses a **AsyncHttpClientConfig** to configure the client. See the documentation at [Async Http Client](#) for more details.

In Camel 2.8, configuration is limited to using the builder pattern provided by **AsyncHttpClientConfig.Builder**. In Camel 2.8, the **AsyncHttpClientConfig** doesn't support getters/setters so its not easy to create/configure using a Spring bean style (eg the <bean> tag in the XML file).

The example below shows how to use a builder to create the **AsyncHttpClientConfig** which we configure on the **AhcComponent**.

In Camel 2.9, the AHC component uses Async HTTP library 1.6.4. This newer version provides added support for plain bean style configuration. The **AsyncHttpClientConfigBean** class provides getters and setters for the configuration options available in **AsyncHttpClientConfig**. An instance of **AsyncHttpClientConfigBean** may be passed directly to the AHC component or referenced in an endpoint URI using the **clientConfig** URI parameter.

Also available in Camel 2.9 is the ability to set configuration options directly in the URI. URI parameters starting with "clientConfig." can be used to set the various configurable properties of **AsyncHttpClientConfig**. The properties specified in the endpoint URI are merged with those specified in the configuration referenced by the "clientConfig" URI parameter with those being set using the "clientConfig." parameter taking priority. The **AsyncHttpClientConfig** instance referenced is always

copied for each endpoint such that settings on one endpoint will remain independent of settings on any previously created endpoints. The example below shows how to configure the AHC component using the "clientConfig." type URI parameters.

```
from("direct:start")
  .to("ahc:http://localhost:8080/foo?
    clientConfig.maxRequestRetry=3&clientConfig.followRedirects=true")
```

3.15. SSL SUPPORT (HTTPS)

Using the JSSE Configuration Utility

As of Camel 2.9, the AHC component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the AHC component.

Programmatic configuration of the component

```
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

AhcComponent component = context.getComponent("ahc", AhcComponent.class);
component.setSslContextParameters(scp);
```

Spring DSL based configuration of endpoint

```
...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:keyManagers
    keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  </camel:sslContextParameters>...
...
<to uri="ahc:https://localhost/foo?sslContextParameters=#sslContextParameters"/>
...

```

CHAPTER 4. AHC WEBSOCKET COMPONENT

Available as of Camel version 2.14

The `ahc-ws` component provides Websocket based endpoints for a client communicating with external servers over Websocket (as a client opening a websocket connection to an external server). The component uses the [AHC](#) component that in turn uses the [Async Http Client](#) library.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ahc-ws</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

4.1. URI FORMAT

```
ahc-ws://hostname[:port]/resourceUri[?options]
ahc-wss://hostname[:port]/resourceUri[?options]
```

Will by default use port 80 for `ahc-ws` and 443 for `ahc-wss`.

4.2. AHC-WS OPTIONS

As the AHC-WS component is based on the AHC component, you can use the various configuration options of the AHC component.

The AHC Websocket component supports 8 options, which are listed below.

Name	Description	Default	Type
<code>client</code> (advanced)	To use a custom <code>AsyncHttpClient</code>		<code>AsyncHttpClient</code>
<code>binding</code> (advanced)	To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel.		<code>AhcBinding</code>
<code>clientConfig</code> (advanced)	To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance.		<code>AsyncHttpClientConfig</code>
<code>sslContextParameters</code> (security)	Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level.		<code>SSLContextParameters</code>

Name	Description	Default	Type
allowJavaSerialized Object (advanced)	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
useGlobalSslContext Parameters (security)	Enable usage of global SSL context parameters.	false	boolean
headerFilterStrategy (filter)	To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AHC Websocket endpoint is configured using URI syntax:

```
ahc-ws:httpUri
```

with the following path and query parameters:

4.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
httpUri	Required The URI to use such as http://hostname:port/path		URI

4.2.2. Query Parameters (18 parameters):

Name	Description	Default	Type
bridgeEndpoint (common)	If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint's URI for request. You may also set the <code>throwExceptionOnFailure</code> to be false to let the <code>AhcProducer</code> send all the fault response back.	false	boolean

Name	Description	Default	Type
bufferSize (common)	The initial in-memory buffer size used when transferring data between Camel and AHC Client.	4096	int
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
throwExceptionOnFailure (common)	Option to disable throwing the AhcOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean
transferException (common)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the AhcOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendMessageOnError (consumer)	Whether to send an message if the web-socket listener received an error.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
connectionClose (producer)	Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default	false	boolean
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
useStreaming (producer)	To enable streaming to send data as multiple text fragments.	false	boolean
binding (advanced)	To use a custom AhcBinding which allows to control how to bind between AHC and Camel.		AhcBinding
clientConfig (advanced)	To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance.		AsyncHttpClientConfig
clientConfigOptions (advanced)	To configure the AsyncHttpClientConfig using the key/values from the Map.		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
clientConfigRealmOptions (security)	To configure the AsyncHttpClientConfig Realm using the key/values from the Map.		Map
sslContextParameters (security)	Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. This reference overrides any configured SSLContextParameters at the component level. See Using the JSSE Configuration Utility. Note that configuring this option will override any SSL/TLS configuration options provided through the clientConfig option at the endpoint or component level.		SSLContextParameters

4.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.ahc-ws.allow-java-serialized-object</code>	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean
<code>camel.component.ahc-ws.binding</code>	To use a custom AhcBinding which allows to control how to bind between AHC and Camel. The option is a <code>org.apache.camel.component.ahc.AhcBinding</code> type.		String
<code>camel.component.ahc-ws.client</code>	To use a custom AsyncHttpClient. The option is a <code>org.asynchttpclient.AsyncHttpClient</code> type.		String
<code>camel.component.ahc-ws.client-config</code>	To configure the AsyncHttpClient to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. The option is a <code>org.asynchttpclient.AsyncHttpClientConfig</code> type.		String
<code>camel.component.ahc-ws.enabled</code>	Enable ahc-ws component	true	Boolean
<code>camel.component.ahc-ws.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
<code>camel.component.ahc-ws.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.ahc-ws.ssl-context-parameters</code>	Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type.		String
<code>camel.component.ahc-ws.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

4.4. WRITING AND READING DATA OVER WEBSOCKET

An ahc-ws endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

4.5. CONFIGURING URI TO WRITE OR READ DATA

In the route below, Camel will write to the specified websocket connection.

```
from("direct:start")
    .to("ahc-ws://targethost");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc-ws://targethost"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```
from("ahc-ws://targethost")
    .to("direct:next");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="ahc-ws://targethost"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

- [Atmosphere-Websocket](#)

CHAPTER 5. AMQP COMPONENT

Available as of Camel version 1.2

The **amqp:** component supports the [AMQP 1.0 protocol](#) using the JMS Client API of the [Qpid](#) project. In case you want to use AMQP 0.9 (in particular RabbitMQ) you might also be interested in the [Camel RabbitMQ](#) component. Please keep in mind that prior to the Camel 2.17.0 AMQP component supported AMQP 0.9 and above, however since Camel 2.17.0 it supports only AMQP 1.0.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-amqp</artifactId>
  <version>${camel.version}</version> <!-- use the same version as your Camel core version -->
</dependency>
```

5.1. URI FORMAT

```
amqp:[queue:|topic:]destinationName[?options]
```

5.2. AMQP OPTIONS

You can specify all of the various configuration options of the [JMS](#) component after the destination name.

The AMQP component supports 81 options which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use a shared JMS configuration		JmsConfiguration
acceptMessagesWhile Stopping (consumer)	Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.	false	boolean

Name	Description	Default	Type
allowReplyManagerQuickStop (consumer)	Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.	false	boolean
acknowledgmentMode (consumer)	The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgment mode. For the regular modes, it is preferable to use the acknowledgmentModeName instead.		int
eagerLoadingOfProperties (consumer)	Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties	false	boolean
acknowledgmentModeName (consumer)	The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE	AUTO_ACKNOWLEDGE	String
autoStartup (consumer)	Specifies whether the consumer container should auto-startup.	true	boolean
cacheLevel (consumer)	Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details.		int
cacheLevelName (consumer)	Sets the cache level by name for the underlying JMS resources. Possible values are: CACHE_AUTO, CACHE_CONNECTION, CACHE_CONSUMER, CACHE_NONE, and CACHE_SESSION. The default setting is CACHE_AUTO. See the Spring documentation and Transactions Cache Levels for more information.	CACHE_AUTO	String

Name	Description	Default	Type
replyToCacheLevelName (producer)	Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: <code>CACHE_CONSUMER</code> for exclusive or shared w/ <code>replyToSelectorName</code> . And <code>CACHE_SESSION</code> for shared without <code>replyToSelectorName</code> . Some JMS brokers such as IBM WebSphere may require to set the <code>replyToCacheLevelName=CACHE_NONE</code> to work. Note: If using temporary queues then <code>CACHE_NONE</code> is not allowed, and you must use a higher value such as <code>CACHE_CONSUMER</code> or <code>CACHE_SESSION</code> .		String
clientId (common)	Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead.		String
concurrentConsumers (consumer)	Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.	1	int
replyToConcurrentConsumers (producer)	Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads.	1	int
connectionFactory (common)	The connection factory to be use. A connection factory must be configured either on the component or endpoint.		ConnectionFactory
username (security)	Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.		String
password (security)	Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.		String

Name	Description	Default	Type
deliveryPersistent (producer)	Specifies whether persistent delivery is used by default.	true	boolean
deliveryMode (producer)	Specifies the delivery mode to be used. Possible values are those defined by <code>javax.jms.DeliveryMode</code> . <code>NON_PERSISTENT = 1</code> and <code>PERSISTENT = 2</code> .		Integer
durableSubscriptionName (common)	The durable subscriber name for specifying durable topic subscriptions. The <code>clientId</code> option must be configured as well.		String
exceptionListener (advanced)	Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions.		ExceptionListener
errorHandler (advanced)	Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler.		ErrorHandler
errorHandlerLoggingLevel (logging)	Allows to configure the default errorHandler logging level for logging uncaught exceptions.	WARN	LoggingLevel
errorHandlerLogStackTrace (logging)	Allows to control whether stacktraces should be logged or not, by the default errorHandler.	true	boolean
explicitQosEnabled (producer)	Set if the deliveryMode, priority or timeToLive qualities of service should be used when sending messages. This option is based on Spring's <code>JmsTemplate</code> . The deliveryMode, priority and timeToLive options are applied to the current endpoint. This contrasts with the <code>preserveMessageQos</code> option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers.	false	boolean
exposeListenerSession (consumer)	Specifies whether the listener session should be exposed when consuming messages.	false	boolean

Name	Description	Default	Type
idleTaskExecutionLimit (advanced)	Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring.	1	int
idleConsumerLimit (advanced)	Specify the limit for the number of consumers that are allowed to be idle at any given time.	1	int
maxConcurrentConsumers (consumer)	Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.		int
replyToMaxConcurrentConsumers (producer)	Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads.		int
replyOnTimeoutToMaxConcurrentConsumers (producer)	Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS.	1	int
maxMessagesPerTask (advanced)	The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required.	-1	int
messageConverter (advanced)	To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> .		MessageConverter
mapJmsMessage (advanced)	Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a String etc.	true	boolean

Name	Description	Default	Type
messageIdEnabled (advanced)	When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker.If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value	true	boolean
messageTimestampEnabled (advanced)	Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker.If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value	true	boolean
alwaysCopyMessage (producer)	If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a <code>replyToDestinationSelectorName</code> is set (incidentally, Camel will set the <code>alwaysCopyMessage</code> option to true, if a <code>replyToDestinationSelectorName</code> is set)	false	boolean
useMessageIDAsCorrelationID (advanced)	Specifies whether <code>JMSMessageID</code> should always be used as <code>JMSCorrelationID</code> for InOut messages.	false	boolean
priority (producer)	Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The <code>explicitQosEnabled</code> option must also be enabled in order for this option to have any effect.	4	int
pubSubNoLocal (advanced)	Specifies whether to inhibit the delivery of messages published by its own connection.	false	boolean
receiveTimeout (advanced)	The timeout for receiving messages (in milliseconds).	1000	long
recoveryInterval (advanced)	Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.	5000	long
taskExecutor (consumer)	Allows you to specify a custom task executor for consuming messages.		TaskExecutor
deliveryDelay (producer)	Sets delivery delay to use for send calls for JMS. This option requires JMS 2.0 compliant broker.	-1	long

Name	Description	Default	Type
timeToLive (producer)	When sending messages, specifies the time-to-live of the message (in milliseconds).	-1	long
transacted (transaction)	Specifies whether to use transacted mode	false	boolean
lazyCreateTransactionManager (transaction)	If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when option <code>transacted=true</code> .	true	boolean
transactionManager (transaction)	The Spring transaction manager to use.		PlatformTransactionManager
transactionName (transaction)	The name of the transaction to use.		String
transactionTimeout (transaction)	The timeout value of the transaction (in seconds), if using transacted mode.	-1	int
testConnectionOnStartup (common)	Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well.	false	boolean
asyncStartListener (advanced)	Whether to startup the <code>JmsConsumer</code> message listener asynchronously, when starting a route. For example if a <code>JmsConsumer</code> cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the <code>JmsConsumer</code> connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.	false	boolean
asyncStopListener (advanced)	Whether to stop the <code>JmsConsumer</code> message listener asynchronously, when stopping a route.	false	boolean

Name	Description	Default	Type
forceSendOriginal Message (producer)	When using <code>mapJmsMessage=false</code> Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.	false	boolean
requestTimeout (producer)	The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header <code>CamelJmsRequestTimeout</code> to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the <code>requestTimeoutCheckerInterval</code> option.	20000	long
requestTimeoutChecker Interval (advanced)	Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option <code>requestTimeout</code> .	1000	long
transferExchange (advanced)	You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.	false	boolean
transferException (advanced)	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a <code>javax.jms.ObjectMessage</code> . If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have <code>transferExchange</code> enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as <code>org.apache.camel.RuntimeCamelException</code> when returned to the producer.	false	boolean

Name	Description	Default	Type
transferFault (advanced)	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on <code>Message#isFault()</code> will be send back in the response as a JMS header with the key <code>org.apache.camel.component.jms.JmsConstants#JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT</code> . If the client is Camel, the returned fault flag will be set on the <code>org.apache.camel.Message#setFault(boolean)</code> . You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.	false	boolean
jmsOperations (advanced)	Allows you to use your own implementation of the <code>org.springframework.jms.core.JmsOperations</code> interface. Camel uses <code>JmsTemplate</code> as default. Can be used for testing purpose, but not used much as stated in the spring API docs.		JmsOperations
destinationResolver (advanced)	A pluggable <code>org.springframework.jms.support.destination.DestinationResolver</code> that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).		DestinationResolver
replyToType (producer)	Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.		ReplyToType

Name	Description	Default	Type
preserveMessageQos (producer)	Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header.	false	boolean
asyncConsumer (consumer)	Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions).	false	boolean
allowNullBody (producer)	Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSException is thrown.	true	boolean
includeSentJMSMessageID (producer)	Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.	false	boolean
includeAllJMSXProperties (advanced)	Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.	false	boolean

Name	Description	Default	Type
defaultTaskExecutor Type (consumer)	Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring's SimpleAsyncTaskExecutor) or ThreadPool (uses Spring's ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.		DefaultTaskExecutor Type
jmsKeyFormatStrategy (advanced)	Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the org.apache.camel.component.jms.JmsKeyFormatStrategy and refer to it using the # notation.		JmsKeyFormatStrategy
allowAdditionalHeaders (producer)	This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.		String
queueBrowseStrategy (advanced)	To use a custom QueueBrowseStrategy when browsing queues		QueueBrowseStrategy
messageCreatedStrategy (advanced)	To use the given MessageCreatedStrategy which are invoked when Camel creates new instances of javax.jms.Message objects when Camel is sending a JMS message.		MessageCreatedStrategy
waitForProvisionCorrelationToBeUpdated Counter (advanced)	Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.	50	int

Name	Description	Default	Type
waitForProvisionCorrelationToBeUpdatedThreadSleepingTime (advanced)	Interval in millis to sleep each time while waiting for provisional correlation id to be updated.	100	long
correlationProperty (producer)	Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of JMSCorrelationID property. This allows you to exchange messages with systems that do not correlate messages using JMSCorrelationID JMS property. If used JMSCorrelationID will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name.		String
subscriptionDurable (consumer)	Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well.	false	boolean
subscriptionShared (consumer)	Set whether to make the subscription shared. The shared subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a shared subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with subscriptionDurable as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. Requires a JMS 2.0 compatible message broker.	false	boolean

Name	Description	Default	Type
subscriptionName (consumer)	Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0).		String
streamMessageTypeEnabled (producer)	Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.	false	boolean
formatDateHeadersToIso8601 (producer)	Sets whether date headers should be formatted according to the ISO 8601 standard.	false	boolean
headerFilterStrategy (filter)	To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AMQP endpoint is configured using URI syntax:

```
amqp:destinationType:destinationName
```

with the following path and query parameters:

5.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
destinationType	The kind of destination to use	queue	String

Name	Description	Default	Type
destinationName	Required Name of the queue or topic to use as destination		String

5.2.2. Query Parameters (92 parameters):

Name	Description	Default	Type
clientId (common)	Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead.		String
connectionFactory (common)	The connection factory to be use. A connection factory must be configured either on the component or endpoint.		ConnectionFactory
disableReplyTo (common)	Specifies whether Camel ignores the JMSReplyTo header in messages. If true, Camel does not send a reply back to the destination specified in the JMSReplyTo header. You can use this option if you want Camel to consume from a route and you do not want Camel to automatically send back a reply message because another component in your code handles the reply message. You can also use this option if you want to use Camel as a proxy between different message brokers and you want to route message from one system to another.	false	boolean
durableSubscriptionName (common)	The durable subscriber name for specifying durable topic subscriptions. The clientId option must be configured as well.		String
jmsMessageType (common)	Allows you to force the use of a specific javax.jms.Message implementation for sending JMS messages. Possible values are: Bytes, Map, Object, Stream, Text. By default, Camel would determine which JMS message type to use from the In body type. This option allows you to specify it.		JmsMessageType

Name	Description	Default	Type
testConnectionOnStartup (common)	Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well.	false	boolean
acknowledgmentModeName (consumer)	The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE	AUTO_ACKNOWLEDGE	String
asyncConsumer (consumer)	Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions).	false	boolean
autoStartup (consumer)	Specifies whether the consumer container should auto-startup.	true	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
cacheLevel (consumer)	Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details.		int

Name	Description	Default	Type
cacheLevelName (consumer)	Sets the cache level by name for the underlying JMS resources. Possible values are: <code>CACHE_AUTO</code> , <code>CACHE_CONNECTION</code> , <code>CACHE_CONSUMER</code> , <code>CACHE_NONE</code> , and <code>CACHE_SESSION</code> . The default setting is <code>CACHE_AUTO</code> . See the Spring documentation and Transactions Cache Levels for more information.	<code>CACHE_AUTO</code>	String
concurrentConsumers (consumer)	Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.	1	int
maxConcurrentConsumers (consumer)	Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.		int
replyTo (consumer)	Provides an explicit <code>ReplyTo</code> destination, which overrides any incoming value of <code>Message.getJMSReplyTo()</code> .		String
replyToDeliveryPersistent (consumer)	Specifies whether to use persistent delivery by default for replies.	true	boolean
selector (consumer)	Sets the JMS selector to use		String

Name	Description	Default	Type
subscriptionDurable (consumer)	Set whether to make the subscription durable. The durable subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a durable subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well.	false	boolean
subscriptionName (consumer)	Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0).		String
subscriptionShared (consumer)	Set whether to make the subscription shared. The shared subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a shared subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with <code>subscriptionDurable</code> as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well. Requires a JMS 2.0 compatible message broker.	false	boolean
acceptMessagesWhileStopping (consumer)	Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.	false	boolean

Name	Description	Default	Type
allowReplyManagerQuickStop (consumer)	Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.	false	boolean
consumerType (consumer)	The consumer type to use, which can be one of: Simple, Default, or Custom. The consumer type determines which Spring JMS listener to use. Default will use org.springframework.jms.listener.DefaultMessageListenerContainer, Simple will use org.springframework.jms.listener.SimpleMessageListenerContainer. When Custom is specified, the MessageListenerContainerFactory defined by the messageListenerContainerFactory option will determine what org.springframework.jms.listener.AbstractMessageListenerContainer to use.	Default	ConsumerType
defaultTaskExecutorType (consumer)	Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring's SimpleAsyncTaskExecutor) or ThreadPool (uses Spring's ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.		DefaultTaskExecutorType
eagerLoadingOfProperties (consumer)	Enables eager loading of JMS properties and payload as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
exposeListenerSession (consumer)	Specifies whether the listener session should be exposed when consuming messages.	false	boolean
replyToSameDestination Allowed (consumer)	Whether a JMS consumer is allowed to send a reply message to the same destination that the consumer is using to consume from. This prevents an endless loop by consuming and sending back the same message to itself.	false	boolean
taskExecutor (consumer)	Allows you to specify a custom task executor for consuming messages.		TaskExecutor
deliveryDelay (producer)	Sets delivery delay to use for send calls for JMS. This option requires JMS 2.0 compliant broker.	-1	long
deliveryMode (producer)	Specifies the delivery mode to be used. Possible values are those defined by javax.jms.DeliveryMode. NON_PERSISTENT = 1 and PERSISTENT = 2.		Integer
deliveryPersistent (producer)	Specifies whether persistent delivery is used by default.	true	boolean
explicitQoSEnabled (producer)	Set if the deliveryMode, priority or timeToLive qualities of service should be used when sending messages. This option is based on Spring's JmsTemplate. The deliveryMode, priority and timeToLive options are applied to the current endpoint. This contrasts with the preserveMessageQoS option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers.	false	Boolean
formatDateHeadersToIso8601 (producer)	Sets whether JMS date properties should be formatted according to the ISO 8601 standard.	false	boolean

Name	Description	Default	Type
preserveMessageQos (producer)	Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header.	false	boolean
priority (producer)	Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The explicitQosEnabled option must also be enabled in order for this option to have any effect.	4	int
replyToConcurrentConsumers (producer)	Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.	1	int
replyToMaxConcurrentConsumers (producer)	Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.		int
replyToOnTimeoutMaxConcurrentConsumers (producer)	Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS.	1	int
replyToOverride (producer)	Provides an explicit ReplyTo destination in the JMS message, which overrides the setting of replyTo. It is useful if you want to forward the message to a remote Queue and receive the reply message from the ReplyTo destination.		String

Name	Description	Default	Type
replyToType (producer)	Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.		ReplyToType
requestTimeout (producer)	The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option.	20000	long
timeToLive (producer)	When sending messages, specifies the time-to-live of the message (in milliseconds).	-1	long
allowAdditionalHeaders (producer)	This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.		String
allowNullBody (producer)	Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSEException is thrown.	true	boolean
alwaysCopyMessage (producer)	If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set)	false	boolean

Name	Description	Default	Type
correlationProperty (producer)	When using InOut exchange pattern use this JMS property instead of JMSCorrelationID JMS property to correlate messages. If set messages will be correlated solely on the value of this property JMSCorrelationID property will be ignored and not set by Camel.		String
disableTimeToLive (producer)	Use this option to force disabling time to live. For example when you do request/reply over JMS, then Camel will by default use the requestTimeout value as time to live on the message being sent. The problem is that the sender and receiver systems have to have their clocks synchronized, so they are in sync. This is not always so easy to archive. So you can use disableTimeToLive=true to not set a time to live value on the sent message. Then the message will not expire on the receiver system. See below in section About time to live for more details.	false	boolean
forceSendOriginalMessage (producer)	When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.	false	boolean
includeSentJMSMessageID (producer)	Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.	false	boolean
replyToCacheLevelName (producer)	Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: CACHE_CONSUMER for exclusive or shared w/ replyToSelectorName. And CACHE_SESSION for shared without replyToSelectorName. Some JMS brokers such as IBM WebSphere may require to set the replyToCacheLevelName=CACHE_NONE to work. Note: If using temporary queues then CACHE_NONE is not allowed, and you must use a higher value such as CACHE_CONSUMER or CACHE_SESSION.		String

Name	Description	Default	Type
replyToDestinationSelectorName (producer)	Sets the JMS Selector using the fixed name to be used so you can filter out your own replies from the others when using a shared queue (that is, if you are not using a temporary reply queue).		String
streamMessageTypeEnabled (producer)	Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.	false	boolean
allowSerializedHeaders (advanced)	Controls whether or not to include serialized headers. Applies only when transferExchange is true. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level.	false	boolean
asyncStartListener (advanced)	Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.	false	boolean
asyncStopListener (advanced)	Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.	false	boolean
destinationResolver (advanced)	A pluggable org.springframework.jms.support.destination.DestinationResolver that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).		DestinationResolver

Name	Description	Default	Type
errorHandler (advanced)	Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler.		ErrorHandler
exceptionListener (advanced)	Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions.		ExceptionListener
headerFilterStrategy (advanced)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
idleConsumerLimit (advanced)	Specify the limit for the number of consumers that are allowed to be idle at any given time.	1	int
idleTaskExecutionLimit (advanced)	Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring.	1	int
includeAllJMSXProperties (advanced)	Whether to include all JMSxxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as <code>JMSXAppID</code> , and <code>JMSXUserID</code> etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.	false	boolean
jmsKeyFormatStrategy (advanced)	Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> and refer to it using the # notation.		String

Name	Description	Default	Type
mapJmsMessage (advanced)	Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a <code>String</code> etc.	true	boolean
maxMessagesPerTask (advanced)	The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required.	-1	int
messageConverter (advanced)	To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> .		MessageConverter
messageCreatedStrategy (advanced)	To use the given <code>MessageCreatedStrategy</code> which are invoked when Camel creates new instances of <code>javax.jms.Message</code> objects when Camel is sending a JMS message.		MessageCreatedStrategy
messageIdEnabled (advanced)	When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value	true	boolean
messageListenerContainerFactory (advanced)	Registry ID of the <code>MessageListenerContainerFactory</code> used to determine what <code>org.springframework.jms.listener.AbstractMessageListenerContainer</code> to use to consume messages. Setting this will automatically set <code>consumerType</code> to <code>Custom</code> .		MessageListenerContainerFactory
messageTimestampEnabled (advanced)	Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value	true	boolean
pubSubNoLocal (advanced)	Specifies whether to inhibit the delivery of messages published by its own connection.	false	boolean
receiveTimeout (advanced)	The timeout for receiving messages (in milliseconds).	1000	long

Name	Description	Default	Type
recoveryInterval (advanced)	Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.	5000	long
requestTimeoutCheckerInterval (advanced)	Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.	1000	long
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
transferException (advanced)	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.	false	boolean
transferExchange (advanced)	You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.	false	boolean

Name	Description	Default	Type
transferFault (advanced)	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on Message#isFault() will be send back in the response as a JMS header with the key org.apache.camel.component.jms.JmsConstants#JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the org.apache.camel.Message#setFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.	false	boolean
useMessageIDAsCorrelation ID (advanced)	Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.	false	boolean
waitForProvisionCorrelation ToBeUpdatedCounter (advanced)	Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.	50	int
waitForProvisionCorrelation ToBeUpdatedThreadSleeping Time (advanced)	Interval in millis to sleep each time while waiting for provisional correlation id to be updated.	100	long
errorHandlerLoggingLevel (logging)	Allows to configure the default errorHandler logging level for logging uncaught exceptions.	WARN	LogLevel
errorHandlerLogStackTrace (logging)	Allows to control whether stacktraces should be logged or not, by the default errorHandler.	true	boolean
password (security)	Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.		String
username (security)	Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.		String
transacted (transaction)	Specifies whether to use transacted mode	false	boolean

Name	Description	Default	Type
lazyCreateTransactionManager (transaction)	If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when option <code>transacted=true</code> .	true	boolean
transactionManager (transaction)	The Spring transaction manager to use.		PlatformTransactionManager
transactionName (transaction)	The name of the transaction to use.		String
transactionTimeout (transaction)	The timeout value of the transaction (in seconds), if using <code>transacted</code> mode.	-1	int

5.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 81 options, which are listed below.

Name	Description	Default	Type
camel.component.amqp.accept-messages-while-stopping	Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.	false	Boolean
camel.component.amqp.acknowledgement-mode	The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgment mode. For the regular modes, it is preferable to use the <code>acknowledgementModeName</code> instead.		Integer
camel.component.amqp.acknowledgement-mode-name	The JMS acknowledgement name, which is one of: <code>SESSION_TRANSACTED</code> , <code>CLIENT_ACKNOWLEDGE</code> , <code>AUTO_ACKNOWLEDGE</code> , <code>DUPS_OK_ACKNOWLEDGE</code>	<code>AUTO_ACKNOWLEDGE</code>	String

Name	Description	Default	Type
camel.component.amqp.allow-additional-headers	This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.		String
camel.component.amqp.allow-null-body	Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSEException is thrown.	true	Boolean
camel.component.amqp.allow-reply-manager-quick-stop	Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.	false	Boolean
camel.component.amqp.always-copy-message	If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set)	false	Boolean
camel.component.amqp.async-consumer	Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions).	false	Boolean

Name	Description	Default	Type
camel.component.amqp.async-start-listener	Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.	false	Boolean
camel.component.amqp.async-stop-listener	Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.	false	Boolean
camel.component.amqp.auto-startup	Specifies whether the consumer container should auto-startup.	true	Boolean
camel.component.amqp.cache-level	Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details.		Integer
camel.component.amqp.cache-level-name	Sets the cache level by name for the underlying JMS resources. Possible values are: CACHE_AUTO, CACHE_CONNECTION, CACHE_CONSUMER, CACHE_NONE, and CACHE_SESSION. The default setting is CACHE_AUTO. See the Spring documentation and Transactions Cache Levels for more information.	CACHE_AUTO	String
camel.component.amqp.client-id	Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead.		String

Name	Description	Default	Type
camel.component.amqp.concurrent-consumers	Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.	1	Integer
camel.component.amqp.configuration	To use a shared JMS configuration. The option is a <code>org.apache.camel.component.jms.JmsConfiguration</code> type.		String
camel.component.amqp.connection-factory	The connection factory to be use. A connection factory must be configured either on the component or endpoint. The option is a <code>javax.jms.ConnectionFactory</code> type.		String
camel.component.amqp.correlation-property	Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of <code>JMSCorrelationID</code> property. This allows you to exchange messages with systems that do not correlate messages using <code>JMSCorrelationID</code> JMS property. If used <code>JMSCorrelationID</code> will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name.		String
camel.component.amqp.default-task-executor-type	Specifies what default <code>TaskExecutor</code> type to use in the <code>DefaultMessageListenerContainer</code> , for both consumer endpoints and the <code>ReplyTo</code> consumer of producer endpoints. Possible values: <code>SimpleAsync</code> (uses Spring's <code>SimpleAsyncTaskExecutor</code>) or <code>ThreadPool</code> (uses Spring's <code>ThreadPoolTaskExecutor</code> with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and <code>SimpleAsync</code> for reply consumers. The use of <code>ThreadPool</code> is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.		<code>DefaultTaskExecutor</code> Type
camel.component.amqp.delivery-mode	Specifies the delivery mode to be used. Possibles values are those defined by <code>javax.jms.DeliveryMode</code> . <code>NON_PERSISTENT</code> = 1 and <code>PERSISTENT</code> = 2.		Integer

Name	Description	Default	Type
<code>camel.component.amqp.delivery-persistent</code>	Specifies whether persistent delivery is used by default.	true	Boolean
<code>camel.component.amqp.destination-resolver</code>	A pluggable <code>org.springframework.jms.support.destination.DestinationResolver</code> that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry). The option is a <code>org.springframework.jms.support.destination.DestinationResolver</code> type.		String
<code>camel.component.amqp.durable-subscription-name</code>	The durable subscriber name for specifying durable topic subscriptions. The <code>clientId</code> option must be configured as well.		String
<code>camel.component.amqp.eager-loading-of-properties</code>	Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties	false	Boolean
<code>camel.component.amqp.enabled</code>	Enable amqp component	true	Boolean
<code>camel.component.amqp.error-handler</code>	Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler. The option is a <code>org.springframework.util.ErrorHandler</code> type.		String
<code>camel.component.amqp.error-handler-log-stack-trace</code>	Allows to control whether stacktraces should be logged or not, by the default errorHandler.	true	Boolean
<code>camel.component.amqp.error-handler-logging-level</code>	Allows to configure the default errorHandler logging level for logging uncaught exceptions.		LogLevel

Name	Description	Default	Type
camel.component.amqp.exception-listener	Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions. The option is a <code>javax.jms.ExceptionListener</code> type.		String
camel.component.amqp.explicit-qos-enabled	Set if the <code>deliveryMode</code> , <code>priority</code> or <code>timeToLive</code> qualities of service should be used when sending messages. This option is based on Spring's <code>JmsTemplate</code> . The <code>deliveryMode</code> , <code>priority</code> and <code>timeToLive</code> options are applied to the current endpoint. This contrasts with the <code>preserveMessageQos</code> option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers.	false	Boolean
camel.component.amqp.expose-listener-session	Specifies whether the listener session should be exposed when consuming messages.	false	Boolean
camel.component.amqp.force-send-original-message	When using <code>mapJmsMessage=false</code> Camel will create a new JMS message to send to a new JMS destination if you touch the headers (<code>get</code> or <code>set</code>) during the route. Set this option to true to force Camel to send the original JMS message that was received.	false	Boolean
camel.component.amqp.format-date-headers-to-iso8601	Sets whether date headers should be formatted according to the ISO 8601 standard.	false	Boolean
camel.component.amqp.header-filter-strategy	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
camel.component.amqp.idle-consumer-limit	Specify the limit for the number of consumers that are allowed to be idle at any given time.	1	Integer
camel.component.amqp.idle-task-execution-limit	Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring.	1	Integer

Name	Description	Default	Type
<code>camel.component.amqp.include-all-j-m-s-x-properties</code>	Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.	false	Boolean
<code>camel.component.amqp.include-sent-j-m-s-message-i-d</code>	Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.	false	Boolean
<code>camel.component.amqp.jms-key-format-strategy</code>	Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> and refer to it using the # notation. The option is a <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> type.		String
<code>camel.component.amqp.jms-operations</code>	Allows you to use your own implementation of the <code>org.springframework.jms.core.JmsOperations</code> interface. Camel uses <code>JmsTemplate</code> as default. Can be used for testing purpose, but not used much as stated in the spring API docs. The option is a <code>org.springframework.jms.core.JmsOperations</code> type.		String
<code>camel.component.amqp.lazy-create-transaction-manager</code>	If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when option <code>transacted=true</code> .	true	Boolean
<code>camel.component.amqp.map-jms-message</code>	Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a String etc.	true	Boolean

Name	Description	Default	Type
<code>camel.component.amqp.max-concurrent-consumers</code>	Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener.		Integer
<code>camel.component.amqp.max-messages-per-task</code>	The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required.	-1	Integer
<code>camel.component.amqp.message-converter</code>	To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> . The option is a <code>org.springframework.jms.support.converter.MessageConverter</code> type.		String
<code>camel.component.amqp.message-created-strategy</code>	To use the given <code>MessageCreatedStrategy</code> which are invoked when Camel creates new instances of <code>javax.jms.Message</code> objects when Camel is sending a JMS message. The option is a <code>org.apache.camel.component.jms.MessageCreatedStrategy</code> type.		String
<code>camel.component.amqp.message-id-enabled</code>	When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value	true	Boolean
<code>camel.component.amqp.message-timestamp-enabled</code>	Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value	true	Boolean
<code>camel.component.amqp.password</code>	Password to use with the <code>ConnectionFactory</code> . You can also configure username/password directly on the <code>ConnectionFactory</code> .		String

Name	Description	Default	Type
<code>camel.component.amqp.preserve-message-qos</code>	Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The <code>explicitQosEnabled</code> option, by contrast, will only use options set on the endpoint, and not values from the message header.	false	Boolean
<code>camel.component.amqp.priority</code>	Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The <code>explicitQosEnabled</code> option must also be enabled in order for this option to have any effect.	4	Integer
<code>camel.component.amqp.pub-sub-no-local</code>	Specifies whether to inhibit the delivery of messages published by its own connection.	false	Boolean
<code>camel.component.amqp.queue-browse-strategy</code>	To use a custom <code>QueueBrowseStrategy</code> when browsing queues. The option is a <code>org.apache.camel.component.jms.QueueBrowseStrategy</code> type.		String
<code>camel.component.amqp.receive-timeout</code>	The timeout for receiving messages (in milliseconds).	1000	Long
<code>camel.component.amqp.recovery-interval</code>	Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.	5000	Long
<code>camel.component.amqp.reply-on-timeout-to-max-concurrent-consumers</code>	Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS.	1	Integer

Name	Description	Default	Type
<code>camel.component.amqp.reply-to-cache-level-name</code>	Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: <code>CACHE_CONSUMER</code> for exclusive or shared w/ <code>replyToSelectorName</code> . And <code>CACHE_SESSION</code> for shared without <code>replyToSelectorName</code> . Some JMS brokers such as IBM WebSphere may require to set the <code>replyToCacheLevelName=CACHE_NONE</code> to work. Note: If using temporary queues then <code>CACHE_NONE</code> is not allowed, and you must use a higher value such as <code>CACHE_CONSUMER</code> or <code>CACHE_SESSION</code> .		String
<code>camel.component.amqp.reply-to-concurrent-consumers</code>	Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads.	1	Integer
<code>camel.component.amqp.reply-to-max-concurrent-consumers</code>	Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads.		Integer
<code>camel.component.amqp.reply-to-type</code>	Allows for explicitly specifying which kind of strategy to use for <code>replyTo</code> queues when doing request/reply over JMS. Possible values are: <code>Temporary</code> , <code>Shared</code> , or <code>Exclusive</code> . By default Camel will use temporary queues. However if <code>replyTo</code> has been configured, then <code>Shared</code> is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that <code>Shared</code> reply queues has lower performance than its alternatives <code>Temporary</code> and <code>Exclusive</code> .		<code>ReplyToType</code>
<code>camel.component.amqp.request-timeout</code>	The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header <code>CamelJmsRequestTimeout</code> to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the <code>requestTimeoutCheckerInterval</code> option.	20000	Long

Name	Description	Default	Type
camel.component.amqp.request-timeout-checker-interval	Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.	1000	Long
camel.component.amqp.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.component.amqp.stream-message-type-enabled	Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.	false	Boolean
camel.component.amqp.subscription-durable	Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well.	false	Boolean
camel.component.amqp.subscription-name	Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0).		String

Name	Description	Default	Type
<code>camel.component.amqp.subscription-shared</code>	Set whether to make the subscription shared. The shared subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a shared subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with <code>subscriptionDurable</code> as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well. Requires a JMS 2.0 compatible message broker.	false	Boolean
<code>camel.component.amqp.task-executor</code>	Allows you to specify a custom task executor for consuming messages. The option is a <code>org.springframework.core.task.TaskExecutor</code> type.		String
<code>camel.component.amqp.test-connection-on-startup</code>	Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well.	false	Boolean
<code>camel.component.amqp.time-to-live</code>	When sending messages, specifies the time-to-live of the message (in milliseconds).	-1	Long
<code>camel.component.amqp.transacted</code>	Specifies whether to use transacted mode	false	Boolean
<code>camel.component.amqp.transaction-manager</code>	The Spring transaction manager to use. The option is a <code>org.springframework.transaction.PlatformTransactionManager</code> type.		String
<code>camel.component.amqp.transaction-name</code>	The name of the transaction to use.		String
<code>camel.component.amqp.transaction-timeout</code>	The timeout value of the transaction (in seconds), if using transacted mode.	-1	Integer

Name	Description	Default	Type
camel.component.amqp.transfer-exception	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.	false	Boolean
camel.component.amqp.transfer-exchange	You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.	false	Boolean
camel.component.amqp.transfer-fault	If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on Message#isFault() will be send back in the response as a JMS header with the key org.apache.camel.component.jms.JmsConstants #JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the org.apache.camel.Message#setFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.	false	Boolean
camel.component.amqp.use-message-i-d-as-correlation-i-d	Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.	false	Boolean
camel.component.amqp.username	Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.		String

Name	Description	Default	Type
<code>camel.component.amqp.wait-for-provision-correlation-to-be-updated-counter</code>	Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option <code>useMessageIDAsCorrelationID</code> is enabled.	50	Integer
<code>camel.component.amqp.wait-for-provision-correlation-to-be-updated-thread-sleeping-time</code>	Interval in millis to sleep each time while waiting for provisional correlation id to be updated.	100	Long

5.4. USAGE

As AMQP component is inherited from JMS component, the usage of the former is almost identical to the latter:

Using AMQP component

```
// Consuming from AMQP queue
from("amqp:queue:incoming").
to(...);

// Sending message to the AMQP topic
from(...).
to("amqp:topic:notify");
```

5.5. CONFIGURING AMQP COMPONENT

Starting from the Camel 2.16.1 you can also use the **`AMQPComponent#amqp10Component(String connectionURI)`** factory method to return the AMQP 1.0 component with the pre-configured topic prefix:

Creating AMQP 1.0 component

```
AMQPComponent amqp =
AMQPComponent.amqp10Component("amqp://guest:guest@localhost:5672");
```

Keep in mind that starting from the Camel 2.17 the **`AMQPComponent#amqp10Component(String connectionURI)`** factory method has been deprecated on the behalf of the **`AMQPComponent#amqpComponent(String connectionURI)`**:

Creating AMQP 1.0 component

```
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672");
```

```
AMQPComponent authorizedAmqp = AMQPComponent.amqpComponent("amqp://localhost:5672",
"user", "password");
```

Starting from Camel 2.17, in order to automatically configure the AMQP component, you can also add an instance of **org.apache.camel.component.amqp.AMQPConnectionDetails** to the registry. For example for Spring Boot you just have to define bean:

AMQP connection details auto-configuration

```
@Bean
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}

@Bean
AMQPConnectionDetails securedAmqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672", "username", "password");
}
```

Likewise, you can also use CDI producer methods when using Camel-CDI

AMQP connection details auto-configuration for CDI

```
@Produces
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}
```

You can also rely on the [Camel properties](#) to read the AMQP connection details. Factory method **AMQPConnectionDetails.discoverAMQP()** attempts to read Camel properties in a Kubernetes-like convention, just as demonstrated on the snippet below:

AMQP connection details auto-configuration

```
export AMQP_SERVICE_HOST = "mybroker.com"
export AMQP_SERVICE_PORT = "6666"
export AMQP_SERVICE_USERNAME = "username"
export AMQP_SERVICE_PASSWORD = "password"

...

@Bean
AMQPConnectionDetails amqpConnection() {
    return AMQPConnectionDetails.discoverAMQP();
}
```

Enabling AMQP specific options

If you, for example, need to enable **amqp.traceFrames** you can do that by appending the option to your URI, like the following example:

```
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672?
amqp.traceFrames=true");
```

For reference take a look at the [QPID JMS client configuration](#)

5.6. USING TOPICS

To have using topics working with **camel-amqp** you need to configure the component to use **topic://** as topic prefix, as shown below:

```
<bean id="amqp" class="org.apache.camel.component.amqp.AmqpComponent">
  <property name="connectionFactory">
    <bean class="org.apache.qpid.jms.JmsConnectionFactory" factory-method="createFromURL">
      <property name="remoteURI" value="amqp://localhost:5672" />
      <property name="topicPrefix" value="topic://" /> <!-- only necessary when connecting to
ActiveMQ over AMQP 1.0 -->
    </bean>
  </property>
</bean>
```

Keep in mind that both **AMQPComponent#amqpComponent()** methods and **AMQPConnectionDetails** pre-configure the component with the topic prefix, so you don't have to configure it explicitly.

5.7. SEE ALSO

- [Getting Started](#)

CHAPTER 6. APNS COMPONENT

Available as of Camel version 2.8

The **apns** component is used for sending notifications to iOS devices. The apns components use [javapns](#) library.

The component supports sending notifications to Apple Push Notification Servers (APNS) and consuming feedback from the servers.

The consumer is configured with 3600 seconds for polling by default because it is a best practice to consume feedback stream from Apple Push Notification Servers only from time to time. For example: every 1 hour to avoid flooding the servers.

The feedback stream gives informations about inactive devices. You only need to get this informations every some hours if your mobile application is not a heavily used one.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-apns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

6.1. URI FORMAT

To send notifications:

```
apns:notify[?options]
```

To consume feedback:

```
apns:consumer[?options]
```

6.2. OPTIONS

The APNS component supports 2 options, which are listed below.

Name	Description	Default	Type
apnsService (common)	Required The ApnsService to use. The org.apache.camel.component.apns.factory.ApnsServiceFactory can be used to build a ApnsService		ApnsService
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The APNS endpoint is configured using URI syntax:

```
apns:name
```

with the following path and query parameters:

6.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Name of the endpoint		String

6.2.2. Query Parameters (20 parameters):

Name	Description	Default	Type
tokens (common)	Configure this property in case you want to statically declare tokens related to devices you want to notify. Tokens are separated by comma.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService

Name	Description	Default	Type
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

6.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.apns.apns-service	The ApnsService to use. The <code>org.apache.camel.component.apns.factory.ApnsServiceFactory</code> can be used to build a <code>ApnsService</code> . The option is a <code>com.notnoop.apns.ApnsService</code> type.		String
camel.component.apns.enabled	Enable apns component	true	Boolean
camel.component.apns.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

6.3.1. Component

The **ApnsComponent** must be configured with a **com.notnoop.apns.ApnsService**. The service can be created and configured using the **org.apache.camel.component.apns.factory.ApnsServiceFactory**. See further below for an example. And as well in the [test source code](#).

6.3.1.1. SSL Setting

In order to use secure connection, an instance of `org.apache.camel.util.jsse.SSLContextParameters` should be injected to `org.apache.camel.component.apns.factory.ApnsServiceFactory` which is used to configure the component. See the test resources for an example. [ssl example](#)

6.4. EXCHANGE DATA FORMAT

When Camel will fetch feedback data corresponding to inactive devices, it will retrieve a List of InactiveDevice objects. Each InactiveDevice object of the retrieved list will be setted as the In body, and then processed by the consumer endpoint.

6.5. MESSAGE HEADERS

Camel Apns uses these headers.

Property	Default	Description
Camel ApnsTokens		Empty by default.
Camel ApnsMessageType	STRING, PAYLOAD, APNS_NOTIFICATION	In case you choose PAYLOAD for the message type, then the message will be considered as a APNS payload and sent as is. In case you choose STRING, message will be converted as a APNS payload. From Camel 2.16 onwards APNS_NOTIFICATION is used for sending message body as <code>com.notnoop.apns.ApnsNotification</code> types.

6.6. APNSSERVICEFACTORY BUILDER CALLBACK

`ApnsServiceFactory` comes with the empty callback method that could be used to configure (or even replace) the default `ApnsServiceBuilder` instance. The signature of the method could look as follows:

```
protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder);
```

And could be used like as follows:

```
ApnsServiceFactory proxiedApnsServiceFactory = new ApnsServiceFactory(){
    @Override
    protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder) {
        return serviceBuilder.withSocksProxy("my.proxy.com", 6666);
    }
};
```

6.7. SAMPLES

6.7.1. Camel Xml route

```

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:camel="http://camel.apache.org/schema/spring"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.5.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-
    spring.xsd">

  <!-- Replace by desired values -->
  <bean id="apnsServiceFactory"
class="org.apache.camel.component.apns.factory.ApnsServiceFactory">

    <!-- Optional configuration of feedback host and port -->
    <!-- <property name="feedbackHost" value="localhost" /> -->
    <!-- <property name="feedbackPort" value="7843" /> -->

    <!-- Optional configuration of gateway host and port -->
    <!-- <property name="gatewayHost" value="localhost" /> -->
    <!-- <property name="gatewayPort" value="7654" /> -->

    <!-- Declaration of certificate used -->
    <!-- from Camel 2.11 onwards you can use prefix: classpath:, file: to refer to load the
certificate from classpath or file. Default it classpath -->
    <property name="certificatePath" value="certificate.p12" />
    <property name="certificatePassword" value="MyCertPassword" />

    <!-- Optional connection strategy - By Default: No need to configure -->
    <!-- Possible options: NON_BLOCKING, QUEUE, POOL or Nothing -->
    <!-- <property name="connectionStrategy" value="POOL" /> -->
    <!-- Optional pool size -->
    <!-- <property name="poolSize" value="15" /> -->

    <!-- Optional connection strategy - By Default: No need to configure -->
    <!-- Possible options: EVERY_HALF_HOUR, EVERY_NOTIFICATION or Nothing (Corresponds
to NEVER javapns option) -->
    <!-- <property name="reconnectionPolicy" value="EVERY_HALF_HOUR" /> -->
  </bean>

  <bean id="apnsService" factory-bean="apnsServiceFactory" factory-method="getApnsService" />

  <!-- Replace this declaration by wanted configuration -->
  <bean id="apns" class="org.apache.camel.component.apns.ApnsComponent">
    <property name="apnsService" ref="apnsService" />
  </bean>

  <camelContext id="camel-apns-test" xmlns="http://camel.apache.org/schema/spring">
    <route id="apns-test">
      <from uri="apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS"
/>

      <to uri="log:org.apache.camel.component.apns?showAll=true&multiline=true" />
      <to uri="mock:result" />
    </route>

```

```
</camelContext>
```

```
</beans>
```

6.7.2. Camel Java route

Create camel context and declare apns component programmatically

```
protected CamelContext createCamelContext() throws Exception {
    CamelContext camelContext = super.createCamelContext();

    ApnsServiceFactory apnsServiceFactory = new ApnsServiceFactory();
    apnsServiceFactory.setCertificatePath("classpath:/certificate.p12");
    apnsServiceFactory.setCertificatePassword("MyCertPassword");

    ApnsService apnsService = apnsServiceFactory.getApnsService(camelContext);

    ApnsComponent apnsComponent = new ApnsComponent(apnsService);
    camelContext.addComponent("apns", apnsComponent);

    return camelContext;
}
```

[[APNS-ApnsProducer-iOSTargetdeviceconfiguredviaheader:"CamelApnsTokens"]]
 ApnsProducer - iOS target device dynamically configured via header: **"CamelApnsTokens"**

```
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test")
                .setHeader(ApnsConstants.HEADER_TOKENS, constant(IOS_DEVICE_TOKEN))
                .to("apns:notify");
        }
    }
}
```

ApnsProducer - iOS target device statically configured via uri

```
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test").
                to("apns:notify?tokens=" + IOS_DEVICE_TOKEN);
        }
    };
}
```

ApnsConsumer

```
from("apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS")
    .to("log:com.apache.camel.component.apns?showAll=true&multiline=true")
    .to("mock:result");
```

CHAPTER 7. ASN.1 FILE DATAFORMAT

Available as of Camel version 2.20

The ASN.1 Data Format Data Format [Introduction to ASN.1](<https://www.itu.int/en/ITU-T/asn1/Pages/introduction.aspx>) is a Camel Framework's data format implementation based on Bouncy Castle's bcprov-jdk15on library and jASN.1's java compiler for the formal notation used for describing data transmitted by telecommunications protocols, regardless of language implementation and physical representation of these data, whatever the application, whether complex or very simple. Messages can be unmarshalled (conversion to simple Java POJO(s)) to plain Java objects. By the help of Camel's routing engine and data transformations you can then play with POJO(s) and apply customised formatting and call other Camel Component's to convert and send messages to upstream systems.

7.1. ASN.1 DATA FORMAT OPTIONS

The ASN.1 File dataformat supports 3 options, which are listed below.

Name	Default	Java Type	Description
<code>usingIterator</code>	false	Boolean	If the asn1 file has more than one entry, the setting this option to true, allows to work with the splitter EIP, to split the data using an iterator in a streaming mode.
<code>clazzName</code>		String	Name of class to use when unmarshalling
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.

7.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.asn1.clazz-name</code>	Name of class to use when unmarshalling		String
<code>camel.dataformat.asn1.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.asn1.enabled</code>	Whether to enable auto configuration of the asn1 data format. This is enabled by default.		Boolean
<code>camel.dataformat.asn1.using-iterator</code>	If the asn1 file has more then one entry, the setting this option to true, allows to work with the splitter EIP, to split the data using an iterator in a streaming mode.	false	Boolean

ND

7.3. UNMARSHAL

There are 3 different ways to unmarshal ASN.1 structured messages. (Usually binary files)

In this first example we unmarshal BER file payload to OutputStream and send it to mock endpoint.

```
from("direct:unmarshal").unmarshal(asn1).to("mock:unmarshal");
```

In the second example we unmarshal BER file payload to byte array using Split EIP. The reason for applying Split EIP is that usually each BER file or (ASN.1 structured file) contains multiple records to process and Split EIP helps us to get each record in a file as byte arrays which is actually ASN1Primitive's instance (by the use of Bouncy Castle's ASN.1 support in bcprov-jdk15on library) Byte arrays then may be converted to ASN1Primitive by the help of public static method in (ASN1Primitive.fromByteArray) In such example, note that you need to set **usingIterator=true**

```
from("direct:unmarshal").unmarshal(asn1).split(body(Iterator.class)).streaming().to("mock:unmarshal");
```

In the last example we unmarshal BER file payload to plain old Java Objects using Split EIP. The reason for applying Split EIP is already mentioned in the previous example. Please note and keep in mind that reason. In such example we also need to set the fully qualified name of the class or <YourObject>.class reference through data format. The important thing to note here is that your object should have been generated by jasn1 compiler which is a nice tool to generate java object representations of your ASN.1 structure. For the reference usage of jasn1 compiler see [JASN.1 Project Page] (<https://www.openmuc.org/asn1/>) and please also see how the compiler is invoked with the help of maven's exec plugin. For example, in this data format's unit tests an example ASN.1 structure (TestSMSBerCdr.asn1) is added in **src/test/resources/asn1_structure**. jasn1 compiler is invoked and java object's representations are generated in **`\${basedir}/target/generated/src/test/java** The nice thing about this example, you will get POJO instance at the mock endpoint or at whatever your endpoint is.

```
from("direct:unmarshaldsl")
    .unmarshal()
    .asn1("org.apache.camel.dataformat.asn1.model.testsmsbercdr.SmsCdr")
    .split(body(Iterator.class)).streaming()
    .to("mock:unmarshaldsl");
```

7.4. DEPENDENCIES

To use ASN.1 data format in your camel routes you need to add a dependency on **camel-asn1** which implements this data format.

If you use Maven you can just add the following to your **pom.xml**, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-asn1 </artifactId>  
  <version>x.x.x</version>  
  <!-- use the same version as your Camel core version -->  
</dependency>
```

CHAPTER 8. AS2 COMPONENT

IMPORTANT

The **camel-as2** component for Karaf is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production.

These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process. For more information about the support scope of Red Hat Technology Preview features, see <https://access.redhat.com/support/offerings/techpreview>.

Available as of Camel version 2.22

The AS2 component provides transport of EDI messages using the HTTP transfer protocol as specified in [RFC4130](#).

NOTE

This component is currently a work in progress. Expect URI options and path and query parameters to change in future versions of this component.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-as2</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

8.1. URI FORMAT

```
as2://apiName/methodName
```

apiName can be one of:

- client
- server

8.2. AS2 OPTIONS

The AS2 component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		AS2Configuration
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AS2 endpoint is configured using URI syntax:

```
as2:apiName
```

with the following path and query parameters:

8.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		AS2ApiName

8.2.2. Query Parameters (30 parameters):

Name	Description	Default	Type
as2From (common)	The value of the AS2From header of AS2 message.		String
as2MessageStructure (common)	The structure of AS2 Message. One of: PLAIN - No encryption, no signature, SIGNED - No encryption, signature, ENCRYPTED - Encryption, no signature, ENCRYPTED_SIGNED - Encryption, signature		AS2MessageStructure
as2To (common)	The value of the AS2To header of AS2 message.		String
as2Version (common)	The version of the AS2 protocol.	1.1	String
clientFqdn (common)	The Client Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint.	camel.apache.org	String

Name	Description	Default	Type
dispositionNotificationTo (common)	The value of the Disposition-Notification-To header. Assigning a value to this parameter requests a message disposition notification (MDN) for the AS2 message.		String
ediMessageTransferEncoding (common)	The transfer encoding of EDI message.		String
ediMessageType (common)	The content type of EDI message. One of application/edifact, application/edi-x12, application/edi-consent		ContentType
encryptingAlgorithm (common)	The algorithm used to encrypt EDI message.		AS2EncryptionAlgorithm
encryptingCertificateChain (common)	The chain of certificates used to encrypt EDI message.		Certificate[]
encryptingPrivateKey (common)	The key used to encrypt the EDI message.		PrivateKey
from (common)	The value of the From header of AS2 message.		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
methodName (common)	Required What sub operation to use for the selected operation		String
requestUri (common)	The request URI of EDI message.	/	String
server (common)	The value included in the Server message header identifying the AS2 Server.	Camel AS2 Server Endpoint	String
serverFqdn (common)	The Server Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint.	camel.apache.org	String

Name	Description	Default	Type
serverPortNumber (common)	The port number of server.		Integer
signedReceiptMicroAlgorithms (common)	The list of algorithms, in order of preference, requested to generate a message integrity check (MIC) returned in message disposition notification (MDN)		String[]
signingAlgorithm (common)	The algorithm used to sign EDI message.		AS2SignatureAlgorithm
signingCertificateChain (common)	The chain of certificates used to sign EDI message.		Certificate[]
signingPrivateKey (common)	The key used to sign the EDI message.		PrivateKey
subject (common)	The value of Subject header of AS2 message.		String
targetHostname (common)	The host name (IP or DNS name) of target host.		String
targetPortNumber (common)	The port number of target host. -1 indicates the scheme default port.		Integer
userAgent (common)	The value included in the User-Agent message header identifying the AS2 user agent.	Camel AS2 Client Endpoint	String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

8.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 28 options, which are listed below.

Name	Description	Default	Type
camel.component.as2.configuration.api-name	What kind of operation to perform		AS2ApiName
camel.component.as2.configuration.as2-from	The value of the AS2From header of AS2 message.		String
camel.component.as2.configuration.as2-message-structure	The structure of AS2 Message. One of: PLAIN - No encryption, no signature, SIGNED - No encryption, signature, ENCRYPTED - Encryption, no signature, ENCRYPTED_SIGNED - Encryption, signature		AS2MessageStructure
camel.component.as2.configuration.as2-to	The value of the AS2To header of AS2 message.		String
camel.component.as2.configuration.as2-version	The version of the AS2 protocol.	1.1	String
camel.component.as2.configuration.client-fqdn	The Client Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint.	camel.apache.org	String
camel.component.as2.configuration.disposition-notification-to	The value of the Disposition-Notification-To header. Assigning a value to this parameter requests a message disposition notification (MDN) for the AS2 message.		String

Name	Description	Default	Type
camel.component.as2.configuration.edi-message-transfer-encoding	The transfer encoding of EDI message.		String
camel.component.as2.configuration.edi-message-type	The content type of EDI message. One of application/edifact, application/edi-x12, application/edi-consent		ContentType
camel.component.as2.configuration.encrypting-algorithm	The algorithm used to encrypt EDI message.		AS2EncryptionAlgorithm
camel.component.as2.configuration.encrypting-certificate-chain	The chain of certificates used to encrypt EDI message.		Certificate[]
camel.component.as2.configuration.encrypting-private-key	The key used to encrypt the EDI message.		PrivateKey
camel.component.as2.configuration.from	The value of the From header of AS2 message.		String
camel.component.as2.configuration.method-name	What sub operation to use for the selected operation		String
camel.component.as2.configuration.request-uri	The request URI of EDI message.	/	String
camel.component.as2.configuration.server	The value included in the Server message header identifying the AS2 Server.	Camel AS2 Server Endpoint	String
camel.component.as2.configuration.server-fqdn	The Server Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint.	camel.apache.org	String

Name	Description	Default	Type
<code>camel.component.as2.configuration.server-port-number</code>	The port number of server.		Integer
<code>camel.component.as2.configuration.signed-receipt-mic-algorithms</code>	The list of algorithms, in order of preference, requested to generate a message integrity check (MIC) returned in message disposition notification (MDN)		String[]
<code>camel.component.as2.configuration.signing-algorithm</code>	The algorithm used to sign EDI message.		AS2SignatureAlgorithm
<code>camel.component.as2.configuration.signing-certificate-chain</code>	The chain of certificates used to sign EDI message.		Certificate[]
<code>camel.component.as2.configuration.signing-private-key</code>	The key used to sign the EDI message.		PrivateKey
<code>camel.component.as2.configuration.subject</code>	The value of Subject header of AS2 message.		String
<code>camel.component.as2.configuration.target-hostname</code>	The host name (IP or DNS name) of target host.		String
<code>camel.component.as2.configuration.target-port-number</code>	The port number of target host. -1 indicates the scheme default port.		Integer
<code>camel.component.as2.configuration.user-agent</code>	The value included in the User-Agent message header identifying the AS2 user agent.	Camel AS2 Client Endpoint	String
<code>camel.component.as2.enabled</code>	Whether to enable auto configuration of the as2 component. This is enabled by default.		Boolean

Name	Description	Default	Type
<code>camel.component.as2.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

8.4. CLIENT ENDPOINTS:

Client endpoints use the endpoint prefix **client** followed by the name of a method and associated options described next. The endpoint URI MUST contain the prefix **client**.

```
as2://client/method?[options]
```

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelAS2.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelAS2.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of AS2 API errors the endpoint will throw a `RuntimeCamelException` with a `org.apache.http.HttpException` derived exception cause.

Method	Options	Result Body Type
--------	---------	------------------

Method	Options	Result Body Type
send	ediMessage, requestUri, subject, from, as2From, as2To, as2MessageStructure, ediMessageContentType, ediMessageTransferEncoding, dispositionNotificationTo, signedReceiptMICAlgorithms	org.apache.http.protocol.HttpCoreContext

URI Options for *client*

Name	Type
ediMessage	String
requestUri	String
subject	String
from	String
as2From	String
as2To	String

Name	Type
as2MessageStructure	org.apache.camel.component.as2.api.AS2MessageStructure
ediMessageContentType	String
ediMessageTransferEncoding	String
dispositionNotificationTo	String
signedReceiptMicAlgorithms	String[]

8.5. SERVER ENDPOINTS:

Server endpoints use the endpoint prefix **server** followed by the name of a method and associated options described next. The endpoint URI MUST contain the prefix **server**.

```
as2://server/method?[options]
```

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelAS2.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelAS2.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of AS2 API errors the endpoint will throw a `RuntimeException` with a `org.apache.http.HttpException` derived exception cause.

Method	Options	Result Body Type
listen	request UriPatt ern	org.apache.http.protocol.HttpCoreContext

URI Options for *server*

Name	Type
request UriPatt ern	String

CHAPTER 9. ASTERISK COMPONENT

Available as of Camel version 2.18

The **asterisk:** component allows you to work easily with an Asterisk PBX Server <http://www.asterisk.org/> using [asterisk-java](#)

This component help to interface with [Asterisk Manager Interface](#)

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-asterisk</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

9.1. URI FORMAT

```
asterisk:name[?options]
```

9.2. OPTIONS

The Asterisk component has no options.

The Asterisk endpoint is configured using URI syntax:

```
asterisk:name
```

with the following path and query parameters:

9.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required Logical name		String

9.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
hostname (common)	Required The hostname of the asterisk server		String
password (common)	Required Login password		String

Name	Description	Default	Type
username (common)	Required Login username		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
action (producer)	What action to perform such as getting queue status, sip peers or extension state.		<code>AsteriskAction</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

9.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.asterisk.enabled	Enable asterisk component	true	Boolean
camel.component.asterisk.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

9.4. ACTION

Supported actions are:

- `QUEUE_STATUS`, Queue Status
- `SIP_PEERS`, List SIP Peers
- `EXTENSION_STATE`, Check Extension Status

CHAPTER 10. ATMOS COMPONENT

Available as of Camel version 2.15

Camel-Atmos is an [Apache Camel](#) component that allows you to work with ViPR object data services using the [Atmos Client](#).

```
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

10.1. OPTIONS

The Atmos component supports 5 options, which are listed below.

Name	Description	Default	Type
fullTokenId (security)	The token id to pass to the Atmos client		String
secretKey (security)	The secret key to pass to the Atmos client		String
uri (advanced)	The URI of the server for the Atmos client to connect to		String
sslValidation (security)	Whether the Atmos client should perform SSL validation	false	boolean
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atmos endpoint is configured using URI syntax:

```
atmos:name/operation
```

with the following path and query parameters:

10.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
name	Atmos name		String
operation	Required Operation to perform		AtmosOperation

10.1.2. Query Parameters (12 parameters):

Name	Description	Default	Type
enableSslValidation (common)	Atmos SSL validation	false	boolean
fullTokenId (common)	Atmos client fullTokenId		String
localPath (common)	Local path to put files		String
newRemotePath (common)	New path on Atmos when moving files		String
query (common)	Search query on Atmos		String
remotePath (common)	Where to put files on Atmos		String
secretKey (common)	Atmos shared secret		String
uri (common)	Atmos server uri		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

10.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.atmos.enabled</code>	Enable atmos component	true	Boolean
<code>camel.component.atmos.full-token-id</code>	The token id to pass to the Atmos client		String
<code>camel.component.atmos.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.atmos.secret-key</code>	The secret key to pass to the Atmos client		String
<code>camel.component.atmos.ssl-validation</code>	Whether the Atmos client should perform SSL validation	false	Boolean
<code>camel.component.atmos.uri</code>	The URI of the server for the Atmos client to connect to		String

10.3. DEPENDENCIES

To use Atmos in your camel routes you need to add the dependency on **camel-atmos** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmos</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

10.4. INTEGRATIONS

When you look at atmos integrations, there is one type of consumer, `GetConsumer`, which is a type of `ScheduledPollConsumer`.

- **Get**

Whereas there are 4 types of producers which are

- **Get**
- **Del**
- **Move**
- **Put**

10.5. EXAMPLES

These example are taken from tests:

```
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

Here, this is a consumer example. **remotePath** represents the path from where the data will be read and passes the camel exchange to regarding producer Underneath, this component uses atmos client API for this and every other operations.

```
from("direct:start")
.to("atmos://get?remotePath=/dummy/dummy.txt")
.to("mock:result");
```

Here, this a producer sample. **remotePath** represents the path where the operations occur on ViPR object data service. In producers, operations(**Get,Del, Move,Put**) run on ViPR object data services and results are set on headers of camel exchange.

Regarding the operations, the following headers are set on camel exchange

```
DOWNLOADED_FILE, DOWNLOADED_FILES, UPLOADED_FILE, UPLOADED_FILES,
FOUND_FILES, DELETED_PATH, MOVED_PATH;
```

10.6. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 11. ATMOSPHERE WEBSOCKET COMPONENT

Available as of Camel version 2.14

The **atmosphere-websocket**: component provides Websocket based endpoints for a servlet communicating with external clients over Websocket (as a servlet accepting websocket connections from external clients).

The component uses the [SERVLET](#) component and uses the [Atmosphere](#) library to support the Websocket transport in various Servlet containers (e.g., Jetty, Tomcat, ...).

Unlike the [Websocket](#) component that starts the embedded Jetty server, this component uses the servlet provider of the container.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmosphere-websocket</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

11.1. ATMOSPHERE-WEBSOCKET OPTIONS

The Atmosphere Websocket component supports 9 options, which are listed below.

Name	Description	Default	Type
servletName (consumer)	Default name of servlet to use. The default name is CamelServlet.	CamelServlet	String
httpRegistry (consumer)	To use a custom org.apache.camel.component.servlet.HttpRegistry.		HttpRegistry
attachmentMultipartBinding (consumer)	Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's.	false	boolean
fileNameExtWhitelist (consumer)	Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml.		String
httpBinding (advanced)	To use a custom HttpBinding to control the mapping between Camel message and HttpClient.		HttpBinding

Name	Description	Default	Type
httpConfiguration (advanced)	To use the shared <code>HttpConfiguration</code> as base configuration.		<code>HttpConfiguration</code>
allowJavaSerialized Object (advanced)	Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
headerFilterStrategy (filter)	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message.		<code>HeaderFilterStrategy</code>
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atmosphere Websocket endpoint is configured using URI syntax:

```
atmosphere-websocket:servicePath
```

with the following path and query parameters:

11.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
servicePath	Required Name of websocket endpoint		String

11.1.2. Query Parameters (38 parameters):

Name	Description	Default	Type
chunked (common)	If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response	true	boolean

Name	Description	Default	Type
disableStreamCache (common)	Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.	false	boolean
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
sendToAll (common)	Whether to send to all (broadcast) or send to a single receiver.	false	boolean
transferException (common)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the HttpOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
useStreaming (common)	To enable streaming to send data as multiple text fragments.	false	boolean
httpBinding (common)	To use a custom HttpBinding to control the mapping between Camel message and HttpClient.		HttpBinding
async (consumer)	Configure the consumer to work in async mode	false	boolean

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
httpMethodRestrict (consumer)	Used to only allow consuming if the HttpMethod matches, such as GET/POST/PUT etc. Multiple methods can be specified separated by comma.		String
matchOnUriPrefix (consumer)	Whether or not the consumer should try to find a target consumer by matching the URI prefix if no exact match is found.	false	boolean
responseBufferSize (consumer)	To use a custom buffer size on the <code>javax.servlet.ServletResponse</code> .		Integer
servletName (consumer)	Name of the servlet to use	Camel Servlet	String
attachmentMultipartBinding (consumer)	Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options <code>attachmentMultipartBinding=true</code> and <code>disableStreamCache=false</code> cannot work together. Remove <code>disableStreamCache</code> to use <code>AttachmentMultipartBinding</code> . This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's.	false	boolean
eagerCheckContentAvailable (consumer)	Whether to eager check whether the HTTP requests has content if the content-length header is 0 or not present. This can be turned on in case HTTP clients do not send streamed data.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>

Name	Description	Default	Type
fileNameExtWhitelist (consumer)	Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml.		String
optionsEnabled (consumer)	Specifies whether to enable HTTP OPTIONS for this Servlet consumer. By default OPTIONS is turned off.	false	boolean
traceEnabled (consumer)	Specifies whether to enable HTTP TRACE for this Servlet consumer. By default TRACE is turned off.	false	boolean
bridgeEndpoint (producer)	If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint's URI for request. You may also set the option <code>throwExceptionOnFailure</code> to be false to let the HttpProducer send all the fault response back.	false	boolean
connectionClose (producer)	Specifies whether a Connection Close header must be added to HTTP Request. By default <code>connectionClose</code> is false.	false	boolean
copyHeaders (producer)	If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).	true	boolean
httpMethod (producer)	Configure the HTTP method to use. The <code>HttpMethod</code> header cannot override this option if set.		HttpMethods
ignoreResponseBody (producer)	If this option is true, The http producer won't read response body and cache the input stream	false	boolean
preserveHostHeader (producer)	If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL's for a proxied service	false	boolean
throwExceptionOnFailure (producer)	Option to disable throwing the <code>HttpOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean

Name	Description	Default	Type
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
okStatusCodeRange (producer)	The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.	200-299	String
urlRewrite (producer)	Deprecated Refers to a custom <code>org.apache.camel.component.http.UrlRewrite</code> which allows you to rewrite urls when you bridge/proxy endpoints. See more details at http://camel.apache.org/urlrewrite.html		UrlRewrite
mapHttpMessageBody (advanced)	If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.	true	boolean
mapHttpMessageFormUrlEncodedBody (advanced)	If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.	true	boolean
mapHttpMessageHeaders (advanced)	If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
proxyAuthScheme (proxy)	Proxy authentication scheme to use		String
proxyHost (proxy)	Proxy hostname to use		String
proxyPort (proxy)	Proxy port to use		int
authHost (security)	Authentication host to use with NTLM		String

11.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.atmosphere-websocket.allow-java-serialized-object</code>	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean
<code>camel.component.atmosphere-websocket.attachment-multipart-binding</code>	Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's.	false	Boolean
<code>camel.component.atmosphere-websocket.enabled</code>	Enable atmosphere-websocket component	true	Boolean
<code>camel.component.atmosphere-websocket.file-name-ext-whitelist</code>	Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml.		String
<code>camel.component.atmosphere-websocket.header-filter-strategy</code>	To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. The option is a org.apache.camel.spi.HeaderFilterStrategy type.		String
<code>camel.component.atmosphere-websocket.http-binding</code>	To use a custom HttpBinding to control the mapping between Camel message and HttpClient. The option is a org.apache.camel.http.common.HttpBinding type.		String
<code>camel.component.atmosphere-websocket.http-configuration</code>	To use the shared HttpConfiguration as base configuration. The option is a org.apache.camel.http.common.HttpConfiguration type.		String
<code>camel.component.atmosphere-websocket.http-registry</code>	To use a custom org.apache.camel.component.servlet.HttpRegistry. The option is a org.apache.camel.component.servlet.HttpRegistry type.		String

Name	Description	Default	Type
<code>camel.component.atmosphere-websocket.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.atmosphere-websocket.servlet-name</code>	Default name of servlet to use. The default name is CamelServlet.	CamelServlet	String

11.3. URI FORMAT

```
atmosphere-websocket:///relative path[?options]
```

11.4. READING AND WRITING DATA OVER WEBSOCKET

An atmosphere-websocket endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

11.5. CONFIGURING URI TO READ OR WRITE DATA

In the route below, Camel will read from the specified websocket connection.

```
from("atmosphere-websocket:///servicepath")
    .to("direct:next");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="atmosphere-websocket:///servicepath"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```
from("direct:next")
    .to("atmosphere-websocket:///servicepath");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:next"/>
```

```
<to uri="atmosphere-websocket:///servicepath"/>
</route>
</camelContext>
```

CHAPTER 12. ATOM COMPONENT

Available as of Camel version 1.2

The `atom:` component is used for polling Atom feeds.

Camel will poll the feed every 60 seconds by default.

Note: The component currently only supports polling (consuming) feeds.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atom</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

12.1. URI FORMAT

```
atom://atomUri[?options]
```

Where `atomUri` is the URI to the Atom feed to poll.

12.2. OPTIONS

The Atom component has no options.

The Atom endpoint is configured using URI syntax:

```
atom:feedUri
```

with the following path and query parameters:

12.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>feedUri</code>	Required The URI to the feed to poll.		String

12.2.2. Query Parameters (27 parameters):

Name	Description	Default	Type
------	-------------	---------	------

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
feedHeader (consumer)	Sets whether to add the feed object as a header	true	boolean
filter (consumer)	Sets whether to use filtering or not of the entries.	true	boolean
lastUpdate (consumer)	Sets the timestamp to be used for filtering entries from the atom feeds. This options is only in conjunction with the <code>splitEntries</code> .		Date
password (consumer)	Sets the password to be used for basic authentication when polling from a HTTP feed		String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
sortEntries (consumer)	Sets whether to sort entries by published date. Only works when <code>splitEntries = true</code> .	false	boolean
splitEntries (consumer)	Sets whether or not entries should be sent individually or whether the entire feed should be sent as a single message	true	boolean
throttleEntries (consumer)	Sets whether all entries identified in a single feed poll should be delivered immediately. If true, only one entry is processed per <code>consumer.delay</code> . Only applicable when <code>splitEntries = true</code> .	true	boolean
username (consumer)	Sets the username to be used for basic authentication when polling from a HTTP feed		String
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel

Name	Description	Default	Type
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLISECONDS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

12.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.atom.enabled	Enable atom component	true	Boolean
camel.component.atom.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

12.4. EXCHANGE DATA FORMAT

Camel will set the In body on the returned **Exchange** with the entries. Depending on the **splitEntries** flag Camel will either return one **Entry** or a **List<Entry>**.

Option	Value	Behavior
splitEntries	true	Only a single entry from the currently being processed feed is set: exchange.in.body(Entry)
splitEntries	false	The entire list of entries from the feed is set: exchange.in.body(List<Entry>)

Camel can set the **Feed** object on the In header (see **feedHeader** option to disable this):

12.5. MESSAGE HEADERS

Camel atom uses these headers.

Header	Description
Camel Atom Feed	When consuming the org.apache.abdera.model.Feed object is set to this header.

12.6. SAMPLES

In this sample we poll James Strachan's blog.

```
from("atom://http://macstrac.blogspot.com/feeds/posts/default").to("seda:feeds");
```

In this sample we want to filter only good blogs we like to a SEDA queue. The sample also shows how to setup Camel standalone, not running in any Container or using Spring.

CHAPTER 13. ATOMIX MAP COMPONENT

Available as of Camel version 2.20

The camel atomix-map component allows you to work with [Atomix's Distributed Map](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

13.1. URI FORMAT

```
atomix-map:mapName
```

13.2. OPTIONS

The Atomix Map component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The shared component configuration		AtomixMapConfiguration
atomix (common)	The shared AtomixClient instance		AtomixClient
nodes (common)	The nodes the AtomixClient should connect to		List
configurationUri (common)	The path to the AtomixClient configuration		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix Map endpoint is configured using URI syntax:

```
atomix-map:resourceName
```

with the following path and query parameters:

13.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

13.2.2. Query Parameters (18 parameters):

Name	Description	Default	Type
atomix (common)	The Atomix instance to use		Atomix
configurationUri (common)	The Atomix configuration uri.		String
defaultAction (common)	The default action.	PUT	Action
key (common)	The key to use if none is set in the header or to listen for events for a specific key.		Object
nodes (common)	The address of the nodes composing the cluster.		String
resultHeader (common)	The header that wil carry the result.		String
transport (common)	Sets the Atomix transport.	io.atomix.catalyst.transport.netty.NettyTransport	Transport
ttl (common)	The resource ttl.		long
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

13.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-map.atomix	The shared AtomixClient instance. The option is a <code>io.atomix.AtomixClient</code> type.		String

Name	Description	Default	Type
<code>camel.component.atomix-map.configuration-uri</code>	The path to the AtomixClient configuration		String
<code>camel.component.atomix-map.configuration.default-action</code>	The default action.		AtomixMap\$Action
<code>camel.component.atomix-map.configuration.key</code>	The key to use if none is set in the header or to listen for events for a specific key.		Object
<code>camel.component.atomix-map.configuration.result-header</code>	The header that wil carry the result.		String
<code>camel.component.atomix-map.configuration.ttl</code>	The resource ttl.		Long
<code>camel.component.atomix-map.enabled</code>	Whether to enable auto configuration of the atomix-map component. This is enabled by default.		Boolean
<code>camel.component.atomix-map.nodes</code>	The nodes the AtomixClient should connect to		List
<code>camel.component.atomix-map.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

13.4. HEADERS

Name	Type	Values	Description
Camel Atomix ResourceAction	Atomix Map.Action	<ul style="list-style-type: none"> ● PUT ● PUT_IF_ABSENT ● GET ● CLEAR ● SIZE ● CONTAINS_KEY ● CONTAINS_VALUE ● IS_EMPTY ● ENTRY_SET ● REMOVE ● REPLACE ● VALUES 	The action to perform
Camel Atomix ResourceKey	Object	-	The key to operate on
Camel Atomix ResourceValue	Object	-	The value, if missing In Body is used
Camel Atomix ResourceOldValue	Object	-	The old value
Camel Atomix ResourceTTL	String / long	-	The entry TTL

Name	Type	Values	Description
Camel Atomix ResourceRead Consistency	ReadConsistency	<ul style="list-style-type: none"> • ATOMIC • ATOMIC_LEASE • SEQUENTIAL • LOCAL 	The read consistency level

13.5. CONFIGURING THE COMPONENT TO CONNECT TO AN ATOMIX CLUSTER

The nodes of the Atomix cluster you want to join can be set at Endpoint or component level (recommended), below some examples:

- **Endpoint:**

```
<beans xmlns="...">
  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <from uri="direct:start"/>
      <to uri="atomix-map:myMap?nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
    </route>
  </camelContext>
</beans>
```

- **Component:**

```
<beans xmlns="...">
  <bean id="atomix-map"
class="org.apache.camel.component.atomix.client.map.AtomixMapComponent">
    <property name="nodes" value="nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
  </bean>

  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <from uri="direct:start"/>
      <to uri="atomix-map:myMap"/>
    </route>
  </camelContext>
</beans>
```

13.6. USAGE EXAMPLES:

- **PUT an element with TTL of 1 second:**

```
FluentProducerTemplate.on(context)
  .withHeader(AtomixClientConstants.RESOURCE_ACTION, AtomixMap.Action.PUT)
  .withHeader(AtomixClientConstants.RESOURCE_KEY, key)
```

```
.withHeader(AtomixClientConstants.RESOURCE_TTL, "1s")  
.withBody(val)  
.to("direct:start")  
.send();
```

CHAPTER 14. ATOMIX MESSAGING COMPONENT

Available as of Camel version 2.20

The camel atomix-messaging component allows you to work with [Atomix's Group Messaging](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

14.1. URI FORMAT

```
atomix-messaging:group
```

The Atomix Messaging component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The shared component configuration		AtomixMessagingConfiguration
atomix (common)	The shared AtomixClient instance		AtomixClient
nodes (common)	The nodes the AtomixClient should connect to		List
configurationUri (common)	The path to the AtomixClient configuration		String
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix Messaging endpoint is configured using URI syntax:

```
atomix-messaging:resourceName
```

with the following path and query parameters:

14.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

14.1.2. Query Parameters (19 parameters):

Name	Description	Default	Type
atomix (common)	The Atomix instance to use		Atomix
broadcastType (common)	The broadcast type.	ALL	BroadcastType
channelName (common)	The messaging channel name		String
configurationUri (common)	The Atomix configuration uri.		String
defaultAction (common)	The default action.	DIRECT	Action
memberName (common)	The Atomix Group member name		String
nodes (common)	The address of the nodes composing the cluster.		String
resultHeader (common)	The header that will carry the result.		String
transport (common)	Sets the Atomix transport.	io.atomix.catalyst.transport.netty.NettyTransport	Transport
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pick up incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

14.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-messaging.atomix	The shared AtomixClient instance. The option is a io.atomix.AtomixClient type.		String

Name	Description	Default	Type
<code>camel.component.atomix-messaging.configuration-uri</code>	The path to the AtomixClient configuration		String
<code>camel.component.atomix-messaging.configuration.broadcast-type</code>	The broadcast type.		AtomixMessaging \$ BroadcastType
<code>camel.component.atomix-messaging.configuration.channel-name</code>	The messaging channel name		String
<code>camel.component.atomix-messaging.configuration.default-action</code>	The default action.		AtomixMessaging \$ Action
<code>camel.component.atomix-messaging.configuration.member-name</code>	The Atomix Group member name		String
<code>camel.component.atomix-messaging.configuration.result-header</code>	The header that wil carry the result.		String
<code>camel.component.atomix-messaging.enabled</code>	Whether to enable auto configuration of the atomix-messaging component. This is enabled by default.		Boolean
<code>camel.component.atomix-messaging.nodes</code>	The nodes the AtomixClient should connect to		List

Name	Description	Default	Type
<code>camel.component.atomix-messaging.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 15. ATOMIX MULTIMAP COMPONENT

Available as of Camel version 2.20

The camel atomix-multimap component allows you to work with [Atomix's Distributed MultiMap](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

15.1. URI FORMAT

```
atomix-multimap:multiMapName
```

The Atomix MultiMap component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (consumer)	The shared component configuration		AtomixMultiMap Configuration
atomix (consumer)	The shared AtomixClient instance		AtomixClient
nodes (consumer)	The nodes the AtomixClient should connect to		List
configurationUri (consumer)	The path to the AtomixClient configuration		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix MultiMap endpoint is configured using URI syntax:

```
atomix-multimap:resourceName
```

with the following path and query parameters:

15.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

15.1.2. Query Parameters (18 parameters):

Name	Description	Default	Type
atomix (consumer)	The Atomix instance to use		Atomix
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
configurationUri (consumer)	The Atomix configuration uri.		String
defaultAction (consumer)	The default action.	PUT	Action
key (consumer)	The key to use if none is set in the header or to listen for events for a specific key.		Object
nodes (consumer)	The address of the nodes composing the cluster.		String
resultHeader (consumer)	The header that wil carry the result.		String
transport (consumer)	Sets the Atomix transport.	<code>io.atomix.catalyst.transport.netty.NettyTransport</code>	Transport
ttl (consumer)	The resource ttl.		long

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

15.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-multimap.atomix	The shared AtomixClient instance. The option is a io.atomix.AtomixClient type.		String

Name	Description	Default	Type
<code>camel.component.atomix-multimap.configuration-uri</code>	The path to the AtomixClient configuration		String
<code>camel.component.atomix-multimap.configuration.default-action</code>	The default action.		AtomixMultiMap\$Action
<code>camel.component.atomix-multimap.configuration.key</code>	The key to use if none is set in the header or to listen for events for a specific key.		Object
<code>camel.component.atomix-multimap.configuration.result-header</code>	The header that wil carry the result.		String
<code>camel.component.atomix-multimap.configuration.ttl</code>	The resource ttl.		Long
<code>camel.component.atomix-multimap.enabled</code>	Whether to enable auto configuration of the atomix-multimap component. This is enabled by default.		Boolean
<code>camel.component.atomix-multimap.nodes</code>	The nodes the AtomixClient should connect to		List
<code>camel.component.atomix-multimap.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 16. ATOMIX QUEUE COMPONENT

Available as of Camel version 2.20

The camel atomix-queue component allows you to work with [Atomix's Distributed Queue](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

16.1. URI FORMAT

```
atomix-queue:queueName
```

The Atomix Queue component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The shared component configuration		AtomixQueue Configuration
atomix (common)	The shared AtomixClient instance		AtomixClient
nodes (common)	The nodes the AtomixClient should connect to		List
configurationUri (common)	The path to the AtomixClient configuration		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix Queue endpoint is configured using URI syntax:

```
atomix-queue:resourceName
```

with the following path and query parameters:

16.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

16.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
atomix (common)	The Atomix instance to use		Atomix
configurationUri (common)	The Atomix configuration uri.		String
defaultAction (common)	The default action.	ADD	Action
nodes (common)	The address of the nodes composing the cluster.		String
resultHeader (common)	The header that wil carry the result.		String
transport (common)	Sets the Atomix transport.	io.atomix.catalyst.transport.netty.NettyTransport	Transport
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

16.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 7 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-queue.atomix	The shared AtomixClient instance. The option is a io.atomix.AtomixClient type.		String
camel.component.atomix-queue.configuration-uri	The path to the AtomixClient configuration		String
camel.component.atomix-queue.configuration.default-action	The default action.		AtomixQueue\$Action

Name	Description	Default	Type
<code>camel.component.atomix-queue.configuration.result-header</code>	The header that will carry the result.		String
<code>camel.component.atomix-queue.enabled</code>	Whether to enable auto configuration of the atomix-queue component. This is enabled by default.		Boolean
<code>camel.component.atomix-queue.nodes</code>	The nodes the AtomixClient should connect to		List
<code>camel.component.atomix-queue.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 17. ATOMIX SET COMPONENT

Available as of Camel version 2.20

The camel atomix-set component allows you to work with [Atomix's Distributed Set](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

17.1. URI FORMAT

```
atomix-set:setName
```

The Atomix Set component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The shared component configuration		AtomixSetConfiguration
atomix (common)	The shared AtomixClient instance		AtomixClient
nodes (common)	The nodes the AtomixClient should connect to		List
configurationUri (common)	The path to the AtomixClient configuration		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix Set endpoint is configured using URI syntax:

```
atomix-set:resourceName
```

with the following path and query parameters:

17.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

17.1.2. Query Parameters (17 parameters):

Name	Description	Default	Type
atomix (common)	The Atomix instance to use		Atomix
configurationUri (common)	The Atomix configuration uri.		String
defaultAction (common)	The default action.	ADD	Action
nodes (common)	The address of the nodes composing the cluster.		String
resultHeader (common)	The header that wil carry the result.		String
transport (common)	Sets the Atomix transport.	io.atomix.catalyst.transport.netty.NettyTransport	Transport
ttl (common)	The resource ttl.		long
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

17.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 8 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-set.atomix	The shared AtomixClient instance. The option is a io.atomix.AtomixClient type.		String
camel.component.atomix-set.configuration-uri	The path to the AtomixClient configuration		String

Name	Description	Default	Type
<code>camel.component.atomix-set.configuration.default-action</code>	The default action.		AtomixSet\$Action
<code>camel.component.atomix-set.configuration.result-header</code>	The header that wil carry the result.		String
<code>camel.component.atomix-set.configuration.ttl</code>	The resource ttl.		Long
<code>camel.component.atomix-set.enabled</code>	Whether to enable auto configuration of the atomix-set component. This is enabled by default.		Boolean
<code>camel.component.atomix-set.nodes</code>	The nodes the AtomixClient should connect to		List
<code>camel.component.atomix-set.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 18. ATOMIX VALUE COMPONENT

Available as of Camel version 2.20

The camel atomix-value component allows you to work with [Atomix's Distributed Value](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

18.1. URI FORMAT

```
atomix-value:valueName
```

The Atomix Value component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The shared component configuration		AtomixValue Configuration
atomix (common)	The shared AtomixClient instance		AtomixClient
nodes (common)	The nodes the AtomixClient should connect to		List
configurationUri (common)	The path to the AtomixClient configuration		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Atomix Value endpoint is configured using URI syntax:

```
atomix-value:resourceName
```

with the following path and query parameters:

18.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceName	Required The distributed resource name		String

18.1.2. Query Parameters (17 parameters):

Name	Description	Default	Type
atomix (common)	The Atomix instance to use		Atomix
configurationUri (common)	The Atomix configuration uri.		String
defaultAction (common)	The default action.	SET	Action
nodes (common)	The address of the nodes composing the cluster.		String
resultHeader (common)	The header that wil carry the result.		String
transport (common)	Sets the Atomix transport.	io.atomix.catalyst.transport.netty.NettyTransport	Transport
ttl (common)	The resource ttl.		long
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
defaultResourceConfig (advanced)	The cluster wide default resource configuration.		Properties
defaultResourceOptions (advanced)	The local default resource options.		Properties
ephemeral (advanced)	Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.	false	boolean
readConsistency (advanced)	The read consistency level.		ReadConsistency
resourceConfigs (advanced)	Cluster wide resources configuration.		Map
resourceOptions (advanced)	Local resources configurations		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

18.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 8 options, which are listed below.

Name	Description	Default	Type
camel.component.atomix-value.atomix	The shared AtomixClient instance. The option is a io.atomix.AtomixClient type.		String
camel.component.atomix-value.configuration-uri	The path to the AtomixClient configuration		String

Name	Description	Default	Type
<code>camel.component.atomix-value.configuration.default-action</code>	The default action.		AtomixValue\$Action
<code>camel.component.atomix-value.configuration.result-header</code>	The header that will carry the result.		String
<code>camel.component.atomix-value.configuration.ttl</code>	The resource ttl.		Long
<code>camel.component.atomix-value.enabled</code>	Whether to enable auto configuration of the atomix-value component. This is enabled by default.		Boolean
<code>camel.component.atomix-value.nodes</code>	The nodes the AtomixClient should connect to		List
<code>camel.component.atomix-value.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 19. AVRO COMPONENT

Available as of Camel version 2.10

This component provides a dataformat for avro, which allows serialization and deserialization of messages using Apache Avro's binary dataformat. Moreover, it provides support for Apache Avro's rpc, by providing producers and consumers endpoint for using avro over netty or http.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-avro</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

19.1. APACHE AVRO OVERVIEW

Avro allows you to define message types and a protocol using a json like format and then generate java code for the specified types and messages. An example of how a schema looks like is below.

```
{"namespace": "org.apache.camel.avro.generated",
 "protocol": "KeyValueProtocol",

 "types": [
  {"name": "Key", "type": "record",
   "fields": [
    {"name": "key", "type": "string"}
   ]
 },
  {"name": "Value", "type": "record",
   "fields": [
    {"name": "value", "type": "string"}
   ]
 }
 ],

 "messages": {
  "put": {
    "request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
    "response": "null"
  },
  "get": {
    "request": [{"name": "key", "type": "Key"}],
    "response": "Value"
  }
 }
 }
```

You can easily generate classes from a schema, using maven, ant etc. More details can be found at the [Apache Avro documentation](#).

However, it doesn't enforce a schema first approach and you can create schema for your existing

classes. **Since 2.12** you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

19.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal>
      <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </marshal>
    <to uri="log:out"/>
  </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
  </dataFormats>
  <route>
    <from uri="direct:in"/>
    <marshal ref="avro"/>
    <to uri="log:out"/>
  </route>
</camelContext>
```

In the same manner you can umarshal using the avro data format.

19.3. USING AVRO RPC IN CAMEL

As mentioned above Avro also provides RPC support over multiple transports such as http and netty. Camel provides consumers and producers for these two transports.

```
avro:[transport]:[host]:[port][?options]
```

The supported transport values are currently http or netty.

Since 2.12 you can specify message name right in the URI:

```
avro:[transport]:[host]:[port][messageName][?options]
```

For consumers this allows you to have multiple routes attached to the same socket. Dispatching to correct route will be done by the avro component automatically. Route with no messageName specified (if any) will be used as default.

When using camel producers for avro ipc, the "in" message body needs to contain the parameters of the operation specified in the avro protocol. The response will be added in the body of the "out" message.

In a similar manner when using camel avro consumers for avro ipc, the requests parameters will be placed inside the "in" message body of the created exchange and once the exchange is processed the body of the "out" message will be send as a response.

Note: By default consumer parameters are wrapped into array. If you've got only one parameter, since 2.12 you can use **singleParameter** URI option to receive it directly in the "in" message body without array wrapping.

19.4. AVRO RPC URI OPTIONS

The Avro component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use a shared AvroConfiguration to configure options once		AvroConfiguration
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Avro endpoint is configured using URI syntax:

```
avro:transport:host:port/messageName
```

with the following path and query parameters:

19.4.1. Path Parameters (4 parameters):

Name	Description	Default	Type
transport	Required Transport to use, can be either http or netty		AvroTransport

Name	Description	Default	Type
port	Required Port number to use		int
host	Required Hostname to use		String
messageName	The name of the message to send.		String

19.4.2. Query Parameters (10 parameters):

Name	Description	Default	Type
protocol (common)	Avro protocol to use		Protocol
protocolClassName (common)	Avro protocol to use defined by the FQN class name		String
protocolLocation (common)	Avro protocol location		String
reflectionProtocol (common)	If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected	false	boolean
singleParameter (common)	If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message	false	boolean
uriAuthority (common)	Authority to use (username and password)		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

19.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
camel.component.avro.configuration.host	Hostname to use		String
camel.component.avro.configuration.message-name	The name of the message to send.		String
camel.component.avro.configuration.port	Port number to use		Integer
camel.component.avro.configuration.protocol	Avro protocol to use		Protocol
camel.component.avro.configuration.protocol-class-name	Avro protocol to use defined by the FQN class name		String
camel.component.avro.configuration.protocol-location	Avro protocol location		String

Name	Description	Default	Type
<code>camel.component.avro.configuration.reflection-protocol</code>	If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected	false	Boolean
<code>camel.component.avro.configuration.single-parameter</code>	If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message	false	Boolean
<code>camel.component.avro.configuration.transport</code>	Transport to use, can be either http or netty		AvroTransport
<code>camel.component.avro.configuration.uri-authority</code>	Authority to use (username and password)		String
<code>camel.component.avro.enabled</code>	Enable avro component	true	Boolean
<code>camel.component.avro.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.dataformat.avro.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.avro.enabled</code>	Enable avro dataformat	true	Boolean
<code>camel.dataformat.avro.instance-class-name</code>	Class name to use for marshal and unmarshalling		String

19.6. AVRO RPC HEADERS

Name	Description
CamelAvroMessageName	The name of the message to send. In consumer overrides message name from URI (if any)

19.7. EXAMPLES

An example of using camel avro producers via http:

```
<route>
  <from uri="direct:start"/>
  <to uri="avro:http:localhost:{{avroport}}?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <to uri="log:avro"/>
</route>
```

In the example above you need to fill **CamelAvroMessageName** header. **Since 2.12** you can use following syntax to call constant messages:

```
<route>
  <from uri="direct:start"/>
  <to uri="avro:http:localhost:{{avroport}}/put?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <to uri="log:avro"/>
</route>
```

An example of consuming messages using camel avro consumers via netty:

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <choice>
    <when>
      <el>${in.headers.CamelAvroMessageName == 'put'}</el>
      <process ref="putProcessor"/>
    </when>
    <when>
      <el>${in.headers.CamelAvroMessageName == 'get'}</el>
      <process ref="getProcessor"/>
    </when>
  </choice>
</route>
```

Since 2.12 you can set up two distinct routes to perform the same task:

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}/put?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol">
  <process ref="putProcessor"/>
</route>
```

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}/get?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol&singleParameter=true"/>
  <process ref="getProcessor"/>
</route>
```

In the example above, `get` takes only one parameter, so **singleParameter** is used and **getProcessor** will receive `Value` class directly in body, while **putProcessor** will receive an array of size 2 with `String` key and `Value` value filled as array contents.

CHAPTER 20. AVRO DATAFORMAT

Available as of Camel version 2.14

This component provides a dataformat for avro, which allows serialization and deserialization of messages using Apache Avro's binary dataformat. Moreover, it provides support for Apache Avro's rpc, by providing producers and consumers endpoint for using avro over netty or http.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-avro</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

20.1. APACHE AVRO OVERVIEW

Avro allows you to define message types and a protocol using a json like format and then generate java code for the specified types and messages. An example of how a schema looks like is below.

```
{ "namespace": "org.apache.camel.avro.generated",
  "protocol": "KeyValueProtocol",

  "types": [
    { "name": "Key", "type": "record",
      "fields": [
        { "name": "key", "type": "string" }
      ]
    },
    { "name": "Value", "type": "record",
      "fields": [
        { "name": "value", "type": "string" }
      ]
    }
  ],

  "messages": {
    "put": {
      "request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
      "response": "null"
    },
    "get": {
      "request": [{"name": "key", "type": "Key"}],
      "response": "Value"
    }
  }
}
```

You can easily generate classes from a schema, using maven, ant etc. More details can be found at the [Apache Avro documentation](#).

However, it doesn't enforce a schema first approach and you can create schema for your existing

classes. **Since 2.12** you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

20.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal>
      <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </marshal>
    <to uri="log:out"/>
  </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
  </dataFormats>
  <route>
    <from uri="direct:in"/>
    <marshal ref="avro"/>
    <to uri="log:out"/>
  </route>
</camelContext>
```

In the same manner you can umarshal using the avro data format.

20.3. AVRO DATAFORMAT OPTIONS

The Avro dataformat supports 2 options, which are listed below.

Name	Default	Java Type	Description
<code>instanceClassName</code>		String	Class name to use for marshal and unmarshalling
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc.

20.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.avro.configuration.host</code>	Hostname to use		String
<code>camel.component.avro.configuration.message-name</code>	The name of the message to send.		String
<code>camel.component.avro.configuration.port</code>	Port number to use		Integer
<code>camel.component.avro.configuration.protocol</code>	Avro protocol to use		Protocol
<code>camel.component.avro.configuration.protocol-class-name</code>	Avro protocol to use defined by the FQN class name		String
<code>camel.component.avro.configuration.protocol-location</code>	Avro protocol location		String
<code>camel.component.avro.configuration.reflection-protocol</code>	If protocol object provided is reflection protocol. Should be used only with protocol parameter because for <code>protocolClassName</code> protocol type will be auto detected	false	Boolean

Name	Description	Default	Type
<code>camel.component.avro.configuration.single-parameter</code>	If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message	false	Boolean
<code>camel.component.avro.configuration.transport</code>	Transport to use, can be either http or netty		AvroTransport
<code>camel.component.avro.configuration.uri-authority</code>	Authority to use (username and password)		String
<code>camel.component.avro.enabled</code>	Enable avro component	true	Boolean
<code>camel.component.avro.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.dataformat.avro.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.avro.enabled</code>	Enable avro dataformat	true	Boolean
<code>camel.dataformat.avro.instance-class-name</code>	Class name to use for marshal and unmarshalling		String

ND

CHAPTER 21. AWS CLOUDWATCH COMPONENT

Available as of Camel version 2.11

The CW component allows messages to be sent to an [Amazon CloudWatch](#) metrics. The implementation of the Amazon API is provided by the [AWS SDK](#).

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon CloudWatch. More information are available at [Amazon CloudWatch](#).

21.1. URI FORMAT

```
aws-cw://namespace[?options]
```

The metrics will be created if they don't already exists.

You can append query options to the URI in the following format, **?options=value&option2=value&...**

21.2. URI OPTIONS

The AWS CloudWatch component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS CW default configuration		CwConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which CW client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS CloudWatch endpoint is configured using URI syntax:

```
aws-cw:namespace
```

with the following path and query parameters:

21.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
namespace	Required The metric namespace		String

21.2.2. Query Parameters (11 parameters):

Name	Description	Default	Type
amazonCwClient (producer)	To use the AmazonCloudWatch as the client		AmazonCloudWatch
name (producer)	The metric name		String
proxyHost (producer)	To define a proxy host when instantiating the CW client		String
proxyPort (producer)	To define a proxy port when instantiating the CW client		Integer
region (producer)	The region in which CW client needs to work		String
timestamp (producer)	The metric timestamp		Date
unit (producer)	The metric unit		String
value (producer)	The metric value		Double
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

21.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-cw.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-cw.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-cw.configuration.amazon-cw-client</code>	To use the AmazonCloudWatch as the client		AmazonCloudWatch
<code>camel.component.aws-cw.configuration.name</code>	The metric name		String
<code>camel.component.aws-cw.configuration.namespace</code>	The metric namespace		String
<code>camel.component.aws-cw.configuration.proxy-host</code>	To define a proxy host when instantiating the CW client		String
<code>camel.component.aws-cw.configuration.proxy-port</code>	To define a proxy port when instantiating the CW client		Integer
<code>camel.component.aws-cw.configuration.region</code>	The region in which CW client needs to work		String
<code>camel.component.aws-cw.configuration.secret-key</code>	Amazon AWS Secret Key		String

Name	Description	Default	Type
camel.component.aws-cw.configuration.timestamp	The metric timestamp		Date
camel.component.aws-cw.configuration.unit	The metric unit		String
camel.component.aws-cw.configuration.value	The metric value		Double
camel.component.aws-cw.enabled	Enable aws-cw component	true	Boolean
camel.component.aws-cw.region	The region in which CW client needs to work		String
camel.component.aws-cw.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.component.aws-cw.secret-key	Amazon AWS Secret Key		String

Required CW component options

You have to provide the `amazonCwClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's CloudWatch](#).

21.4. USAGE

21.4.1. Message headers evaluated by the CW producer

Header	Type	Description
CamelAwsCwMetricName	String	The Amazon CW metric name.

Header	Type	Description
Camel AwsC wMetr icValu e	Doubl e	The Amazon CW metric value.
Camel AwsC wMetr icUnit	String	The Amazon CW metric unit.
Camel AwsC wMetr icNam espac e	String	The Amazon CW metric namespace.
Camel AwsC wMetr icTim estam p	Date	The Amazon CW metric timestamp.
Camel AwsC wMetr icDim ensio nNam e	String	Camel 2.12: The Amazon CW metric dimension name.
Camel AwsC wMetr icDim ensio nValu e	String	Camel 2.12: The Amazon CW metric dimension value.
Camel AwsC wMetr icDim ensio ns	Map< String , String >	Camel 2.12: A map of dimension names and dimension values.

21.4.2. Advanced AmazonCloudWatch configuration

If you need more control over the **AmazonCloudWatch** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-cw://namespace?amazonCwClient=#client");
```

The **#client** refers to a **AmazonCloudWatch** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonCloudWatch client = new AmazonCloudWatchClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

21.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.10 or higher).

- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 22. AWS DYNAMODB COMPONENT

Available as of Camel version 2.10

The DynamoDB component supports storing and retrieving data from/to [Amazon's DynamoDB](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB. More information are available at [Amazon DynamoDB](#).

22.1. URI FORMAT

```
aws-ddb://domainName[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

22.2. URI OPTIONS

The AWS DynamoDB component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS DDB default configuration		DdbConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which DDB client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS DynamoDB endpoint is configured using URI syntax:

```
aws-ddb:tableName
```

with the following path and query parameters:

22.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
tableName	Required The name of the table currently worked with.		String

22.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
amazonDDBClient (producer)	To use the AmazonDynamoDB as the client		AmazonDynamoDB
consistentRead (producer)	Determines whether or not strong consistency should be enforced when data is read.	false	boolean
keyAttributeName (producer)	Attribute name when creating table		String
keyAttributeType (producer)	Attribute type when creating table		String
operation (producer)	What operation to perform	PutItem	DdbOperations
proxyHost (producer)	To define a proxy host when instantiating the DDB client		String
proxyPort (producer)	To define a proxy port when instantiating the DDB client		Integer
readCapacity (producer)	The provisioned throughput to reserve for reading resources from your table		Long
region (producer)	The region in which DDB client needs to work		String
writeCapacity (producer)	The provisioned throughput to reserved for writing resources to your table		Long
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessKey (security)	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>secretKey</code> (security)	Amazon AWS Secret Key		String

22.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-ddb.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-ddb.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-ddb.configuration.amazon-d-d-b-client</code>	To use the AmazonDynamoDB as the client		AmazonDynamoDB
<code>camel.component.aws-ddb.configuration.consistent-read</code>	Determines whether or not strong consistency should be enforced when data is read.	false	Boolean
<code>camel.component.aws-ddb.configuration.key-attribute-name</code>	Attribute name when creating table		String
<code>camel.component.aws-ddb.configuration.key-attribute-type</code>	Attribute type when creating table		String
<code>camel.component.aws-ddb.configuration.operation</code>	What operation to perform		DdbOperations

Name	Description	Default	Type
<code>camel.component.aws-ddb.configuration.proxy-host</code>	To define a proxy host when instantiating the DDB client		String
<code>camel.component.aws-ddb.configuration.proxy-port</code>	To define a proxy port when instantiating the DDB client		Integer
<code>camel.component.aws-ddb.configuration.read-capacity</code>	The provisioned throughput to reserve for reading resources from your table		Long
<code>camel.component.aws-ddb.configuration.region</code>	The region in which DDB client needs to work		String
<code>camel.component.aws-ddb.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-ddb.configuration.table-name</code>	The name of the table currently worked with.		String
<code>camel.component.aws-ddb.configuration.write-capacity</code>	The provisioned throughput to reserved for writing resources to your table		Long
<code>camel.component.aws-ddb.enabled</code>	Enable aws-ddb component	true	Boolean
<code>camel.component.aws-ddb.region</code>	The region in which DDB client needs to work		String
<code>camel.component.aws-ddb.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
camel.component.aws-ddb.secret-key	Amazon AWS Secret Key		String

Required DDB component options

You have to provide the amazonDDBClient in the Registry or your accessKey and secretKey to access the [Amazon's DynamoDB](#).

22.4. USAGE

22.4.1. Message headers evaluated by the DDB producer

Header	Type	Description
CamelAwsDdbBatchItems	Map<String, KeysAndAttributes>	A map of the table name and corresponding items to get by primary key.
CamelAwsDdbTableName	String	Table Name for this operation.
CamelAwsDdbKey	Key	The primary key that uniquely identifies each item in a table. From Camel 2.16.0 the type of this header is Map<String, AttributeValue> and not Key
CamelAwsDdbReturnValues	String	Use this parameter if you want to get the attribute name-value pairs before or after they are modified(NONE, ALL_OLD, UPDATED_OLD, ALL_NEW, UPDATED_NEW).
CamelAwsDdbUpdateCondition	Map<String, ExpectedAttributeValue>	Designates an attribute for a conditional modification.

Header	Type	Description
CamelAwsDdbAttributeNames	Collection<String>	If attribute names are not specified then all attributes will be returned.
CamelAwsDdbConsistentRead	Boolean	If set to true, then a consistent read is issued, otherwise eventually consistent is used.
CamelAwsDdbIndexName	String	If set will be used as Secondary Index for Query operation.
CamelAwsDdbItem	Map<String, AttributeValue>	A map of the attributes for the item, and must include the primary key values that define the item.
CamelAwsDdbExactCount	Boolean	If set to true, Amazon DynamoDB returns a total number of items that match the query parameters, instead of a list of the matching items and their attributes. From Camel 2.16.0 this header doesn't exist anymore.
CamelAwsDdbKeyConditions	Map<String, Condition>	From Camel 2.16.0. This header specify the selection criteria for the query, and merge together the two old headers CamelAwsDdbHashKeyValue and CamelAwsDdbScanRangeKeyCondition
CamelAwsDdbStartKey	Key	Primary key of the item from which to continue an earlier query.
CamelAwsDdbHashKeyValue	AttributeValue	Value of the hash component of the composite primary key. From Camel 2.16.0 this header doesn't exist anymore.

Header	Type	Description
Camel AwsD dbLim it	Inte ger	The maximum number of items to return.
Camel AwsD dbSca nRang eKeyC onditi on	Condi tion	A container for the attribute values and comparison operators to use for the query. From Camel 2.16.0 this header doesn't exist anymore.
Camel AwsD dbSca nInde xForw ard	Boole an	Specifies forward or backward traversal of the index.
Camel AwsD dbSca nFilter	Map< String , Condi tion>	Evaluates the scan results and returns only the desired values.
Camel AwsD dbUp dateV alues	Map< String , Attrib uteVal ueUpd ate>	Map of attribute name to the new value and action for the update.

22.4.2. Message headers set during BatchGetItems operation

Header	Type	Description
Camel AwsD dbBat chRes ponse	Map< String ,Batch Respo nse>	Table names and the respective item attributes from the tables.

Header	Type	Description
Camel AwsD dbUn proce ssedK eys	Map< String ,Keys AndAt tribute s>	Contains a map of tables and their respective keys that were not processed with the current response.

22.4.3. Message headers set during DeleteItem operation

Header	Type	Description
Camel AwsD dbAttr ibutes	Map< String , Attrib uteVal ue>	The list of attributes returned by the operation.

22.4.4. Message headers set during DeleteTable operation

Header	Type	Description
Camel AwsD dbPro vision edThr oughp ut		
Provis ioned Throu ghput Descri ption		The value of the ProvisionedThroughput property for this table
Camel AwsD dbCre ationD ate	Date	Creation DateTime of this table.

Header	Type	Description
Camel AwsD dbTab leItem Count	Long	Item count for this table.
Camel AwsD dbKey Sche ma	KeySc hema	The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List<KeySchemaElement> and not KeySchema
Camel AwsD dbTab leNam e	String	The table name.
Camel AwsD dbTab leSize	Long	The table size in bytes.
Camel AwsD dbTab leStat us	String	The status of the table: CREATING, UPDATING, DELETING, ACTIVE

22.4.5. Message headers set during DescribeTable operation

Header	Type	Description
Camel AwsD dbPro vision edThr oughp ut	{{Provi sioned Throug hputDe scriptio n}}	The value of the ProvisionedThroughput property for this table
Camel AwsD dbCre ationD ate	Date	Creation DateTime of this table.

Header	Type	Description
Camel AwsD dbTab leItem Count	Long	Item count for this table.
Camel AwsD dbKey Sche ma	<code>{{KeyS chema} }</code>	The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List<KeySchemaElement> and not KeySchema
Camel AwsD dbTab leNam e	String	The table name.
Camel AwsD dbTab leSize	Long	The table size in bytes.
Camel AwsD dbTab leStat us	String	The status of the table: CREATING, UPDATING, DELETING, ACTIVE
Camel AwsD dbRea dCapa city	Long	ReadCapacityUnits property of this table.
Camel AwsD dbWri teCap acity	Long	WriteCapacityUnits property of this table.

22.4.6. Message headers set during GetItem operation

Header	Type	Description
Camel AwsD dbAttr ibutes	Map< String , Attrib uteVal ue>	The list of attributes returned by the operation.

22.4.7. Message headers set during PutItem operation

Header	Type	Description
Camel AwsD dbAttr ibutes	Map< String , Attrib uteVal ue>	The list of attributes returned by the operation.

22.4.8. Message headers set during Query operation

Header	Type	Description
Camel AwsD dbItem s	List<java.util.Map<String,AttributeValue>>	The list of attributes returned by the operation.
Camel AwsD dbLast EvaluatedKey	Key	Primary key of the item where the query operation stopped, inclusive of the previous result set.
Camel AwsD dbConsumedCapacity	Double	The number of Capacity Units of the provisioned throughput of the table consumed during the operation.

Header	Type	Description
Camel AwsD dbCo unt	Intege r	Number of items in the response.

22.4.9. Message headers set during Scan operation

Header	Type	Description
Camel AwsD dblte ms	List<j ava.ut il.Map <Strin g,Attri buteV alue>>	The list of attributes returned by the operation.
Camel AwsD dbLas tEvalu atedK ey	Key	Primary key of the item where the query operation stopped, inclusive of the previous result set.
Camel AwsD dbCo nsum edCap acity	Doubl e	The number of Capacity Units of the provisioned throughput of the table consumed during the operation.
Camel AwsD dbCo unt	Intege r	Number of items in the response.
Camel AwsD dbSca nnedC ount	Intege r	Number of items in the complete scan before any filters are applied.

22.4.10. Message headers set during UpdateItem operation

Header	Type	Description
Camel AwsD dbAttr ibutes	Map< String , Attrib uteVal ue>	The list of attributes returned by the operation.

22.4.11. Advanced AmazonDynamoDB configuration

If you need more control over the **AmazonDynamoDB** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-ddb://domainName?amazonDDBClient=#client");
```

The **#client** refers to a **AmazonDynamoDB** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonDynamoDB client = new AmazonDynamoDBClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

22.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.10 or higher).

22.6. SEE ALSO

- AWS Component

CHAPTER 23. AWS DYNAMODB STREAMS COMPONENT

Available as of Camel version 2.17

The DynamoDB Stream component supports receiving messages from Amazon DynamoDB Stream service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB Streams. More information are available at [AWS DynamoDB](#)

23.1. URI FORMAT

```
aws-ddbstream://table-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

23.2. URI OPTIONS

The AWS DynamoDB Streams component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS DDB stream default configuration		DdbStreamConfiguration
accessKey (consumer)	Amazon AWS Access Key		String
secretKey (consumer)	Amazon AWS Secret Key		String
region (consumer)	Amazon AWS Region		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS DynamoDB Streams endpoint is configured using URI syntax:

```
aws-ddbstream:tableName
```

with the following path and query parameters:

23.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
tableName	Required Name of the dynamodb table		String

23.2.2. Query Parameters (28 parameters):

Name	Description	Default	Type
amazonDynamoDBStreams Client (consumer)	Amazon DynamoDB client to use for all requests for this endpoint		AmazonDynamoDBStreams
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
iteratorType (consumer)	Defines where in the DynaboDB stream to start getting records. Note that using TRIM_HORIZON can cause a significant delay before the stream has caught up to real-time. if AT,AFTER_SEQUENCE_NUMBER are used, then a <code>sequenceNumberProvider</code> MUST be supplied.	LATEST	ShardIteratorType
maxResultsPerRequest (consumer)	Maximum number of records that will be fetched in each poll		int
proxyHost (consumer)	To define a proxy host when instantiating the DDBStreams client		String
proxyPort (consumer)	To define a proxy port when instantiating the DDBStreams client		Integer
region (consumer)	The region in which DDBStreams client needs to work		String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean

Name	Description	Default	Type
sequenceNumberProvider (consumer)	Provider for the sequence number when using one of the two <code>ShardIteratorType.AT,AFTER_SEQUENCE_NUMBER</code> iterator types. Can be a registry reference or a literal sequence number.		SequenceNumberProvider
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at <code>WARN</code> or <code>ERROR</code> level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as <code>60s</code> (60 seconds), <code>5m30s</code> (5 minutes and 30 seconds), and <code>1h</code> (1 hour).	500	long

Name	Description	Default	Type
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

23.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-ddbstream.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-ddbstream.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-ddbstream.configuration.amazon-dynamo-db-streams-client</code>	Amazon DynamoDB client to use for all requests for this endpoint		AmazonDynamoDBStreams
<code>camel.component.aws-ddbstream.configuration.iterator-type</code>	Defines where in the DynaboDB stream to start getting records. Note that using TRIM_HORIZON can cause a significant delay before the stream has caught up to real-time. if AT,AFTER_SEQUENCE_NUMBER are used, then a sequenceNumberProvider MUST be supplied.		ShardIteratorType
<code>camel.component.aws-ddbstream.configuration.max-results-per-request</code>	Maximum number of records that will be fetched in each poll		Integer
<code>camel.component.aws-ddbstream.configuration.proxy-host</code>	To define a proxy host when instantiating the DDBStreams client		String
<code>camel.component.aws-ddbstream.configuration.proxy-port</code>	To define a proxy port when instantiating the DDBStreams client		Integer
<code>camel.component.aws-ddbstream.configuration.region</code>	The region in which DDBStreams client needs to work		String

Name	Description	Default	Type
<code>camel.component.aws-ddbstream.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-ddbstream.configuration.sequence-number-provider</code>	Provider for the sequence number when using one of the two <code>ShardIteratorType.AT,AFTER_SEQUENCE_NUMBER</code> iterator types. Can be a registry reference or a literal sequence number.		SequenceNumberProvider
<code>camel.component.aws-ddbstream.configuration.table-name</code>	Name of the dynamodb table		String
<code>camel.component.aws-ddbstream.enabled</code>	Enable aws-ddbstream component	true	Boolean
<code>camel.component.aws-ddbstream.region</code>	Amazon AWS Region		String
<code>camel.component.aws-ddbstream.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-ddbstream.secret-key</code>	Amazon AWS Secret Key		String

Required DynampDBStream component options

You have to provide the `amazonDynamoDbStreamsClient` in the Registry with proxies and relevant credentials configured.

23.4. SEQUENCE NUMBERS

You can provide a literal string as the sequence number or provide a bean in the registry. An example of using the bean would be to save your current position in the change feed and restore it on Camel startup.

It is an error to provide a sequence number that is greater than the largest sequence number in the describe-streams result, as this will lead to the AWS call returning an HTTP 400.

23.5. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

23.6. USAGE

23.6.1. AmazonDynamoDBStreamsClient configuration

You will need to create an instance of AmazonDynamoDBStreamsClient and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonDynamoDBStreamsClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
DefaultAWSCredentialsProviderChain

registry.bind("kinesisClient", client);
```

23.6.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the [DefaultAWSCredentialsProviderChain](#) that is the default when creating a new ClientConfiguration instance, however, a different [AWSCredentialsProvider](#) can be specified when calling createClient(...).

23.7. COPING WITH DOWNTIME

23.7.1. AWS DynamoDB Streams outage of less than 24 hours

The consumer will resume from the last seen sequence number (as implemented for [CAMEL-9515](#)), so you should receive a flood of events in quick succession, as long as the outage did not also include DynamoDB itself.

23.7.2. AWS DynamoDB Streams outage of more than 24 hours

Given that AWS only retain 24 hours worth of changes, you will have missed change events no matter what mitigations are in place.

23.8. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.7 or higher).

23.9. SEE ALSO

CHAPTER 24. AWS EC2 COMPONENT

Available as of Camel version 2.16

The EC2 component supports create, run, start, stop and terminate [AWS EC2](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon EC2. More information are available at [Amazon EC2](#).

24.1. URI FORMAT

```
aws-ec2://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

24.2. URI OPTIONS

The AWS EC2 component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS EC2 default configuration		EC2Configuration
region (producer)	The region in which EC2 client needs to work		String
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS EC2 endpoint is configured using URI syntax:

```
aws-ec2:label
```

with the following path and query parameters:

24.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
label	Required Logical name		String

24.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
accessKey (producer)	Amazon AWS Access Key		String
amazonEc2Client (producer)	To use a existing configured AmazonEC2Client as client		AmazonEC2Client
operation (producer)	Required The operation to perform. It can be createAndRunInstances, startInstances, stopInstances, terminateInstances, describeInstances, describeInstancesStatus, rebootInstances, monitorInstances, unmonitorInstances, createTags or deleteTags		EC2Operations
proxyHost (producer)	To define a proxy host when instantiating the EC2 client		String
proxyPort (producer)	To define a proxy port when instantiating the EC2 client		Integer
region (producer)	The region in which EC2 client needs to work		String
secretKey (producer)	Amazon AWS Secret Key		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

24.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-ec2.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-ec2.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-ec2.configuration.amazon-ec2-client</code>	To use a existing configured AmazonEC2Client as client		AmazonEC2Client
<code>camel.component.aws-ec2.configuration.operation</code>	The operation to perform. It can be <code>createAndRunInstances</code> , <code>startInstances</code> , <code>stopInstances</code> , <code>terminateInstances</code> , <code>describeInstances</code> , <code>describeInstancesStatus</code> , <code>rebootInstances</code> , <code>monitorInstances</code> , <code>unmonitorInstances</code> , <code>createTags</code> or <code>deleteTags</code>		EC2Operations
<code>camel.component.aws-ec2.configuration.proxy-host</code>	To define a proxy host when instantiating the EC2 client		String
<code>camel.component.aws-ec2.configuration.proxy-port</code>	To define a proxy port when instantiating the EC2 client		Integer
<code>camel.component.aws-ec2.configuration.region</code>	The region in which EC2 client needs to work		String
<code>camel.component.aws-ec2.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-ec2.enabled</code>	Enable aws-ec2 component	true	Boolean
<code>camel.component.aws-ec2.region</code>	The region in which EC2 client needs to work		String
<code>camel.component.aws-ec2.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
camel.component.aws-ec2.secret-key	Amazon AWS Secret Key		String

Required EC2 component options

You have to provide the `amazonEc2Client` in the Registry or your `accessKey` and `secretKey` to access the [Amazon EC2](#) service.

24.4. USAGE

24.4.1. Message headers evaluated by the EC2 producer

Header	Type	Description
Camel AwsE C2Ima geld	String	An image ID of the AWS marketplace
Camel AwsE C2Inst anceT ype	com.amazonaws.services.ec2.model.InstanceType	The instance type we want to create and run
Camel AwsE C2Op eratio n	String	The operation we want to perform
Camel AwsE C2Inst anceM inCou nt	Int	The minimum number of instances we want to run.
Camel AwsE C2Inst anceM axCou nt	Int	The maximum number of instances we want to run.

Header	Type	Description
Camel AwsE C2Inst anceM onitori ng	Boolea n	Define if we want the running instances to be monitored
Camel AwsE C2Inst anceE bsOpt imized	Boole an	Define if the creating instance is optimized for EBS I/O.
Camel AwsE C2Inst anceS ecurit yGrou ps	Collecti on	The security groups to associate to the instances
Camel AwsE C2Inst ancesl ds	Collec tion	A collection of instances IDS to execute start, stop, describe and terminate operations on.
Camel AwsE C2Inst ances Tags	Collec tion	A collection of tags to add or remove from EC2 resources

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.16 or higher).

CHAPTER 25. AWS IAM COMPONENT

Available as of Camel version 2.23

The KMS component supports create, run, start, stop and terminate [AWS IAM](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon IAM. More information are available at [Amazon IAM](#).

25.1. URI FORMAT

```
aws-kms://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

25.2. URI OPTIONS

The AWS IAM component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS IAM default configuration		IAMConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which IAM client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS IAM endpoint is configured using URI syntax:

```
aws-iam:label
```

with the following path and query parameters:

25.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
label	Required Logical name		String

25.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
accessKey (producer)	Amazon AWS Access Key		String
iamClient (producer)	To use a existing configured AWS IAM as client		AmazonIdentityManagementClient
operation (producer)	Required The operation to perform		IAMOperations
proxyHost (producer)	To define a proxy host when instantiating the KMS client		String
proxyPort (producer)	To define a proxy port when instantiating the KMS client		Integer
region (producer)	The region in which KMS client needs to work		String
secretKey (producer)	Amazon AWS Secret Key		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

25.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-iam.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-iam.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-iam.configuration.iam-client</code>	To use a existing configured AWS IAM as client		AmazonIdentityManagementClient
<code>camel.component.aws-iam.configuration.operation</code>	The operation to perform		IAMOperations
<code>camel.component.aws-iam.configuration.proxy-host</code>	To define a proxy host when instantiating the KMS client		String
<code>camel.component.aws-iam.configuration.proxy-port</code>	To define a proxy port when instantiating the KMS client		Integer
<code>camel.component.aws-iam.configuration.region</code>	The region in which KMS client needs to work		String
<code>camel.component.aws-iam.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-iam.enabled</code>	Whether to enable auto configuration of the aws-iam component. This is enabled by default.		Boolean
<code>camel.component.aws-iam.region</code>	The region in which IAM client needs to work		String
<code>camel.component.aws-iam.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
camel.component.aws-iam.secret-key	Amazon AWS Secret Key		String

Required IAM component options

You have to provide the amazonKmsClient in the Registry or your accessKey and secretKey to access the [Amazon IAM](#) service.

25.4. USAGE

25.4.1. Message headers evaluated by the IAM producer

Header	Type	Description
CamelAwsIAMOperation	String	The operation we want to perform
CamelAwsIAMUsername	String	The username for the user you want to manage
CamelAwsIAMAccessKeyId	String	The accessKey you want to manage
CamelAwsIAMAccessKeyStatus	String	The Status of the AccessKey you want to set, possible value are active and inactive

25.4.2. IAM Producer operations

Camel-AWS IAM component provides the following operation on the producer side:

- listAccessKeys
- createUser
- deleteUser

- `listUsers`
- `getUser`
- `createAccessKey`
- `deleteAccessKey`
- `updateAccessKey`

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-aws</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

25.5. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 26. AWS KINESIS COMPONENT

Available as of Camel version 2.17

The Kinesis component supports receiving messages from and sending messages to Amazon Kinesis service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis. More information are available at [AWS Kinesis](#)

26.1. URI FORMAT

```
aws-kinesis://stream-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

26.2. URI OPTIONS

The AWS Kinesis component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS S3 default configuration		KinesisConfigurati on
accessKey (common)	Amazon AWS Access Key		String
secretKey (common)	Amazon AWS Secret Key		String
region (common)	Amazon AWS Region		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Kinesis endpoint is configured using URI syntax:

```
aws-kinesis:streamName
```

with the following path and query parameters:

26.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
streamName	Required Name of the stream		String

26.2.2. Query Parameters (30 parameters):

Name	Description	Default	Type
amazonKinesisClient (common)	Amazon Kinesis client to use for all requests for this endpoint		AmazonKinesis
proxyHost (common)	To define a proxy host when instantiating the DDBStreams client		String
proxyPort (common)	To define a proxy port when instantiating the DDBStreams client		Integer
region (common)	The region in which Kinesis client needs to work		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
iteratorType (consumer)	Defines where in the Kinesis stream to start getting records	TRIM_HORIZON	ShardIteratorType
maxResultsPerRequest (consumer)	Maximum number of records that will be fetched in each poll	1	int
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
sequenceNumber (consumer)	The sequence number to start polling from. Required if <code>iteratorType</code> is set to <code>AFTER_SEQUENCE_NUMBER</code> or <code>AT_SEQUENCE_NUMBER</code>		String

Name	Description	Default	Type
shardClosed (consumer)	Define what will be the behavior in case of shard closed. Possible value are ignore, silent and fail. In case of ignore a message will be logged and the consumer will restart from the beginning, in case of silent there will be no logging and the consumer will start from the beginning, in case of fail a ReachedClosedStateException will be raised	ignore	KinesisShardClosedStrategyEnum
shardId (consumer)	Defines which shardId in the Kinesis stream to get records from		String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int

Name	Description	Default	Type
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECONDS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

26.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-kinesis.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-kinesis.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-kinesis.configuration.amazon-kinesis-client</code>	Amazon Kinesis client to use for all requests for this endpoint		AmazonKinesis
<code>camel.component.aws-kinesis.configuration.iterator-type</code>	Defines where in the Kinesis stream to start getting records		ShardIteratorType
<code>camel.component.aws-kinesis.configuration.max-results-per-request</code>	Maximum number of records that will be fetched in each poll	1	Integer
<code>camel.component.aws-kinesis.configuration.proxy-host</code>	To define a proxy host when instantiating the DDBStreams client		String
<code>camel.component.aws-kinesis.configuration.proxy-port</code>	To define a proxy port when instantiating the DDBStreams client		Integer
<code>camel.component.aws-kinesis.configuration.region</code>	The region in which Kinesis client needs to work		String

Name	Description	Default	Type
<code>camel.component.aws-kinesis.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-kinesis.configuration.sequence-number</code>	The sequence number to start polling from. Required if <code>iteratorType</code> is set to <code>AFTER_SEQUENCE_NUMBER</code> or <code>AT_SEQUENCE_NUMBER</code>		String
<code>camel.component.aws-kinesis.configuration.shard-closed</code>	Define what will be the behavior in case of shard closed. Possible value are ignore, silent and fail. In case of ignore a message will be logged and the consumer will restart from the beginning, in case of silent there will be no logging and the consumer will start from the beginning, in case of fail a <code>ReachedClosedStateException</code> will be raised		<code>KinesisShardClosedStrategyEnum</code>
<code>camel.component.aws-kinesis.configuration.shard-id</code>	Defines which <code>shardId</code> in the Kinesis stream to get records from		String
<code>camel.component.aws-kinesis.configuration.stream-name</code>	Name of the stream		String
<code>camel.component.aws-kinesis.enabled</code>	Enable aws-kinesis component	true	Boolean
<code>camel.component.aws-kinesis.region</code>	Amazon AWS Region		String
<code>camel.component.aws-kinesis.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-kinesis.secret-key</code>	Amazon AWS Secret Key		String

Required Kinesis component options

You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

26.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

26.5. USAGE

26.5.1. Message headers set by the Kinesis consumer

Header	Type	Description
Camel AwsKinesis SequenceNumber	String	The sequence number of the record. This is represented as a String as it size is not defined by the API. If it is to be used as a numerical type then use
Camel AwsKinesis ApproximateArrivalTimestamp	String	The time AWS assigned as the arrival time of the record.
Camel AwsKinesis PartitionKey	String	Identifies which shard in the stream the data record is assigned to.

26.5.2. AmazonKinesis configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
```

```
DefaultAWSCredentialsProviderChain
```

```
registry.bind("kinesisClient", client);
```

You then have to reference the AmazonKinesisClient in the **amazonKinesisClient** URI option.

```
from("aws-kinesis://mykinesisstream?amazonKinesisClient=#kinesisClient")
    .to("log:out?showAll=true");
```

26.5.3. Providing AWS Credentials

It is recommended that the credentials are obtained by using the [DefaultAWSCredentialsProviderChain](#) that is the default when creating a new ClientConfiguration instance, however, a different [AWSCredentialsProvider](#) can be specified when calling createClient(...).

26.5.4. Message headers used by the Kinesis producer to write to Kinesis. The producer expects that the message body is a byte[].

Header	Type	Description
Camel AwsKinesis PartitionKey	String	The PartitionKey to pass to Kinesis to store this record.
Camel AwsKinesis SequenceNumber	String	Optional paramter to indicate the sequence number of this record.

26.5.5. Message headers set by the Kinesis producer on successful storage of a Record

Header	Type	Description
Camel AwsKinesis SequenceNumber	String	The sequence number of the record, as defined in Response Syntax
Camel AwsKinesis ShardId	String	The shard ID of where the Record was stored

26.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.17 or higher).

26.7. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 27. AWS KINESIS FIREHOSE COMPONENT

Available as of Camel version 2.19

The Kinesis Firehose component supports sending messages to Amazon Kinesis Firehose service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis Firehose. More information are available at [AWS Kinesis Firehose](#)

27.1. URI FORMAT

```
aws-kinesis-firehose://delivery-stream-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

27.2. URI OPTIONS

The AWS Kinesis Firehose component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS Kinesis Firehose default configuration		KinesisFirehose Configuration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	Amazon AWS Region		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Kinesis Firehose endpoint is configured using URI syntax:

```
aws-kinesis-firehose:streamName
```

with the following path and query parameters:

27.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
streamName	Required Name of the stream		String

27.2.2. Query Parameters (7 parameters):

Name	Description	Default	Type
amazonKinesisFirehoseClient (producer)	Amazon Kinesis Firehose client to use for all requests for this endpoint		AmazonKinesisFirehose
proxyHost (producer)	To define a proxy host when instantiating the DDBStreams client		String
proxyPort (producer)	To define a proxy port when instantiating the DDBStreams client		Integer
region (producer)	The region in which Kinesis client needs to work		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

27.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-kinesis-firehose.access-key	Amazon AWS Access Key		String
camel.component.aws-kinesis-firehose.configuration.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-kinesis-firehose.configuration.amazon-kinesis-firehose-client</code>	Amazon Kinesis Firehose client to use for all requests for this endpoint		AmazonKinesisFirehose
<code>camel.component.aws-kinesis-firehose.configuration.proxy-host</code>	To define a proxy host when instantiating the DDBStreams client		String
<code>camel.component.aws-kinesis-firehose.configuration.proxy-port</code>	To define a proxy port when instantiating the DDBStreams client		Integer
<code>camel.component.aws-kinesis-firehose.configuration.region</code>	The region in which Kinesis client needs to work		String
<code>camel.component.aws-kinesis-firehose.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-kinesis-firehose.configuration.stream-name</code>	Name of the stream		String
<code>camel.component.aws-kinesis-firehose.enabled</code>	Enable aws-kinesis-firehose component	true	Boolean
<code>camel.component.aws-kinesis-firehose.region</code>	Amazon AWS Region		String
<code>camel.component.aws-kinesis-firehose.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
<code>camel.component.aws-kinesis-firehose.secret-key</code>	Amazon AWS Secret Key		String

Required Kinesis Firehose component options

You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

27.4. USAGE

27.4.1. Amazon Kinesis Firehose configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
// DefaultAWSCredentialsProviderChain

registry.bind("kinesisFirehoseClient", client);
```

You then have to reference the `AmazonKinesisFirehoseClient` in the `amazonKinesisFirehoseClient` URI option.

```
from("aws-kinesis-firehose://mykinesisdeliverystream?amazonKinesisFirehoseClient=#kinesisClient")
.to("log:out?showAll=true");
```

27.4.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the `DefaultAWSCredentialsProviderChain` that is the default when creating a new `ClientConfiguration` instance, however, a different `AWSCredentialsProvider` can be specified when calling `createClient(...)`.

27.4.3. Message headers set by the Kinesis producer on successful storage of a Record

Header	Type	Description
Camel AwsKinesis FirehoseRecordId	String	The record ID, as defined in Response Syntax

27.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-aws</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.19 or higher).

27.6. SEE ALSO

CHAPTER 28. AWS KMS COMPONENT

Available as of Camel version 2.21

The KMS component supports create, run, start, stop and terminate [AWS KMS](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon KMS. More information are available at [Amazon KMS](#).

28.1. URI FORMAT

```
aws-kms://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

28.2. URI OPTIONS

The AWS KMS component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS KMS default configuration		KMSConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which KMS client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS KMS endpoint is configured using URI syntax:

```
aws-kms:label
```

with the following path and query parameters:

28.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
label	Required Logical name		String

28.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
accessKey (producer)	Amazon AWS Access Key		String
kmsClient (producer)	To use a existing configured AWS KMS as client		AWSKMS
operation (producer)	Required The operation to perform		KMSOperations
proxyHost (producer)	To define a proxy host when instantiating the KMS client		String
proxyPort (producer)	To define a proxy port when instantiating the KMS client		Integer
region (producer)	The region in which KMS client needs to work		String
secretKey (producer)	Amazon AWS Secret Key		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

28.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-kms.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-kms.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-kms.configuration.kms-client</code>	To use a existing configured AWS KMS as client		AWSKMS
<code>camel.component.aws-kms.configuration.operation</code>	The operation to perform		KMSOperations
<code>camel.component.aws-kms.configuration.proxy-host</code>	To define a proxy host when instantiating the KMS client		String
<code>camel.component.aws-kms.configuration.proxy-port</code>	To define a proxy port when instantiating the KMS client		Integer
<code>camel.component.aws-kms.configuration.region</code>	The region in which KMS client needs to work		String
<code>camel.component.aws-kms.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-kms.enabled</code>	Whether to enable auto configuration of the aws-kms component. This is enabled by default.		Boolean
<code>camel.component.aws-kms.region</code>	The region in which KMS client needs to work		String
<code>camel.component.aws-kms.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
camel.component.aws-kms.secret-key	Amazon AWS Secret Key		String

Required KMS component options

You have to provide the amazonKmsClient in the Registry or your accessKey and secretKey to access the [Amazon KMS](#) service.

28.4. USAGE

28.4.1. Message headers evaluated by the MQ producer

Header	Type	Description
CamelAwsKMSLimit	Integer	The limit number of keys to return while performing a listKeys operation
CamelAwsKMSOperation	String	The operation we want to perform
CamelAwsKMSDescription	String	A key description to use while performing a createKey operation
CamelAwsKMSKeyId	String	The key Id

28.4.2. KMS Producer operations

Camel-AWS KMS component provides the following operation on the producer side:

- listKeys
- createKey
- disableKey

- `scheduleKeyDeletion`
- `describeKey`
- `enableKey`

Dependencies

Maven users will need to add the following dependency to their `pom.xml`.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-aws</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

28.5. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 29. AWS LAMBDA COMPONENT

Available as of Camel version 2.20

The Lambda component supports create, get, list, delete and invoke [AWS Lambda](#) functions.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Lambda. More information are available at [Amazon Lambda](#).

When creating a Lambda function, you need to specify a IAM role which has at least the `AWSLambdaBasicExecuteRole` policy attached.

Warning

Lambda is regional service. Unlike S3 bucket, Lambda function created in a given region is not available on other regions.

29.1. URI FORMAT

```
aws-lambda://functionName[?options]
```

You can append query options to the URI in the following format, `?options=value&option2=value&...`

29.2. URI OPTIONS

The AWS Lambda component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS Lambda default configuration		LambdaConfigura tion
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	Amazon AWS Region		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Lambda endpoint is configured using URI syntax:

```
aws-lambda:function
```

with the following path and query parameters:

29.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
function	Required Name of the Lambda function.		String

29.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
operation (producer)	Required The operation to perform. It can be listFunctions, getFunction, createFunction, deleteFunction or invokeFunction		LambdaOperations
region (producer)	Amazon AWS Region		String
awsLambdaClient (advanced)	To use a existing configured AwsLambdaClient as client		AWSLambda
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
proxyHost (proxy)	To define a proxy host when instantiating the Lambda client		String
proxyPort (proxy)	To define a proxy port when instantiating the Lambda client		Integer
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

29.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-lambda.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-lambda.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-lambda.configuration.aws-lambda-client</code>	To use a existing configured <code>AwsLambdaClient</code> as client		<code>AWSLambda</code>
<code>camel.component.aws-lambda.configuration.function</code>	Name of the Lambda function.		String
<code>camel.component.aws-lambda.configuration.operation</code>	The operation to perform. It can be <code>listFunctions</code> , <code>getFunction</code> , <code>createFunction</code> , <code>deleteFunction</code> or <code>invokeFunction</code>		<code>LambdaOperations</code>
<code>camel.component.aws-lambda.configuration.proxy-host</code>	To define a proxy host when instantiating the Lambda client		String
<code>camel.component.aws-lambda.configuration.proxy-port</code>	To define a proxy port when instantiating the Lambda client		Integer
<code>camel.component.aws-lambda.configuration.region</code>	Amazon AWS Region		String
<code>camel.component.aws-lambda.configuration.secret-key</code>	Amazon AWS Secret Key		String

Name	Description	Default	Type
<code>camel.component.aws-lambda.enabled</code>	Whether to enable auto configuration of the aws-lambda component. This is enabled by default.		Boolean
<code>camel.component.aws-lambda.region</code>	Amazon AWS Region		String
<code>camel.component.aws-lambda.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-lambda.secret-key</code>	Amazon AWS Secret Key		String

Required Lambda component options

You have to provide the `awsLambdaClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon Lambda](#) service.

29.4. USAGE

29.4.1. Message headers evaluated by the Lambda producer

O	H	Type	Description	R
p	e			e
e	a			q
r	d			u
t	er			r
o				e
n				d

Operation	Header	Type	Description	Required
All	C a m e l A w s L a m b d a O p e r a t i o n	String	The operation we want to perform. Override operation passed as query parameter	Yes
createFunction	C a m e l A w s L a m b d a S 3 B u c k e t	String	Amazon S3 bucket name where the .zip file containing your deployment package is stored. This bucket must reside in the same AWS region where you are creating the Lambda function.	No

Operation	Header	Type	Description	Required
createFunction	CamelAwsLambdaS3Key	String	The Amazon S3 object (the deployment package) key name you want to upload.	No
createFunction	CamelAwsLambdaS3ObjectVersion	String	The Amazon S3 object (the deployment package) version you want to upload.	No

Operation	Header	Type	Description	Required
createFunction	CamelAWSLambdaZipFile	String	The local path of the zip file (the deployment package). Content of zip file can also be put in Message body.	No
createFunction	CamelAWSLambdaRole	String	The Amazon Resource Name (ARN) of the IAM role that Lambda assumes when it executes your function to access any other Amazon Web Services (AWS) resources.	Yes

Operation	Header	Type	Description	Required
create Function	CamelAWSLambdaRuntime	String	The runtime environment for the Lambda function you are uploading. (nodejs, nodejs4.3, nodejs6.10, java8, python2.7, python3.6, dotnetcore1.0, odejs4.3-edge)	Yes
create Function	CamelAWSLambdaHandler	String	The function within your code that Lambda calls to begin execution. For Node.js, it is the module-name.export value in your function. For Java, it can be package.class-name::handler or package.class-name.	Yes

Operation	Header	Type	Description	Required
createFunction	CamelAwsLambdaDescription	String	The user-provided description.	No
createFunction	CamelAwsLambdaTargetArn	String	The parent object that contains the target ARN (Amazon Resource Name) of an Amazon SQS queue or Amazon SNS topic.	No

Operation	Header	Type	Description	Required
create Function	Camel AWS Lambda Memory Size	Integer	The memory size, in MB, you configured for the function. Must be a multiple of 64 MB.	No
create Function	Camel AWS Lambda KMS Key Arn	String	The Amazon Resource Name (ARN) of the KMS key used to encrypt your function's environment variables. If not provided, AWS Lambda will use a default service key.	No

Operation	Header	Type	Description	Required
createFunction	Camel AWS Lambda Publish	Boolean	This boolean parameter can be used to request AWS Lambda to create the Lambda function and publish a version as an atomic operation.	No
createFunction	Camel AWS Lambda Timeout	Integer	The function execution time at which Lambda should terminate the function. The default is 3 seconds.	No

Operation	Header	Type	Description	Required
createFunction	Camel Aws Lambda Tracing Config	String	Your function's tracing settings (Active or PassThrough).	No

Operation	Header	Type	Description	Required
createFunction	CamelAwsLambdaEnvironmentVariables	Map<String, String>	The key-value pairs that represent your environment's configuration settings.	No

Operation	Header	Type	Description	Required
createFunction	CamelAwsLambdaEnvironmentTags	Map<String, String>	The list of tags (key-value pairs) assigned to the new function.	No

Operation	Header	Type	Description	Required
createFunction	CamelAWSLambdaSecurityGroupIds	List<String>	If your Lambda function accesses resources in a VPC, a list of one or more security groups IDs in your VPC.	No

Operation	Header	Type	Description	Required
createFunction	Camel AWS Lambda Subnet Ids	List<String>	If your Lambda function accesses resources in a VPC, a list of one or more subnet IDs in your VPC.	No

29.5. LIST OF AVAILABLE OPERATIONS

- listFunctions
- getFunction,
- createFunction
- deleteFunction
- invokeFunction
- updateFunction
- createEventSourceMapping
- deleteEventSourceMapping
- listEventSourceMapping

29.6. EXAMPLE

To have a full understanding of how the component works, you may have a look at this [integration test](#)

29.7. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.16 or higher).

29.8. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 30. AWS MQ COMPONENT

Available as of Camel version 2.21

The EC2 component supports create, run, start, stop and terminate [AWS MQ](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon MQ. More information are available at [Amazon MQ](#).

30.1. URI FORMAT

```
aws-mq://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

30.2. URI OPTIONS

The AWS MQ component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS MQ default configuration		MQConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which MQ client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS MQ endpoint is configured using URI syntax:

```
aws-mq:label
```

with the following path and query parameters:

30.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
label	Required Logical name		String

30.2.2. Query Parameters (8 parameters):

Name	Description	Default	Type
accessKey (producer)	Amazon AWS Access Key		String
amazonMqClient (producer)	To use a existing configured AmazonMQClient as client		AmazonMQ
operation (producer)	Required The operation to perform. It can be listBrokers,createBroker,deleteBroker		MQOperations
proxyHost (producer)	To define a proxy host when instantiating the MQ client		String
proxyPort (producer)	To define a proxy port when instantiating the MQ client		Integer
region (producer)	The region in which MQ client needs to work		String
secretKey (producer)	Amazon AWS Secret Key		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

30.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-mq.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-mq.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-mq.configuration.amazon-mq-client</code>	To use a existing configured AmazonMQClient as client		AmazonMQ
<code>camel.component.aws-mq.configuration.operation</code>	The operation to perform. It can be <code>listBrokers</code> , <code>createBroker</code> , <code>deleteBroker</code>		MQOperations
<code>camel.component.aws-mq.configuration.proxy-host</code>	To define a proxy host when instantiating the MQ client		String
<code>camel.component.aws-mq.configuration.proxy-port</code>	To define a proxy port when instantiating the MQ client		Integer
<code>camel.component.aws-mq.configuration.region</code>	The region in which MQ client needs to work		String
<code>camel.component.aws-mq.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-mq.enabled</code>	Whether to enable auto configuration of the <code>aws-mq</code> component. This is enabled by default.		Boolean
<code>camel.component.aws-mq.region</code>	The region in which MQ client needs to work		String
<code>camel.component.aws-mq.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	<code>true</code>	Boolean

Name	Description	Default	Type
camel.component. aws-mq.secret- key	Amazon AWS Secret Key		String

Required EC2 component options

You have to provide the `amazonEc2Client` in the Registry or your `accessKey` and `secretKey` to access the [Amazon EC2](#) service.

30.4. USAGE

30.4.1. Message headers evaluated by the MQ producer

Header	Type	Description
Camel AwsMQMax Results	String	The number of results that must be retrieved from listBrokers operation
Camel AwsMQBrokerName	String	The broker name
Camel AwsMQOperation	String	The operation we want to perform
Camel AwsMQBrokerId	String	The broker id
Camel AwsMQBrokerDeploymentMode	String	The deployment mode for the broker in the createBroker operation

Header	Type	Description
Camel AwsMQBrokerInstanceType	String	The instance type for the EC2 machine in the createBroker operation
Camel AwsMQBrokerEngine	String	The Broker Engine for MQ. Default is ACTIVEMQ
Camel AwsMQBrokerEngineVersion	String	The Broker Engine Version for MQ. Currently you can choose between 5.15.6 and 5.15.0 of ACTIVEMQ
Camel AwsMQBrokerUsers	List<User>	The list of users for MQ
Camel AwsMQBrokerPubliclyAccessible	Boolean	If the MQ instance must be publicly available or not. Default is false.

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.16 or higher).

- [AWS Component](#)

CHAPTER 31. AWS S3 STORAGE SERVICE COMPONENT

Available as of Camel version 2.8

The S3 component supports storing and retrieving objects from/to [Amazon's S3](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon S3. More information are available at [Amazon S3](#).

31.1. URI FORMAT

```
aws-s3://bucketNameOrArn[?options]
```

The bucket will be created if it don't already exists.

You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to read file **hello.txt** from bucket **helloBucket**, use the following snippet:

```
from("aws-s3:helloBucket?accessKey=yourAccessKey&secretKey=yourSecretKey&prefix=hello.txt")
.to("file:/var/downloaded");
```

31.2. URI OPTIONS

The AWS S3 Storage Service component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS S3 default configuration		S3Configuration
accessKey (common)	Amazon AWS Access Key		String
secretKey (common)	Amazon AWS Secret Key		String
region (common)	The region where the bucket is located. This option is used in the <code>com.amazonaws.services.s3.model.CreateBucketRequest</code> .		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS S3 Storage Service endpoint is configured using URI syntax:

`aws-s3:bucketNameOrArn`

with the following path and query parameters:

31.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>bucketNameOrArn</code>	Required Bucket name or ARN		String

31.2.2. Query Parameters (50 parameters):

Name	Description	Default	Type
<code>amazonS3Client</code> (common)	Reference to a <code>com.amazonaws.services.sqs.AmazonS3</code> in the link: https://camel.apache.org/registry.htmlRegistry .		AmazonS3
<code>pathStyleAccess</code> (common)	Whether or not the S3 client should use path style access	false	boolean
<code>policy</code> (common)	The policy for this queue to set in the <code>com.amazonaws.services.s3.AmazonS3#setBucketPolicy()</code> method.		String
<code>proxyHost</code> (common)	To define a proxy host when instantiating the SQS client		String
<code>proxyPort</code> (common)	Specify a proxy port to be used inside the client definition.		Integer
<code>region</code> (common)	The region in which S3 client needs to work		String
<code>useIAMCredentials</code> (common)	Set whether the S3 client should expect to load credentials on an EC2 instance or to expect static credentials to be passed in.	false	boolean
<code>encryptionMaterials</code> (common)	The encryption materials to use in case of Symmetric/Asymmetric client usage		EncryptionMaterials
<code>useEncryption</code> (common)	Define if encryption must be used or not	false	boolean

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
deleteAfterRead (consumer)	Delete objects from S3 after they have been retrieved. The delete is only performed if the Exchange is committed. If a rollback occurs, the object is not deleted. If this option is false, then the same objects will be retrieve over and over again on the polls. Therefore you need to use the Idempotent Consumer EIP in the route to filter out duplicates. You can filter using the <code>S3Constants#BUCKET_NAME</code> and <code>S3Constants#KEY</code> headers, or only the <code>S3Constants#KEY</code> header.	true	boolean
fileName (consumer)	To get the object from the bucket with the given file name		String
includeBody (consumer)	If it is true, the exchange body will be set to a stream to the contents of the file. If false, the headers will be set with the S3 object metadata, but the body will be null. This option is strongly related to <code>autocloseBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically.	true	boolean
maxConnections (consumer)	Set the <code>maxConnections</code> parameter in the S3 client configuration	60	int
maxMessagesPerPoll (consumer)	Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited.	10	int
prefix (consumer)	The prefix which is used in the <code>com.amazonaws.services.s3.model.ListObjectsRequest</code> to only consume objects we are interested in.		String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean

Name	Description	Default	Type
autocloseBody (consumer)	If this option is true and includeBody is true, then the <code>S3Object.close()</code> method will be called on exchange completion. This option is strongly related to includeBody option. In case of setting includeBody to true and autocloseBody to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting autocloseBody to true, will close the <code>S3Object</code> stream automatically.	true	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at <code>WARN</code> or <code>ERROR</code> level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an <code>Exchange</code> have been created and being routed in Camel.		<code>PollingConsumerPollStrategy</code>
deleteAfterWrite (producer)	Delete file object after the <code>S3</code> file has been uploaded	false	boolean
multiPartUpload (producer)	If it is true, camel will upload the file with multi part format, the part size is decided by the option of <code>partSize</code>	false	boolean
operation (producer)	The operation to do in case the user don't want to do only an upload		<code>S3Operations</code>
partSize (producer)	Setup the <code>partSize</code> which is used in multi part upload, the default size is 25M.	26214400	long
serverSideEncryption (producer)	Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use <code>AES256</code> .		String
storageClass (producer)	The storage class to set in the <code>com.amazonaws.services.s3.model.PutObjectRequest</code> request.		String
awsKMSKeyId (producer)	Define the id of KMS key to use in case KMS is enabled		String

Name	Description	Default	Type
useAwsKMS (producer)	Define if KMS must be used or not	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accelerateModeEnabled (advanced)	Define if Accelerate Mode enabled is true or false	false	boolean
chunkedEncodingDisabled (advanced)	Define if disabled Chunked Encoding is true or false	false	boolean
dualstackEnabled (advanced)	Define if Dualstack enabled is true or false	false	boolean
forceGlobalBucketAccessEnabled (advanced)	Define if Force Global Bucket Access enabled is true or false	false	boolean
payloadSigningEnabled (advanced)	Define if Payload Signing enabled is true or false	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean

Name	Description	Default	Type
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LogLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

31.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 34 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-s3.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-s3.configuration.accelerate-mode-enabled</code>	Define if Accelerate Mode enabled is true or false	false	Boolean
<code>camel.component.aws-s3.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-s3.configuration.amazon-s3-client</code>	Reference to a <code>com.amazonaws.services.sqs.AmazonS3</code> in the link: https://camel.apache.org/registry.htmlRegistry .		AmazonS3
<code>camel.component.aws-s3.configuration.autoclose-body</code>	If this option is true and <code>includeBody</code> is true, then the <code>S3Object.close()</code> method will be called on exchange completion. This option is strongly related to <code>includeBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically.	true	Boolean
<code>camel.component.aws-s3.configuration.aws-k-m-s-key-id</code>	Define the id of KMS key to use in case KMS is enabled		String
<code>camel.component.aws-s3.configuration.bucket-name</code>	Name of the bucket. The bucket will be created if it doesn't already exists.		String
<code>camel.component.aws-s3.configuration.chunked-encoding-disabled</code>	Define if disabled Chunked Encoding is true or false	false	Boolean

Name	Description	Default	Type
<code>camel.component.aws-s3.configuration.delete-after-read</code>	Delete objects from S3 after they have been retrieved. The delete is only performed if the Exchange is committed. If a rollback occurs, the object is not deleted. If this option is false, then the same objects will be retrieve over and over again on the polls. Therefore you need to use the Idempotent Consumer EIP in the route to filter out duplicates. You can filter using the <code>S3Constants#BUCKET_NAME</code> and <code>S3Constants#KEY</code> headers, or only the <code>S3Constants#KEY</code> header.	true	Boolean
<code>camel.component.aws-s3.configuration.delete-after-write</code>	Delete file object after the S3 file has been uploaded	false	Boolean
<code>camel.component.aws-s3.configuration.dualstack-enabled</code>	Define if Dualstack enabled is true or false	false	Boolean
<code>camel.component.aws-s3.configuration.encryption-materials</code>	The encryption materials to use in case of Symmetric/Asymmetric client usage		EncryptionMaterials
<code>camel.component.aws-s3.configuration.file-name</code>	To get the object from the bucket with the given file name		String
<code>camel.component.aws-s3.configuration.force-global-bucket-access-enabled</code>	Define if Force Global Bucket Access enabled is true or false	false	Boolean
<code>camel.component.aws-s3.configuration.include-body</code>	If it is true, the exchange body will be set to a stream to the contents of the file. If false, the headers will be set with the S3 object metadata, but the body will be null. This option is strongly related to <code>autocloseBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically.	true	Boolean

Name	Description	Default	Type
camel.component.aws-s3.configuration.multi-part-upload	If it is true, camel will upload the file with multi part format, the part size is decided by the option of partSize	false	Boolean
camel.component.aws-s3.configuration.operation	The operation to do in case the user don't want to do only an upload		S3Operations
camel.component.aws-s3.configuration.part-size	Setup the partSize which is used in multi part upload, the default size is 25M.	26214400	Long
camel.component.aws-s3.configuration.path-style-access	Whether or not the S3 client should use path style access	false	Boolean
camel.component.aws-s3.configuration.payload-signing-enabled	Define if Payload Signing enabled is true or false	false	Boolean
camel.component.aws-s3.configuration.policy	The policy for this queue to set in the com.amazonaws.services.s3.AmazonS3#setBucketPolicy() method.		String
camel.component.aws-s3.configuration.prefix	The prefix which is used in the com.amazonaws.services.s3.model.ListObjectsRequest to only consume objects we are interested in.		String
camel.component.aws-s3.configuration.proxy-host	To define a proxy host when instantiating the SQS client		String
camel.component.aws-s3.configuration.proxy-port	Specify a proxy port to be used inside the client definition.		Integer

Name	Description	Default	Type
<code>camel.component.aws-s3.configuration.region</code>	The region in which S3 client needs to work		String
<code>camel.component.aws-s3.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-s3.configuration.server-side-encryption</code>	Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use AES256.		String
<code>camel.component.aws-s3.configuration.storage-class</code>	The storage class to set in the <code>com.amazonaws.services.s3.model.PutObjectRequest</code> request.		String
<code>camel.component.aws-s3.configuration.use-aws-k-m-s</code>	Define if KMS must be used or not	false	Boolean
<code>camel.component.aws-s3.configuration.use-encryption</code>	Define if encryption must be used or not	false	Boolean
<code>camel.component.aws-s3.enabled</code>	Enable aws-s3 component	true	Boolean
<code>camel.component.aws-s3.region</code>	The region where the bucket is located. This option is used in the <code>com.amazonaws.services.s3.model.CreateBucketRequest</code> .		String
<code>camel.component.aws-s3.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
camel.component.aws-s3.secret-key	Amazon AWS Secret Key		String

Required S3 component options

You have to provide the amazonS3Client in the Registry or your accessKey and secretKey to access the [Amazon's S3](#).

31.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

31.5. USAGE

31.5.1. Message headers evaluated by the S3 producer

Header	Type	Description
CamelAwsS3BucketName	String	The bucket Name which this object will be stored or which will be used for the current operation
CamelAwsS3BucketDestinationName	String	Camel 2.18: The bucket Destination Name which will be used for the current operation
CamelAwsS3ContentLength	Long	The content length of this object.
CamelAwsS3ContentType	String	The content type of this object.

Header	Type	Description
Camel AwsS 3Cont entCo ntrol	String	Camel 2.8.2: The content control of this object.
Camel AwsS 3Cont entDis positi on	String	Camel 2.8.2: The content disposition of this object.
Camel AwsS 3Cont entEn codin g	String	Camel 2.8.2: The content encoding of this object.
Camel AwsS 3Cont entMD 5	String	Camel 2.8.2: The md5 checksum of this object.
Camel AwsS 3Desti nation Key	String	Camel 2.18: The Destination key which will be used for the current operation
Camel AwsS 3Key	String	The key under which this object will be stored or which will be used for the current operation
Camel AwsS 3Last Modifi ed	java.u til.Dat e	Camel 2.8.2: The last modified timestamp of this object.
Camel AwsS 3Oper ation	String	Camel 2.18: The operation to perform. Permitted values are copyObject, deleteObject, listBuckets, deleteBucket, downloadLink, listObjects

Header	Type	Description
Camel AwsS 3Stora geCla ss	String	Camel 2.8.4: The storage class of this object.
Camel AwsS 3Cann edAcl	String	Camel 2.11.0: The canned acl that will be applied to the object. see com.amazonaws.services.s3.model.CannedAccessControlList for allowed values.
Camel AwsS 3Acl	com.a mazo naws. servic es.s3. model .Acce ssCon trolLis t	Camel 2.11.0: a well constructed Amazon S3 Access Control List object. see com.amazonaws.services.s3.model.AccessControlList for more details
Camel AwsS 3Head ers	Map< String ,Strin g>	Camel 2.15.0: support to get or set custom objectMetadata headers.
Camel AwsS 3Serv erSide Encry ption	String	Camel 2.16: Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use AES256.
Camel AwsS 3Versi onId	String	The version Id of the object to be stored or returned from the current operation

31.5.2. Message headers set by the S3 producer

Header	Type	Description
Camel AwsS 3ETag	String	The ETag value for the newly uploaded object.

Header	Type	Description
CamelAwsS3VersionId	String	The optional version ID of the newly uploaded object.
CamelAwsS3DownloadLinkExpiration	String	The expiration (millis) of URL download link. The link will be stored into CamelAwsS3DownloadLink response header.

31.5.3. Message headers set by the S3 consumer

Header	Type	Description
CamelAwsS3Key	String	The key under which this object is stored.
CamelAwsS3BucketName	String	The name of the bucket in which this object is contained.
CamelAwsS3ETag	String	The hex encoded 128-bit MD5 digest of the associated object according to RFC 1864. This data is used as an integrity check to verify that the data received by the caller is the same data that was sent by Amazon S3.
CamelAwsS3LastModified	Date	The value of the Last-Modified header, indicating the date and time at which Amazon S3 last recorded a modification to the associated object.
CamelAwsS3VersionId	String	The version ID of the associated Amazon S3 object if available. Version IDs are only assigned to objects when an object is uploaded to an Amazon S3 bucket that has object versioning enabled.
CamelAwsS3ContentType	String	The Content-Type HTTP header, which indicates the type of content stored in the associated object. The value of this header is a standard MIME type.

Header	Type	Description
Camel AwsS3ContentMD5	String	The base64 encoded 128-bit MD5 digest of the associated object (content - not including headers) according to RFC 1864. This data is used as a message integrity check to verify that the data received by Amazon S3 is the same data that the caller sent.
Camel AwsS3ContentLength	Long	The Content-Length HTTP header indicating the size of the associated object in bytes.
Camel AwsS3ContentEncoding	String	The optional Content-Encoding HTTP header specifying what content encodings have been applied to the object and what decoding mechanisms must be applied in order to obtain the media-type referenced by the Content-Type field.
Camel AwsS3ContentDisposition	String	The optional Content-Disposition HTTP header, which specifies presentational information such as the recommended filename for the object to be saved as.
Camel AwsS3ContentControl	String	The optional Cache-Control HTTP header which allows the user to specify caching behavior along the HTTP request/reply chain.
Camel AwsS3ServerSideEncryption	String	Camel 2.16: The server-side encryption algorithm when encrypting the object using AWS-managed keys.

31.5.4. S3 Producer operations

Camel-AWS s3 component provides the following operation on the producer side:

- copyObject
- deleteObject
- listBuckets
- deleteBucket

- `downloadLink`
- `listObjects`

31.5.5. Advanced AmazonS3 configuration

If your Camel Application is running behind a firewall or if you need to have more control over the **AmazonS3** instance configuration, you can create your own instance:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonS3 client = new AmazonS3Client(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

and refer to it in your Camel `aws-s3` component configuration:

```
from("aws-s3://MyBucket?amazonS3Client=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

31.5.6. Use KMS with the S3 component

To use AWS KMS to encrypt/decrypt data by using AWS infrastructure you can use the options introduced in 2.21.x like in the following example

```
from("file:tmp/test?fileName=test.txt")
.setHeader(S3Constants.KEY, constant("testFile"))
.to("aws-s3://mybucket?amazonS3Client=#client&useAwsKMS=true&awsKMSKeyId=3f0637ad-296a-3dfe-a796-e60654fb128c");
```

In this way you'll ask to S3, to use the KMS key `3f0637ad-296a-3dfe-a796-e60654fb128c`, to encrypt the file `test.txt`. When you'll ask to download this file, the decryption will be done directly before the download.

31.5.7. Use "useIAMCredentials" with the s3 component

To use AWS IAM credentials, you must first verify that the EC2 in which you are launching the Camel application on has an IAM role associated with it containing the appropriate policies attached to run effectively. Keep in mind that this feature should only be set to "true" on remote instances. To clarify even further, you must still use static credentials locally since IAM is an AWS specific component, but AWS environments should now be easier to manage. After this is implemented and understood, you can set the query parameter "useIAMCredentials" to "true" for AWS environments! To effectively toggle this on and off based on local and remote environments, you can consider enabling this query parameter with system environment variables. For example, your code could set the "useIAMCredentials" query parameter to "true", when the system environment variable called "isRemote" is set to true (there are many other ways to do this and this should act as a simple example). Although it doesn't take away the need for static credentials completely, using IAM credentials on AWS environments takes away the need to refresh on remote environments and adds a major security boost (IAM credentials are refreshed automatically every 6 hours and update when their policies are updated). This is the AWS recommended way to manage credentials and therefore should be used as often as possible.

31.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8 or higher).

31.7. SEE ALSO

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 32. AWS SIMPLEDB COMPONENT

Available as of Camel version 2.9

The sdb component supports storing and retrieving data from/to [Amazon's SDB](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SDB. More information are available at [Amazon SDB](#).

32.1. URI FORMAT

```
aws-sdb://domainName[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

32.2. URI OPTIONS

The AWS SimpleDB component has no options.

The AWS SimpleDB endpoint is configured using URI syntax:

```
aws-sdb:domainName
```

with the following path and query parameters:

32.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
domainName	Required The name of the domain currently worked with.		String

32.2.2. Query Parameters (10 parameters):

Name	Description	Default	Type
accessKey (producer)	Amazon AWS Access Key		String
amazonSDBClient (producer)	To use the AmazonSimpleDB as the client		AmazonSimpleDB
consistentRead (producer)	Determines whether or not strong consistency should be enforced when data is read.	false	boolean

Name	Description	Default	Type
maxNumberOfDomains (producer)	The maximum number of domain names you want returned. The range is 1 to 100.		Integer
operation (producer)	Operation to perform	PutAttributes	SdbOperations
proxyHost (producer)	To define a proxy host when instantiating the SDB client		String
proxyPort (producer)	To define a proxy port when instantiating the SDB client		Integer
region (producer)	The region in which SDB client needs to work		String
secretKey (producer)	Amazon AWS Secret Key		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

32.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-sdb.enabled	Enable aws-sdb component	true	Boolean
camel.component.aws-sdb.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Required SDB component options

You have to provide the `amazonSDBClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SDB](#).

32.4. USAGE

32.4.1. Message headers evaluated by the SDB producer

Header	Type	Description
Camel AwsS dbAttr ibutes	Collec tion< Attrib ute>	List of attributes to be acted upon.
Camel AwsS dbAttr ibuteN ames	Collec tion<S tring>	The names of the attributes to be retrieved.
Camel AwsS dbCo nsiste ntRea d	Boole an	Determines whether or not strong consistency should be enforced when data is read.
Camel AwsS dbDel etable Items	Collec tion< Deleta bleIte m>	A list of items on which to perform the delete operation in a batch.
Camel AwsS dbDo mainN ame	String	The name of the domain currently worked with.
Camel AwsS dbIte mNam e	String	The unique key for this item
Camel AwsS dbMa xNum berOf Domai ns	Intege r	The maximum number of domain names you want returned. The range is 1 * to 100.
Camel AwsS dbNex tToke n	String	A string specifying where to start the next list of domain/item names.

Header	Type	Description
Camel AwsS dbOp eratio n	String	To override the operation from the URI options.
Camel AwsS dbRep laceab leAttri butes	Collec tion< Repla ceable Attrib ute>	List of attributes to put in an Item.
Camel AwsS dbRep laceab leItem s	Collec tion< Repla ceable Item>	A list of items to put in a Domain.
Camel AwsS dbSel ectEx pressi on	String	The expression used to query the domain.
Camel AwsS dbUp dateC onditi on	Updat eCondi tion	The update condition which, if specified, determines whether the specified attributes will be updated/deleted or not.

32.4.2. Message headers set during DomainMetadata operation

Header	Type	Description
Camel AwsS dbTim estam p	Intege r	The data and time when metadata was calculated, in Epoch (UNIX) seconds.

Header	Type	Description
Camel AwsS dbIte mCou nt	Intege r	The number of all items in the domain.
Camel AwsS dbAttr ibuteN ameC ount	Intege r	The number of unique attribute names in the domain.
Camel AwsS dbAttr ibuteV alueC ount	Intege r	The number of all attribute name/value pairs in the domain.
Camel AwsS dbAttr ibuteN ameSi ze	Long	The total size of all unique attribute names in the domain, in bytes.
Camel AwsS dbAttr ibuteV alueSi ze	Long	The total size of all attribute values in the domain, in bytes.
Camel AwsS dbIte mNam eSize	Long	The total size of all item names in the domain, in bytes.

32.4.3. Message headers set during GetAttributes operation

Header	Type	Description
Camel AwsS dbAttr ibutes	List<A ttribut e>	The list of attributes returned by the operation.

32.4.4. Message headers set during ListDomains operation

Header	Type	Description
Camel AwsS dbDo mainN ames	List<S tring>	A list of domain names that match the expression.
Camel AwsS dbNex tToke n	String	An opaque token indicating that there are more domains than the specified MaxNumberOfDomains still available.

32.4.5. Message headers set during Select operation

Header	Type	Description
Camel AwsS dbIte ms	List<I tem>	A list of items that match the select expression.
Camel AwsS dbNex tToke n	String	An opaque token indicating that more items than MaxNumberOfItems were matched, the response size exceeded 1 megabyte, or the execution time exceeded 5 seconds.

32.4.6. Advanced AmazonSimpleDB configuration

If you need more control over the **AmazonSimpleDB** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-sdb://domainName?amazonSDBClient=#client");
```

The **#client** refers to a **AmazonSimpleDB** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleDB client = new AmazonSimpleDBClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

32.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8.4 or higher).

CHAPTER 33. AWS SIMPLE EMAIL SERVICE COMPONENT

Available as of Camel version 2.9

The ses component supports sending emails with [Amazon's SES](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SES. More information are available at [Amazon SES](#).

33.1. URI FORMAT

```
aws-ses://from[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

33.2. URI OPTIONS

The AWS Simple Email Service component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS SES default configuration		SesConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which SES client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Simple Email Service endpoint is configured using URI syntax:

```
aws-ses:from
```

with the following path and query parameters:

33.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
from	Required The sender's email address.		String

33.2.2. Query Parameters (11 parameters):

Name	Description	Default	Type
amazonSESClient (producer)	To use the AmazonSimpleEmailService as the client		AmazonSimpleEmail Service
proxyHost (producer)	To define a proxy host when instantiating the SES client		String
proxyPort (producer)	To define a proxy port when instantiating the SES client		Integer
region (producer)	The region in which SES client needs to work		String
replyToAddresses (producer)	List of reply-to email address(es) for the message, override it using 'CamelAwsSesReplyToAddresses' header.		List
returnPath (producer)	The email address to which bounce notifications are to be forwarded, override it using 'CamelAwsSesReturnPath' header.		String
subject (producer)	The subject which is used if the message header 'CamelAwsSesSubject' is not present.		String
to (producer)	List of destination email address. Can be overridden with 'CamelAwsSesTo' header.		List
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

33.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
camel.component. .aws-ses.access- key	Amazon AWS Access Key		String
camel.component. .aws- ses.configuration. access-key	Amazon AWS Access Key		String
camel.component. .aws- ses.configuration. amazon-s-e-s- client	To use the AmazonSimpleEmailService as the client		AmazonSimpleEmail Service
camel.component. .aws- ses.configuration. from	The sender's email address.		String
camel.component. .aws- ses.configuration. proxy-host	To define a proxy host when instantiating the SES client		String
camel.component. .aws- ses.configuration. proxy-port	To define a proxy port when instantiating the SES client		Integer
camel.component. .aws- ses.configuration. region	The region in which SES client needs to work		String
camel.component. .aws- ses.configuration. reply-to- addresses	List of reply-to email address(es) for the message, override it using 'CamelAwsSesReplyToAddresses' header.		List
camel.component. .aws- ses.configuration. return-path	The email address to which bounce notifications are to be forwarded, override it using 'CamelAwsSesReturnPath' header.		String

Name	Description	Default	Type
camel.component.aws-ses.configuration.secret-key	Amazon AWS Secret Key		String
camel.component.aws-ses.configuration.subject	The subject which is used if the message header 'CamelAwsSesSubject' is not present.		String
camel.component.aws-ses.configuration.to	List of destination email address. Can be overridden with 'CamelAwsSesTo' header.		List
camel.component.aws-ses.enabled	Enable aws-ses component	true	Boolean
camel.component.aws-ses.region	The region in which SES client needs to work		String
camel.component.aws-ses.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.component.aws-ses.secret-key	Amazon AWS Secret Key		String

Required SES component options

You have to provide the amazonSESClient in the Registry or your accessKey and secretKey to access the [Amazon's SES](#).

33.4. USAGE

33.4.1. Message headers evaluated by the SES producer

Header	Type	Description
CamelAwsSesFrom	String	The sender's email address.

Header	Type	Description
Camel AwsS esTo	List<S tring>	The destination(s) for this email.
Camel AwsS esSub ject	String	The subject of the message.
Camel AwsS esRep lyToA ddres ses	List<S tring>	The reply-to email address(es) for the message.
Camel AwsS esRet urnPa th	String	The email address to which bounce notifications are to be forwarded.
Camel AwsS esHtm lEmail	Boole an	Since Camel 2.12.3 The flag to show if email content is HTML.

33.4.2. Message headers set by the SES producer

Header	Type	Description
Camel AwsS esMes sageI d	String	The Amazon SES message ID.

33.4.3. Advanced AmazonSimpleEmailService configuration

If you need more control over the **AmazonSimpleEmailService** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-ses://example@example.com?amazonSESCient=#client");
```

The **#client** refers to a **AmazonSimpleEmailService** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSimpleEmailService client = new AmazonSimpleEmailServiceClient(awsCredentials,
clientConfiguration);

registry.bind("client", client);
```

33.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8.4 or higher).

33.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)

CHAPTER 34. AWS SIMPLE NOTIFICATION SYSTEM COMPONENT

Available as of Camel version 2.8

The SNS component allows messages to be sent to an [Amazon Simple Notification Topic](#). The implementation of the Amazon API is provided by the [AWS SDK](#).

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SNS. More information are available at [Amazon SNS](#).

34.1. URI FORMAT

```
aws-sns://topicNameOrArn[?options]
```

The topic will be created if they don't already exists.

You can append query options to the URI in the following format, **?options=value&option2=value&...**

34.2. URI OPTIONS

The AWS Simple Notification System component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS SNS default configuration		SnsConfiguration
accessKey (producer)	Amazon AWS Access Key		String
secretKey (producer)	Amazon AWS Secret Key		String
region (producer)	The region in which SNS client needs to work		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Simple Notification System endpoint is configured using URI syntax:

```
aws-sns:topicNameOrArn
```

with the following path and query parameters:

34.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
topicNameOrArn	Required Topic name or ARN		String

34.2.2. Query Parameters (11 parameters):

Name	Description	Default	Type
amazonSNSClient (producer)	To use the AmazonSNS as the client		AmazonSNS
headerFilterStrategy (producer)	To use a custom HeaderFilterStrategy to map headers to/from Camel.		HeaderFilterStrategy
messageStructure (producer)	The message structure to use such as json		String
policy (producer)	The policy for this queue		String
proxyHost (producer)	To define a proxy host when instantiating the SNS client		String
proxyPort (producer)	To define a proxy port when instantiating the SNS client		Integer
region (producer)	The region in which SNS client needs to work		String
subject (producer)	The subject which is used if the message header 'CamelAwsSnsSubject' is not present.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

34.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.aws-sns.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-sns.configuration.access-key</code>	Amazon AWS Access Key		String
<code>camel.component.aws-sns.configuration.amazon-s-n-s-client</code>	To use the AmazonSNS as the client		AmazonSNS
<code>camel.component.aws-sns.configuration.message-structure</code>	The message structure to use such as json		String
<code>camel.component.aws-sns.configuration.policy</code>	The policy for this queue		String
<code>camel.component.aws-sns.configuration.proxy-host</code>	To define a proxy host when instantiating the SNS client		String
<code>camel.component.aws-sns.configuration.proxy-port</code>	To define a proxy port when instantiating the SNS client		Integer
<code>camel.component.aws-sns.configuration.region</code>	The region in which SNS client needs to work		String
<code>camel.component.aws-sns.configuration.secret-key</code>	Amazon AWS Secret Key		String

Name	Description	Default	Type
<code>camel.component.aws-sns.configuration.subject</code>	The subject which is used if the message header 'CamelAwsSnsSubject' is not present.		String
<code>camel.component.aws-sns.configuration.topic-arn</code>	The Amazon Resource Name (ARN) assigned to the created topic.		String
<code>camel.component.aws-sns.configuration.topic-name</code>	The name of the topic		String
<code>camel.component.aws-sns.enabled</code>	Enable aws-sns component	true	Boolean
<code>camel.component.aws-sns.region</code>	The region in which SNS client needs to work		String
<code>camel.component.aws-sns.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-sns.secret-key</code>	Amazon AWS Secret Key		String

Required SNS component options

You have to provide the `amazonSNSClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SNS](#).

34.4. USAGE

34.4.1. Message headers evaluated by the SNS producer

Header	Type	Description
CamelAwsSnsSubject	String	The Amazon SNS message subject. If not set, the subject from the SnsConfiguration is used.

34.4.2. Message headers set by the SNS producer

Header	Type	Description
Camel AwsS nsMes sageI d	String	The Amazon SNS message ID.

34.4.3. Advanced AmazonSNS configuration

If you need more control over the **AmazonSNS** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-sns://MyTopic?amazonSNSClient=#client");
```

The **#client** refers to a **AmazonSNS** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSNS client = new AmazonSNSClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

34.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.8 or higher).

CHAPTER 35. AWS SIMPLE QUEUE SERVICE COMPONENT

Available as of Camel version 2.6

The sqs component supports sending and receiving messages to [Amazon's SQS](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SQS. More information are available at [Amazon SQS](#).

35.1. URI FORMAT

```
aws-sqs://queueNameOrArn[?options]
```

The queue will be created if they don't already exists.

You can append query options to the URI in the following format, ?options=value&option2=value&...

35.2. URI OPTIONS

The AWS Simple Queue Service component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS SQS default configuration		SqsConfiguration
accessKey (common)	Amazon AWS Access Key		String
secretKey (common)	Amazon AWS Secret Key		String
region (common)	Specify the queue region which could be used with queueOwnerAWSAccountId to build the service URL.		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Simple Queue Service endpoint is configured using URI syntax:

```
aws-sqs:queueNameOrArn
```

with the following path and query parameters:

35.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
queueNameOrArn	Required Queue name or ARN		String

35.2.2. Query Parameters (48 parameters):

Name	Description	Default	Type
amazonAWSHost (common)	The hostname of the Amazon AWS cloud.	amazonaws.com	String
amazonSQSClient (common)	To use the AmazonSQS as client		AmazonSQS
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to map headers to/from Camel.		HeaderFilterStrategy
queueOwnerAWSAccountId (common)	Specify the queue owner aws account id when you need to connect the queue with different account owner.		String
region (common)	Specify the queue region which could be used with queueOwnerAWSAccountId to build the service URL.		String
attributeNames (consumer)	A list of attribute names to receive when consuming. Multiple names can be separated by comma.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
concurrentConsumers (consumer)	Allows you to use multiple threads to poll the sqs queue to increase throughput	1	int
defaultVisibilityTimeout (consumer)	The default visibility timeout (in seconds)		Integer
deleteAfterRead (consumer)	Delete message from SQS after it has been read	true	boolean

Name	Description	Default	Type
deleteIfFiltered (consumer)	Whether or not to send the DeleteMessage to the SQS queue if an exchange fails to get through a filter. If 'false' and exchange does not make it through a Camel filter upstream in the route, then don't send DeleteMessage.	true	boolean
extendMessageVisibility (consumer)	If enabled then a scheduled background task will keep extending the message visibility on SQS. This is needed if it takes a long time to process the message. If set to true defaultVisibilityTimeout must be set. See details at Amazon docs.	false	boolean
maxMessagesPerPoll (consumer)	Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited.		int
messageAttributeNames (consumer)	A list of message attribute names to receive when consuming. Multiple names can be separated by comma.		String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
visibilityTimeout (consumer)	The duration (in seconds) that the received messages are hidden from subsequent retrieve requests after being retrieved by a ReceiveMessage request to set in the <code>com.amazonaws.services.sqs.model.SetQueueAttributesRequest</code> . This only make sense if its different from defaultVisibilityTimeout. It changes the queue visibility timeout attribute permanently.		Integer
waitTimeSeconds (consumer)	Duration in seconds (0 to 20) that the ReceiveMessage action call will wait until a message is in the queue to include in the response.		Integer
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
delaySeconds (producer)	Delay sending messages for a number of seconds.		Integer
messageDeduplicationId Strategy (producer)	Only for FIFO queues. Strategy for setting the <code>messageDeduplicationId</code> on the message. Can be one of the following options: <code>useExchangeId</code> , <code>useContentBasedDeduplication</code> . For the <code>useContentBasedDeduplication</code> option, no <code>messageDeduplicationId</code> will be set on the message.	<code>useExchangeId</code>	MessageDeduplicationId Strategy
messageGroupId Strategy (producer)	Only for FIFO queues. Strategy for setting the <code>messageGroupId</code> on the message. Can be one of the following options: <code>useConstant</code> , <code>useExchangeId</code> , <code>usePropertyValue</code> . For the <code>usePropertyValue</code> option, the value of property <code>CamelAwsMessageGroupId</code> will be used.		MessageGroupIdStrategy
delayQueue (advanced)	Define if you want to apply <code>delaySeconds</code> option to the queue or on single messages	<code>false</code>	boolean
queueUrl (advanced)	To define the <code>queueUrl</code> explicitly. All other parameters, which would influence the <code>queueUrl</code> , are ignored. This parameter is intended to be used, to connect to a mock implementation of SQS, for testing purposes.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	<code>false</code>	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int

Name	Description	Default	Type
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for <code>initialDelay</code> and <code>delay</code> options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean

Name	Description	Default	Type
proxyHost (proxy)	To define a proxy host when instantiating the SQS client		String
proxyPort (proxy)	To define a proxy port when instantiating the SQS client		Integer
maximumMessageSize (queue)	The maximumMessageSize (in bytes) an SQS message can contain for this queue.		Integer
messageRetentionPeriod (queue)	The messageRetentionPeriod (in seconds) a message will be retained by SQS for this queue.		Integer
policy (queue)	The policy for this queue		String
receiveMessageWaitTimeSeconds (queue)	If you do not specify WaitTimeSeconds in the request, the queue attribute ReceiveMessageWaitTimeSeconds is used to determine how long to wait.		Integer
redrivePolicy (queue)	Specify the policy that send message to DeadLetter queue. See detail at Amazon docs.		String
accessKey (security)	Amazon AWS Access Key		String
secretKey (security)	Amazon AWS Secret Key		String

35.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 31 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-sqs.access-key	Amazon AWS Access Key		String
camel.component.aws-sqs.configuration.access-key	Amazon AWS Access Key		String

Name	Description	Default	Type
<code>camel.component.aws-sqs.configuration.amazon-a-w-s-host</code>	The hostname of the Amazon AWS cloud.	<code>amazonaws.com</code>	String
<code>camel.component.aws-sqs.configuration.amazon-s-q-s-client</code>	To use the AmazonSQS as client		AmazonSQS
<code>camel.component.aws-sqs.configuration.attribute-names</code>	A list of attribute names to receive when consuming. Multiple names can be separated by comma.		String
<code>camel.component.aws-sqs.configuration.concurrent-consumers</code>	Allows you to use multiple threads to poll the sqs queue to increase throughput	1	Integer
<code>camel.component.aws-sqs.configuration.default-visibility-timeout</code>	The default visibility timeout (in seconds)		Integer
<code>camel.component.aws-sqs.configuration.delay-queue</code>	Define if you want to apply <code>delaySeconds</code> option to the queue or on single messages	<code>false</code>	Boolean
<code>camel.component.aws-sqs.configuration.delay-seconds</code>	Delay sending messages for a number of seconds.		Integer
<code>camel.component.aws-sqs.configuration.delete-after-read</code>	Delete message from SQS after it has been read	<code>true</code>	Boolean

Name	Description	Default	Type
<code>camel.component.aws-sqs.configuration.delete-if-filtered</code>	Whether or not to send the DeleteMessage to the SQS queue if an exchange fails to get through a filter. If 'false' and exchange does not make it through a Camel filter upstream in the route, then don't send DeleteMessage.	true	Boolean
<code>camel.component.aws-sqs.configuration.extend-message-visibility</code>	If enabled then a scheduled background task will keep extending the message visibility on SQS. This is needed if it takes a long time to process the message. If set to true defaultVisibilityTimeout must be set. See details at Amazon docs.	false	Boolean
<code>camel.component.aws-sqs.configuration.maximum-message-size</code>	The maximumMessageSize (in bytes) an SQS message can contain for this queue.		Integer
<code>camel.component.aws-sqs.configuration.message-attribute-names</code>	A list of message attribute names to receive when consuming. Multiple names can be separated by comma.		String
<code>camel.component.aws-sqs.configuration.message-retention-period</code>	The messageRetentionPeriod (in seconds) a message will be retained by SQS for this queue.		Integer
<code>camel.component.aws-sqs.configuration.policy</code>	The policy for this queue		String
<code>camel.component.aws-sqs.configuration.proxy-host</code>	To define a proxy host when instantiating the SQS client		String
<code>camel.component.aws-sqs.configuration.proxy-port</code>	To define a proxy port when instantiating the SQS client		Integer
<code>camel.component.aws-sqs.configuration.queue-name</code>	Name of queue. The queue will be created if they don't already exists.		String

Name	Description	Default	Type
<code>camel.component.aws-sqs.configuration.queue-owner-aws-account-id</code>	Specify the queue owner aws account id when you need to connect the queue with different account owner.		String
<code>camel.component.aws-sqs.configuration.queue-url</code>	To define the queueUrl explicitly. All other parameters, which would influence the queueUrl, are ignored. This parameter is intended to be used, to connect to a mock implementation of SQS, for testing purposes.		String
<code>camel.component.aws-sqs.configuration.receive-message-wait-time-seconds</code>	If you do not specify WaitTimeSeconds in the request, the queue attribute <code>ReceiveMessageWaitTimeSeconds</code> is used to determine how long to wait.		Integer
<code>camel.component.aws-sqs.configuration.redrive-policy</code>	Specify the policy that send message to DeadLetter queue. See detail at Amazon docs.		String
<code>camel.component.aws-sqs.configuration.region</code>	Specify the queue region which could be used with <code>queueOwnerAWSAccountId</code> to build the service URL.		String
<code>camel.component.aws-sqs.configuration.secret-key</code>	Amazon AWS Secret Key		String
<code>camel.component.aws-sqs.configuration.visibility-timeout</code>	The duration (in seconds) that the received messages are hidden from subsequent retrieve requests after being retrieved by a <code>ReceiveMessage</code> request to set in the <code>com.amazonaws.services.sqs.model.SetQueueAttributesRequest</code> . This only make sense if its different from <code>defaultVisibilityTimeout</code> . It changes the queue visibility timeout attribute permanently.		Integer
<code>camel.component.aws-sqs.configuration.wait-time-seconds</code>	Duration in seconds (0 to 20) that the <code>ReceiveMessage</code> action call will wait until a message is in the queue to include in the response.		Integer

Name	Description	Default	Type
<code>camel.component.aws-sqs.enabled</code>	Enable aws-sqs component	true	Boolean
<code>camel.component.aws-sqs.region</code>	Specify the queue region which could be used with <code>queueOwnerAWSAccountId</code> to build the service URL.		String
<code>camel.component.aws-sqs.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-sqs.secret-key</code>	Amazon AWS Secret Key		String

Required SQS component options

You have to provide the `amazonSQSClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SQS](#).

35.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

35.5. USAGE

35.5.1. Message headers set by the SQS producer

Header	Type	Description
<code>CamelAwsSqsMD5OfBody</code>	String	The MD5 checksum of the Amazon SQS message.
<code>CamelAwsSqsMessageId</code>	String	The Amazon SQS message ID.

Header	Type	Description
Camel AwsS qsDel aySec onds	Intege r	Since Camel 2.11 , the delay seconds that the Amazon SQS message can be see by others.

35.5.2. Message headers set by the SQS consumer

Header	Type	Description
Camel AwsS qsMD 5OfBo dy	String	The MD5 checksum of the Amazon SQS message.
Camel AwsS qsMes sageI d	String	The Amazon SQS message ID.
Camel AwsS qsRec eiptHa ndle	String	The Amazon SQS message receipt handle.
Camel AwsS qsMes sageA ttribut es	Map< String , String >	The Amazon SQS message attributes.

35.5.3. Advanced AmazonSQS configuration

If your Camel Application is running behind a firewall or if you need to have more control over the AmazonSQS instance configuration, you can create your own instance:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
```

```
AmazonSQS client = new AmazonSQSClient(awsCredentials, clientConfiguration);
registry.bind("client", client);
```

and refer to it in your Camel aws-sqs component configuration:

```
from("aws-sqs://MyQueue?amazonSQSClient=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

35.5.4. Creating or updating an SQS Queue

In the SQS Component, when an endpoint is started, a check is executed to obtain information about the existence of the queue or not. You're able to customize the creation through the QueueAttributeName mapping with the SQSConfiguration option.

```
from("aws-sqs://MyQueue?amazonSQSClient=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

In this example if the MyQueue queue is not already created on AWS, it will be created with default parameters from the SQS configuration. If it's already up on AWS, the SQS configuration options will be used to override the existent AWS configuration.

35.5.5. DelayQueue VS Delay for Single message

From 2.23.0 the component has a new option: delayQueue. When the option is set to true, the SQS Queue will be a DelayQueue with the DelaySeconds option as delay. For more information about DelayQueue you can read the [AWS SQS documentation](#). One important information to take into account is the following:

- For standard queues, the per-queue delay setting is not retroactive—changing the setting doesn't affect the delay of messages already in the queue.
- For FIFO queues, the per-queue delay setting is retroactive—changing the setting affects the delay of messages already in the queue.

as stated in the official documentation. If you want to specify a delay on single messages, you can ignore the delayQueue option, while you can set this option to true, if you need to add a fixed delay to all messages enqueued.

35.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.6 or higher).

35.7. JMS-STYLE SELECTORS

SQS does not allow selectors, but you can effectively achieve this by using the Camel Filter EIP and setting an appropriate **visibilityTimeout**. When SQS dispatches a message, it will wait up to the visibility timeout before it will try to dispatch the message to a different consumer unless a `DeleteMessage` is received. By default, Camel will always send the `DeleteMessage` at the end of the route, unless the route ended in failure. To achieve appropriate filtering and not send the `DeleteMessage` even on successful completion of the route, use a Filter:

```
from("aws-sqs://MyQueue?
amazonSQSClient=#client&defaultVisibilityTimeout=5000&deleteIfFiltered=false")
.filter("${header.login} == true")
.to("mock:result");
```

In the above code, if an exchange doesn't have an appropriate header, it will not make it through the filter AND also not be deleted from the SQS queue. After 5000 milliseconds, the message will become visible to other consumers.

CHAPTER 36. AWS SIMPLE WORKFLOW COMPONENT

Available as of Camel version 2.13

The Simple Workflow component supports managing workflows from [Amazon's Simple Workflow](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Simple Workflow. More information are available at [Amazon Simple Workflow](#).

36.1. URI FORMAT

```
aws-swf://<workflow/activity>[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

36.2. URI OPTIONS

The AWS Simple Workflow component supports 5 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The AWS SWF default configuration		SWFConfiguration
accessKey (common)	Amazon AWS Access Key.		String
secretKey (common)	Amazon AWS Secret Key.		String
region (common)	Amazon AWS Region.		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The AWS Simple Workflow endpoint is configured using URI syntax:

```
aws-swf:type
```

with the following path and query parameters:

36.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
type	Required Activity or workflow		String

36.2.2. Query Parameters (30 parameters):

Name	Description	Default	Type
amazonSWClient (common)	To use the given AmazonSimpleWorkflowClient as client		AmazonSimpleWorkflowClient
dataConverter (common)	An instance of <code>com.amazonaws.services.simpleworkflow.flow.DataConverter</code> to use for serializing/deserializing the data.		DataConverter
domainName (common)	The workflow domain to use.		String
eventName (common)	The workflow or activity event name to use.		String
region (common)	Amazon AWS Region.		String
version (common)	The workflow or activity event version to use.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
clientConfiguration Parameters (advanced)	To configure the ClientConfiguration using the key/values from the Map.		Map

Name	Description	Default	Type
startWorkflowOptions Parameters (advanced)	To configure the StartWorkflowOptions using the key/values from the Map.		Map
swClientParameters (advanced)	To configure the AmazonSimpleWorkflowClient using the key/values from the Map.		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
activityList (activity)	The list name to consume activities from.		String
activitySchedulingOptions (activity)	Activity scheduling options		ActivitySchedulingOptions
activityThreadPoolSize (activity)	Maximum number of threads in work pool for activity.	100	int
activityTypeExecution Options (activity)	Activity execution options		ActivityTypeExecutionOptions
activityTypeRegistration Options (activity)	Activity registration options		ActivityTypeRegistrationOptions
childPolicy (workflow)	The policy to use on child workflows when terminating a workflow.		String
executionStartTo Close Timeout (workflow)	Set the execution start to close timeout.	3600	String
operation (workflow)	Workflow operation	START	String
signalName (workflow)	The name of the signal to send to the workflow.		String
stateResultType (workflow)	The type of the result when a workflow state is queried.		String

Name	Description	Default	Type
taskStartToCloseTimeout (workflow)	Set the task start to close timeout.	600	String
terminationDetails (workflow)	Details for terminating a workflow.		String
terminationReason (workflow)	The reason for terminating a workflow.		String
workflowList (workflow)	The list name to consume workflows from.		String
workflowTypeRegistrationOptions (workflow)	Workflow registration options		WorkflowTypeRegistrationOptions
accessKey (security)	Amazon AWS Access Key.		String
secretKey (security)	Amazon AWS Secret Key.		String

36.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 32 options, which are listed below.

Name	Description	Default	Type
camel.component.aws-swf.access-key	Amazon AWS Access Key.		String
camel.component.aws-swf.configuration.access-key	Amazon AWS Access Key.		String
camel.component.aws-swf.configuration.activity-list	The list name to consume activities from.		String

Name	Description	Default	Type
<code>camel.component.aws-swf.configuration.activity-scheduling-options</code>	Activity scheduling options		ActivitySchedulingOptions
<code>camel.component.aws-swf.configuration.activity-thread-pool-size</code>	Maximum number of threads in work pool for activity.	100	Integer
<code>camel.component.aws-swf.configuration.activity-type-execution-options</code>	Activity execution options		ActivityTypeExecutionOptions
<code>camel.component.aws-swf.configuration.activity-type-registration-options</code>	Activity registration options		ActivityTypeRegistrationOptions
<code>camel.component.aws-swf.configuration.amazon-s-w-client</code>	To use the given AmazonSimpleWorkflowClient as client		AmazonSimpleWorkflowClient
<code>camel.component.aws-swf.configuration.child-policy</code>	The policy to use on child workflows when terminating a workflow.		String
<code>camel.component.aws-swf.configuration.client-configuration-parameters</code>	To configure the ClientConfiguration using the key/values from the Map.		Map
<code>camel.component.aws-swf.configuration.data-converter</code>	An instance of <code>com.amazonaws.services.simpleworkflow.flow.DataConverter</code> to use for serializing/deserializing the data.		DataConverter

Name	Description	Default	Type
<code>camel.component.aws-swf.configuration.domain-name</code>	The workflow domain to use.		String
<code>camel.component.aws-swf.configuration.event-name</code>	The workflow or activity event name to use.		String
<code>camel.component.aws-swf.configuration.execution-start-to-close-timeout</code>	Set the execution start to close timeout.	3600	String
<code>camel.component.aws-swf.configuration.operation</code>	Workflow operation	START	String
<code>camel.component.aws-swf.configuration.region</code>	Amazon AWS Region.		String
<code>camel.component.aws-swf.configuration.s-w-client-parameters</code>	To configure the AmazonSimpleWorkflowClient using the key/values from the Map.		Map
<code>camel.component.aws-swf.configuration.secret-key</code>	Amazon AWS Secret Key.		String
<code>camel.component.aws-swf.configuration.signal-name</code>	The name of the signal to send to the workflow.		String

Name	Description	Default	Type
<code>camel.component.aws-swf.configuration.start-workflow-options-parameters</code>	To configure the StartWorkflowOptions using the key/values from the Map.		Map
<code>camel.component.aws-swf.configuration.state-result-type</code>	The type of the result when a workflow state is queried.		String
<code>camel.component.aws-swf.configuration.task-start-to-close-timeout</code>	Set the task start to close timeout.	600	String
<code>camel.component.aws-swf.configuration.termination-details</code>	Details for terminating a workflow.		String
<code>camel.component.aws-swf.configuration.termination-reason</code>	The reason for terminating a workflow.		String
<code>camel.component.aws-swf.configuration.type</code>	Activity or workflow		String
<code>camel.component.aws-swf.configuration.version</code>	The workflow or activity event version to use.		String
<code>camel.component.aws-swf.configuration.workflow-list</code>	The list name to consume workflows from.		String

Name	Description	Default	Type
<code>camel.component.aws-swf.configuration.workflow-type-registration-options</code>	Workflow registration options		WorkflowType RegistrationOptions
<code>camel.component.aws-swf.enabled</code>	Enable aws-swf component	true	Boolean
<code>camel.component.aws-swf.region</code>	Amazon AWS Region.		String
<code>camel.component.aws-swf.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.aws-swf.secret-key</code>	Amazon AWS Secret Key.		String

Required SWF component options

You have to provide the `amazonSWClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's Simple Workflow Service](#).

36.4. USAGE

36.4.1. Message headers evaluated by the SWF Workflow Producer

A workflow producer allows interacting with a workflow. It can start a new workflow execution, query its state, send signals to a running workflow, or terminate and cancel it.

Header	Type	Description
Camel SWFOperation	String	The operation to perform on the workflow. Supported operations are: SIGNAL, CANCEL, TERMINATE, GET_STATE, START, DESCRIBE, GET_HISTORY.
Camel SWFWorkflowId	String	A workflow ID to use.

Header	Type	Description
Camel AwsD bKey Camel SWFR unId	String	A workflow run ID to use.
Camel SWFS tateRe sultTy pe	String	The type of the result when a workflow state is queried.
Camel SWFE ventN ame	String	The workflow or activity event name to use.
Camel SWFV ersion	String	The workflow or activity event version to use.
Camel SWFR eason	String	The reason for terminating a workflow.
Camel SWFD etails	String	Details for terminating a workflow.
Camel SWFC hildPo licy	String	The policy to use on child workflows when terminating a workflow.

36.4.2. Message headers set by the SWF Workflow Producer

Header	Type	Description
Camel SWFW orkflo wId	String	The workflow ID used or newly generated.

Header	Type	Description
Camel AwsD bKey Camel SWFR unId	String	The workflow run ID used or generated.

36.4.3. Message headers set by the SWF Workflow Consumer

A workflow consumer represents the workflow logic. When it is started, it will start polling workflow decision tasks and process them. In addition to processing decision tasks, a workflow consumer route, will also receive signals (send from a workflow producer) or state queries. The primary purpose of a workflow consumer is to schedule activity tasks for execution using activity producers. Actually activity tasks can be scheduled only from a thread started by a workflow consumer.

Header	Type	Description
Camel SWFA ction	String	Indicates what type is the current event: CamelSWFActionExecute, CamelSWFSignalReceivedAction or CamelSWFGetStateAction.
Camel SWFW orkflo wRepl aying	boole an	Indicates whether the current decision task is a replay or not.
Camel SWFW orkflo wStart Time	long	The time of the start event for this decision task.

36.4.4. Message headers set by the SWF Activity Producer

An activity producer allows scheduling activity tasks. An activity producer can be used only from a thread started by a workflow consumer ie, it can process synchronous exchanges started by a workflow consumer.

Header	Type	Description
Camel SWFE ventN ame	String	The activity name to schedule.

Header	Type	Description
Camel SWFV ersion	String	The activity version to schedule.

36.4.5. Message headers set by the SWF Activity Consumer

Header	Type	Description
Camel SWFT askTo ken	String	The task token that is required to report task completion for manually completed tasks.

36.4.6. Advanced amazonSWClient configuration

If you need more control over the AmazonSimpleWorkflowClient instance configuration you can create your own instance and refer to it from the URI:

The **#client** refers to a AmazonSimpleWorkflowClient in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleWorkflowClient client = new AmazonSimpleWorkflowClient(awsCredentials,
clientConfiguration);

registry.bind("client", client);
```

36.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.13 or higher).

AWS Component

CHAPTER 37. AWS XRAY COMPONENT

Available as of Camel 2.21

The camel-aws-xray component is used for tracing and timing incoming and outgoing Camel messages using [AWS XRay](#).

Events (subsegments) are captured for incoming and outgoing messages being sent to/from Camel.

37.1. DEPENDENCY

In order to include AWS XRay support into Camel, the archive containing the Camel related AWS XRay related classes need to be added to the project. In addition to that, AWS XRay libraries also need to be available.

To include both, AWS XRay and Camel, dependencies use the following Maven imports:

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>com.amazonaws</groupId>
      <artifactId>aws-xray-recorder-sdk-bom</artifactId>
      <version>1.3.1</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>

<dependencies>
  <dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws-xray</artifactId>
  </dependency>

  <dependency>
    <groupId>com.amazonaws</groupId>
    <artifactId>aws-xray-recorder-sdk-core</artifactId>
  </dependency>
  <dependency>
    <groupId>com.amazonaws</groupId>
    <artifactId>aws-xray-recorder-sdk-aws-sdk</artifactId>
  </dependency>
</dependencies>
```

37.2. CONFIGURATION

The configuration properties for the AWS XRay tracer are:

Option	Default	Description
addExcludePatterns		Sets exclude pattern(s) that will disable tracing for Camel messages that matches the pattern. The content is a Set<String> where the key is a pattern matching routeId's. The pattern uses the rules from Intercept.
setTracingStrategy	NoopTracingStrategy	Allows a custom Camel InterceptStrategy to be provided in order to track invoked processor definitions like BeanDefinition or ProcessDefinition . TraceAnnotatedTracingStrategy will track any classes invoked via .bean(...) or .process(...) that contain a @XRayTrace annotation at class level.

There is currently only one way an AWS XRay tracer can be configured to provide distributed tracing for a Camel application:

37.2.1. Explicit

Include the **camel-aws-xray** component in your POM, along with any specific dependencies associated with the AWS XRay Tracer.

To explicitly configure AWS XRay support, instantiate the **XRayTracer** and initialize the camel context. You can optionally specify a **Tracer**, or alternatively it can be implicitly discovered using the **Registry** or **ServiceLoader**.

```
XRayTracer xrayTracer = new XRayTracer();
// By default it uses a NoopTracingStrategy, but you can override it with a specific InterceptStrategy
// implementation.
xrayTracer.setTracingStrategy(...);
// And then initialize the context
xrayTracer.init(camelContext);
```

To use XRayTracer in XML, all you need to do is to define the AWS XRay tracer bean. Camel will automatically discover and use it.

```
<bean id="tracingStrategy" class="..."/>
<bean id="aws-xray-tracer" class="org.apache.camel.component.aws.xray.XRayTracer" />
  <property name="tracer" ref="tracingStrategy"/>
</bean>
```

In case of the default **NoopTracingStrategy** only the creation and deletion of exchanges is tracked but not the invocation of certain beans or EIP patterns.

37.2.2. Tracking of comprehensive route execution

In order to track the execution of an exchange among multiple routes, on exchange creation a unique trace ID is generated and stored in the headers if no corresponding value was yet available. This trace ID is copied over to new exchanges in order to keep a consistent view of the processed exchange.

As AWS XRay traces work on a thread-local basis the current sub/segment should be copied over to the new thread and set as explained in [in the AWS XRay documentation](#). The Camel AWS XRay component therefore provides an additional header field that the component will use in order to set the passed AWS XRay **Entity** to the new thread and thus keep the tracked data to the route rather than exposing a new segment which seems uncorrelated with any of the executed routes.

The component will use the following constants found in the headers of the exchange:

Header	Description
Camel-AWS-XRay-Trace-ID	Contains a reference to the AWS XRay TraceID object to provide a comprehensive view of the invoked routes
Camel-AWS-XRay-Trace-Entity	Contains a reference to the actual AWS XRay Segment or Subsegment which is copied over to the new thread. This header should be set in case a new thread is spawned and the performed tasks should be exposed as part of the executed route instead of creating a new unrelated segment.

Note that the AWS XRay **Entity** (i.e., **Segment** and **Subsegment**) are not serializable and therefore should not get passed to other JVM processes.

37.3. EXAMPLE

You can find an example demonstrating the way to configure AWS XRay tracing within the tests accompanying this project.

CHAPTER 38. CAMEL COMPONENTS FOR WINDOWS AZURE SERVICES

The Camel Components for [Windows Azure Services](#) provide connectivity to Azure services from Camel.

Azure Service	Camel Component	Camel Version	Component Description
Storage Blob Service	Azure-Blob	2.9.0	Supports storing and retrieving of blobs
Storage Queue Service	Azure-Queue	2.9.0	Supports storing and retrieving of messages in the queues

CHAPTER 39. AZURE STORAGE BLOB SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Blob component supports storing and retrieving the blobs to/from [Azure Storage Blob](#) service.

Prerequisites

You must have a valid Windows Azure Storage account. More information is available at [Azure Documentation Portal](#).

39.1. URI FORMAT

```
azure-blob://accountName/containerName[/blobName][?options]
```

In most cases a blobName is required and the blob will be created if it does not already exist. You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to download a blob content from the public block blob **blockBlob** located on the **container1** in the **camelazure** storage account, use the following snippet:

```
from("azure-blob://camelazure/container1/blockBlob").
to("file://blobdirectory");
```

39.2. URI OPTIONS

The Azure Storage Blob Service component has no options.

The Azure Storage Blob Service endpoint is configured using URI syntax:

```
azure-blob:containerOrBlobUri
```

with the following path and query parameters:

39.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
containerOrBlobUri	Required Container or Blob compact Uri		String

39.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
azureBlobClient (common)	The blob service client		CloudBlob
blobOffset (common)	Set the blob offset for the upload or download operations, default is 0	0	Long
blobType (common)	Set a blob type, 'blockblob' is default	blockblob	BlobType
closeStreamAfterRead (common)	Close the stream after read or keep it open, default is true	true	boolean
credentials (common)	Set the storage credentials, required in most cases		StorageCredentials
dataLength (common)	Set the data length for the download or page blob upload operations		Long
fileDir (common)	Set the file directory where the downloaded blobs will be saved to		String
publicForRead (common)	Storage resources can be public for reading their content, if this property is enabled then the credentials do not have to be set	false	boolean
streamReadSize (common)	Set the minimum read size in bytes when reading the blob content		int
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
blobMetadata (producer)	Set the blob meta-data		Map
blobPrefix (producer)	Set a prefix which can be used for listing the blobs		String
closeStreamAfterWrite (producer)	Close the stream after write or keep it open, default is true	true	boolean
operation (producer)	Blob service operation hint to the producer	listBlobs	BlobServiceOperations
streamWriteSize (producer)	Set the size of the buffer for writing block and page blocks		int
useFlatListing (producer)	Specify if the flat or hierarchical blob listing should be used	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

39.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.azure-blob.enabled	Enable azure-blob component	true	Boolean
camel.component.azure-blob.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Required Azure Storage Blob Service component options

You have to provide the containerOrBlob name and the credentials if the private blob needs to be accessed.

39.4. USAGE

39.4.1. Message headers evaluated by the Azure Storage Blob Service producer

Header	Type	Description

39.4.2. Message headers set by the Azure Storage Blob Service producer

Header	Type	Description
CamelFileName	String	The file name for the downloaded blob content.

39.4.3. Message headers set by the Azure Storage Blob Service producer consumer

Header	Type	Description
CamelFileName	String	The file name for the downloaded blob content.

39.4.4. Azure Blob Service operations

Operations common to all block types

Operation	Description
getBlob	Get the content of the blob. You can restrict the output of this operation to a blob range.
deleteBlob	Delete the blob.
listBlobs	List the blobs.

Block blob operations

Operation	Description
updateBlockBlob	Put block blob content that either creates a new block blob or overwrites the existing block blob content.

Operation	Description
uploadBlobBlocks	Upload block blob content, by first generating a sequence of blob blocks and then committing them to a blob. If you enable the message CommitBlockListLater property, you can execute the commit later with the commitBlobBlockList operation. You can later update individual block blobs.
commitBlobBlockList	Commit a sequence of blob blocks to the block list that you previously uploaded to the blob service (by using the updateBlockBlob operation with the message CommitBlockListLater property enabled).
getBlobBlockList	Get the block blob list.

Append blob operations

Operation	Description
createAppendBlob	Create an append block. By default, if the block already exists then it is not reset. Note that you can alternately create an append blob by enabling the message AppendBlobCreated property and using the updateAppendBlob operation.
updateAppendBlob	Append the new content to the blob. This operation also creates the blob if it does not already exist and if you enabled a message AppendBlobCreated property.

Page Block operations

Operation	Description
createPageBlob	Create a page block. By default, if the block already exists then it is not reset. Note that you can also create a page blob (and set its contents) by enabling a message PageBlobCreated property and by using the updatePageBlob operation.
updatePageBlob	Create a page block (unless you enable a message PageBlobCreated property and the identically named block already exists) and set the content of this blob.
resizePageBlob	Resize the page blob.
clearPageBlob	Clear the page blob.
getPageBlobRanges	Get the page blob page ranges.

39.4.5. Azure Blob Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Blob Client configuration, you can create your own instance:

```
StorageCredentials credentials = new StorageCredentialsAccountAndKey("camelazure", "thekey");  
CloudBlob client = new CloudBlob("camelazure", credentials);  
registry.bind("azureBlobClient", client);
```

and refer to it in your Camel azure-blob component configuration:

```
from("azure-blob:/camelazure/container1/blockBlob?azureBlobClient=#client")  
.to("mock:result");
```

39.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-azure</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.19.0 or higher).

39.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [Azure Component](#)

CHAPTER 40. AZURE STORAGE QUEUE SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Queue component supports storing and retrieving the messages to/from [Azure Storage Queue](#) service.

Prerequisites

You must have a valid Microsoft Azure account. More information is available at [Azure Portal](#).

40.1. URI FORMAT

```
azure-queue://accountName/queueName[?options]
```

The queue will be created if it does not already exist.

You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to get a message content from the queue **messageQueue** in the **camelazure** storage account and, use the following snippet:

```
from("azure-queue:/camelazure/messageQueue").
to("file://queuedirectory");
```

40.2. URI OPTIONS

The Azure Storage Queue Service component has no options.

The Azure Storage Queue Service endpoint is configured using URI syntax:

```
azure-queue:containerAndQueueUri
```

with the following path and query parameters:

40.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
containerAndQueueUri	Required Container Queue compact Uri		String

40.2.2. Query Parameters (10 parameters):

Name	Description	Default	Type
azureQueueClient (common)	The queue service client		CloudQueue
credentials (common)	Set the storage credentials, required in most cases		StorageCredentials
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
messageTimeToLive (producer)	Message Time To Live in seconds		int
messageVisibilityDelay (producer)	Message Visibility Delay in seconds		int
operation (producer)	Queue service operation hint to the producer	listQueues	QueueServiceOperations
queuePrefix (producer)	Set a prefix which can be used for listing the queues		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

40.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.azure-queue.enabled</code>	Enable azure-queue component	true	Boolean
<code>camel.component.azure-queue.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Required Azure Storage Queue Service component options

You have to provide the `containerAndQueue` URI and the credentials.

40.4. USAGE

40.4.1. Message headers evaluated by the Azure Storage Queue Service producer

Header	Type	Description

40.4.2. Message headers set by the Azure Storage Queue Service producer

Header	Type	Description

40.4.3. Message headers set by the Azure Storage Queue Service producer consumer

Header	Type	Description

40.4.4. Azure Queue Service operations

Operation	Description
<code>listQueues</code>	List the queues.

Operation	Description
createQueue	Create the queue.
deleteQueue	Delete the queue.
addMessage	Add a message to the queue.
retrieveMessage	Retrieve a message from the queue.
peekMessage	View the message inside the queue, for example, to determine whether the message arrived at the correct queue.
updateMessage	Update the message in the queue.
deleteMessage	Delete the message in the queue.

40.4.5. Azure Queue Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Queue Client configuration, you can create your own instance:

```
StorageCredentials credentials = new StorageCredentialsAccountAndKey("camelazure", "thekey");
CloudQueue client = new CloudQueue("camelazure", credentials);
registry.bind("azureQueueClient", client);
```

and refer to it in your Camel azure-queue component configuration:

```
from("azure-queue:/camelazure/messageQueue?azureQueueClient=#client")
.to("mock:result");
```

40.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-azure</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.19.0 or higher).

40.6. SEE ALSO

- [Getting Started](#)
- [Azure Component](#)

CHAPTER 41. BARCODE DATAFORMAT

Available as of Camel version 2.14

The barcode data format is based on the [zxing library](#). The goal of this component is to create a barcode image from a String (marshal) and a String from a barcode image (unmarshal). You're free to use all features that zxing offers.

41.1. DEPENDENCIES

To use the barcode data format in your camel routes you need to add the a dependency on **camel-barcode** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-barcode</artifactId>
  <version>x.x.x</version>
</dependency>
```

41.2. BARCODE OPTIONS

The Barcode dataformat supports 5 options, which are listed below.

Name	Default	Java Type	Description
width		Integer	Width of the barcode
height		Integer	Height of the barcode
imageType		String	Image type of the barcode such as png
barcodeFormat		String	Barcode format such as QR-Code
contentTypeHeader	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

41.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.barcode.barcode-format</code>	Barcode format such as QR-Code		String
<code>camel.dataformat.barcode.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.barcode.enabled</code>	Enable barcode dataformat	true	Boolean
<code>camel.dataformat.barcode.height</code>	Height of the barcode		Integer
<code>camel.dataformat.barcode.image-type</code>	Image type of the barcode such as png		String
<code>camel.dataformat.barcode.width</code>	Width of the barcode		Integer

ND

41.4. USING THE JAVA DSL

First you have to initialize the barcode data format class. You can use the default constructor, or one of parameterized (see JavaDoc). The default values are:

Parameter	Default Value
image type (BarcodeImageType)	PNG
width	100 px
height	100 px
encoding	UTF-8

Parameter	Default Value
barcode format (BarcodeFormat)	QR-Code

```
// QR-Code default
DataFormat code = new BarcodeDataFormat();
```

If you want to use zxing hints, you can use the 'addToHintMap' method of your BarcodeDataFormat instance:

```
code.addToHintMap(DecodeHintType.TRY_HARDER, Boolean.TRUE);
```

For possible hints, please consult the zxing documentation.

41.4.1. Marshalling

```
from("direct://code")
  .marshal(code)
  .to("file://barcode_out");
```

You can call the route from a test class with:

```
template.sendBody("direct://code", "This is a testmessage!");
```

You should find inside the 'barcode_out' folder this image:

41.4.2. Unmarshalling

The unmarshaller is generic. For unmarshalling you can use any BarcodeDataFormat instance. If you've two instances, one for (generating) QR-Code and one for PDF417, it doesn't matter which one will be used.

```
from("file://barcode_in?noop=true")
  .unmarshal(code) // for unmarshalling, the instance doesn't matter
  .to("mock:out");
```

If you'll paste the QR-Code image above into the 'barcode_in' folder, you should find 'This is a testmessage!' inside the mock. You can find the barcode data format as header variable:

Name	Type	Description
BarcodeFormat	String	Value of com.google.zxing.BarcodeFormat.

CHAPTER 42. BASE64 DATAFORMAT

Available as of Camel version 2.11

The Base64 data format is used for base64 encoding and decoding.

42.1. OPTIONS

The Base64 dataformat supports 4 options, which are listed below.

Name	Default	Java Type	Description
<code>lineLength</code>	76	Integer	To specific a maximum line length for the encoded data. By default 76 is used.
<code>lineSeparator</code>		String	The line separators to use. Uses new line characters (CRLF) by default.
<code>urlSafe</code>	false	Boolean	Instead of emitting " and '/' we emit '-' and '_' respectively. urlSafe is only applied to encode operations. Decoding seamlessly handles both modes. Is by default false.
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

42.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.base64.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.base64.enabled</code>	Enable base64 dataformat	true	Boolean
<code>camel.dataformat.base64.line-length</code>	To specific a maximum line length for the encoded data. By default 76 is used.	76	Integer

Name	Description	Default	Type
<code>camel.dataformat.base64.line-separator</code>	The line separators to use. Uses new line characters (CRLF) by default.		String
<code>camel.dataformat.base64.url-safe</code>	Instead of emitting " and '/' we emit '-' and '_' respectively. urlSafe is only applied to encode operations. Decoding seamlessly handles both modes. Is by default false.	false	Boolean

ND

In Spring DSL, you configure the data format using this tag:

```
<camelContext>
  <dataFormats>
    <!-- for a newline character (\n), use the HTML entity notation coupled with the ASCII code. -->
    <base64 lineSeparator="&#10;" id="base64withNewLine" />
    <base64 lineLength="64" id="base64withLineLength64" />
  </dataFormats>
  ...
</camelContext>
```

Then you can use it later by its reference:

```
<route>
  <from uri="direct:startEncode" />
  <marshal ref="base64withLineLength64" />
  <to uri="mock:result" />
</route>
```

Most of the time, you won't need to declare the data format if you use the default options. In that case, you can declare the data format inline as shown below.

42.3. MARSHAL

In this example we marshal the file content to base64 object.

```
from("file://data.bin")
  .marshal().base64()
  .to("jms://myqueue");
```

In Spring DSL:

```
<from uri="file://data.bin">
  <marshal>
    <base64/>
  </marshal>
  <to uri="jms://myqueue"/>
```

42.4. UNMARSHAL

In this example we unmarshal the payload from the JMS queue to a `byte[]` object, before its processed by the `newOrder` processor.

```
from("jms://queue/order")
    .unmarshal().base64()
    .process("newOrder");
```

In Spring DSL:

```
<from uri="jms://queue/order">
<unmarshal>
  <base64/>
</unmarshal>
<to uri="bean:newOrder"/>
```

42.5. DEPENDENCIES

To use Base64 in your Camel routes you need to add a dependency on **camel-base64** which implements this data format.

If you use Maven you can just add the following to your `pom.xml`:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-base64</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

CHAPTER 43. BEAN COMPONENT

Available as of Camel version 1.0

The **bean:** component binds beans to Camel message exchanges.

43.1. URI FORMAT

```
bean:beanName[?options]
```

Where **beanID** can be any string which is used to look up the bean in the Registry

43.2. OPTIONS

The Bean component supports 2 options, which are listed below.

Name	Description	Default	Type
cache (advanced)	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Bean endpoint is configured using URI syntax:

```
bean:beanName
```

with the following path and query parameters:

43.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
beanName	Required Sets the name of the bean to invoke		String

43.2.2. Query Parameters (5 parameters):

Name	Description	Default	Type
method (producer)	Sets the name of the method to invoke on the bean		String
cache (advanced)	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
multiParameterArray (advanced)	Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use.	false	boolean
parameters (advanced)	Used for configuring additional properties on the bean		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

43.3. USING

The object instance that is used to consume messages must be explicitly registered with the Registry. For example, if you are using Spring you must define the bean in the Spring configuration, **spring.xml**; or if you don't use Spring, by registering the bean in JNDI.

Error formatting macro: snippet: java.lang.IndexOutOfBoundsException: Index: 20, Size: 20

Once an endpoint has been registered, you can build Camel routes that use it to process exchanges.

A **bean:** endpoint cannot be defined as the input to the route; i.e. you cannot consume from it, you can only route from some inbound message Endpoint to the bean endpoint as output. So consider using a **direct:** or **queue:** endpoint as the input.

You can use the **createProxy()** methods on [ProxyHelper](#) to create a proxy that will generate BeanExchanges and send them to any endpoint:

And the same route using Spring DSL:

```
<route>
  <from uri="direct:hello">
    <to uri="bean:bye"/>
  </route>
```

43.4. BEAN AS ENDPOINT

Camel also supports invoking [Bean](#) as an Endpoint. In the route below:

What happens is that when the exchange is routed to the **myBean** Camel will use the Bean Binding to invoke the bean.

The source for the bean is just a plain POJO:

Camel will use Bean Binding to invoke the **sayHello** method, by converting the Exchange's In body to the **String** type and storing the output of the method on the Exchange Out body.

43.5. JAVA DSL BEAN SYNTAX

Java DSL comes with syntactic sugar for the [Bean](#) component. Instead of specifying the bean explicitly as the endpoint (i.e. `to("bean:beanName")`) you can use the following syntax:

```
// Send message to the bean endpoint  
// and invoke method resolved using Bean Binding.  
from("direct:start").beanRef("beanName");  
  
// Send message to the bean endpoint  
// and invoke given method.  
from("direct:start").beanRef("beanName", "methodName");
```

Instead of passing name of the reference to the bean (so that Camel will lookup for it in the registry), you can specify the bean itself:

```
// Send message to the given bean instance.  
from("direct:start").bean(new ExampleBean());  
  
// Explicit selection of bean method to be invoked.  
from("direct:start").bean(new ExampleBean(), "methodName");  
  
// Camel will create the instance of bean and cache it for you.  
from("direct:start").bean(ExampleBean.class);
```

43.6. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the **method** parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

- [Class](#) component

- Bean Binding
- Bean Integration

CHAPTER 44. BEANIO DATAFORMAT

Available as of Camel version 2.10

The BeanIO Data Format uses [BeanIO](#) to handle flat payloads (such as XML, CSV, delimited, or fixed length formats).

BeanIO is configured using a [mappings XML](#) file where you define the mapping from the flat format to Objects (POJOs). This mapping file is mandatory to use.

44.1. OPTIONS

The BeanIO dataformat supports 9 options, which are listed below.

Name	Default	Java Type	Description
mapping		String	The BeanIO mapping file. Is by default loaded from the classpath. You can prefix with file:, http:, or classpath: to denote from where to load the mapping file.
streamName		String	The name of the stream to use.
ignoreUnidentifiedRecords	false	Boolean	Whether to ignore unidentified records.
ignoreUnexpectedRecords	false	Boolean	Whether to ignore unexpected records.
ignoreInvalidRecords	false	Boolean	Whether to ignore invalid records.
encoding		String	The charset to use. Is by default the JVM platform default charset.
beanReaderErrorHandlerType		String	To use a custom <code>org.apache.camel.dataformat.beanio.BeanIOErrorHandler</code> as error handler while parsing. Configure the fully qualified class name of the error handler. Notice the options <code>ignoreUnidentifiedRecords</code> , <code>ignoreUnexpectedRecords</code> , and <code>ignoreInvalidRecords</code> may not be in use when you use a custom error handler.
unmarshalSingleObject	false	Boolean	This options controls whether to unmarshal as a list of objects or as a single object only. The former is the default mode, and the latter is only intended in special use-cases where beanio maps the Camel message to a single POJO bean.

Name	Default	Java Type	Description
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

44.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.beanio.bean-reader-error-handler-type</code>	To use a custom <code>org.apache.camel.dataformat.beanio.BeanIOErrorHandler</code> as error handler while parsing. Configure the fully qualified class name of the error handler. Notice the options <code>ignoreUnidentifiedRecords</code> , <code>ignoreUnexpectedRecords</code> , and <code>ignoreInvalidRecords</code> may not be in use when you use a custom error handler.		String
<code>camel.dataformat.beanio.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.beanio.enabled</code>	Enable beanio dataformat	true	Boolean
<code>camel.dataformat.beanio.encoding</code>	The charset to use. Is by default the JVM platform default charset.		String
<code>camel.dataformat.beanio.ignore-invalid-records</code>	Whether to ignore invalid records.	false	Boolean
<code>camel.dataformat.beanio.ignore-unexpected-records</code>	Whether to ignore unexpected records.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.beanio.ignore-unidentified-records</code>	Whether to ignore unidentified records.	false	Boolean
<code>camel.dataformat.beanio.mapping</code>	The BeanIO mapping file. Is by default loaded from the classpath. You can prefix with <code>file;</code> , <code>http;</code> , or <code>classpath:</code> to denote from where to load the mapping file.		String
<code>camel.dataformat.beanio.stream-name</code>	The name of the stream to use.		String
<code>camel.dataformat.beanio.unmarshal-single-object</code>	This options controls whether to unmarshal as a list of objects or as a single object only. The former is the default mode, and the latter is only intended in special use-cases where beanio maps the Camel message to a single POJO bean.	false	Boolean

ND

44.3. USAGE

An example of a [mapping file is here](#).

44.3.1. Using Java DSL

To use the **BeanIODataFormat** you need to configure the data format with the mapping file, as well the name of the stream.

In Java DSL this can be done as shown below. The streamName is "employeeFile".

Then we have two routes. The first route is for transforming CSV data into a `List<Employee>` Java objects. Which we then split, so the mock endpoint receives a message for each row.

The 2nd route is for the reverse operation, to transform a `List<Employee>` into a stream of CSV data.

The CSV data could for example be as below:

44.3.2. Using XML DSL

To use the BeanIO data format in XML, you need to configure it using the `<beanio>` XML tag as shown below. The routes is similar to the example above.

44.4. DEPENDENCIES

To use BeanIO in your Camel routes you need to add a dependency on **camel-beanio** which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-beanio</artifactId>  
  <version>2.10.0</version>  
</dependency>
```

CHAPTER 45. BEANSTALK COMPONENT

Available as of Camel version 2.15

camel-beanstalk project provides a Camel component for job retrieval and post-processing of Beanstalk jobs.

You can find the detailed explanation of Beanstalk job lifecycle at [Beanstalk protocol](#).

45.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-beanstalk</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.15.0 or higher).

45.2. URI FORMAT

```
beanstalk://[host[:port]]/[tube][?options]
```

You may omit either **port** or both **host** and **port**: for the Beanstalk defaults to be used ("localhost" and 11300). If you omit **tube**, Beanstalk component will use the tube with name "default".

When listening, you may probably want to watch for jobs from several tubes. Just separate them with plus sign, e.g.

```
beanstalk://localhost:11300/tube1+tube2
```

Tube name will be URL decoded, so if your tube names include special characters like + or ?, you need to URL-encode them appropriately, or use the RAW syntax, see [more details here](#).

By the way, you cannot specify several tubes when you are writing jobs into Beanstalk.

45.3. BEANSTALK OPTIONS

The Beanstalk component supports 2 options, which are listed below.

Name	Description	Default	Type
connectionSettingsFactory (common)	Custom ConnectionSettingsFactory. Specify which ConnectionSettingsFactory to use to make connections to Beanstalkd. Especially useful for unit testing without beanstalkd daemon (you can mock ConnectionSettings)		ConnectionSettingsFactory

Name	Description	Default	Type
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Beanstalk endpoint is configured using URI syntax:

```
beanstalk:connectionSettings
```

with the following path and query parameters:

45.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
connectionSettings	Connection settings host:port/tube		String

45.3.2. Query Parameters (26 parameters):

Name	Description	Default	Type
command (common)	put means to put the job into Beanstalk. Job body is specified in the Camel message body. Job ID will be returned in beanstalk.jobId message header. delete, release, touch or bury expect Job ID in the message header beanstalk.jobId. Result of the operation is returned in beanstalk.result message header kick expects the number of jobs to kick in the message body and returns the number of jobs actually kicked out in the message header beanstalk.result.		BeanstalkCommand
jobDelay (common)	Job delay in seconds.	0	int
jobPriority (common)	Job priority. (0 is the highest, see Beanstalk protocol)	1000	long
jobTimeToRun (common)	Job time to run in seconds. (when 0, the beanstalkd daemon raises it to 1 automatically, see Beanstalk protocol)	60	int

Name	Description	Default	Type
awaitJob (consumer)	Whether to wait for job to complete before ack the job from beanstalk	true	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
onFailure (consumer)	Command to use when processing failed.		BeanstalkCommand
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
useBlockIO (consumer)	Whether to use blockIO.	true	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int

Name	Description	Default	Type
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit

Name	Description	Default	Type
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean

45.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.beanstalk.connection-settings-factory	Custom <code>ConnectionSettingsFactory</code> . Specify which <code>ConnectionSettingsFactory</code> to use to make connections to Beanstalkd. Especially useful for unit testing without beanstalkd daemon (you can mock <code>ConnectionSettings</code>). The option is a <code>org.apache.camel.component.beanstalk.ConnectionSettingsFactory</code> type.		String
camel.component.beanstalk.enabled	Enable beanstalk component	true	Boolean
camel.component.beanstalk.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Producer behavior is affected by the **command** parameter which tells what to do with the job, it can be

The consumer may delete the job immediately after reserving it or wait until Camel routes process it. While the first scenario is more like a "message queue", the second is similar to "job queue". This behavior is controlled by **consumer.awaitJob** parameter, which equals **true** by default (following Beanstalkd nature).

When synchronous, the consumer calls **delete** on successful job completion and calls **bury** on failure. You can choose which command to execute in the case of failure by specifying **consumer.onFailure** parameter in the URI. It can take values of **bury**, **delete** or **release**.

There is a boolean parameter **consumer.useBlockIO** which corresponds to the same parameter in `JavaBeanstalkClient` library. By default it is **true**.

Be careful when specifying **release**, as the failed job will immediately become available in the same tube and your consumer will try to acquire it again. You can **release** and specify `jobDelay` though.

The beanstalk consumer is a Scheduled [Polling Consumer](#) which means there is more options you can configure, such as how frequent the consumer should poll. For more details see [Polling Consumer](#).

45.5. CONSUMER HEADERS

The consumer stores a number of job headers in the Exchange message:

Property	Type	Description
<code>beanstalk.jobId</code>	long	Job ID
<code>beanstalk.tube</code>	string	the name of the tube that contains this job
<code>beanstalk.state</code>	string	"ready" or "delayed" or "reserved" or "buried" (must be "reserved")
<code>beanstalk.priority</code>	long	the priority value set
<code>beanstalk.age</code>	int	the time in seconds since the put command that created this job
<code>beanstalk.time-left</code>	int	the number of seconds left until the server puts this job into the ready queue
<code>beanstalk.timeouts</code>	int	the number of times this job has timed out during a reservation
<code>beanstalk.releases</code>	int	the number of times a client has released this job from a reservation
<code>beanstalk.buries</code>	int	the number of times this job has been buried
<code>beanstalk.kicks</code>	int	the number of times this job has been kicked

45.6. EXAMPLES

This Camel component lets you both request the jobs for processing and supply them to Beanstalkd daemon. Our simple demo routes may look like

```
from("beanstalk:testTube").
  log("Processing job #${property.beanstalk.jobId} with body ${in.body}").
  process(new Processor() {
    @Override
    public void process(Exchange exchange) {
      // try to make integer value out of body
    }
  })
```

```
exchange.getIn().setBody( Integer.valueOf(exchange.getIn().getBody(classOf[String])) );  
    }  
}).  
log("Parsed job #${property.beanstalk.jobId} to body ${in.body}");
```

```
from("timer:dig?period=30seconds").  
    setBody(constant(10)).log("Kick ${in.body} buried/delayed tasks").  
    to("beanstalk:testTube?command=kick");
```

In the first route we are listening for new jobs in tube “testTube”. When they are arriving, we are trying to parse integer value from the message body. If done successful, we log it and this successful exchange completion makes Camel component to *delete* this job from Beanstalk automatically. Contrary, when we cannot parse the job data, the exchange failed and the Camel component *buries* it by default, so that it can be processed later or probably we are going to inspect failed jobs manually.

So the second route periodically requests Beanstalk to *kick* 10 jobs out of buried and/or delayed state to the normal queue.

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 46. BEAN VALIDATOR COMPONENT

Available as of Camel version 2.3

The Validator component performs bean validation of the message body using the Java Bean Validation API (JSR 303). Camel uses the reference implementation, which is [Hibernate Validator](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bean-validator</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

46.1. URI FORMAT

```
bean-validator:label[?options]
```

or

```
bean-validator://label[?options]
```

Where **label** is an arbitrary text value describing the endpoint.

You can append query options to the URI in the following format, ?option=value&option=value&...

46.2. URI OPTIONS

The Bean Validator component has no options.

The Bean Validator endpoint is configured using URI syntax:

```
bean-validator:label
```

with the following path and query parameters:

46.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
label	Required Where label is an arbitrary text value describing the endpoint	t	String

46.2.2. Query Parameters (6 parameters):

Name	Description	Default	Type
constraintValidatorFactory (producer)	To use a custom ConstraintValidatorFactory		ConstraintValidatorFactory
group (producer)	To use a custom validation group	javax.validation.groups.Default	String
messageInterpolator (producer)	To use a custom MessageInterpolator		MessageInterpolator
traversableResolver (producer)	To use a custom TraversableResolver		TraversableResolver
validationProviderResolver (producer)	To use a a custom ValidationProviderResolver		ValidationProviderResolver
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

46.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.bean-validator.enabled	Enable bean-validator component	true	Boolean
camel.component.bean-validator.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

46.4. OSGI DEPLOYMENT

To use Hibernate Validator in the OSGi environment use dedicated **ValidationProviderResolver** implementation, just as **org.apache.camel.component.bean.validator.HibernateValidationProviderResolver**. The snippet

below demonstrates this approach. Keep in mind that you can use **HibernateValidationProviderResolver** starting from the Camel 2.13.0.

Using HibernateValidationProviderResolver

```
from("direct:test").
  to("bean-validator://ValidationProviderResolverTest?
validationProviderResolver=#myValidationProviderResolver");

...

<bean id="myValidationProviderResolver"
class="org.apache.camel.component.bean.validator.HibernateValidationProviderResolver"/>
```

If no custom **ValidationProviderResolver** is defined and the validator component has been deployed into the OSGi environment, the **HibernateValidationProviderResolver** will be automatically used.

46.5. EXAMPLE

Assumed we have a java bean with the following annotations

Car.java

```
public class Car {

    @NotNull
    private String manufacturer;

    @NotNull
    @Size(min = 5, max = 14, groups = OptionalChecks.class)
    private String licensePlate;

    // getter and setter
}
```

and an interface definition for our custom validation group

OptionalChecks.java

```
public interface OptionalChecks {
}
```

with the following Camel route, only the **@NotNull** constraints on the attributes `manufacturer` and `licensePlate` will be validated (Camel uses the default group **javax.validation.groups.Default**).

```
from("direct:start")
.to("bean-validator://x")
.to("mock:end")
```

If you want to check the constraints from the group **OptionalChecks**, you have to define the route like this

```
from("direct:start")
.to("bean-validator://x?group=OptionalChecks")
.to("mock:end")
```

If you want to check the constraints from both groups, you have to define a new interface first

AllChecks.java

```
@GroupSequence({Default.class, OptionalChecks.class})
public interface AllChecks {
}
```

and then your route definition should look like this

```
from("direct:start")
.to("bean-validator://x?group=AllChecks")
.to("mock:end")
```

And if you have to provide your own message interpolator, traversable resolver and constraint validator factory, you have to write a route like this

```
<bean id="myMessageInterpolator" class="my.ConstraintValidatorFactory" />
<bean id="myTraversableResolver" class="my.TraversableResolver" />
<bean id="myConstraintValidatorFactory" class="my.ConstraintValidatorFactory" />

from("direct:start")
.to("bean-validator://x?group=AllChecks&messageInterpolator=#myMessageInterpolator
&traversableResolver=#myTraversableResolver&constraintValidatorFactory=#myConstraintValidatorFactory")
.to("mock:end")
```

It's also possible to describe your constraints as XML and not as Java annotations. In this case, you have to provide the file **META-INF/validation.xml** which could look like this

validation.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<validation-config
  xmlns="http://jboss.org/xml/ns/javax/validation/configuration"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/configuration">
  <default-provider>org.hibernate.validator.HibernateValidator</default-provider>
  <message-
interpolator>org.hibernate.validator.engine.ResourceBundleMessageInterpolator</message-
interpolator>
  <traversable-
resolver>org.hibernate.validator.engine.resolver.DefaultTraversableResolver</traversable-resolver>
  <constraint-validator-
factory>org.hibernate.validator.engine.ConstraintValidatorFactoryImpl</constraint-validator-factory>

  <constraint-mapping>/constraints-car.xml</constraint-mapping>
</validation-config>
```

and the **constraints-car.xml** file

constraints-car.xml

```

<?xml version="1.0" encoding="UTF-8"?>
<constraint-mappings xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/mapping validation-mapping-1.0.xsd"
  xmlns="http://jboss.org/xml/ns/javax/validation/mapping">
  <default-package>org.apache.camel.component.bean.validator</default-package>

  <bean class="CarWithoutAnnotations" ignore-annotations="true">
    <field name="manufacturer">
      <constraint annotation="javax.validation.constraints.NotNull" />
    </field>

    <field name="licensePlate">
      <constraint annotation="javax.validation.constraints.NotNull" />

      <constraint annotation="javax.validation.constraints.Size">
        <groups>
          <value>org.apache.camel.component.bean.validator.OptionalChecks</value>
        </groups>
        <element name="min">5</element>
        <element name="max">14</element>
      </constraint>
    </field>
  </bean>
</constraint-mappings>

```

Here is the XML syntax for the example route definition where **OrderedChecks** can be <https://github.com/apache/camel/blob/master/components/camel-bean-validator/src/test/java/org/apache/camel/component/bean/validator/OrderedChecks.java>

Note that the body should include an instance of a class to validate.

```

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-spring.xsd">

  <camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <route>
      <from uri="direct:start"/>
      <to uri="bean-validator://x?
group=org.apache.camel.component.bean.validator.OrderedChecks"/>
    </route>
  </camelContext>
</beans>

```

46.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 47. BINDING COMPONENT (DEPRECATED)

Available as of Camel version 2.11

In Camel terms a *binding* is a way of wrapping an Endpoint in a contract; such as a Data Format, a [Content Enricher](#) or validation step. Bindings are completely optional and you can choose to use them on any camel endpoint.

Bindings are inspired by the work of [SwitchYard project](#) adding service contracts to various technologies like Camel and many others. But rather than the SwitchYard approach of wrapping Camel in SCA, *Camel Bindings* provide a way of wrapping Camel endpoints with contracts inside the Camel framework itself; so you can use them easily inside any Camel route.

47.1. OPTIONS

The Binding component has no options.

The Binding endpoint is configured using URI syntax:

```
binding:bindingName:delegateUri
```

with the following path and query parameters:

47.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
bindingName	Required Name of the binding to lookup in the Camel registry.		String
delegateUri	Required Uri of the delegate endpoint.		String

47.1.2. Query Parameters (4 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

47.2. USING BINDINGS

A Binding is currently a bean which defines the contract (though we'll hopefully add bindings to the Camel DSL).

There are a few approaches to defining a bound endpoint (i.e. an endpoint bound with a Binding).

47.3. USING THE BINDING URI

You can prefix any endpoint URI with **binding:nameOfBinding:** where *nameOfBinding* is the name of the Binding bean in your registry.

```
from("binding:jaxb:activemq:myQueue").to("binding:jaxb:activemq:anotherQueue")
```

Here we are using the "jaxb" binding which may, for example, use the JAXB Data Format to marshal and unmarshal messages.

47.4. USING A BINDINGCOMPONENT

There is a Component called `BindingComponent` which can be configured in your Registry by dependency injection which allows the creation of endpoints which are already bound to some binding.

For example if you registered a new component called "jsonmq" in your registry using code like this

```
JacksonDataFormat format = new JacksonDataFormat(MyBean.class);
context.bind("jsonmq", new BindingComponent(new DataFormatBinding(format, "activemq:foo."));
```

Then you could use the endpoint as if it were any other endpoint.

```
from("jsonmq:myQueue").to("jsonmq:anotherQueue")
```

which would be using the queueus "foo.myQueue" and "foo.anotherQueue" and would use the given Jackson Data Format to marshal on and off the queue.

47.5. WHEN TO USE BINDINGS

If you only use an endpoint once in a single route; a binding may actually be more complex and more work than just using the 'raw' endpoint directly and using explicit marshalling and validation in the camel route as normal.

However bindings can help when you are composing many routes together; or using a single route as a 'template' that is configured input and output endpoints; bindings then provide a nice way to wrap up a contract and endpoint together.

Another good use case for bindings is when you are using many endpoints which use the same binding; rather than always having to mention a specific data format or validation rule, you can just use the `BindingComponent` to wrap the endpoints in the binding of your choice.

So bindings are a composition tool really; only use them when they make sense - the extra complexity may not be worth it unless you have lots of routes or endpoints.

CHAPTER 48. BINDY DATAFORMAT

Available as of Camel version 2.0

The goal of this component is to allow the parsing/binding of non-structured data (or to be more precise non-XML data) to/from Java Beans that have binding mappings defined with annotations. Using Bindy, you can bind data from sources such as :

- CSV records,
- Fixed-length records,
- FIX messages,
- or almost any other non-structured data

to one or many Plain Old Java Object (POJO). Bindy converts the data according to the type of the java property. POJOs can be linked together with one-to-many relationships available in some cases. Moreover, for data type like Date, Double, Float, Integer, Short, Long and BigDecimal, you can provide the pattern to apply during the formatting of the property.

For the BigDecimal numbers, you can also define the precision and the decimal or grouping separators.

Type	Format Type	Pattern example	Link
Date	DateFormat	dd-MM-yyyy	http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html
Decimal*	DecimalFormat	..##	http://java.sun.com/j2se/1.5.0/docs/api/java/text/DecimalFormat.html

Decimal* = Double, Integer, Float, Short, Long

Format supported

This first release only support comma separated values fields and key value pair fields (e.g. : FIX messages).

To work with camel-bindy, you must first define your model in a package (e.g. com.acme.model) and for each model class (e.g. Order, Client, Instrument, ...) add the required annotations (described hereafter) to the Class or field.

Multiple models

If you use multiple models, each model has to be placed in it's own package to prevent unpredictable results.

From **Camel 2.16** onwards this is no longer the case, as you can safely have multiple models in the same package, as you configure bindy using class names instead of package names now.

48.1. OPTIONS

The Bindy dataformat supports 5 options, which are listed below.

Name	Default	Java Type	Description
<code>type</code>		Bindy Type	Whether to use csv, fixed or key value pairs mode. The default value is either Csv or KeyValue depending on chosen dataformat.
<code>classType</code>		String	Name of model class to use.
<code>locale</code>		String	To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default
<code>unwrapSingleInstance</code>	true	Boolean	When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a java.util.List.
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

48.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.bindy-csv.class-type</code>	Name of model class to use.		String
<code>camel.dataformat.bindy-csv.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.bindy-csv.enabled</code>	Enable bindy-csv dataformat	true	Boolean

Name	Description	Default	Type
<code>camel.dataformat.bindy-csv.locale</code>	To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default		String
<code>camel.dataformat.bindy-csv.type</code>	Whether to use csv, fixed or key value pairs mode.		BindyType
<code>camel.dataformat.bindy-csv.unwrap-single-instance</code>	When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> .	true	Boolean
<code>camel.dataformat.bindy-fixed.class-type</code>	Name of model class to use.		String
<code>camel.dataformat.bindy-fixed.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.bindy-fixed.enabled</code>	Enable bindy-fixed dataformat	true	Boolean
<code>camel.dataformat.bindy-fixed.locale</code>	To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default		String
<code>camel.dataformat.bindy-fixed.type</code>	Whether to use csv, fixed or key value pairs mode.		BindyType
<code>camel.dataformat.bindy-fixed.unwrap-single-instance</code>	When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> .	true	Boolean
<code>camel.dataformat.bindy-kvp.class-type</code>	Name of model class to use.		String

Name	Description	Default	Type
<code>camel.dataformat.bindy-kvp.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.bindy-kvp.enabled</code>	Enable bindy-kvp dataformat	true	Boolean
<code>camel.dataformat.bindy-kvp.locale</code>	To configure a default locale to use, such as <code>us</code> for united states. To use the JVM platform default locale then use the name <code>default</code>		String
<code>camel.dataformat.bindy-kvp.type</code>	Whether to use csv, fixed or key value pairs mode.		BindyType
<code>camel.dataformat.bindy-kvp.unwrap-single-instance</code>	When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> .	true	Boolean

ND

48.3. ANNOTATIONS

The annotations created allow to map different concept of your model to the POJO like :

- Type of record (csv, key value pair (e.g. FIX message), fixed length ...),
- Link (to link object in another object),
- DataField and their properties (int, type, ...),
- KeyValuePairField (for key = value format like we have in FIX financial messages),
- Section (to identify header, body and footer section),
- OneToMany,
- BindyConverter (since 2.18.0),
- FormatFactories (since 2.18.0)

This section will describe them :

48.4. 1. CSVRECORD

The CsvRecord annotation is used to identified the root class of the model. It represents a record = a line of a CSV file and can be linked to several children model classes.

Annotation name	Record type	Level
CsvRecord	csv	Class

Parameter name	type	Info
separator	string	mandatory - can be ',' or ';' or 'anything'. The only whitespace character supported is tab (\t). No other whitespace characters (spaces) are not supported. This value is interpreted as a regular expression. If you want to use a sign which has a special meaning in regular expressions, e.g. the ' ' sign, than you have to mask it, like ' '
skipFirstLine	boolean	optional - default value = false - allow to skip the first line of the CSV file
crlf	string	optional - possible values = WINDOWS,UNIX,MAC, or custom; default value. WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s)
generateHeaderColumns	boolean	optional - default value = false - uses to generate the header columns of the CSV generates
autoSpanLine	boolean	Camel 2.13/2.12.2: optional - default value = false - if enabled then the last column is auto spanned to end of line, for example if its a comment, etc this allows the line to contain all characters, also the delimiter char.
isOrdered	boolean	optional - default value = false - allow to change the order of the fields when CSV is generated
quote	String	Camel 2.8.3/2.9: option - allow to specify a quote character of the fields when CSV is generated. This annotation is associated to the root class of the model and must be declared one time.
quoting	boolean	*Camel 2.11: optional - default value = false - Indicate if the values (and headers) must be quoted when marshaling when CSV is generated.

Parameter name	type	Info
endWithLineBreak	boolean	Camel 2.21: optional - default value = true - Indicate if the CSV generated file should end with a line break.

case 1 : separator = ','

The separator used to segregate the fields in the CSV record is ',' :

```
10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500,
USD,08-01-2009
```

```
@CsvRecord( separator = "," )
public Class Order {
}

```

case 2 : separator = ';' :

Compare to the previous case, the separator here is ';' instead of ',' :

```
10; J; Pauline; M; XD12345678; Fortis Dynamic 15/15; 2500; USD; 08-01-2009
```

```
@CsvRecord( separator = ";" )
public Class Order {
}

```

case 3 : separator = '|'

Compare to the previous case, the separator here is '|' instead of ',' :

```
10| J| Pauline| M| XD12345678| Fortis Dynamic 15/15| 2500| USD|
08-01-2009
```

```
@CsvRecord( separator = "\\|" )
public Class Order {
}

```

case 4 : separator = '\\,\\'

Applies for Camel 2.8.2 or older

When the field to be parsed of the CSV record contains ',' or ';' which is also used as separator, we would find another strategy to tell camel bindy how to handle this case. To define the field containing the data with a comma, you will

use simple or double quotes

as delimiter (e.g : '10', 'Street 10, NY', 'USA' or "10", "Street 10, NY", "USA").

Remark : In this case, the first and last character of the line which are a simple or double quotes will be removed by bindy

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15"
2500","USD","08-01-2009"
```

```
@CsvRecord( separator = "\",\"" )
public Class Order {

}
```

From **Camel 2.8.3/2.9** or **never** bindy will automatically detect if the record is enclosed with either single or double quotes and automatically remove those quotes when unmarshalling from CSV to Object. Therefore do **not** include the quotes in the separator, but simply do as below:

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15"
2500","USD","08-01-2009"
```

```
@CsvRecord( separator = "," )
public Class Order {

}
```

Notice that if you want to marshal from Object to CSV and use quotes, then you need to specify which quote character to use, using the **quote** attribute on the @CsvRecord as shown below:

```
@CsvRecord( separator = ",", quote = "\"" )
public Class Order {

}
```

case 5 : separator & skipfirstline

The feature is interesting when the client wants to have in the first line of the file, the name of the data fields :

order id, client id, first name, last name, isin code, instrument name, quantity, currency, date

To inform bindy that this first line must be skipped during the parsing process, then we use the attribute :

```
@CsvRecord(separator = ",", skipFirstLine = true)
public Class Order {

}
```

case 6 : generateHeaderColumns

To add at the first line of the CSV generated, the attribute generateHeaderColumns must be set to true in the annotation like this :

```
@CsvRecord( generateHeaderColumns = true )
public Class Order {

}
```

As a result, Bindy during the unmarshaling process will generate CSV like this :

order id, client id, first name, last name, isin code, instrument name, quantity, currency, date

```
10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500, USD,08-01-2009
```

case 7 : carriage return

If the platform where camel-bindy will run is not Windows but Macintosh or Unix, than you can change the crlf property like this. Three values are available : WINDOWS, UNIX or MAC

```
@CsvRecord(separator = ",", crlf="MAC")
public Class Order {

}
```

Additionally, if for some reason you need to add a different line ending character, you can opt to specify it using the crlf parameter. In the following example, we can end the line with a comma followed by the newline character:

```
@CsvRecord(separator = ",", crlf=",\n")
public Class Order {

}
```

case 8 : isOrdered

Sometimes, the order to follow during the creation of the CSV record from the model is different from the order used during the parsing. Then, in this case, we can use the attribute `isOrdered = true` to indicate this in combination with attribute 'position' of the `DataField` annotation.

```
@CsvRecord(isOrdered = true)
public Class Order {

    @DataField(pos = 1, position = 11)
    private int orderNr;

    @DataField(pos = 2, position = 10)
    private String clientNr;

}
```

Remark : `pos` is used to parse the file, stream while `positions` is used to generate the CSV

48.5. 2. LINK

The link annotation will allow to link objects together.

Annotation name	Record type	Level
Link	all	Class & Property

Parameter name	type	Info
linkType	LinkType	optional - by default the value is LinkType.oneToOne - so you are not obliged to mention it

Only one-to-one relation is allowed.

e.g : If the model Class Client is linked to the Order class, then use annotation Link in the Order class like this :

Property Link

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;
}
```

AND for the class Client :

Class Link

```
@Link
public class Client {

}
```

48.6. 3. DATAFIELD

The DataField annotation defines the property of the field. Each datafield is identified by its position in the record, a type (string, int, date, ...) and optionally of a pattern

Annotation name	Record type	Level
DataField	all	Property

Parameter name	type	Info
pos	int	mandatory - The input position of the field. digit number starting from 1 to ... - See the position parameter.
pattern	string	optional - default value = "" - will be used to format Decimal, Date,
length	int	optional - represents the length of the field for fixed length format
precision	int	optional - represents the precision to be used when the Decimal number will be formatted/parsed
pattern	string	optional - default value = "" - is used by the Java formatter (SimpleDateFormat by example) to format/validate data. If using pattern, then setting locale on bindy data format is recommended. Either set to a known locale such as "us" or use "default" to use platform default locale. Notice that "default" requires Camel 2.14/2.13.3/2.12.5.
position	int	optional - must be used when the position of the field in the CSV generated (output message) must be different compare to input position (pos). See the pos parameter.
required	boolean	optional - default value = "false"
trim	boolean	optional - default value = "false"
default Value	string	Camel 2.10: optional - default value = "" - defines the field's default value when the respective CSV field is empty/not available
implied Decimal Separator	boolean	Camel 2.11: optional - default value = "false" - Indicates if there is a decimal point implied at a specified location
length Pos	int	Camel 2.11: optional - can be used to identify a data field in a fixed-length record that defines the fixed length for this field
align	string	optional - default value = "R" - Align the text to the right or left within a fixed-length field. Use values 'R' or 'L'

Parameter name	type	Info
delimiter	string	Camel 2.11: optional - can be used to demarcate the end of a variable-length field within a fixed-length record

case 1 : pos

This parameter/attribute represents the position of the field in the csv record

Position

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 5)
    private String isinCode;

}
```

As you can see in this example the position starts at '1' but continues at '5' in the class Order. The numbers from '2' to '4' are defined in the class Client (see here after).

Position continues in another model class

```
public class Client {

    @DataField(pos = 2)
    private String clientNr;

    @DataField(pos = 3)
    private String firstName;

    @DataField(pos = 4)
    private String lastName;

}
```

case 2 : pattern

The pattern allows to enrich or validates the format of your data

Pattern

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;
```

```

@DataField(pos = 5)
private String isinCode;

@DataField(name = "Name", pos = 6)
private String instrumentName;

@DataField(pos = 7, precision = 2)
private BigDecimal amount;

@DataField(pos = 8)
private String currency;

// pattern used during parsing or when the date is created
@DataField(pos = 9, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

case 3 : precision

The precision is helpful when you want to define the decimal part of your number

Precision

```

@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;

    @DataField(pos = 5)
    private String isinCode;

    @DataField(name = "Name", pos = 6)
    private String instrumentName;

    @DataField(pos = 7, precision = 2)
    private BigDecimal amount;

    @DataField(pos = 8)
    private String currency;

    @DataField(pos = 9, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

```

case 4 : Position is different in output

The position attribute will inform bindy how to place the field in the CSV record generated. By default, the position used corresponds to the position defined with the attribute 'pos'. If the position is different (that means that we have an asymmetric process comparing marshaling from unmarshaling) than we can use 'position' to indicate this.

Here is an example

Position is different in output

```

@CsvRecord(separator = ",", isOrdered = true)
public class Order {

    // Positions of the fields start from 1 and not from 0

    @DataField(pos = 1, position = 11)
    private int orderNr;

    @DataField(pos = 2, position = 10)
    private String clientNr;

    @DataField(pos = 3, position = 9)
    private String firstName;

    @DataField(pos = 4, position = 8)
    private String lastName;

    @DataField(pos = 5, position = 7)
    private String instrumentCode;

    @DataField(pos = 6, position = 6)
    private String instrumentNumber;
}

```

This attribute of the annotation `@DataField` must be used in combination with attribute `isOrdered = true` of the annotation `@CsvRecord`

case 5 : required

If a field is mandatory, simply use the attribute 'required' setted to true

Required

```

@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 2, required = true)
    private String clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4, required = true)
    private String lastName;
}

```

If this field is not present in the record, than an error will be raised by the parser with the following information :

Some fields are missing (optional or mandatory), line :

case 6 : trim

If a field has leading and/or trailing spaces which should be removed before they are processed, simply use the attribute 'trim' setted to true

Trim

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1, trim = true)
    private int orderNr;

    @DataField(pos = 2, trim = true)
    private Integer clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4)
    private String lastName;
}
```

case 7 : defaultValue

If a field is not defined then uses the value indicated by the defaultValue attribute

Default value

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 2)
    private Integer clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4, defaultValue = "Barin")
    private String lastName;
}
```

This attribute is only applicable to optional fields.

48.7. 4. FIXEDLENGTHRECORD

The FixedLengthRecord annotation is used to identified the root class of the model. It represents a record = a line of a file/message containing data fixed length formatted and can be linked to several children model classes. This format is a bit particular beause data of a field can be aligned to the right or to the left.

When the size of the data does not fill completely the length of the field, we can then add 'padd' characters.

Annotation name	Record type	Level
FixedLengthRecord	fixed	Class

Parameter name	type	Info
crlf	string	optional - possible values = WINDOWS,UNIX,MAC, or custom; default value. WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s). This option is used only during marshalling, whereas unmarshalling uses system default JDK provided line delimiter unless eol is customized
eol	string	optional - default="" which is empty string. Character to be used to process considering end of line after each record while unmarshalling (optional - default = "" which help default JDK provided line delimiter to be used unless any other line delimiter provided). This option is used only during unmarshalling, where marshalling uses system default provided line delimiter as "WINDOWS" unless any other value is provided
paddingChar	char	mandatory - default value = ' '
length	int	mandatory = size of the fixed length record
hasHeader	boolean	Camel 2.11 - optional - Indicates that the record(s) of this type may be preceded by a single header record at the beginning of the file / stream
hasFooter	boolean	Camel 2.11 - optional - Indicates that the record(s) of this type may be followed by a single footer record at the end of the file / stream
skipHeader	boolean	Camel 2.11 - optional - Configures the data format to skip marshalling / unmarshalling of the header record. Configure this parameter on the primary record (e.g., not the header or footer).
skipFooter	boolean	Camel 2.11 - optional - Configures the data format to skip marshalling / unmarshalling of the footer record Configure this parameter on the primary record (e.g., not the header or footer)..
isHeader	boolean	Camel 2.11 - optional - Identifies this FixedLengthRecord as a header record
isFooter	boolean	Camel 2.11 - optional - Identifies this FixedLengthRecords as a footer record

Parameter name	type	Info
ignoreTrailingChars	boolean	Camel 2.11.1 - optional - Indicates that characters beyond the last mapped field can be ignored when unmarshalling / parsing. This annotation is associated to the root class of the model and must be declared one time.

The hasHeader/hasFooter parameters are mutually exclusive with isHeader/isFooter. A record may not be both a header/footer and a primary fixed-length record.

case 1: Simple fixed length record

This simple example shows how to design the model to parse/format a fixed message

```
10A9PaulineMISINXD12345678BUYShare2500.45USD01-08-2009
```

Fixed-simple

```
@FixedLengthRecord(length=54, paddingChar=' ')
public static class Order {

    @DataField(pos = 1, length=2)
    private int orderNr;

    @DataField(pos = 3, length=2)
    private String clientNr;

    @DataField(pos = 5, length=7)
    private String firstName;

    @DataField(pos = 12, length=1, align="L")
    private String lastName;

    @DataField(pos = 13, length=4)
    private String instrumentCode;

    @DataField(pos = 17, length=10)
    private String instrumentNumber;

    @DataField(pos = 27, length=3)
    private String orderType;

    @DataField(pos = 30, length=5)
    private String instrumentType;

    @DataField(pos = 35, precision = 2, length=7)
    private BigDecimal amount;

    @DataField(pos = 42, length=3)
    private String currency;
```

```

    @DataField(pos = 45, length=10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

```

case 2 : Fixed length record with alignment and padding

This more elaborated example show how to define the alignment for a field and how to assign a padding character which is ' ' here"

```
10A9 PaulineM ISINXD12345678BUYShare2500.45USD01-08-2009
```

Fixed-padding-align

```

@DataFieldRecord(length=60, paddingChar=' ')
public static class Order {

    @DataField(pos = 1, length=2)
    private int orderNr;

    @DataField(pos = 3, length=2)
    private String clientNr;

    @DataField(pos = 5, length=9)
    private String firstName;

    @DataField(pos = 14, length=5, align="L") // align text to the LEFT zone of the block
    private String lastName;

    @DataField(pos = 19, length=4)
    private String instrumentCode;

    @DataField(pos = 23, length=10)
    private String instrumentNumber;

    @DataField(pos = 33, length=3)
    private String orderType;

    @DataField(pos = 36, length=5)
    private String instrumentType;

    @DataField(pos = 41, precision = 2, length=7)
    private BigDecimal amount;

    @DataField(pos = 48, length=3)
    private String currency;

    @DataField(pos = 51, length=10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

```

case 3 : Field padding

Sometimes, the default padding defined for record cannot be applied to the field as we have a number format where we would like to padd with '0' instead of ' '. In this case, you can use in the model the attribute `paddingField` to set this value.

```
10A9 PaulineM ISINXD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-padding-field

```
@FixedLengthRecord(length = 65, paddingChar = ' ')
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    @DataField(pos = 5, length = 9)
    private String firstName;

    @DataField(pos = 14, length = 5, align = "L")
    private String lastName;

    @DataField(pos = 19, length = 4)
    private String instrumentCode;

    @DataField(pos = 23, length = 10)
    private String instrumentNumber;

    @DataField(pos = 33, length = 3)
    private String orderType;

    @DataField(pos = 36, length = 5)
    private String instrumentType;

    @DataField(pos = 41, precision = 2, length = 12, paddingChar = '0')
    private BigDecimal amount;

    @DataField(pos = 53, length = 3)
    private String currency;

    @DataField(pos = 56, length = 10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}
```

case 4: Fixed length record with delimiter

Fixed-length records sometimes have delimited content within the record. The firstName and lastName fields are delimited with the '^' character in the following example:

```
10A9Pauline^M^ISINXD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-delimited

```
@FixedLengthRecord()
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;
```

```

@DataField(pos = 2, length = 2)
private String clientNr;

@DataField(pos = 3, delimiter = "^")
private String firstName;

@DataField(pos = 4, delimiter = "^")
private String lastName;

@DataField(pos = 5, length = 4)
private String instrumentCode;

@DataField(pos = 6, length = 10)
private String instrumentNumber;

@DataField(pos = 7, length = 3)
private String orderType;

@DataField(pos = 8, length = 5)
private String instrumentType;

@DataField(pos = 9, precision = 2, length = 12, paddingChar = '0')
private BigDecimal amount;

@DataField(pos = 10, length = 3)
private String currency;

@DataField(pos = 11, length = 10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

As of **Camel 2.11** the 'pos' value(s) in a fixed-length record may optionally be defined using ordinal, sequential values instead of precise column numbers.

case 5 : Fixed length record with record-defined field length

Occasionally a fixed-length record may contain a field that define the expected length of another field within the same record. In the following example the length of the instrumentNumber field value is defined by the value of instrumentNumberLen field in the record.

```
10A9Pauline^M^ISIN10XD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-delimited

```

@FixedLengthRecord()
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, delimiter = "^")

```

```

private String firstName;

@DataField(pos = 4, delimiter = "^")
private String lastName;

@DataField(pos = 5, length = 4)
private String instrumentCode;

@DataField(pos = 6, length = 2, align = "R", paddingChar = '0')
private int instrumentNumberLen;

@DataField(pos = 7, lengthPos=6)
private String instrumentNumber;

@DataField(pos = 8, length = 3)
private String orderType;

@DataField(pos = 9, length = 5)
private String instrumentType;

@DataField(pos = 10, precision = 2, length = 12, paddingChar = '0')
private BigDecimal amount;

@DataField(pos = 11, length = 3)
private String currency;

@DataField(pos = 12, length = 10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

case 6 : Fixed length record with header and footer

Bindy will discover fixed-length header and footer records that are configured as part of the model – provided that the annotated classes exist either in the same package as the primary `@FixedLengthRecord` class, or within one of the configured scan packages. The following text illustrates two fixed-length records that are bracketed by a header record and footer record.

```

101-08-2009

9000000002

```

Fixed-header-and-footer-main-class

```

@FixedLengthRecord(hasHeader = true, hasFooter = true)
public class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, length = 9)
    private String firstName;
}

```

```

@DataField(pos = 4, length = 5, align = "L")
private String lastName;

@DataField(pos = 5, length = 4)
private String instrumentCode;

@DataField(pos = 6, length = 10)
private String instrumentNumber;

@DataField(pos = 7, length = 3)
private String orderType;

@DataField(pos = 8, length = 5)
private String instrumentType;

@DataField(pos = 9, precision = 2, length = 12, paddingChar = '0')
private BigDecimal amount;

@DataField(pos = 10, length = 3)
private String currency;

@DataField(pos = 11, length = 10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

@FixedLengthRecord(isHeader = true)
public class OrderHeader {
    @DataField(pos = 1, length = 1)
    private int recordType = 1;

    @DataField(pos = 2, length = 10, pattern = "dd-MM-yyyy")
    private Date recordDate;
}

@FixedLengthRecord(isFooter = true)
public class OrderFooter {

    @DataField(pos = 1, length = 1)
    private int recordType = 9;

    @DataField(pos = 2, length = 9, align = "R", paddingChar = '0')
    private int numberOfRecordsInTheFile;
}

```

case 7 : Skipping content when parsing a fixed length record. (Camel 2.11.1)

It is common to integrate with systems that provide fixed-length records containing more information than needed for the target use case. It is useful in this situation to skip the declaration and parsing of those fields that we do not need. To accommodate this, Bindy will skip forward to the next mapped field within a record if the 'pos' value of the next declared field is beyond the cursor position of the last parsed field. Using absolute 'pos' locations for the fields of interest (instead of ordinal values) causes Bindy to skip content between two fields.

Similarly, it is possible that none of the content beyond some field is of interest. In this case, you can tell Bindy to skip parsing of everything beyond the last mapped field by setting the `ignoreTrailingChars` property on the `@FixedLengthRecord` declaration.

```
@FixedLengthRecord(ignoreTrailingChars = true)
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    // any characters that appear beyond the last mapped field will be ignored

}
```

48.8. 5. MESSAGE

The Message annotation is used to identify the class of your model who will contain key value pairs fields. This kind of format is used mainly in Financial Exchange Protocol Messages (FIX). Nevertheless, this annotation can be used for any other format where data are identified by keys. The key pair values are separated each other by a separator which can be a special character like a tab delimiter (unicode representation : `\u0009`) or a start of heading (unicode representation : `\u0001`)

```
*"FIX information"*
```

More information about FIX can be found on this web site : <http://www.fixprotocol.org/>. To work with FIX messages, the model must contain a Header and Trailer classes linked to the root message class which could be a Order class. This is not mandatory but will be very helpful when you will use camel-bindy in combination with camel-fix which is a Fix gateway based on quickFix project <http://www.quickfixj.org/>.

Annota tion name	Record type	Level
Messa ge	key value pair	Class

Param eter name	type	Info
pairSep arator	string	mandatory - can be '=' or ';' or 'anything'

Parameter name	type	Info
keyValuePairSeparator	string	mandatory - can be '\u0001', '\u0009', '#' or 'anything'
crlf	string	optional - possible values = WINDOWS,UNIX,MAC, or custom; default value = WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s)
type	string	optional - define the type of message (e.g. FIX, EMX, ...)
version	string	optional - version of the message (e.g. 4.1)
isOrdered	boolean	optional - default value = false - allow to change the order of the fields when FIX message is generated. This annotation is associated to the message class of the model and must be declared one time.

case 1: separator = '\u0001'

The separator used to segregate the key value pair fields in a FIX message is the ASCII '01' character or in unicode format '\u0001'. This character must be escaped a second time to avoid a java runtime error. Here is an example :

```
8=FIX.4.1 9=20 34=1 35=0 49=INVMGR 56=BRKR 1=BE.CHM.001 11=CHM0001-01
22=4 ...
```

and how to use the annotation

FIX - message

```
@Message(keyValuePairSeparator = "=", pairSeparator = "\u0001", type="FIX", version="4.1")
public class Order {
}
}
```

Look at test cases

The ASCII character like tab, ... cannot be displayed in WIKI page. So, have a look to the test case of camel-bindy to see exactly how the FIX message looks like (src\test\data\fix\fix.txt) and the Order, Trailer, Header classes (src\test\java\org\apache\camel\dataformat\bindy\model\fix\simple\Order.java)

48.9. 6. KEYVALUEPAIRFIELD

The `KeyValuePairField` annotation defines the property of a key value pair field. Each `KeyValuePairField` is identified by a tag (= key) and its value associated, a type (string, int, date, ...), optionally a pattern and if the field is required

Annotation name	Record type	Level
KeyValuePairField	Key Value Pair - FIX	Property

Parameter name	type	Info
tag	int	mandatory - digit number identifying the field in the message - must be unique
pattern	string	optional - default value = "" - will be used to format Decimal, Date, ...
precision	int	optional - digit number - represents the precision to be used when the Decimal number will be formatted/parsed
position	int	optional - must be used when the position of the key/tag in the FIX message must be different
required	boolean	optional - default value = "false"
impliedDecimalSeparator	boolean	Camel 2.11: optional - default value = "false" - Indicates if there is a decimal point implied at a specified location

case 1: tag

This parameter represents the key of the field in the message

FIX message - Tag

```
@Message(keyValuePairSeparator = "=", pairSeparator = "\u0001", type="FIX", version="4.1")
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1) // Client reference
    private String Account;
```

```

    @KeyValuePairField(tag = 11) // Order reference
    private String ClOrdId;

    @KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
    private String IDSource;

    @KeyValuePairField(tag = 48) // Fund code
    private String SecurityId;

    @KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
    private String Side;

    @KeyValuePairField(tag = 58) // Free text
    private String Text;
}

```

case 2 : Different position in output

If the tags/keys that we will put in the FIX message must be sorted according to a predefined order, then use the attribute 'position' of the annotation `@KeyValuePairField`

FIX message - Tag - sort

```

@Message(keyValuePairSeparator = "=", pairSeparator = "\\u0001", type = "FIX", version = "4.1",
isOrdered = true)
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1, position = 1) // Client reference
    private String account;

    @KeyValuePairField(tag = 11, position = 3) // Order reference
    private String clOrdId;
}

```

48.10. 7. SECTION

In FIX message of fixed length records, it is common to have different sections in the representation of the information : header, body and section. The purpose of the annotation `@Section` is to inform bindy about which class of the model represents the header (= section 1), body (= section 2) and footer (= section 3)

Only one attribute/parameter exists for this annotation.

Annota tion name	Record type	Level
------------------------	----------------	-------

Annota tion name	Record type	Level
Section	FIX	Class

Parameter name	type	Info
number	int	digit number identifying the section position

case 1: Section

Definition of the header section

FIX message - Section - Header

```
@Section(number = 1)
public class Header {

    @KeyValuePairField(tag = 8, position = 1) // Message Header
    private String beginString;

    @KeyValuePairField(tag = 9, position = 2) // Checksum
    private int bodyLength;
}
```

Definition of the body section

FIX message - Section - Body

```
@Section(number = 2)
@Message(keyValuePairSeparator = "=", pairSeparator = "\\u0001", type = "FIX", version = "4.1",
isOrdered = true)
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1, position = 1) // Client reference
    private String account;

    @KeyValuePairField(tag = 11, position = 3) // Order reference
    private String clOrdId;
}
```

Definition of the footer section

FIX message - Section - Footer

■

```

@Section(number = 3)
public class Trailer {

    @KeyValuePairField(tag = 10, position = 1)
    // CheckSum
    private int checkSum;

    public int getCheckSum() {
        return checkSum;
    }
}

```

48.11. 8. ONETOMANY

The purpose of the annotation `@OneToMany` is to allow to work with a **List<?>** field defined a POJO class or from a record containing repetitive groups.

Restrictions OneToMany

Be careful, the one to many of bindy does not allow to handle repetitions defined on several levels of the hierarchy

The relation `OneToMany` ONLY WORKS in the following cases :

- Reading a FIX message containing repetitive groups (= group of tags/keys)
- Generating a CSV with repetitive data

Annotation name	Record type	Level
OneToMany	all	property

Parameter name	type	Info
mappedTo	string	optional - string - class name associated to the type of the List<Type of the Class>

case 1: Generating CSV with repetitive data

Here is the CSV output that we want :

```

Claus,Ibsen,Camel in Action 1,2010,35
Claus,Ibsen,Camel in Action 2,2012,35
Claus,Ibsen,Camel in Action 3,2013,35
Claus,Ibsen,Camel in Action 4,2014,35

```

Remark : the repetitive data concern the title of the book and its publication date while first, last name and age are common

and the classes used to modeling this. The Author class contains a List of Book.

Generate CSV with repetitive data

```
@CsvRecord(separator=",")
public class Author {

    @DataField(pos = 1)
    private String firstName;

    @DataField(pos = 2)
    private String lastName;

    @OneToMany
    private List<Book> books;

    @DataField(pos = 5)
    private String Age;
}

public class Book {

    @DataField(pos = 3)
    private String title;

    @DataField(pos = 4)
    private String year;
}
```

Very simple isn't it !!!

case 2 : Reading FIX message containing group of tags/keys

Here is the message that we would like to process in our model :

```
8=FIX 4.19=2034=135=049=INVMGR56=BRKR
1=BE.CHM.00111=CHM0001-0158=this is a camel - bindy test
22=448=BE000124567854=1
22=548=BE000987654354=2
22=648=BE000999999954=3
10=220
```

tags 22, 48 and 54 are repeated

and the code

Reading FIX message containing group of tags/keys

```
public class Order {

    @Link Header header;

    @Link Trailer trailer;
```

```

@KeyValuePairField(tag = 1) // Client reference
private String account;

@KeyValuePairField(tag = 11) // Order reference
private String clOrdId;

@KeyValuePairField(tag = 58) // Free text
private String text;

@OneToMany(mappedTo =
"org.apache.camel.dataformat.bindy.model.fix.complex.onetomany.Security")
List<Security> securities;
}

public class Security {

@KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
private String idSource;

@KeyValuePairField(tag = 48) // Fund code
private String securityCode;

@KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
private String side;
}

```

48.12. 9. BINDYCONVERTER

The purpose of the annotation `@BindyConverter` is define a converter to be used on field level. The provided class must implement the `Format` interface.

```

@FixedLengthRecord(length = 10, paddingChar = ' ')
public static class DataModel {
@DataField(pos = 1, length = 10, trim = true)
@BindyConverter(CustomConverter.class)
public String field1;
}

public static class CustomConverter implements Format<String> {
@Override
public String format(String object) throws Exception {
return (new StringBuilder(object)).reverse().toString();
}

@Override
public String parse(String string) throws Exception {
return (new StringBuilder(string)).reverse().toString();
}
}

```

48.13. 10. FORMATFACTORIES

The purpose of the annotation `@FormatFactories` is to define a set of converters at record-level. The provided classes must implement the `FormatFactoryInterface` interface.

```

@CsvRecord(separator = ",")
@FormatFactories({OrderNumberFormatFactory.class})
public static class Order {

    @DataField(pos = 1)
    private OrderNumber orderNr;

    @DataField(pos = 2)
    private String firstName;
}

public static class OrderNumber {
    private int orderNr;

    public static OrderNumber ofString(String orderNumber) {
        OrderNumber result = new OrderNumber();
        result.orderNr = Integer.valueOf(orderNumber);
        return result;
    }
}

public static class OrderNumberFormatFactory extends AbstractFormatFactory {

    {
        supportedClasses.add(OrderNumber.class);
    }

    @Override
    public Format<?> build(FormattingOptions formattingOptions) {
        return new Format<OrderNumber>() {
            @Override
            public String format(OrderNumber object) throws Exception {
                return String.valueOf(object.orderNr);
            }

            @Override
            public OrderNumber parse(String string) throws Exception {
                return OrderNumber.ofString(string);
            }
        };
    }
}

```

48.14. SUPPORTED DATATYPES

The `DefaultFormatFactory` makes formatting of the following datatype available by returning an instance of the interface `FormatFactoryInterface` based on the provided `FormattingOptions`:

- `BigDecimal`
- `BigInteger`

- Boolean
- Byte
- Character
- Date
- Double
- Enums
- Float
- Integer
- LocalDate (java 8, since 2.18.0)
- LocalDateTime (java 8, since 2.18.0)
- LocalTime (java 8, since 2.18.0)
- Long
- Short
- String

The `DefaultFormatFactory` can be overridden by providing an instance of `FactoryRegistry` in the registry in use (e.g. spring or JNDI).

48.15. USING THE JAVA DSL

The next step consists in instantiating the `DataFormat` *bindy* class associated with this record type and providing Java package name(s) as parameter.

For example the following uses the class **`BindyCsvDataFormat`** (who correspond to the class associated with the CSV record type) which is configured with **`com.acme.model`** package name to initialize the model objects configured in this package.

```
// Camel 2.15 or older (configure by package name)
DataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
DataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);
```

48.15.1. Setting locale

Bindy supports configuring the locale on the dataformat, such as

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
```

```
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("us");
```

Or to use the platform default locale then use "default" as the locale name. Notice this requires Camel 2.14/2.13.3/2.12.5.

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("default");
```

for older releases you can set it using Java code as shown

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale(Locale.getDefault().getISO3Country());
```

48.15.2. Unmarshaling

```
from("file://inbox")
    .unmarshal(bindy)
    .to("direct:handleOrders");
```

Alternatively, you can use a named reference to a data format which can then be defined in your Registry e.g. your Spring XML file:

```
from("file://inbox")
    .unmarshal("myBindyDataFormat")
    .to("direct:handleOrders");
```

The Camel route will pick-up files in the inbox directory, unmarshall CSV records into a collection of model objects and send the collection to the route referenced by 'handleOrders'.

The collection returned is a **List of Map** objects. Each Map within the list contains the model objects that were marshalled out of each line of the CSV. The reason behind this is that *each line can correspond to more than one object*. This can be confusing when you simply expect one object to be returned per line.

Each object can be retrieve using its class name.

```
List<Map<String, Object>> unmarshaledModels = (List<Map<String, Object>>)
exchange.getIn().getBody();

int modelCount = 0;
for (Map<String, Object> model : unmarshaledModels) {
    for (String className : model.keySet()) {
        Object obj = model.get(className);
```

```

    LOG.info("Count : " + modelCount + ", " + obj.toString());
  }
  modelCount++;
}

LOG.info("Total CSV records received by the csv bean : " + modelCount);

```

Assuming that you want to extract a single Order object from this map for processing in a route, you could use a combination of a Splitter and a Processor as per the following:

```

from("file://inbox")
  .unmarshal(bindy)
  .split(body())
  .process(new Processor() {
    public void process(Exchange exchange) throws Exception {
      Message in = exchange.getIn();
      Map<String, Object> modelMap = (Map<String, Object>) in.getBody();
      in.setBody(modelMap.get(Order.class.getCanonicalName()));
    }
  })
  .to("direct:handleSingleOrder")
  .end();

```

Take care of the fact that Bindy uses CHARSET_NAME property or the CHARSET_NAME header as define in the Exchange interface to do a charset conversion of the inputstream received for unmarshalling. In some producers (e.g. file-endpoint) you can define a charset. The charset conversion can already been done by this producer. Sometimes you need to remove this property or header from the exchange before sending it to the unmarshal. If you don't remove it the conversion might be done twice which might lead to unwanted results.

```

from("file://inbox?charset=Cp922")
  .removeProperty(Exchange.CHARSET_NAME)
  .unmarshal("myBindyDataFormat")
  .to("direct:handleOrders");

```

48.15.3. Marshaling

To generate CSV records from a collection of model objects, you create the following route :

```

from("direct:handleOrders")
  .marshal(bindy)
  .to("file://outbox")

```

48.16. USING SPRING XML

This is really easy to use Spring as your favorite DSL language to declare the routes to be used for camel-bindy. The following example shows two routes where the first will pick-up records from files, unmarshal the content and bind it to their model. The result is then send to a pojo (doing nothing special) and place them into a queue.

The second route will extract the pojoes from the queue and marshal the content to generate a file containing the csv record. The example above is for using Camel 2.16 onwards.

spring dsl

```

<?xml version="1.0" encoding="UTF-8"?>

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans.xsd
    http://camel.apache.org/schema/spring
    http://camel.apache.org/schema/spring/camel-spring.xsd">

  <!-- Queuing engine - ActiveMq - work locally in mode virtual memory -->
  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="brokerURL" value="vm://localhost:61616"/>
  </bean>

  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <dataFormats>
      <bindy id="bindyDataformat" type="Csv" classType="org.apache.camel.bindy.model.Order"/>
    </dataFormats>

    <route>
      <from uri="file://src/data/csv/?noop=true" />
      <unmarshal ref="bindyDataformat" />
      <to uri="bean:csv" />
      <to uri="activemq:queue:in" />
    </route>

    <route>
      <from uri="activemq:queue:in" />
      <marshal ref="bindyDataformat" />
      <to uri="file://src/data/csv/out/" />
    </route>
  </camelContext>
</beans>

```

NOTE

Please verify that your model classes implements serializable otherwise the queue manager will raise an error

48.17. DEPENDENCIES

To use Bindy in your camel routes you need to add the a dependency on **camel-bindy** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```

<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bindy</artifactId>
  <version>x.x.x</version>
</dependency>

```

CHAPTER 49. USING OSGI BLUEPRINT WITH CAMEL

A custom XML namespace for Blueprint has been created to let you leverage the nice XML dialect. Given Blueprint custom namespaces are not standardized yet, this namespace can only be used on the Apache Aries Blueprint implementation, which is the one used by Apache Karaf.

49.1. OVERVIEW

The XML schema is mostly the same as the one for Spring, so all the xml snippets throughout the documentation referring to Spring XML also apply to Blueprint routes.

Here is a very simple route definition using blueprint:

```
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0">
  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <route>
      <from uri="timer:test" />
      <to uri="log:test" />
    </route>
  </camelContext>
</blueprint>
```

There are a few limitations at this point about the supported xml elements (compared to the Spring xml syntax):

- beanPostProcessor are specific to Spring and aren't allowed

However, using blueprint when you deploy your applications in an OSGi environment has several advantages:

- when upgrading to a new camel version, you don't have to change the namespace, as the correct version will be selected based on the camel packages that are imported by your bundle
- no startup ordering issue with respect to the custom namespaces and your bundles
- you can use Blueprint property placeholders

49.2. USING CAMEL-BLUEPRINT

To leverage camel-blueprint in OSGi, you only need the Aries Blueprint bundle and the camel-blueprint bundle, in addition to camel-core and its dependencies.

If you use Karaf, you can use the feature named camel-blueprint which will install all the required bundles.

CHAPTER 50. BONITA COMPONENT

Available as of Camel version 2.19

Used for communicating with a remote Bonita BPM process engine.

50.1. URI FORMAT

```
bonita://[operation]?[options]
```

Where **operation** is the specific action to perform on Bonita.

50.2. GENERAL OPTIONS

The Bonita component has no options.

The Bonita endpoint is configured using URI syntax:

```
bonita:operation
```

with the following path and query parameters:

50.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
operation	Required Operation to use		BonitaOperation

50.2.2. Query Parameters (9 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
hostname (consumer)	Hostname where Bonita engine runs	localhost	String
port (consumer)	Port of the server hosting Bonita engine	8080	String

Name	Description	Default	Type
processName (consumer)	Name of the process involved in the operation		String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
password (security)	Password to authenticate to Bonita engine.		String
username (security)	Username to authenticate to Bonita engine.		String

50.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.bonita.enabled	Enable bonita component	true	Boolean
camel.component.bonita.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

50.4. BODY CONTENT

For the `startCase` operation, the input variables are retrieved from the body message. This one has to contains a `Map<String,Serializable>`.

50.5. EXAMPLES

The following example start a new case in Bonita:

```
from("direct:start").to("bonita:startCase?  
hostname=localhost&port=8080&processName=TestProcess&username=install&pa  
ssword=install")
```

50.6. DEPENDENCIES

To use Bonita in your Camel routes you need to add a dependency on **camel-bonita**, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-bonita</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 51. BOON DATAFORMAT

Available as of Camel version 2.16

Boon is a Data Format which uses the [Boon JSON](#) marshalling library to unmarshal an JSON payload into Java objects or to marshal Java objects into an JSON payload. Boon aims to be a simple and [fast parser](#) than other common parsers currently used.

51.1. OPTIONS

The Boon dataformat supports 3 options, which are listed below.

Name	Default	Java Type	Description
<code>unmarshalTypeName</code>		String	Class name of the java type to use when unarmshalling
<code>useList</code>	false	Boolean	To unarmshal to a List of Map or a List of Pojo.
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

51.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.boon.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.boon.enabled</code>	Enable boon dataformat	true	Boolean
<code>camel.dataformat.boon.unmarshal-type-name</code>	Class name of the java type to use when unarmshalling		String
<code>camel.dataformat.boon.use-list</code>	To unarmshal to a List of Map or a List of Pojo.	false	Boolean

ND

51.3. USING THE JAVA DSL

```
DataFormat boonDataFormat = new BoonDataFormat("com.acme.model.Person");  
  
from("activemq:My.Queue")  
  .unmarshal(boonDataFormat)  
  .to("mqseries:Another.Queue");
```

51.4. USING BLUEPRINT XML

```
<bean id="boonDataFormat" class="org.apache.camel.component.boon.BoonDataFormat">  
  <argument value="com.acme.model.Person"/>  
</bean>  
  
<camelContext id="camel" xmlns="http://camel.apache.org/schema/blueprint">  
  <route>  
    <from uri="activemq:My.Queue"/>  
    <unmarshal ref="boonDataFormat"/>  
    <to uri="mqseries:Another.Queue"/>  
  </route>  
</camelContext>
```

51.5. DEPENDENCIES

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-boon</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 52. BOX COMPONENT

Available as of Camel version 2.14

The Box component provides access to all of the Box.com APIs accessible using <https://github.com/box/box-java-sdk>. It allows producing messages to upload and download files, create, edit, and manage folders, etc. It also supports APIs that allow polling for updates to user accounts and even changes to enterprise accounts, etc.

Box.com requires the use of OAuth2.0 for all client application authentication. In order to use camel-box with your account, you'll need to create a new application within Box.com at <https://developer.box.com>. The Box application's client id and secret will allow access to Box APIs which require a current user. A user access token is generated and managed by the API for an end user.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-box</artifactId>
  <version>${camel-version}</version>
</dependency>
```

52.1. CONNECTION AUTHENTICATION TYPES

The Box component supports three different types of authenticated connections.

52.1.1. Standard Authentication

Standard Authentication uses the **OAuth 2.0 three-legged authentication process** to authenticate its connections with Box.com. This type of authentication enables Box **managed users** and **external users** to access, edit, and save their Box content through the Box component.

52.1.2. App Enterprise Authentication

App Enterprise Authentication uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as a **Service Account** for a **Box Application**. This type of authentication enables a service account to access, edit, and save the Box content of its **Box Application** through the Box component.

52.1.3. App User Authentication

App User Authentication uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as an **App User** for a **Box Application**. This type of authentication enables app users to access, edit, and save their Box content in its **Box Application** through the Box component.

52.2. BOX OPTIONS

The Box component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		BoxConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Box endpoint is configured using URI syntax:

```
box:apiName/methodName
```

with the following path and query parameters:

52.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		BoxApiName
methodName	Required What sub operation to use for the selected operation		String

52.2.2. Query Parameters (20 parameters):

Name	Description	Default	Type
clientId (common)	Box application client ID		String
enterpriseId (common)	The enterprise ID to use for an App Enterprise.		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
userId (common)	The user ID to use for an App User.		String

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
httpParams (advanced)	Custom HTTP params for settings like proxy host		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
accessTokenCache (security)	Custom Access Token Cache for storing and retrieving access tokens.		IAccessTokenCache
clientSecret (security)	Box application client secret		String
encryptionAlgorithm (security)	The type of encryption algorithm for JWT. Supported Algorithms: RSA_SHA_256 RSA_SHA_384 RSA_SHA_512	RSA_SHA_256	EncryptionAlgorithm
maxCacheEntries (security)	The maximum number of access tokens in cache.	100	int
authenticationType (authentication)	The type of authentication for connection. Types of Authentication: STANDARD_AUTHENTICATION - OAuth 2.0 (3-legged) SERVER_AUTHENTICATION - OAuth 2.0 with JSON Web Tokens	APP_USER_AUTHENTICATION	String
privateKeyFile (security)	The private key for generating the JWT signature.		String

Name	Description	Default	Type
privateKeyPassword (security)	The password for the private key.		String
publicKeyId (security)	The ID for public key for validating the JWT signature.		String
sslContextParameters (security)	To configure security using SSLContextParameters.		SSLContextParameters
userName (security)	Box user name, MUST be provided		String
userPassword (security)	Box user password, MUST be provided if authSecureStorage is not set, or returns null on first call		String

52.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
camel.component.box.configuration.access-token-cache	Custom Access Token Cache for storing and retrieving access tokens.		IAccessTokenCache
camel.component.box.configuration.api-name	What kind of operation to perform		BoxApiName
camel.component.box.configuration.authentication-type	The type of authentication for connection. Types of Authentication: STANDARD_AUTHENTICATION - OAuth 2.0 (3-legged) SERVER_AUTHENTICATION - OAuth 2.0 with JSON Web Tokens	APP_USER_AUTHENTICATION	String
camel.component.box.configuration.client-id	Box application client ID		String
camel.component.box.configuration.client-secret	Box application client secret		String

Name	Description	Default	Type
<code>camel.component.box.configuration.enterprise-id</code>	The enterprise ID to use for an App Enterprise.		String
<code>camel.component.box.configuration.http-params</code>	Custom HTTP params for settings like proxy host		Map
<code>camel.component.box.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.box.configuration.private-key-file</code>	The private key for generating the JWT signature.		String
<code>camel.component.box.configuration.private-key-password</code>	The password for the private key.		String
<code>camel.component.box.configuration.public-key-id</code>	The ID for public key for validating the JWT signature.		String
<code>camel.component.box.configuration.ssl-context-parameters</code>	To configure security using SSLContextParameters.		SSLContextParameters
<code>camel.component.box.configuration.user-id</code>	The user ID to use for an App User.		String
<code>camel.component.box.configuration.user-name</code>	Box user name, MUST be provided		String
<code>camel.component.box.configuration.user-password</code>	Box user password, MUST be provided if authSecureStorage is not set, or returns null on first call		String
<code>camel.component.box.enabled</code>	Enable box component	true	Boolean

Name	Description	Default	Type
<code>camel.component.box.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

52.4. URI FORMAT

`box:apiName/methodName`

apiName can be one of:

- collaborations
- comments
- event-logs
- files
- folders
- groups
- events
- search
- tasks
- users

52.5. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI **MUST** contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options **MUST** be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelBox.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelBox.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of Box API errors the endpoint will throw a `RuntimeCamelException` with a `com.box.sdk.BoxAPIException` derived exception cause.

52.5.1. Endpoint Prefix *collaborations*

For more information on Box collaborations see <https://developer.box.com/reference#collaboration-object>. The following endpoints can be invoked with the prefix **collaborations** as follows:

```
box:collaborations/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
addFolderCollaboration	add	folderId, collaborator, role	com.box.sdk.BoxCollaboration
addFolderCollaborationByEmail	addByEmail	folderId, email, role	com.box.sdk.BoxCollaboration
deleteCollaboration	delete	collaborationId	
getFolderCollaborations	collaborations	folderId	java.util.Collection
getPendingCollaborations	pendingCollaborations		java.util.Collection
getCollaborationInfo	info	collaborationId	com.box.sdk.BoxCollaboration.Info
updateCollaborationInfo	updateInfo	collaborationId, info	com.box.sdk.BoxCollaboration

URI Options for *collaborations*

Name	Type
collaborationId	String
collaborator	com.box.sdk.BoxCollaborator
role	com.box.sdk.BoxCollaboration.Role
folderId	String
email	String
info	com.box.sdk.BoxCollaboration.Info

52.5.2. Endpoint Prefix *comments*

For more information on Box comments see <https://developer.box.com/reference#comment-object>. The following endpoints can be invoked with the prefix **comments** as follows:

box:comments/endpoint?[options]

Endpoint	Shorthand and Alias	Options	Result Body Type
addFileComment	add	fileId, message	com.box.sdk.BoxFile
changeCommentMessage	updateMessage	commentId, message	com.box.sdk.BoxComment
deleteComment	delete	commentId	
getCommentInfo	info	commentId	com.box.sdk.BoxComment.Info
getFileComments	comments	fileId	java.util.List

Endpoint	Shorthand and Alias	Options	Result Body Type
replyToComment	reply	commentId, message	com.box.sdk.BoxComment

URI Options for *collaborations*

Name	Type
commentId	String
fileId	String
message	String

52.5.3. Endpoint Prefix *events-logs*

For more information on Box event logs see <https://developer.box.com/reference#events>. The following endpoints can be invoked with the prefix **event-logs** as follows:

```
box:event-logs/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
getEnterpriseEvents	events	position, after, before, [types]	java.util.List

URI Options for *event-logs*

Name	Type
position	String
after	Date

Name	Type
before	Date
types	com.box.sdk.BoxEvent.Types[]

52.5.4. Endpoint Prefix *files*

For more information on Box files see <https://developer.box.com/reference#file-object>. The following endpoints can be invoked with the prefix **files** as follows.

`box:files/endpoint?[options]`

Endpoint	Shorthand and Alias	Options	Result Body Type
uploadFile	upload	parentFolderId, content, fileName, [created], [modified], [size], [listener]	com.box.sdk.BoxFile
downloadFile	download	fileId, output, [rangeStart], [rangeEnd], [listener]	java.io.OutputStream
copyFile	copy	fileId, destinationFolderId, [newName]	com.box.sdk.BoxFile

Endpoint	Shorthand and Alias	Options	Result Body Type
moveFile	move	fileId, destinationFolderId, [newName]	com.box.sdk.BoxFile
renameFile	rename	fileId, newFileName	com.box.sdk.BoxFile
createFileSharedLink	link	fileId, access, [unshareDate], [permissions]	com.box.sdk.BoxSharedLink
deleteFile	delete	fileId	
uploadNewFileVersion	uploadVersion	fileId, fileContent, [modified], [fileSize], [listener]	com.box.sdk.BoxFile
promoteFileVersion	promoteVersion	fileId, version	com.box.sdk.BoxFileVersion
getFileVersions	versions	fileId	java.util.Collection
downloadPreviousFileVersions	downloadVersion	fileId, version, output, [listener]	java.io.OutputStream

Endpoint	Shorthand and Alias	Options	Result Body Type
delete FileVersion	delete Version	fileId, version	
getFileInfo	info	fileId, fields	com.box.sdk.BoxFile.Info
update FileInfo	updateInfo	fileId, info	com.box.sdk.BoxFile
create FileMetadata	create Metadata	fileId, metadata, [typeName]	com.box.sdk.Metadata
getFileMetadata	metadata	fileId, [typeName]	com.box.sdk.Metadata
update FileMetadata	update Metadata	fileId, metadata	com.box.sdk.Metadata
delete FileMetadata	delete Metadata	fileId	
getDownloadUrl	url	fileId	java.net.URL
getPreviewLink	preview	fileId	java.net.URL

Endpoint	Shorthand and Alias	Options	Result Body Type
getFileThumbnail	thumbnail	fileId, fileType, minWidth, minHeight, maxWidth, maxHeight	byte[]

URI Options for *files*

Name	Type
parentFolderId	String
content	java.io.InputStream
fileName	String
created	Date
modified	Date
size	Long
listener	com.box.sdk.ProgressListener
output	java.io.OutputStream
rangeStart	Long
rangeEnd	Long

Name	Type
outputStreams	java.io.OutputStream[]
destinationFolderId	String
newName	String
fields	String[]
info	com.box.sdk.BoxFile.Info
fileSize	Long
version	Integer
access	com.box.sdk.BoxSharedLink.Access
unshareDate	Date
permissions	com.box.sdk.BoxSharedLink.Permissions
fileType	com.box.sdk.BoxFile.ThumbnailFileType
minWidth	Integer
minHeight	Integer
maxWidth	Integer
maxHeight	Integer
metadata	com.box.sdk.Metadata

Name	Type
typeName	String

52.5.5. Endpoint Prefix *folders*

For more information on Box folders see <https://developer.box.com/reference#folder-object>. The following endpoints can be invoked with the prefix **folders** as follows.

```
box:folders/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
getRootFolder	root		com.box.sdk.BoxFolder
createFolder	create	parentFolderId, folderName	com.box.sdk.BoxFolder
createFolder	create	parentFolderId, path	com.box.sdk.BoxFolder
copyFolder	copy	folderId, destinationFolderId, [newName]	com.box.sdk.BoxFolder
moveFolder	move	folderId, destinationFolderId, newName	com.box.sdk.BoxFolder
renameFolder	rename	folderId, newFolderName	com.box.sdk.BoxFolder

Endpoint	Shorthand and Alias	Options	Result Body Type
create Folder Shared Link	link	folderId, access, [unsharedDate], [permissions]	java.util.List
delete Folder	delete	folderId	
getFolder	folder	path	com.box.sdk.BoxFolder
getFolderInfo	info	folderId, fields	com.box.sdk.BoxFolder.Info
getFolderItems	items	folderId, offset, limit, fields	java.util.List
update FolderInfo	updateInfo	folderId, info	com.box.sdk.BoxFolder

URI Options for *folders*

Name	Type
path	String[]
folderId	String
offset	Long
limit	Long
fields	String[]

Name	Type
parentFolderId	String
folderName	String
destinationFolderId	String
newName	String
newFolderName	String
info	String
access	com.box.sdk.BoxSharedLink.Access
unshareDate	Date
permissions	com.box.sdk.BoxSharedLink.Permissions

52.5.6. Endpoint Prefix *groups*

For more information on Box groups see <https://developer.box.com/reference#group-object>. The following endpoints can be invoked with the prefix **groups** as follows:

```
box:groups/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
----------	---------------------	---------	------------------

Endpoint	Shorthand and Alias	Options	Result Body Type
create Group	create	name, [provenance, externalSyncldentifier, description, invitabilityLevel, memberViewabilityLevel]	com.box.sdk.BoxGroup
addGroupMembership	create Membership	groupId, userId, role	com.box.sdk.BoxGroupMembership
delete Group	delete	groupId	
getAllGroups	groups		java.util.Collection
getGroupInfo	info	groupId	com.box.sdk.BoxGroup.Info
updateGroupInfo	updateInfo	groupId, groupInfo	com.box.sdk.BoxGroup
addGroupMembership	addMembership	groupId, userId, role	com.box.sdk.BoxGroupMembership
deleteGroupMembership	delete Membership	groupMembershipId	

Endpoint	Shorthand and Alias	Options	Result Body Type
getGroupMemberships	memberships	groupId	java.util.Collection
getGroupMembershipInfo	membershipInfo	groupMembershipId	com.box.sdk.BoxGroup.Info
updateGroupMembershipInfo	updateMembershipInfo	groupMembershipId, info	com.box.sdk.BoxGroupMembership

URI Options for *groups*

Name	Type
name	String
groupId	String
userId	String
role	com.box.sdk.BoxGroupMembership.Role
groupMembershipId	String
info	com.box.sdk.BoxGroupMembership.Info

52.5.7. Endpoint Prefix *search*

For more information on Box search API see <https://developer.box.com/reference#searching-for-content>. The following endpoints can be invoked with the prefix **search** as follows:

```
box:search/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
search Folder	search	folderId, query	java.util.Collection

URI Options for *search*

Name	Type
folderId	String
query	String

52.5.8. Endpoint Prefix *tasks*

For information on Box tasks see <https://developer.box.com/reference#task-object-1>. The following endpoints can be invoked with the prefix **tasks** as follows:

```
box:tasks/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
addFile Task	add	fileId, action, dueAt, [message]	com.box.sdk.BoxUser
delete Task	delete	taskId	
getFile Tasks	tasks	fileId	java.util.List
getTaskInfo	info	taskId	com.box.sdk.BoxTask.Info
updateTaskInfo	updateInfo	taskId, info	com.box.sdk.BoxTask

Endpoint	Shorthand and Alias	Options	Result Body Type
addAssignmentToTask	addAssignment	taskId, assignTo	com.box.sdk.BoxTask
deleteTaskAssignment	deleteAssignment	taskId	
getTaskAssignments	assignments	taskId	java.util.List
getTaskAssignmentInfo	assignmentInfo	taskId	com.box.sdk.BoxTaskAssignment.Info

URI Options for *tasks*

Name	Type
fileId	String
action	com.box.sdk.BoxTask.Action
dueAt	Date
message	String
taskId	String
info	com.box.sdk.BoxTask.Info
assignTo	com.box.sdk.BoxUser
taskId	String

52.5.9. Endpoint Prefix *users*

For information on Box users see <https://developer.box.com/reference#user-object>. The following endpoints can be invoked with the prefix **users** as follows:

box:users/endpoint?[options]

Endpoint	Shorthand and Alias	Options	Result Body Type
getCurrentUser	currentUser		com.box.sdk.BoxUser
getAllEnterpriseOrExternalUsers	users	filterTerm, [fields]	com.box.sdk.BoxUser
createAppUser	create	name, [params]	com.box.sdk.BoxUser
createEnterpriseUser	create	login, name, [params]	com.box.sdk.BoxUser
deleteUser	delete	userId, notifyUser, force	
getUserEmailAlias	emailAlias	userId	com.box.sdk.BoxUser
deleteUserEmailAliases	deleteEmailAliases	userId, emailAliasId	java.util.List
getUserInfo	info	userId	com.box.sdk.BoxUser.Info
updateUserInfo	updateInfo	userId, info	com.box.sdk.BoxUser

Endpoint	Shorthand and Alias	Options	Result Body Type
moveFolderToUser	-	userId, source UserId	com.box.sdk.BoxFolder.Info

URI Options for *users*

Name	Type
defaultRequest	com.box.restclientv2.requestsbase.BoxDefaultRequestObject
emailAliasRequest	com.box.boxjavalibv2.requests.requestobjects.BoxEmailAliasRequestObject
emailId	String
filterTerm	String
folderId	String
simpleUserRequest	com.box.boxjavalibv2.requests.requestobjects.BoxSimpleUserRequestObject
userDeleteRequest	com.box.boxjavalibv2.requests.requestobjects.BoxUserDeleteRequestObject
userId	String
userRequest	com.box.boxjavalibv2.requests.requestobjects.BoxUserRequestObject
userUpdateLoginRequest	com.box.boxjavalibv2.requests.requestobjects.BoxUserUpdateLoginRequestObject

52.6. CONSUMER ENDPOINTS:

For more information on Box events see <https://developer.box.com/reference#events>. Consumer endpoints can only use the endpoint prefix **events** as shown in the example next.

```
box:events/endpoint?[options]
```

Endpoint	Shorthand and Alias	Options	Result Body Type
events		[startingPosition]	com.box.sdk.BoxEvent

URI Options for *events*

Name	Type
startingPosition	Long

52.7. MESSAGE HEADER

Any of the options can be provided in a message header for producer endpoints with **CamelBox.** prefix.

52.8. MESSAGE BODY

All result message bodies utilize objects provided by the Box Java SDK. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

52.9. CONFIGURE THE COMPONENT AND ENABLE AUTHENTICATION

For authentication with Box, set the authentication properties on the component as demonstrated in the following example:

```
BoxConfiguration configuration = new BoxConfiguration();
configuration.setClientId("clientId");
configuration.setClientSecret("clientSecret");
configuration.setUserName("userName");
configuration.setUserPassword("userPassword");

// add BoxComponent to Camel context
BoxComponent component = new BoxComponent(context);
component.setConfiguration(configuration);
context.addComponent("box", component);
```

52.10. SAMPLES

The following route uploads new files to the user's root folder:

```
from("file:...")
  .to("box://files/upload/inBody=fileUploadRequest");
```

The following route polls user's account for updates:

```
from("box://events/listen?startingPosition=-1")
  .to("bean:blah");
```

The following route uses a producer with dynamic header options. The **fileId** property has the Box file id and the **output** property has the output stream of the file contents, so they are assigned to the **CamelBox.fileId** header and **CamelBox.output** header respectively as follows:

```
from("direct:foo")
  .setHeader("CamelBox.fileId", header("fileId"))
  .setHeader("CamelBox.output", header("output"))
  .to("box://files/download")
  .to("file://...");
```

CHAPTER 53. BRAINTREE COMPONENT

Available as of Camel version 2.17

The Braintree component provides access to [Braintree Payments](#) through their [Java SDK](#).

All client applications need API credential in order to process payments. In order to use camel-braintree with your account, you'll need to create a new [Sandbox](#) or [Production](#) account.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-braintree</artifactId>
  <version>${camel-version}</version>
</dependency>
```

53.1. BRAINTREE OPTIONS

The Braintree component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		BraintreeConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Braintree endpoint is configured using URI syntax:

```
braintree:apiName/methodName
```

with the following path and query parameters:

53.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		BraintreeApiName
methodName	What sub operation to use for the selected operation		String

53.1.2. Query Parameters (14 parameters):

Name	Description	Default	Type
environment (common)	The environment Either SANDBOX or PRODUCTION		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
merchantId (common)	The merchant id provided by Braintree.		String
privateKey (common)	The private key provided by Braintree.		String
publicKey (common)	The public key provided by Braintree.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
accessToken (advanced)	The access token granted by a merchant to another in order to process transactions on their behalf. Used in place of environment, merchant id, public key and private key fields.		String
httpReadTimeout (advanced)	Set read timeout for http calls.		Integer
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

Name	Description	Default	Type
httpLogLevel (logging)	Set logging level for http calls, see <code>java.util.logging.Level</code>		String
proxyHost (proxy)	The proxy host		String
proxyPort (proxy)	The proxy port		Integer

53.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 14 options, which are listed below.

Name	Description	Default	Type
camel.component.braintree.configuration.access-token	The access token granted by a merchant to another in order to process transactions on their behalf. Used in place of environment, merchant id, public key and private key fields.		String
camel.component.braintree.configuration.api-name	What kind of operation to perform		BraintreeApiName
camel.component.braintree.configuration.environment	The environment Either SANDBOX or PRODUCTION		String
camel.component.braintree.configuration.http-log-level	Set logging level for http calls, see <code>java.util.logging.Level</code>		Level
camel.component.braintree.configuration.http-log-name	Set log category to use to log http calls, default "Braintree"		String
camel.component.braintree.configuration.http-read-timeout	Set read timeout for http calls.		Integer

Name	Description	Default	Type
<code>camel.component.braintree.configuration.merchant-id</code>	The merchant id provided by Braintree.		String
<code>camel.component.braintree.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.braintree.configuration.private-key</code>	The private key provided by Braintree.		String
<code>camel.component.braintree.configuration.proxy-host</code>	The proxy host		String
<code>camel.component.braintree.configuration.proxy-port</code>	The proxy port		Integer
<code>camel.component.braintree.configuration.public-key</code>	The public key provided by Braintree.		String
<code>camel.component.braintree.enabled</code>	Enable braintree component	true	Boolean
<code>camel.component.braintree.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

53.3. URI FORMAT

`braintree://endpoint-prefix/endpoint?[options]`

Endpoint prefix can be one of:

- addOn
- address

- clientToken
- creditCardverification
- customer
- discount
- dispute
- documentUpload
- merchantAccount
- paymentmethod
- paymentmethodNonce
- plan
- report
- settlementBatchSummary
- subscription
- transaction
- webhookNotification

53.4. BRAINTREECOMPONENT

The Braintree Component can be configured with the options below. These options can be provided using the component's bean property **configuration** of type **org.apache.camel.component.braintree.BraintreeConfiguration**.

Option	Type	Description
environment	String	Value that specifies where requests should be directed – sandbox or production
merchantId	String	A unique identifier for your gateway account, which is different than your merchant account ID
publicKey	String	User-specific public identifier
privateKey	String	User-specific secure identifier that should not be shared – even with us!

Option	Type	Description
accessToken	String	Token granted to a merchant using Braintree Auth allowing them to process transactions on another's behalf. Used in place of the environment, merchantId, publicKey and privateKey options.

All the options above are provided by Braintree Payments

53.5. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelBraintree.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelBraintree.option** header.

For more information on the endpoints and options see Braintree references at <https://developers.braintreepayments.com/reference/overview>

53.5.1. Endpoint prefix *addOn*

The following endpoints can be invoked with the prefix **addOn** as follows:

```
braintree://addOn/endpoint
```

Endpoint	Shorthand Alias	Options	Result Body Type
all			List<com.braintreegateway.Addon>

53.5.2. Endpoint prefix *address*

The following endpoints can be invoked with the prefix **address** as follows:

braintree://address/endpoint?[options]

Endpoint	Shorthand Alias	Options	Result Body Type
create		customerId, request	com.braintreegateway.Result<com.braintreegateway.Address>
delete		customerId, id	com.braintreegateway.Result<com.braintreegateway.Address>
find		customerId, id	com.braintreegateway.Address
update		customerId, id, request	com.braintreegateway.Result<com.braintreegateway.Address>

URI Options for *address*

Name	Type
customerId	String
request	com.braintreegateway.AddressRequest
id	String

53.5.3. Endpoint prefix *clientToken*

The following endpoints can be invoked with the prefix **clientToken** as follows:

braintree://clientToken/endpoint?[options]

Endpoint	Shorthand Alias	Options	Result Body Type
generate		request	String

URI Options for *clientToken*

Name	Type
request	com.braintreegateway.ClientTokenrequest

53.5.4. Endpoint prefix *creditCardVerification*

The following endpoints can be invoked with the prefix **creditCardverification** as follows:

```
braintree://creditCardVerification/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
find		id	com.braintreegateway.CreditCardVerification
search		query	com.braintreegateway.ResourceCollection<com.braintreegateway.CreditCardVerification>

URI Options for *creditCardVerification*

Name	Type
id	String
query	com.braintreegateway.CreditCardVerificationSearchRequest

53.5.5. Endpoint prefix *customer*

The following endpoints can be invoked with the prefix **customer** as follows:

```
braintree://customer/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
all			
create		request	com.braintreegateway.Result<com.braintreegateway.Customer>
delete		id	com.braintreegateway.Result<com.braintreegateway.Customer>

Endpoint	Shorthand Alias	Options	Result Body Type
find		id	com.braintreegateway.Customer
search		query	com.braintreegateway.ResourceCollection<com.braintreegateway.Customer>
update		id, request	com.braintreegateway.Result<com.braintreegateway.Customer>

URI Options for *customer*

Name	Type
id	String
request	com.braintreegateway.CustomerRequest
query	com.braintreegateway.CustomerSearchRequest

53.5.6. Endpoint prefix *discount*

The following endpoints can be invoked with the prefix **discount** as follows:

`braintree://discount/endpoint`

Endpoint	Shorthand Alias	Options	Result Body Type
all			List<com.braintreegateway.Discount>

+

+

53.5.7. Endpoint prefix *dispute*

The following endpoints can be invoked with the prefix **dispute** as follows:

`braintree://dispute/endpoint?[options]`

Endpoint	Shorthand Alias	Options	Result Body Type
accept		id	com.braintreeregateway.Result
addFileEvidence		disputeld, documentId	com.braintreeregateway.Result<DisputeEvidence>
addFileEvidence		disputeld, fileEvidenceRequest	com.braintreeregateway.Result<DisputeEvidence>
addTextEvidence		disputeld, content	com.braintreeregateway.Result<DisputeEvidence>
addTextEvidence		disputeld, textEvidenceRequest	com.braintreeregateway.Result<DisputeEvidence>
finalize		id	com.braintreeregateway.Result
find		id	com.braintreeregateway.Dispute
removeEvidence		id	com.braintreeregateway.Result
search		disputeSearchRequest	com.braintreeregateway.PaginatedCollection<com.braintreeregateway.Dispute>

URI Options for *dispute*

Name	Type
id	String
disputeld	String
documentId	String
fileEvidenceRequest	com.braintreeregateway.FileEvidenceRequest
content	String
	textEvidenceRequest
com.braintreeregateway.TextEvidenceRequest	disputeSearchRequest

53.5.8. Endpoint prefix *documentUpload*

The following endpoints can be invoked with the prefix **documentUpload** as follows:

```
braintree://documentUpload/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
create		request	com.braintreegateway.Result<com.braintreegateway.DocumentUpload>

URI Options for *documentUpload*

Name	Type
request	com.braintreegateway.DocumentUploadRequest

53.5.9. Endpoint prefix *merchantAccount*

The following endpoints can be invoked with the prefix **merchantAccount** as follows:

```
braintree://merchantAccount/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
create		request	com.braintreegateway.Result<com.braintreegateway.MerchantAccount>
createForCurrency		currencyRequest	com.braintreegateway.Result<com.braintreegateway.MerchantAccount>
find		id	com.braintreegateway.MerchantAccount
update		id, request	com.braintreegateway.Result<com.braintreegateway.MerchantAccount>

URI Options for *merchantAccount*

Name	Type
id	String
request	com.braintreegateway.MerchantAccountRequest
currencyRequest	com.braintreegateway.MerchantAccountCreateForCurrencyRequest

53.5.10. Endpoint prefix *paymentMethod*

The following endpoints can be invoked with the prefix **paymentMethod** as follows:

braintree://paymentMethod/endpoint?[options]

Endpoint	Shorthand Alias	Options	Result Body Type
create		request	com.braintreegateway.Result<com.braintreegateway.PaymentMethod>
delete		token, deleteRequest	com.braintreegateway.Result<com.braintreegateway.PaymentMethod>
find		token	com.braintreegateway.PaymentMethod
update		token, request	com.braintreegateway.Result<com.braintreegateway.PaymentMethod>

URI Options for *paymentMethod*

Name	Type
token	String
request	com.braintreegateway.PaymentMethodRequest
deleteRequest	com.braintreegateway.PaymentMethodDeleteRequest

53.5.11. Endpoint prefix *paymentMethodNonce*

The following endpoints can be invoked with the prefix **paymentMethodNonce** as follows:

`braintree://paymentMethodNonce/endpoint?[options]`

Endpoint	Shorthand Alias	Options	Result Body Type
create		paymentMethodToken	com.braintreegateway.Result<com.braintreegateway.PaymentMethodNonce>
find		paymentMethodNonce	com.braintreegateway.PaymentMethodNonce

URI Options for *paymentMethodNonce*

Name	Type
paymentMethodToken	String
paymentMethodNonce	String

53.5.12. Endpoint prefix *plan*

The following endpoints can be invoked with the prefix **plan** as follows:

`braintree://plan/endpoint`

Endpoint	Shorthand Alias	Options	Result Body Type
all			List<com.braintreegateway.Plan>

53.5.13. Endpoint prefix *report*

The following endpoints can be invoked with the prefix **report** as follows:

`braintree://plan/report?[options]`

Endpoint	Shorthand Alias	Options	Result Body Type
----------	-----------------	---------	------------------

Endpoint	Shorthand Alias	Options	Result Body Type
transactionLevelFees		request	com.braintreegateway.Result<com.braintreegateway.TransactionLevelFeeReport>

URI Options for *report*

Name	Type
request	com.braintreegateway.TransactionLevelFeeReportRequest

53.5.14. Endpoint prefix *settlementBatchSummary*

The following endpoints can be invoked with the prefix **settlementBatchSummary** as follows:

```
braintree://settlementBatchSummary/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
generate		request	com.braintreegateway.Result<com.braintreegateway.SettlementBatchSummary>

URI Options for *settlementBatchSummary*

Name	Type
settlementDate	Calendar
groupByCustomField	String

53.5.15. Endpoint prefix *subscription*

The following endpoints can be invoked with the prefix **subscription** as follows:

```
braintree://subscription/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
cancel		id	com.braintreegateway.Result<com.braintreegateway.Subscription>
create		request	com.braintreegateway.Result<com.braintreegateway.Subscription>
delete		customerId, id	com.braintreegateway.Result<com.braintreegateway.Subscription>
find		id	com.braintreegateway.Subscription
retryCharge		subscriptionId, amount	com.braintreegateway.Result<com.braintreegateway.Transaction>
search		searchRequest	com.braintreegateway.ResourceCollection<com.braintreegateway.Subscription>
update		id, request	com.braintreegateway.Result<com.braintreegateway.Subscription>

URI Options for *subscription*

Name	Type
id	String
request	com.braintreegateway.SubscriptionRequest
customerId	String
subscriptionId	String
amount	BigDecimal
searchRequest	com.braintreegateway.SubscriptionSearchRequest.

53.5.16. Endpoint prefix *transaction*

The following endpoints can be invoked with the prefix **transaction** as follows:

`braintree://transaction/endpoint?[options]`

Endpoint	Shorthand Alias	Options	Result Body Type
cancelRelease		id	com.braintreegateway.Result<com.braintreegateway.Transaction>
cloneTransaction		id, cloneRequest	com.braintreegateway.Result<com.braintreegateway.Transaction>
credit		request	com.braintreegateway.Result<com.braintreegateway.Transaction>
find		id	com.braintreegateway.Transaction
holdInEscrow		id	com.braintreegateway.Result<com.braintreegateway.Transaction>
releaseFromEscrow		id	com.braintreegateway.Result<com.braintreegateway.Transaction>
refund		id, amount, refundRequest	com.braintreegateway.Result<com.braintreegateway.Transaction>
sale		request	com.braintreegateway.Result<com.braintreegateway.Transaction>
search		query	com.braintreegateway.ResourceCollection<com.braintreegateway.Transaction>
submitForPartialSettlement		id, amount	com.braintreegateway.Result<com.braintreegateway.Transaction>

Endpoint	Shorthand Alias	Options	Result Body Type
submitForSettlement		id, amount, request	com.braintreegateway.Result<com.braintreegateway.Transaction>
voidTransaction		id	com.braintreegateway.Result<com.braintreegateway.Transaction>

URI Options for *transaction*

Name	Type
id	String
request	com.braintreegateway.TransactionCloneRequest
cloneRequest	com.braintreegateway.TransactionCloneRequest
refundRequest	com.braintreegateway.TransactionRefundRequest
amount	BigDecimal
query	com.braintreegateway.TransactionSearchRequest

53.5.17. Endpoint prefix *webhookNotification*

The following endpoints can be invoked with the prefix **webhookNotification** as follows:

```
braintree://webhookNotification/endpoint?[options]
```

Endpoint	Shorthand Alias	Options	Result Body Type
parse		signature, payload	com.braintreegateway.WebhookNotification
verify		challenge	String

URI Options for *webhookNotification*

Name	Type
signature	String
payload	String
challenge	String

53.6. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. By default Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange. To change this behavior use the property **consumer.splitResults=true** to return a single exchange for the entire list or array.

53.7. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelBraintree.** prefix.

53.8. MESSAGE BODY

All result message bodies utilize objects provided by the Braintree Java SDK. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

53.9. EXAMPLES

Blueprint

```
<?xml version="1.0"?>
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xsi:schemaLocation="
    http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0
    http://aries.apache.org/schemas/blueprint-cm/blueprint-cm-1.0.0.xsd
    http://www.osgi.org/xmlns/blueprint/v1.0.0
    https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd
    http://camel.apache.org/schema/blueprint http://camel.apache.org/schema/blueprint/camel-
    blueprint.xsd">

  <cm:property-placeholder id="placeholder" persistent-id="camel.braintree">
  </cm:property-placeholder>
```

```
<bean id="braintree" class="org.apache.camel.component.braintree.BraintreeComponent">
  <property name="configuration">
    <bean class="org.apache.camel.component.braintree.BraintreeConfiguration">
      <property name="environment" value="{environment}"/>
      <property name="merchantId" value="{merchantId}"/>
      <property name="publicKey" value="{publicKey}"/>
      <property name="privateKey" value="{privateKey}"/>
    </bean>
  </property>
</bean>

<camelContext trace="true" xmlns="http://camel.apache.org/schema/blueprint" id="braintree-
example-context">
  <route id="braintree-example-route">
    <from uri="direct:generateClientToken"/>
    <to uri="braintree://clientToken/generate"/>
    <to uri="stream:out"/>
  </route>
</camelContext>

</blueprint>
```

53.10. SEE ALSO

* [Configuring Camel](#) * [Component](#) * [Endpoint](#) * [Getting Started](#)

CHAPTER 54. BROWSE COMPONENT

Available as of Camel version 1.3

The Browse component provides a simple `BrowsableEndpoint` which can be useful for testing, visualisation tools or debugging. The exchanges sent to the endpoint are all available to be browsed.

54.1. URI FORMAT

```
browse:someName[?options]
```

Where `someName` can be any string to uniquely identify the endpoint.

54.2. OPTIONS

The Browse component has no options.

The Browse endpoint is configured using URI syntax:

```
browse:name
```

with the following path and query parameters:

54.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>name</code>	Required A name which can be any string to uniquely identify the endpoint		String

54.2.2. Query Parameters (4 parameters):

Name	Description	Default	Type
<code>bridgeErrorHandler</code> (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

54.3. SAMPLE

In the route below, we insert a **browse:** component to be able to browse the Exchanges that are passing through:

```
from("activemq:order.in").to("browse:orderReceived").to("bean:processOrder");
```

We can now inspect the received exchanges from within the Java code:

```
private CamelContext context;

public void inspectRecievedOrders() {
    BrowseableEndpoint browse = context.getEndpoint("browse:orderReceived",
BrowseableEndpoint.class);
    List<Exchange> exchanges = browse.getExchanges();

    // then we can inspect the list of received exchanges from Java
    for (Exchange exchange : exchanges) {
        String payload = exchange.getIn().getBody();
        // do something with payload
    }
}
```

54.4. SEE ALSO

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 55. EHCACHE COMPONENT (DEPRECATED)

Available as of Camel version 2.1

The **cache** component enables you to perform caching operations using EHCache as the Cache Implementation. The cache itself is created on demand or if a cache of that name already exists then it is simply utilized with its original settings.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities. If you need to perform selections from a pre-existing cache, use the processors defined for the cache component.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

55.1. URI FORMAT

```
cache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

55.2. OPTIONS

The EHCache component supports 4 options, which are listed below.

Name	Description	Default	Type
cacheManagerFactory (advanced)	To use the given CacheManagerFactory for creating the CacheManager. By default the DefaultCacheManagerFactory is used.		CacheManagerFactory
configuration (common)	Sets the Cache configuration		CacheConfiguration
configurationFile (common)	Sets the location of the ehcache.xml file to load from classpath or file system. By default the file is loaded from classpath:ehcache.xml	classpath:ehcache.xml	String

Name	Description	Default	Type
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The EHCACHE endpoint is configured using URI syntax:

```
cache:cacheName
```

with the following path and query parameters:

55.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required Name of the cache		String

55.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
diskExpiryThreadIntervalSeconds (common)	The number of seconds between runs of the disk expiry thread.		long
diskPersistent (common)	Whether the disk store persists between restarts of the application.	false	boolean
diskStorePath (common)	Deprecated This parameter is ignored. CacheManager sets it using setter injection.		String
eternal (common)	Sets whether elements are eternal. If eternal, timeouts are ignored and the element never expires.	false	boolean
key (common)	The default key to use. If a key is provided in the message header, then the key from the header takes precedence.		String
maxElementsInMemory (common)	The number of elements that may be stored in the defined cache in memory.	1000	int

Name	Description	Default	Type
memoryStoreEvictionPolicy (common)	Which eviction strategy to use when maximum number of elements in memory is reached. The strategy defines which elements to be removed. LRU - Lest Recently Used LFU - Lest Frequently Used FIFO - First In First Out	LFU	MemoryStoreEvictionPolicy
objectCache (common)	Whether to turn on allowing to store non serializable objects in the cache. If this option is enabled then overflow to disk cannot be enabled as well.	false	boolean
operation (common)	The default cache operation to use. If an operation in the message header, then the operation from the header takes precedence.		String
overflowToDisk (common)	Specifies whether cache may overflow to disk	true	boolean
timeToldleSeconds (common)	The maximum amount of time between accesses before an element expires	300	long
timeToLiveSeconds (common)	The maximum time between creation time and when an element expires. Is used only if the element is not eternal	300	long
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
cacheLoaderRegistry (advanced)	To configure cache loader using the CacheLoaderRegistry		CacheLoaderRegistry

Name	Description	Default	Type
cacheManagerFactory (advanced)	To use a custom CacheManagerFactory for creating the CacheManager to be used by this endpoint. By default the CacheManagerFactory configured on the component is used.		CacheManagerFactory
eventListenerRegistry (advanced)	To configure event listeners using the CacheEventListenerRegistry		CacheEventListenerRegistry
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

55.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
camel.component.cache.cache-manager-factory	To use the given CacheManagerFactory for creating the CacheManager. By default the DefaultCacheManagerFactory is used. The option is a <code>org.apache.camel.component.cache.CacheManagerFactory</code> type.		String
camel.component.cache.configuration-file	Sets the location of the ehcache.xml file to load from classpath or file system. By default the file is loaded from classpath:ehcache.xml	classpath:ehcache.xml	String
camel.component.cache.configuration.cache-loader-registry	To configure cache loader using the CacheLoaderRegistry		CacheLoaderRegistry
camel.component.cache.configuration.cache-name	Name of the cache		String
camel.component.cache.configuration.disk-expiry-thread-interval-seconds	The number of seconds between runs of the disk expiry thread.		Long

Name	Description	Default	Type
<code>camel.component.cache.configuration.disk-persistent</code>	Whether the disk store persists between restarts of the application.	false	Boolean
<code>camel.component.cache.configuration.eternal</code>	Sets whether elements are eternal. If eternal, timeouts are ignored and the element never expires.	false	Boolean
<code>camel.component.cache.configuration.event-listener-registry</code>	To configure event listeners using the CacheEventListenerRegistry		CacheEventListenerRegistry
<code>camel.component.cache.configuration.max-elements-in-memory</code>	The number of elements that may be stored in the defined cache in memory.	1000	Integer
<code>camel.component.cache.configuration.memory-store-eviction-policy</code>	Which eviction strategy to use when maximum number of elements in memory is reached. The strategy defines which elements to be removed. LRU - Lest Recently Used LFU - Lest Frequently Used FIFO - First In First Out		MemoryStoreEvictionPolicy
<code>camel.component.cache.configuration.object-cache</code>	Whether to turn on allowing to store non serializable objects in the cache. If this option is enabled then overflow to disk cannot be enabled as well.	false	Boolean
<code>camel.component.cache.configuration.overflow-to-disk</code>	Specifies whether cache may overflow to disk	true	Boolean
<code>camel.component.cache.configuration.time-to-idle-seconds</code>	The maximum amount of time between accesses before an element expires	300	Long
<code>camel.component.cache.configuration.time-to-live-seconds</code>	The maximum time between creation time and when an element expires. Is used only if the element is not eternal	300	Long
<code>camel.component.cache.enabled</code>	Enable cache component	true	Boolean

Name	Description	Default	Type
<code>camel.component.cache.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.cache.configuration.disk-store-path</code>	This parameter is ignored. CacheManager sets it using setter injection.		String

55.4. SENDING/RECEIVING MESSAGES TO/FROM THE CACHE

55.4.1. Message Headers up to Camel 2.7

Header	Description
CACHE_OPERATION	The operation to be performed on the cache. Valid options are * GET * CHECK * ADD * UPDATE * DELETE * DELETEALL GET and CHECK requires Camel 2.3 onwards.
CACHE_KEY	The cache key used to store the Message in the cache. The cache key is optional if the CACHE_OPERATION is DELETEALL

55.4.2. Message Headers Camel 2.8+

Header changes in Camel 2.8

The header names and supported values have changed to be prefixed with 'CamelCache' and use mixed case. This makes them easier to identify and keep separate from other headers. The CacheConstants variable names remain unchanged, just their values have been changed. Also, these headers are now removed from the exchange after the cache operation is performed.

Header	Description
CamelCacheOperation	The operation to be performed on the cache. The valid options are * CamelCacheGet * CamelCacheCheck * CamelCacheAdd * CamelCacheUpdate * CamelCacheDelete * CamelCacheDeleteAll
CamelCacheKey	The cache key used to store the Message in the cache. The cache key is optional if the CamelCacheOperation is CamelCacheDeleteAll

The **CamelCacheAdd** and **CamelCacheUpdate** operations support additional headers:

Header	Type	Description
Camel Cache TimeToLive	Integer	Camel 2.11: Time to live in seconds.
Camel Cache TimeToIdle	Integer	Camel 2.11: Time to idle in seconds.
Camel Cache Eternal	Boolean	Camel 2.11: Whether the content is eternal.

55.4.3. Cache Producer

Sending data to the cache involves the ability to direct payloads in exchanges to be stored in a pre-existing or created-on-demand cache. The mechanics of doing this involve

- setting the Message Exchange Headers shown above.
- ensuring that the Message Exchange Body contains the message directed to the cache

55.4.4. Cache Consumer

Receiving data from the cache involves the ability of the CacheConsumer to listen on a pre-existing or created-on-demand Cache using an event Listener and receive automatic notifications when any cache activity take place (i.e CamelCacheGet/CamelCacheUpdate/CamelCacheDelete/CamelCacheDeleteAll). Upon such an activity taking place

- an exchange containing Message Exchange Headers and a Message Exchange Body containing the just added/updated payload is placed and sent.
- in case of a CamelCacheDeleteAll operation, the Message Exchange Header CamelCacheKey and the Message Exchange Body are not populated.

55.4.5. Cache Processors

There are a set of nice processors with the ability to perform cache lookups and selectively replace payload content at the

- body
- token
- xpath level

55.5. CACHE USAGE SAMPLES

55.5.1. Example 1: Configuring the cache

```
from("cache://MyApplicationCache" +
    "?maxElementsInMemory=1000" +
    "&memoryStoreEvictionPolicy=" +
    "MemoryStoreEvictionPolicy.LFU" +
    "&overflowToDisk=true" +
    "&eternal=true" +
    "&timeToLiveSeconds=300" +
    "&timeToIdleSeconds=true" +
    "&diskPersistent=true" +
    "&diskExpiryThreadIntervalSeconds=300")
```

55.5.2. Example 2: Adding keys to the cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_OPERATION_ADD))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

55.5.3. Example 2: Updating existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_OPERATION_UPDATE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

55.5.4. Example 3: Deleting existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_DELETE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

55.5.5. Example 4: Deleting all existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
```

```

public void configure() {
    from("direct:start")
        .setHeader(CacheConstants.CACHE_OPERATION,
            constant(CacheConstants.CACHE_DELETEALL))
        .to("cache://TestCache1");
}
};

```

55.5.6. Example 5: Notifying any changes registering in a Cache to Processors and other Producers

```

RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("cache://TestCache1")
            .process(new Processor() {
                public void process(Exchange exchange)
                    throws Exception {
                    String operation = (String)
exchange.getIn().getHeader(CacheConstants.CACHE_OPERATION);
                    String key = (String) exchange.getIn().getHeader(CacheConstants.CACHE_KEY);
                    Object body = exchange.getIn().getBody();
                    // Do something
                }
            })
    }
};

```

55.5.7. Example 6: Using Processors to selectively replace payload with cache values

```

RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        //Message Body Replacer
        from("cache://TestCache1")
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("greeting"))
            .process(new CacheBasedMessageBodyReplacer("cache://TestCache1","farewell"))
            .to("direct:next");

        //Message Token replacer
        from("cache://TestCache1")
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("quote"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","novel","#novel#"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","author","#author#"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","number","#number#"))
            .to("direct:next");

        //Message XPath replacer
        from("cache://TestCache1").
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("XML_FRAGMENT"))
            .process(new CacheBasedXPathReplacer("cache://TestCache1","book1","/books/book1"))
            .process (new CacheBasedXPathReplacer("cache://TestCache1","book2","/books/book2"))
            .to("direct:next");
    }
};

```

55.5.8. Example 7: Getting an entry from the Cache

```

from("direct:start")
  // Prepare headers
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_GET))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson")).
  to("cache://TestCache1").
  // Check if entry was not found
  .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
  // If not found, get the payload and put it to cache
  .to("cxf:bean:someHeavyweightOperation").
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_ADD))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
  .to("cache://TestCache1")
  .end()
  .to("direct:nextPhase");

```

55.5.9. Example 8: Checking for an entry in the Cache

Note: The CHECK command tests existence of an entry in the cache but doesn't place a message in the body.

```

from("direct:start")
  // Prepare headers
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_CHECK))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson")).
  to("cache://TestCache1").
  // Check if entry was not found
  .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
  // If not found, get the payload and put it to cache
  .to("cxf:bean:someHeavyweightOperation").
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_ADD))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
  .to("cache://TestCache1")
  .end();

```

55.6. MANAGEMENT OF EHCACHE

[EHCache](#) has its own statistics and management from JMX.

Here's a snippet on how to expose them via JMX in a Spring application context:

```

<bean id="ehCacheManagementService" class="net.sf.ehcache.management.ManagementService"
init-method="init" lazy-init="false">
  <constructor-arg>
    <bean class="net.sf.ehcache.CacheManager" factory-method="getInstance"/>
  </constructor-arg>
  <constructor-arg>
    <bean class="org.springframework.jmx.support.JmxUtils" factory-method="locateMBeanServer"/>
  </constructor-arg>

```

```
<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
</bean>
```

Of course you can do the same thing in straight Java:

```
ManagementService.registerMBeans(CacheManager.getInstance(), mbeanServer, true, true, true,
true);
```

You can get cache hits, misses, in-memory hits, disk hits, size stats this way. You can also change CacheConfiguration parameters on the fly.

55.7. CACHE REPLICATION CAMEL 2.8

The Camel Cache component is able to distribute a cache across server nodes using several different replication mechanisms including: RMI, JGroups, JMS and Cache Server.

There are two different ways to make it work:

1. You can configure **ehcache.xml** manually

OR

2. You can configure these three options:

- cacheManagerFactory
- eventListenerRegistry
- cacheLoaderRegistry

Configuring Camel Cache replication using the first option is a bit of hard work as you have to configure all caches separately. So in a situation when the all names of caches are not known, using **ehcache.xml** is not a good idea.

The second option is much better when you want to use many different caches as you do not need to define options per cache. This is because replication options are set per **CacheManager** and per **CacheEndpoint**. Also it is the only way when cache names are not known at the development phase.

Note: It might be useful to read the [EHCache manual](#) to get a better understanding of the Camel Cache replication mechanism.

55.7.1. Example: JMS cache replication

JMS replication is the most powerful and secured replication method. Used together with Camel Cache replication makes it also rather simple. An example is available on [a separate page](#).

CHAPTER 56. CAFFEINE CACHE COMPONENT

Available as of Camel version 2.20

The **caffeine-cache** component enables you to perform caching operations using the simple cache from Caffeine.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

56.1. URI FORMAT

```
caffeine-cache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

56.2. OPTIONS

The Caffeine Cache component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	Sets the global component configuration		CaffeineConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Caffeine Cache endpoint is configured using URI syntax:

```
caffeine-cache:cacheName
```

with the following path and query parameters:

56.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required the cache name		String

56.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
createCacheIfNotExist (common)	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
action (producer)	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String
cache (producer)	To configure an already instantiated cache to be used		Cache
cacheLoader (producer)	To configure a <code>CacheLoader</code> in case of a <code>LoadCache</code> use		<code>CacheLoader</code>
evictionType (producer)	Set the eviction Type for this cache	SIZE_B ASED	<code>EvictionType</code>
expireAfterAccessTime (producer)	Set the expire After Access Time in case of time based Eviction (in seconds)	300	int

Name	Description	Default	Type
expireAfterWriteTime (producer)	Set the expire After Access Write in case of time based Eviction (in seconds)	300	int
initialCapacity (producer)	Set the initial Capacity for the cache	10000	int
key (producer)	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object
maximumSize (producer)	Set the maximum size for the cache	10000	int
removalListener (producer)	Set a specific removal Listener for the cache		RemovalListener
statsCounter (producer)	Set a specific Stats Counter for the cache stats		StatsCounter
statsEnabled (producer)	To enable stats on the cache	false	boolean
keyType (advanced)	The cache key type, default java.lang.Object	java.lang.Object	String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
valueType (advanced)	The cache value type, default java.lang.Object	java.lang.Object	String

56.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
camel.component.caffeine-cache.configuration.action	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String

Name	Description	Default	Type
<code>camel.component.caffeine-cache.configuration.cache</code>	To configure an already instantiated cache to be used		Cache
<code>camel.component.caffeine-cache.configuration.cache-loader</code>	To configure a CacheLoader in case of a LoadCache use		CacheLoader
<code>camel.component.caffeine-cache.configuration.create-cache-if-not-exist</code>	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	Boolean
<code>camel.component.caffeine-cache.configuration.eviction-type</code>	Set the eviction Type for this cache		EvictionType
<code>camel.component.caffeine-cache.configuration.expire-after-access-time</code>	Set the expire After Access Time in case of time based Eviction (in seconds)	300	Integer
<code>camel.component.caffeine-cache.configuration.expire-after-write-time</code>	Set the expire After Access Write in case of time based Eviction (in seconds)	300	Integer
<code>camel.component.caffeine-cache.configuration.initial-capacity</code>	Set the initial Capacity for the cache	10000	Integer
<code>camel.component.caffeine-cache.configuration.key</code>	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object
<code>camel.component.caffeine-cache.configuration.key-type</code>	The cache key type, default java.lang.Object	java.lang.Object	String

Name	Description	Default	Type
<code>camel.component.caffeine-cache.configuration.maximum-size</code>	Set the maximum size for the cache	10000	Integer
<code>camel.component.caffeine-cache.configuration.removal-listener</code>	Set a specific removal Listener for the cache		RemovalListener
<code>camel.component.caffeine-cache.configuration.stats-counter</code>	Set a specific Stats Counter for the cache stats		StatsCounter
<code>camel.component.caffeine-cache.configuration.stats-enabled</code>	To enable stats on the cache	false	Boolean
<code>camel.component.caffeine-cache.configuration.value-type</code>	The cache value type, default java.lang.Object	java.lang.Object	String
<code>camel.component.caffeine-cache.enabled</code>	Whether to enable auto configuration of the caffeine-cache component. This is enabled by default.		Boolean
<code>camel.component.caffeine-cache.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

56.4. EXAMPLES

You can use your cache with the following code:

```
@Override
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() {
            from("direct://start")
                .toF("caffeine-cache://%s?cache=#cache&action=PUT&key=1", "test")
                .toF("caffeine-cache://%s?cache=#cache&key=1&action=GET", "test")
        }
    };
}
```

```
        .log("Test! ${body}")
        .to("mock:result");
    }
};
}
```

In this way you'll work always on the same cache in the registry.

56.5. CHECK OPERATION RESULT

Each time you'll use an operation on the cache you'll have two different headers to check for status:

```
CaffeineConstants.ACTION_HAS_RESULT
CaffeineConstants.ACTION_SUCCEEDED
```

CHAPTER 57. CAFFEINE LOADCACHE COMPONENT

Available as of Camel version 2.20

The **caffeine-loadcache** component enables you to perform caching operations using The Load cache from Caffeine.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

57.1. URI FORMAT

```
caffeine-loadcache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

57.2. OPTIONS

The Caffeine LoadCache component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	Sets the global component configuration		CaffeineConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Caffeine LoadCache endpoint is configured using URI syntax:

```
caffeine-loadcache:cacheName
```

with the following path and query parameters:

57.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required the cache name		String

57.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
createCacheIfNotExist (common)	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
action (producer)	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String
cache (producer)	To configure an already instantiated cache to be used		Cache
cacheLoader (producer)	To configure a <code>CacheLoader</code> in case of a <code>LoadCache</code> use		<code>CacheLoader</code>
evictionType (producer)	Set the eviction Type for this cache	SIZE_B ASED	<code>EvictionType</code>
expireAfterAccessTime (producer)	Set the expire After Access Time in case of time based Eviction (in seconds)	300	int

Name	Description	Default	Type
expireAfterWriteTime (producer)	Set the expire After Access Write in case of time based Eviction (in seconds)	300	int
initialCapacity (producer)	Set the initial Capacity for the cache	10000	int
key (producer)	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object
maximumSize (producer)	Set the maximum size for the cache	10000	int
removalListener (producer)	Set a specific removal Listener for the cache		RemovalListener
statsCounter (producer)	Set a specific Stats Counter for the cache stats		StatsCounter
statsEnabled (producer)	To enable stats on the cache	false	boolean
keyType (advanced)	The cache key type, default java.lang.Object	java.lang.Object	String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
valueType (advanced)	The cache value type, default java.lang.Object	java.lang.Object	String

57.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
camel.component.caffeine-loadcache.configuration.action	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String

Name	Description	Default	Type
<code>camel.component.caffeine-loadcache.configuration.cache</code>	To configure an already instantiated cache to be used		Cache
<code>camel.component.caffeine-loadcache.configuration.cache-loader</code>	To configure a CacheLoader in case of a LoadCache use		CacheLoader
<code>camel.component.caffeine-loadcache.configuration.create-cache-if-not-exist</code>	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	Boolean
<code>camel.component.caffeine-loadcache.configuration.eviction-type</code>	Set the eviction Type for this cache		EvictionType
<code>camel.component.caffeine-loadcache.configuration.expire-after-access-time</code>	Set the expire After Access Time in case of time based Eviction (in seconds)	300	Integer
<code>camel.component.caffeine-loadcache.configuration.expire-after-write-time</code>	Set the expire After Access Write in case of time based Eviction (in seconds)	300	Integer
<code>camel.component.caffeine-loadcache.configuration.initial-capacity</code>	Set the initial Capacity for the cache	10000	Integer
<code>camel.component.caffeine-loadcache.configuration.key</code>	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object

Name	Description	Default	Type
<code>camel.component.caffeine-loadcache.configuration.key-type</code>	The cache key type, default <code>java.lang.Object</code>	<code>java.lang.Object</code>	String
<code>camel.component.caffeine-loadcache.configuration.maximum-size</code>	Set the maximum size for the cache	10000	Integer
<code>camel.component.caffeine-loadcache.configuration.removal-listener</code>	Set a specific removal Listener for the cache		RemovalListener
<code>camel.component.caffeine-loadcache.configuration.stats-counter</code>	Set a specific Stats Counter for the cache stats		StatsCounter
<code>camel.component.caffeine-loadcache.configuration.stats-enabled</code>	To enable stats on the cache	<code>false</code>	Boolean
<code>camel.component.caffeine-loadcache.configuration.value-type</code>	The cache value type, default <code>java.lang.Object</code>	<code>java.lang.Object</code>	String
<code>camel.component.caffeine-loadcache.enabled</code>	Whether to enable auto configuration of the caffeine-loadcache component. This is enabled by default.		Boolean
<code>camel.component.caffeine-loadcache.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	<code>true</code>	Boolean

CHAPTER 58. CASTOR DATAFORMAT (DEPRECATED)

Available as of Camel version 2.1

Castor is a Data Format which uses the [Castor XML library](#) to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

As usually you can use either Java DSL or Spring XML to work with Castor Data Format.

58.1. USING THE JAVA DSL

```
from("direct:order").
  marshal().castor().
  to("activemq:queue:order");
```

For example the following uses a named DataFormat of Castor which uses default Castor data binding features.

```
CastorDataFormat castor = new CastorDataFormat ();

from("activemq:My.Queue").
  unmarshal(castor).
  to("mqseries:Another.Queue");
```

If you prefer to use a named reference to a data format which can then be defined in your Registry such as via your Spring XML file. e.g.

```
from("activemq:My.Queue").
  unmarshal("mycastorType").
  to("mqseries:Another.Queue");
```

If you want to override default mapping schema by providing a mapping file you can set it as follows.

```
CastorDataFormat castor = new CastorDataFormat ();
castor.setMappingFile("mapping.xml");
```

Also if you want to have more control on Castor Marshaller and Unmarshaller you can access them as below.

```
castor.getMarshaller();
castor.getUnmarshaller();
```

58.2. USING SPRING XML

The following example shows how to use Castor to unmarshal using Spring configuring the castor data type

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <unmarshal>
      <castor validation="true" />
    </unmarshal>
  </route>
</camelContext>
```

```

</unmarshal>
<to uri="mock:result"/>
</route>
</camelContext>

```

This example shows how to configure the data type just once and reuse it on multiple routes. You have to set the `<castor>` element directly in `<camelContext>`.

```

<camelContext>
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <castor id="myCastor"/>
  </dataFormats>

  <route>
    <from uri="direct:start"/>
    <marshal ref="myCastor"/>
    <to uri="direct:marshalled"/>
  </route>
  <route>
    <from uri="direct:marshalled"/>
    <unmarshal ref="myCastor"/>
    <to uri="mock:result"/>
  </route>

</camelContext>

```

58.3. OPTIONS

The Castor dataformat supports 9 options, which are listed below.

Name	Default	Java Type	Description
<code>mappingFile</code>		String	Path to a Castor mapping file to load from the classpath.
<code>whitelistEnabled</code>	true	Boolean	Define if Whitelist feature is enabled or not
<code>allowedUnmarshalledObjects</code>		String	Define the allowed objects to be unmarshalled. You can specify the FQN class name of allowed objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code> . Denied objects takes precedence over allowed objects.
<code>deniedUnmarshalledObjects</code>		String	Define the denied objects to be unmarshalled. You can specify the FQN class name of denied objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code> . Denied objects takes precedence over allowed objects.

Name	Default	Java Type	Description
validation	true	Boolean	Whether validation is turned on or off. Is by default true.
encoding	UTF-8	String	Encoding to use when marshalling an Object to XML. Is by default UTF-8
packages		String []	Add additional packages to Castor XmlContext
classes		String []	Add additional class names to Castor XmlContext
contentTypeHeader	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

58.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
camel.dataformat.castor.allowed-unmarshall-objects	Define the allowed objects to be unmarshalled. You can specify the FQN class name of allowed objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by link org.apache.camel.util.EndpointHelper#matchPattern (String, String) . Denied objects takes precedence over allowed objects.		String
camel.dataformat.castor.classes	Add additional class names to Castor XmlContext		String[]
camel.dataformat.castor.content-type-header	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.castor.denied-unmarshall-objects</code>	Define the denied objects to be unmarshalled. You can specify the FQN class name of deined objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by link <code>org.apache.camel.util.EndpointHelper#matchPattern</code> (String, String). Denied objects takes precedence over allowed objects.		String
<code>camel.dataformat.castor.enabled</code>	Enable castor dataformat	true	Boolean
<code>camel.dataformat.castor.encoding</code>	Encoding to use when marshalling an Object to XML. Is by default UTF-8	UTF-8	String
<code>camel.dataformat.castor.mapping-file</code>	Path to a Castor mapping file to load from the classpath.		String
<code>camel.dataformat.castor.packages</code>	Add additional packages to Castor XmlContext		String[]
<code>camel.dataformat.castor.validation</code>	Whether validation is turned on or off. Is by default true.	true	Boolean
<code>camel.dataformat.castor.whitelist-enabled</code>	Define if Whitelist feature is enabled or not	true	Boolean

ND

58.5. DEPENDENCIES

To use Castor in your camel routes you need to add the a dependency on **camel-castor** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-castor</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 59. CAMEL CDI

The Camel CDI component provides auto-configuration for Apache Camel using CDI as dependency injection framework based on *convention-over-configuration*. It auto-detects Camel routes available in the application and provides beans for common Camel primitives like

Endpoint, **FluentProducerTemplate**, **ProducerTemplate** or **TypeConverter**. It implements standard Camel bean integration so that Camel annotations like **@Consume**, **@Produce** and **@PropertyInject** can be used seamlessly in CDI beans. Besides, it bridges Camel events (e.g. **RouteAddedEvent**, **CamelContextStartedEvent**, **ExchangeCompletedEvent**, ...) as CDI events and provides a CDI events endpoint that can be used to consume / produce CDI events from / to Camel routes.

While the Camel CDI component is available as of **Camel 2.10**, it's been rewritten in **Camel 2.17** to better fit into the CDI programming model. Hence some of the features like the Camel events to CDI events bridge and the CDI events endpoint only apply starting Camel 2.17.

More details on how to test Camel CDI applications are available in Camel CDI testing.

CAUTION

camel-cdi is deprecated in OSGi and not supported. Use OSGi Blueprint if using Camel with OSGi.

59.1. AUTO-CONFIGURED CAMEL CONTEXT

Camel CDI automatically deploys and configures a **CamelContext** bean. That **CamelContext** bean is automatically instantiated, configured and started (resp. stopped) when the CDI container initializes (resp. shuts down). It can be injected in the application, e.g.:

```
@Inject
CamelContext context;
```

That default **CamelContext** bean is qualified with the built-in **@Default** qualifier, is scoped **@ApplicationScoped** and is of type **DefaultCamelContext**.

Note that this bean can be customized programmatically and other Camel context beans can be deployed in the application as well.

59.2. AUTO-DETECTING CAMEL ROUTES

Camel CDI automatically collects all the **RoutesBuilder** beans in the application, instantiates and add them to the **CamelContext** bean instance when the CDI container initializes. For example, adding a Camel route is as simple as declaring a class, e.g.:

```
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```

Note that you can declare as many **RoutesBuilder** beans as you want. Besides, **RouteContainer** beans are also automatically collected, instantiated and added to the **CamelContext** bean instance managed by Camel CDI when the container initializes.

Available as of Camel 2.19

In some situations, it may be necessary to disable the auto-configuration of the **RouteBuilder** and **RouteContainer** beans. That can be achieved by observing for the **CdiCamelConfiguration** event, e.g.:

```
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoConfigureRoutes(false);
}
```

Similarly, it is possible to deactivate the automatic starting of the configured **CamelContext** beans, e.g.:

```
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoStartContexts(false);
}
```

59.3. AUTO-CONFIGURED CAMEL PRIMITIVES

Camel CDI provides beans for common Camel primitives that can be injected in any CDI beans, e.g.:

```
@Inject
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@Uri("direct:inbound")
Endpoint endpoint;

@Inject
TypeConverter converter;
```

59.4. CAMEL CONTEXT CONFIGURATION

If you just want to change the name of the default **CamelContext** bean, you can use the **@ContextName** qualifier provided by Camel CDI, e.g.:

```
@ContextName("camel-context")
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```

Else, if more customization is needed, any **CamelContext** class can be used to declare a custom Camel context bean. Then, the **@PostConstruct** and **@PreDestroy** lifecycle callbacks can be done to do the customization, e.g.:

```
@ApplicationScoped
class CustomCamelContext extends DefaultCamelContext {

    @PostConstruct
    void customize() {
        // Set the Camel context name
        setName("custom");
        // Disable JMX
        disableJMX();
    }

    @PreDestroy
    void cleanUp() {
        // ...
    }
}
```

Producer and **disposer** methods can also be used as well to customize the Camel context bean, e.g.:

```
class CamelContextFactory {

    @Produces
    @ApplicationScoped
    CamelContext customize() {
        DefaultCamelContext context = new DefaultCamelContext();
        context.setName("custom");
        return context;
    }

    void cleanUp(@Disposes CamelContext context) {
        // ...
    }
}
```

Similarly, **producer fields** can be used, e.g.:

```
@Produces
@ApplicationScoped
CamelContext context = new CustomCamelContext();

class CustomCamelContext extends DefaultCamelContext {

    CustomCamelContext() {
        setName("custom");
    }
}
```

This pattern can be used for example to avoid having the Camel context routes started automatically when the container initializes by calling the **setAutoStartup** method, e.g.:

```
@ApplicationScoped
```

```
class ManualStartupCamelContext extends DefaultCamelContext {

    @PostConstruct
    void manual() {
        setAutoStartup(false);
    }
}
```

59.5. MULTIPLE CAMEL CONTEXTS

Any number of **CamelContext** beans can actually be declared in the application as documented above. In that case, the CDI qualifiers declared on these **CamelContext** beans are used to bind the Camel routes and other Camel primitives to the corresponding Camel contexts. For example, if the following beans get declared:

```
@ApplicationScoped
@ContextName("foo")
class FooCamelContext extends DefaultCamelContext {
}

@ApplicationScoped
@BarContextQualifier
class BarCamelContext extends DefaultCamelContext {
}

@ContextName("foo")
class RouteAddedToFooCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@BarContextQualifier
class RouteAddedToBarCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@ContextName("baz")
class RouteAddedToBazCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@MyOtherQualifier
class RouteNotAddedToAnyCamelContext extends RouteBuilder {
```

```

@Override
public void configure() {
    // ...
}
}

```

The **RoutesBuilder** beans qualified with **@ContextName** are automatically added to the corresponding **CamelContext** beans by Camel CDI. If no such **CamelContext** bean exists, it gets automatically created, as for the **RouteAddedToBazCamelContext** bean. Note this only happens for the **@ContextName** qualifier provided by Camel CDI. Hence the **RouteNotAddedToAnyCamelContext** bean qualified with the user-defined **@MyOtherQualifier** qualifier does not get added to any Camel contexts. That may be useful, for example, for Camel routes that may be required to be added later during the application execution.

NOTE

Since Camel version 2.17.0, Camel CDI is capable of managing any kind of **CamelContext** beans (e.g. **DefaultCamelContext**). In previous versions, it is only capable of managing beans of type **CdiCamelContext** so it is required to extend it.

The CDI qualifiers declared on the **CamelContext** beans are also used to bind the corresponding Camel primitives, e.g.:

```

@Inject
@ContextName("foo")
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@ContextName("foo")
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
@BarContextQualifier
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@ContextName("baz")
@Uri("direct:inbound")
Endpoint endpoint;

```

59.6. CONFIGURATION PROPERTIES

To configure the sourcing of the configuration properties used by Camel to resolve properties placeholders, you can declare a **PropertiesComponent** bean qualified with **@Named("properties")**, e.g.:

```

@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent propertiesComponent() {
    Properties properties = new Properties();
    properties.put("property", "value");
}

```

```

PropertiesComponent component = new PropertiesComponent();
component.setInitialProperties(properties);
component.setLocation("classpath:placeholder.properties");
return component;
}

```

If you want to use [DeltaSpike configuration mechanism](#) you can declare the following **PropertiesComponent** bean:

```

@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent properties(PropertiesParser parser) {
    PropertiesComponent component = new PropertiesComponent();
    component.setPropertiesParser(parser);
    return component;
}

// PropertiesParser bean that uses DeltaSpike to resolve properties
static class DeltaSpikeParser extends DefaultPropertiesParser {
    @Override
    public String parseProperty(String key, String value, Properties properties) {
        return ConfigResolver.getPropertyValue(key);
    }
}

```

You can see the **camel-example-cdi-properties** example for a working example of a Camel CDI application using DeltaSpike configuration mechanism.

59.7. AUTO-CONFIGURED TYPE CONVERTERS

CDI beans annotated with the **@Converter** annotation are automatically registered into the deployed Camel contexts, e.g.:

```

@Converter
public class MyTypeConverter {

    @Converter
    public Output convert(Input input) {
        //...
    }
}

```

Note that CDI injection is supported within the type converters.

59.8. CAMEL BEAN INTEGRATION

59.8.1. Camel annotations

As part of the Camel [bean integration](#), Camel comes with a set of [annotations](#) that are seamlessly supported by Camel CDI. So you can use any of these annotations in your CDI beans, e.g.:

	Camel annotation	CDI equivalent
Configuration property	<pre>@PropertyInject("key") String value;</pre>	<p>If using DeltaSpike configuration mechanism:</p> <pre>@Inject @ConfigProperty(name = "key") String value;</pre> <p>See configuration properties for more details.</p>
Producer template injection (default Camel context)	<pre>@Produce(uri = "mock:outbound") ProducerTemplate producer;</pre> <pre>@Produce(uri = "mock:outbound") FluentProducerTemplate producer;</pre>	<pre>@Inject @Uri("direct:outbound") ProducerTemplate producer;</pre> <pre>@Produce(uri = "direct:outbound") FluentProducerTemplate producer;</pre>
Endpoint injection (default Camel context)	<pre>@EndpointInject(uri = "direct:inbound") Endpoint endpoint;</pre>	<pre>@Inject @Uri("direct:inbound") Endpoint endpoint;</pre>
Endpoint injection (Camel context by name)	<pre>@EndpointInject(uri = "direct:inbound", context = "foo") Endpoint contextEndpoint;</pre>	<pre>@Inject @ContextName("foo") @Uri("direct:inbound") Endpoint contextEndpoint;</pre>
Bean injection (by type)	<pre>@BeanInject MyBean bean;</pre>	<pre>@Inject MyBean bean;</pre>
Bean injection (by name)	<pre>@BeanInject("foo") MyBean bean;</pre>	<pre>@Inject @Named("foo") MyBean bean;</pre>
POJO consuming	<pre>@Consume(uri = "seda:inbound") void consume(@Body String body) { //... }</pre>	

59.8.2. Bean component

You can refer to CDI beans, either by type or name, From the Camel DSL, e.g. with the Java Camel DSL:

```
class MyBean {
    //...
}

from("direct:inbound").bean(MyBean.class);
```

Or to lookup a CDI bean by name from the Java DSL:

```
@Named("foo")
class MyNamedBean {
    //...
}

from("direct:inbound").bean("foo");
```

59.8.3. Referring beans from Endpoint URIs

When configuring endpoints using the URI syntax you can refer to beans in the Registry using the **#** notation. If the URI parameter value starts with a **#** sign then Camel CDI will lookup for a bean of the given type by name, e.g.:

```
from("jms:queue:{{destination}}?
transacted=true&transactionManager=#jtaTransactionManager").to("...");
```

Having the following CDI bean qualified with **@Named("jtaTransactionManager")**:

```
@Produces
@Named("jtaTransactionManager")
PlatformTransactionManager createTransactionManager(TransactionManager transactionManager,
UserTransaction userTransaction) {
    JtaTransactionManager jtaTransactionManager = new JtaTransactionManager();
    jtaTransactionManager.setUserTransaction(userTransaction);
    jtaTransactionManager.setTransactionManager(transactionManager);
    jtaTransactionManager.afterPropertiesSet();
    return jtaTransactionManager;
}
```

59.9. CAMEL EVENTS TO CDI EVENTS

Available as of Camel 2.17

Camel provides a set of [management events](#) that can be subscribed to for listening to Camel context, service, route and exchange events. Camel CDI seamlessly translates these Camel events into CDI events that can be observed using CDI [observer methods](#), e.g.:

```
void onContextStarting(@Observes CamelContextStartingEvent event) {
    // Called before the default Camel context is about to start
}
```

As of Camel 2.18, it is possible to observe events for a particular route (**RouteAddedEvent**, **RouteStartedEvent**, **RouteStoppedEvent** and **RouteRemovedEvent**) should it have an explicit defined, e.g.:

```
from("...").routeId("foo").to("...");

void onRouteStarted(@Observes @Named("foo") RouteStartedEvent event) {
    // Called after the route "foo" has started
}
```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like **@ContextName**, can be used to refine the observer method resolution to a particular Camel context as specified in [observer resolution](#), e.g.:

```
void onRouteStarted(@Observes @ContextName("foo") RouteStartedEvent event) {
    // Called after the route 'event.getRoute()' for the Camel context 'foo' has started
}

void onContextStarted(@Observes @Manual CamelContextStartedEvent event) {
    // Called after the Camel context qualified with '@Manual' has started
}
```

Similarly, the **@Default** qualifier can be used to observe Camel events for the *default* Camel context if multiples contexts exist, e.g.:

```
void onExchangeCompleted(@Observes @Default ExchangeCompletedEvent event) {
    // Called after the exchange 'event.getExchange()' processing has completed
}
```

In that example, if no qualifier is specified, the **@Any** qualifier is implicitly assumed, so that corresponding events for all the Camel contexts get received.

Note that the support for Camel events translation into CDI events is only activated if observer methods listening for Camel events are detected in the deployment, and that per Camel context.

59.10. CDI EVENTS ENDPOINT

Available as of Camel 2.17

The CDI event endpoint bridges the [CDI events](#) with the Camel routes so that CDI events can be seamlessly observed / consumed (resp. produced / fired) from Camel consumers (resp. by Camel producers).

The **CdiEventEndpoint<T>** bean provided by Camel CDI can be used to observe / consume CDI events whose *event type* is **T**, for example:

```
@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from(cdiEventEndpoint).log("CDI event received: ${body}");
```

This is equivalent to writing:

```
@Inject
```

```

@Uri("direct:event")
ProducerTemplate producer;

void observeCdiEvents(@Observes String event) {
    producer.sendBody(event);
}

from("direct:event").log("CDI event received: ${body}");

```

Conversely, the **CdiEventEndpoint<T>** bean can be used to produce / fire CDI events whose *event type* is **T**, for example:

```

@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint).log("CDI event sent: ${body}");

```

This is equivalent to writing:

```

@Inject
Event<String> event;

from("direct:event").process(new Processor() {
    @Override
    public void process(Exchange exchange) {
        event.fire(exchange.getBody(String.class));
    }
}).log("CDI event sent: ${body}");

```

Or using a Java 8 lambda expression:

```

@Inject
Event<String> event;

from("direct:event")
    .process(exchange -> event.fire(exchange.getIn().getBody(String.class)))
    .log("CDI event sent: ${body}");

```

The type variable **T** (resp. the qualifiers) of a particular **CdiEventEndpoint<T>** injection point are automatically translated into the parameterized *event type* (resp. into the *event qualifiers*) e.g.:

```

@Inject
@FooQualifier
CdiEventEndpoint<List<String>> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint);

void observeCdiEvents(@Observes @FooQualifier List<String> event) {
    logger.info("CDI event: {}", event);
}

```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like **@ContextName**, can be used to qualify the **CdiEventEndpoint<T>** injection points, e.g.:

```

@Inject
@ContextName("foo")
CdiEventEndpoint<List<String>> cdiEventEndpoint;
// Only observes / consumes events having the @ContextName("foo") qualifier
from(cdiEventEndpoint).log("Camel context (foo) > CDI event received: ${body}");
// Produces / fires events with the @ContextName("foo") qualifier
from("...").to(cdiEventEndpoint);

void observeCdiEvents(@Observes @ContextName("foo") List<String> event) {
    logger.info("Camel context (foo) > CDI event: {}", event);
}

```

Note that the CDI event Camel endpoint dynamically adds an [observer method](#) for each unique combination of *event type* and *event qualifiers* and solely relies on the container typesafe [observer resolution](#), which leads to an implementation as efficient as possible.

Besides, as the impedance between the *typesafe* nature of CDI and the *dynamic* nature of the [Camel component](#) model is quite high, it is not possible to create an instance of the CDI event Camel endpoint via [URIs](#). Indeed, the URI format for the CDI event component is:

```
cdi-event://PayloadType<T1,...,Tn>[?qualifiers=QualifierType1[,...[,QualifierTypeN]...]]
```

With the authority **PayloadType** (resp. the **QualifierType**) being the URI escaped fully qualified name of the payload (resp. qualifier) raw type followed by the type parameters section delimited by angle brackets for payload parameterized type. Which leads to *unfriendly* URIs, e.g.:

```
cdi-event://org.apache.camel.cdi.example.EventPayload%3Cjava.lang.Integer%3E?
qualifiers=org.apache.camel.cdi.example.FooQualifier%2Corg.apache.camel.cdi.example.BarQualifier
```

But more fundamentally, that would prevent efficient binding between the endpoint instances and the observer methods as the CDI container doesn't have any ways of discovering the Camel context model during the deployment phase.

59.11. CAMEL XML CONFIGURATION IMPORT

Available as of Camel 2.18

While CDI favors a typesafe dependency injection mechanism, it may be useful to reuse existing Camel XML configuration files into a Camel CDI application. In other use cases, it might be handy to rely on the Camel XML DSL to configure its Camel context(s).

You can use the **@ImportResource** annotation that's provided by Camel CDI on any CDI beans and Camel CDI will automatically load the Camel XML configuration at the specified locations, e.g.:

```

@ImportResource("camel-context.xml")
class MyBean {
}

```

Camel CDI will load the resources at the specified locations from the classpath (other protocols may be added in the future).

Every **CamelContext** elements and other Camel *primitives* from the imported resources are automatically deployed as CDI beans during the container bootstrap so that they benefit from the auto-configuration provided by Camel CDI and become available for injection at runtime. If such an element

has an explicit **id** attribute set, the corresponding CDI bean is qualified with the **@Named** qualifier, e.g., given the following Camel XML configuration:

```
<camelContext id="foo">
  <endpoint id="bar" uri="seda:inbound">
    <property key="queue" value="#queue"/>
    <property key="concurrentConsumers" value="10"/>
  </endpoint>
</camelContext/>
```

The corresponding CDI beans are automatically deployed and can be injected, e.g.:

```
@Inject
@ContextName("foo")
CamelContext context;

@Inject
@Named("bar")
Endpoint endpoint;
```

Note that the **CamelContext** beans are automatically qualified with both the **@Named** and **@ContextName** qualifiers. If the imported **CamelContext** element doesn't have an **id** attribute, the corresponding bean is deployed with the built-in **@Default** qualifier.

Conversely, CDI beans deployed in the application can be referred to from the Camel XML configuration, usually using the **ref** attribute, e.g., given the following bean declared:

```
@Produces
@Named("baz")
Processor processor = exchange -> exchange.getIn().setHeader("qux", "quux");
```

A reference to that bean can be declared in the imported Camel XML configuration, e.g.:

```
<camelContext id="foo">
  <route>
    <from uri="..."/>
    <process ref="baz"/>
  </route>
</camelContext/>
```

59.12. TRANSACTION SUPPORT

Available as of Camel 2.19

Camel CDI provides support for Camel transactional client using JTA.

That support is optional hence you need to have JTA in your application classpath, e.g., by explicitly add JTA as a dependency when using Maven:

```
<dependency>
  <groupId>javax.transaction</groupId>
  <artifactId>javax.transaction-api</artifactId>
  <scope>runtime</scope>
</dependency>
```

You'll have to have your application deployed in a JTA capable container or provide a standalone JTA implementation.

CAUTION

Note that, for the time being, the transaction manager is looked up as JNDI resource with the **java:TransactionManager** key.

More flexible strategies will be added in the future to support a wider range of deployment scenarios.

59.12.1. Transaction policies

Camel CDI provides implementation for the typically supported Camel **TransactedPolicy** as CDI beans. It is possible to have these policies looked up by name using the transacted EIP, e.g.:

```
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .transacted("PROPAGATION_REQUIRED")
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

This would be equivalent to:

```
class MyRouteBean extends RouteBuilder {

    @Inject
    @Named("PROPAGATION_REQUIRED")
    Policy required;

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .policy(required)
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

The list of supported transaction policy names is:

- **PROPAGATION_NEVER,**
- **PROPAGATION_NOT_SUPPORTED,**
- **PROPAGATION_SUPPORTS,**
- **PROPAGATION_REQUIRED,**

- `PROPAGATION_REQUIRES_NEW`,
- `PROPAGATION_NESTED`,
- `PROPAGATION_MANDATORY`.

59.12.2. Transactional error handler

Camel CDI provides a transactional error handler that extends the redelivery error handler, forces a rollback whenever an exception occurs and creates a new transaction for each redelivery.

Camel CDI provides the `CdiRouteBuilder` class that exposes the `transactionErrorHandler` helper method to enable quick access to the configuration, e.g.:

```
class MyRouteBean extends CdiRouteBuilder {

    @Override
    public void configure() {
        errorHandler(transactionErrorHandler()
            .setTransactionPolicy("PROPAGATION_SUPPORTS")
            .maximumRedeliveries(5)
            .maximumRedeliveryDelay(5000)
            .collisionAvoidancePercent(10)
            .backOffMultiplier(1.5));
    }
}
```

59.13. AUTO-CONFIGURED OSGI INTEGRATION

Available as of Camel 2.17

The Camel context beans are automatically adapted by Camel CDI so that they are registered as OSGi services and the various resolvers (like `ComponentResolver` and `DataFormatResolver`) integrate with the OSGi registry. That means that the Karaf Camel commands can be used to operate the Camel contexts auto-configured by Camel CDI, e.g.:

```
karaf@root()> camel:context-list
Context      Status      Total #    Failed #    Inflight #    Uptime
-----      -
camel-cdi    Started      1          0           0 1 minute
```

See the `camel-example-cdi-osgi` example for a working example of the Camel CDI OSGi integration.

59.14. LAZY INJECTION / PROGRAMMATIC LOOKUP

While the CDI programmatic model favors a `typesafe resolution` mechanism that occurs at application initialization time, it is possible to perform dynamic / lazy injection later during the application execution using the `programmatic lookup` mechanism.

Camel CDI provides for convenience the annotation literals corresponding to the CDI qualifiers that you can use for standard injection of Camel primitives. These annotation literals can be used in conjunction with the `javax.enterprise.inject.Instance` interface which is the CDI entry point to perform lazy injection / programmatic lookup.

For example, you can use the provided annotation literal for the **@Uri** qualifier to lazily lookup for Camel primitives, e.g. for **ProducerTemplate** beans:

```
@Any
@Inject
Instance<ProducerTemplate> producers;

ProducerTemplate inbound = producers
    .select(Uri.Literal.of("direct:inbound"))
    .get();
```

Or for **Endpoint** beans, e.g.:

```
@Any
@Inject
Instance<Endpoint> endpoints;

MockEndpoint outbound = endpoints
    .select(MockEndpoint.class, Uri.Literal.of("mock:outbound"))
    .get();
```

Similarly, you can use the provided annotation literal for the **@ContextName** qualifier to lazily lookup for **CamelContext** beans, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

CamelContext context = contexts
    .select(ContextName.Literal.of("foo"))
    .get();
```

You can also refined the selection based on the Camel context type, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

// Refine the selection by type
Instance<DefaultCamelContext> context = contexts.select(DefaultCamelContext.class);

// Check if such a bean exists then retrieve a reference
if (!context.isUnsatisfied())
    context.get();
```

Or even iterate over a selection of Camel contexts, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

for (CamelContext context : contexts)
    context.setUseBreadcrumb(true);
```

59.15. MAVEN ARCHETYPE

Among the available [Camel Maven archetypes](#), you can use the provided **camel-archetype-cdi** to generate a Camel CDI Maven project, e.g.:

```
mvn archetype:generate -DarchetypeGroupId=org.apache.camel.archetypes -
DarchetypeArtifactId=camel-archetype-cdi
```

59.16. SUPPORTED CONTAINERS

The Camel CDI component is compatible with any CDI 1.0, CDI 1.1 and CDI 1.2 compliant runtime. It's been successfully tested against the following runtimes:

Container	Version	Runtime
Weld SE	1.1.28.Final	CDI 1.0 / Java SE 7
OpenWebBeans	1.2.7	CDI 1.0 / Java SE 7
Weld SE	2.4.2.Final	CDI 1.2 / Java SE 7
OpenWebBeans	1.7.2	CDI 1.2 / Java SE 7
WildFly	8.2.1.Final	CDI 1.2 / Java EE 7
WildFly	9.0.1.Final	CDI 1.2 / Java EE 7
WildFly	10.1.0.Final	CDI 1.2 / Java EE 7

59.17. EXAMPLES

The following examples are available in the **examples** directory of the Camel project:

Example	Description
camel-example-cdi	Illustrates how to work with Camel using CDI to configure components, endpoints and beans
camel-example-cdi-kubernetes	Illustrates the integration between Camel, CDI and Kubernetes
camel-example-cdi-metrics	Illustrates the integration between Camel, Dropwizard Metrics and CDI
camel-example-cdi-properties	Illustrates the integration between Camel, DeltaSpike and CDI for configuration properties

Example	Description
camel-example-cdi-osgi	A CDI application using the SJMS component that can be executed inside an OSGi container using PAX CDI
camel-example-cdi-rest-servlet	Illustrates the Camel REST DSL being used in a Web application that uses CDI as dependency injection framework
camel-example-cdi-test	Demonstrates the testing features that are provided as part of the integration between Camel and CDI
camel-example-cdi-xml	Illustrates the use of Camel XML configuration files into a Camel CDI application
camel-example-openapi-cdi	An example using REST DSL and OpenAPI Java with CDI
camel-example-swagger-cdi	An example using REST DSL and Swagger Java with CDI
camel-example-widget-gadget-cdi	The Widget and Gadget use-case from the EIP book implemented in Java with CDI dependency Injection

59.19. CAMEL CDI FOR EAR DEPLOYMENTS ON WILDFLY-CAMEL

Camel CDI EAR deployments on WildFly-Camel have some differences in class and resource loading behaviour, compared to standard WAR or JAR deployments.

WildFly bootstraps Weld using the EAR deployment ClassLoader. WildFly also mandates that only a single CDI extension is created and shared by all EAR sub-deployments.

This results in the 'Auto-configured' CDI Camel Context using the EAR deployment ClassLoader to dynamically load classes and resources. By default, this ClassLoader does not have access to resources within EAR sub-deployments.

For EAR deployments, it is recommended that usage of the 'Auto-configured' CDI Camel Context is

avoided and that **RouteBuilder** classes are annotated with **@ContextName**, or that a **CamelContext** is created via the **@ImportResource** annotation or through CDI producer methods and fields. This helps WildFly-Camel to determine the correct ClassLoader to use with Camel.

CHAPTER 60. CHRONICLE ENGINE COMPONENT

Available as of Camel version 2.18

The camel chronicle-engine component let you leverage the power of OpenHFT's Chronicle-Engine

60.1. URI FORMAT

```
chronicle-engine:addresses/path[?options]
```

60.2. URI OPTIONS

The Chronicle Engine component has no options.

The Chronicle Engine endpoint is configured using URI syntax:

```
chronicle-engine:addresses/path
```

with the following path and query parameters:

60.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
addresses	Required Engine addresses. Multiple addresses can be separated by comma.		String
path	Required Engine path		String

60.2.2. Query Parameters (12 parameters):

Name	Description	Default	Type
action (common)	The default action to perform, valid values are: - PUBLISH - PPUBLISH_AND_INDEX - PPUT - PGET_AND_PUT - PPUT_ALL - PPUT_IF_ABSENT - PGET - PGET_AND_REMOVE - PREMOVE - PIS_EMPTY - PSIZE		String
clusterName (common)	Cluster name for queue		String
filteredMapEvents (common)	A comma separated list of Map event type to filter, valid values are: INSERT, UPDATE, REMOVE.		String

Name	Description	Default	Type
persistent (common)	Enable/disable data persistence	true	boolean
subscribeMapEvents (common)	Set if consumer should subscribe to Map events, default true.	true	boolean
subscribeTopicEvents (common)	Set if consumer should subscribe to TopicEvents, default false.	false	boolean
subscribeTopologicalEvents (common)	Set if consumer should subscribe to TopologicalEvents, default false.	false	boolean
wireType (common)	The Wire type to use, default to binary wire.	BINARY	String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

60.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.chronicle-engine.enabled</code>	Enable chronicle-engine component	true	Boolean
<code>camel.component.chronicle-engine.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 61. CHUNK COMPONENT

Available as of Camel version 2.15

The **chunk**: component allows for processing a message using a [Chunk](#) template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-chunk</artifactId>
<version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

61.1. URI FORMAT

```
chunk:templateName[?options]
```

Where **templateName** is the classpath-local URI of the template to invoke.

You can append query options to the URI in the following format, **?option=value&option=value&...**

61.2. OPTIONS

The Chunk component supports 2 options, which are listed below.

Name	Description	Default	Type
allowContextMapAll (producer)	Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API.	false	boolean
allowTemplateFromHeader (producer)	Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.	false	boolean

The Chunk endpoint is configured using URI syntax:

```
chunk:resourceUri
```

with the following path and query parameters:

61.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceUri	Required Path to the resource. You can prefix with: classpath, file, http, ref, or bean. classpath, file and http loads the resource using these protocols (classpath is default). ref will lookup the resource in the registry. bean will call a method on a bean to be used as the resource. For bean you can specify the method name after dot, eg bean:myBean.myMethod.		String

61.2.2. Query Parameters (9 parameters):

Name	Description	Default	Type
allowContextMapAll (producer)	Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API.	false	boolean
allowTemplateFromHeader (producer)	Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.	false	boolean
contentCache (producer)	Sets whether to use resource content cache or not	false	boolean
encoding (producer)	Define the encoding of the body		String
extension (producer)	Define the file extension of the template		String
themeFolder (producer)	Define the themes folder to scan		String
themeLayer (producer)	Define the theme layer to elaborate		String

Name	Description	Default	Type
themeSubfolder (producer)	Define the themes subfolder to scan		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

61.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.chunk.enabled	Enable chunk component	true	Boolean
camel.component.chunk.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Chunk component will look for a specific template in *themes* folder with extensions *.html* or *_.xml*. If you need to specify a different folder or extensions, you will need to use the specific options listed above.

61.4. CHUNK CONTEXT

Camel will provide exchange information in the Chunk context (just a **Map**). The **Exchange** is transferred as:

key	value
exchange	The Exchange itself.
exchange.properties	The Exchange properties.
headers	The headers of the In message.
camelContext	The Camel Context.
request	The In message.

key	value
body	The In message body.
response	The Out message (only for InOut message exchange pattern).

61.5. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

Header	Type	Description	Support Version
ChunkConstants.C HUNK_RESOURCE _URI	String	A URI for the template resource to use instead of the endpoint configured.	
ChunkConstants.C HUNK_TEMPLATE	String	The template to use instead of the endpoint configured.	

61.6. SAMPLES

For example you could use something like:

```
from("activemq:My.Queue").
to("chunk:template");
```

To use a Chunk template to formulate a response for a message for InOut message exchanges (where there is a **JMSReplyTo** header).

If you want to use `InOnly` and consume the message and send it to another destination you could use:

```
from("activemq:My.Queue").
to("chunk:template").
to("activemq:Another.Queue");
```

It's possible to specify what template the component should use dynamically via a header, so for example:

```
from("direct:in").
setHeader(ChunkConstants.CHUNK_RESOURCE_URI).constant("template").
to("chunk:dummy?allowTemplateFromHeader=true");
```

WARNING

Enabling the **allowTemplateFromHeader** option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.

An example of Chunk component options use:

```
from("direct:in").
to("chunk:file_example?themeFolder=template&themeSubfolder=subfolder&extension=chunk");
```

In this example Chunk component will look for the file *file_example.chunk* in the folder *template/subfolder*.

61.7. THE EMAIL SAMPLE

In this sample we want to use Chunk templating for an order confirmation email. The email template is laid out in Chunk as:

```
Dear {$headers.lastName}, {$headers.firstName}

Thanks for the order of {$headers.item}.

Regards Camel Riders Bookstore
{$body}
```

61.8. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)

- [Getting Started](#)

CHAPTER 62. CLASS COMPONENT

Available as of Camel version 2.4

The **class**: component binds beans to Camel message exchanges. It works in the same way as the [Bean](#) component but instead of looking up beans from a Registry it creates the bean based on the class name.

62.1. URI FORMAT

```
class:className[?options]
```

Where **className** is the fully qualified class name to create and use as bean.

62.2. OPTIONS

The Class component supports 2 options, which are listed below.

Name	Description	Default	Type
cache (advanced)	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Class endpoint is configured using URI syntax:

```
class:beanName
```

with the following path and query parameters:

62.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
beanName	Required Sets the name of the bean to invoke		String

62.2.2. Query Parameters (5 parameters):

Name	Description	Default	Type
method (producer)	Sets the name of the method to invoke on the bean		String
cache (advanced)	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
multiParameterArray (advanced)	Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use.	false	boolean
parameters (advanced)	Used for configuring additional properties on the bean		Map
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

62.3. USING

You simply use the **class** component just as the [Bean](#) component but by specifying the fully qualified classname instead.

For example to use the **MyFooBean** you have to do as follows:

```
from("direct:start").to("class:org.apache.camel.component.bean.MyFooBean").to("mock:result");
```

You can also specify which method to invoke on the **MyFooBean**, for example **hello**:

```
from("direct:start").to("class:org.apache.camel.component.bean.MyFooBean?method=hello").to("mock:result");
```

62.4. SETTING PROPERTIES ON THE CREATED INSTANCE

In the endpoint uri you can specify properties to set on the created instance, for example if it has a **setPrefix** method:

```
// Camel 2.17 onwards
from("direct:start")
    .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.prefix=Bye")
    .to("mock:result");

// Camel 2.16 and older
```

```
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?prefix=Bye")
  .to("mock:result");
```

And you can also use the **#** syntax to refer to properties to be looked up in the Registry.

```
// Camel 2.17 onwards
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.cool=#foo")
  .to("mock:result");

// Camel 2.16 and older
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?cool=#foo")
  .to("mock:result");
```

Which will lookup a bean from the Registry with the id **foo** and invoke the **setCool** method on the created instance of the **MyPrefixBean** class.

TIP:See more details at the [Bean](#) component as the **class** component works in much the same way.

CHAPTER 63. CMIS COMPONENT

Available as of Camel version 2.11

The cmis component uses the [Apache Chemistry](#) client API and allows you to add/read nodes to/from a CMIS compliant content repositories.

63.1. URI FORMAT

```
cmis://cmisServerUrl[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

63.2. CMIS OPTIONS

The CMIS component supports 2 options, which are listed below.

Name	Description	Default	Type
sessionFacadeFactory (common)	To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances		CMISSessionFacade Factory
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The CMIS endpoint is configured using URI syntax:

```
cmis:cmsUrl
```

with the following path and query parameters:

63.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cmsUrl	Required URL to the cmis repository		String

63.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
pageSize (common)	Number of nodes to retrieve per page	100	int
readContent (common)	If set to true, the content of document node will be retrieved in addition to the properties	false	boolean
readCount (common)	Max number of nodes to read		int
repositoryId (common)	The Id of the repository to use. If not specified the first available repository is used		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
query (consumer)	The cmis query to execute against the repository. If not specified, the consumer will retrieve every node from the content repository by iterating the content tree recursively		String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
queryMode (producer)	If true, will execute the cmis query from the message body and return result, otherwise will create a node in the cmis repository	false	boolean
sessionFacadeFactory (advanced)	To use a custom CMISessionFacadeFactory to create the CMISessionFacade instances		CMISessionFacadeFactory
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

Name	Description	Default	Type
password (security)	Password for the cmis repository		String
username (security)	Username for the cmis repository		String

63.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.cmis.enabled	Enable cmis component	true	Boolean
camel.component.cmis.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.component.cmis.session-facade-factory	To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances. The option is a <code>org.apache.camel.component.cmis.CMISSessionFacadeFactory</code> type.		String

63.4. USAGE

63.4.1. Message headers evaluated by the producer

Header	Default Value	Description
Camel CMIS FolderPath	/	The current folder to use during the execution. If not specified will use the root folder
Camel CMIS RetrieveContent	false	In queryMode this header will force the producer to retrieve the content of document nodes.

Header	Default Value	Description
Camel CMIS ReadSize	0	Max number of nodes to read.
cmis: path	null	If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is name
cmis: name	null	If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is path
cmis: object TypeId	null	The type of the node
cmis: contentStreamMimeType	null	The mimetype to set for a document

63.4.2. Message headers set during querying Producer operation

Header	Type	Description
Camel CMIS Result Count	Integer	Number of nodes returned from the query.

The message body will contain a list of maps, where each entry in the map is cmis property and its value. If **CamelCMISRetrieveContent** header is set to true, one additional entry in the map with key **CamelCMISContent** will contain **InputStream** of the document type of nodes.

63.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cmis</artifactId>
```

```
<version>${camel-version}</version>  
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.11 or higher).

63.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 64. CM SMS GATEWAY COMPONENT

Available as of Camel version 2.18

Camel-Cm-Sms is an [Apache Camel](#) component for the [CM SMS Gateway] (<https://www.cmtelecom.com>).

It allows to integrate [CM SMS API](#) in an application as a camel component.

You must have a valid account. More information are available at [CM Telecom](#).

```
cm-sms://sgw01.cm.nl/gateway.ashx?
defaultFrom=DefaultSender&defaultMaxNumberOfParts=8&productToken=xxxxx
```

Maven users will need to add the following dependency to their pom.xml for this component:

```
---
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-cm-sms</artifactId>
<version>x.x.x</version>
<!-- use the same version as your Camel core version -->
</dependency>
---
```

64.1. OPTIONS

The CM SMS Gateway component has no options.

The CM SMS Gateway endpoint is configured using URI syntax:

```
cm-sms:host
```

with the following path and query parameters:

64.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
host	Required SMS Provider HOST with scheme		String

64.1.2. Query Parameters (5 parameters):

Name	Description	Default	Type
defaultFrom (producer)	This is the sender name. The maximum length is 11 characters.		String)

Name	Description	Default	Type
defaultMaxNumberOfParts (producer)	If it is a multipart message forces the max number. Message can be truncated. Technically the gateway will first check if a message is larger than 160 characters, if so, the message will be cut into multiple 153 characters parts limited by these parameters.	8	Max(8L)::Int)
productToken (producer)	Required The unique token to use		String)
testConnectionOnStartup (producer)	Whether to test the connection to the SMS Gateway on startup	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

64.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.cm-sms.enabled	Enable cm-sms component	true	Boolean
camel.component.cm-sms.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

64.3. SAMPLE

You can try [this project](#) to see how camel-cm-sms can be integrated in a camel route.

CHAPTER 65. COAP COMPONENT

Available as of Camel version 2.16

Camel-CoAP is an [Apache Camel](#) component that allows you to work with CoAP, a lightweight REST-type protocol for machine-to-machine operation. [CoAP](#), Constrained Application Protocol is a specialized web transfer protocol for use with constrained nodes and constrained networks and it is based on RFC 7252.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-coap</artifactId>
<version>x.x.x</version>
<!-- use the same version as your Camel core version -->
</dependency>
```

65.1. OPTIONS

The CoAP component has no options.

The CoAP endpoint is configured using URI syntax:

```
coap:uri
```

with the following path and query parameters:

65.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
uri	The URI for the CoAP endpoint		URI

65.1.2. Query Parameters (5 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
coapMethodRestrict (consumer)	Comma separated list of methods that the CoAP consumer will bind to. The default is to bind to all methods (DELETE, GET, POST, PUT).		String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

65.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.coap.enabled	Enable coap component	true	Boolean
camel.component.coap.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

65.3. MESSAGE HEADERS

Name	Type	Description
Camel Coap Method	String	The request method that the CoAP producer should use when calling the target CoAP server URI. Valid options are DELETE, GET, PING, POST & PUT.

Name	Type	Description
Camel Coap ResponseCode	String	The CoAP response code sent by the external server. See RFC 7252 for details of what each code means.
Camel Coap Uri	String	The URI of a CoAP server to call. Will override any existing URI configured directly on the endpoint.

65.3.1. Configuring the CoAP producer request method

The following rules determine which request method the CoAP producer will use to invoke the target URI:

1. The value of the **CamelCoapMethod** header
2. **GET** if a query string is provided on the target CoAP server URI.
3. **POST** if the message exchange body is not null.
4. **GET** otherwise.

CHAPTER 66. CONSTANT LANGUAGE

Available as of Camel version 1.5

The Constant Expression Language is really just a way to specify constant strings as a type of expression.

NOTE

This is a fixed constant value that is only set once during starting up the route, do not use this if you want dynamic values during routing.

66.1. CONSTANT OPTIONS

The Constant language supports 1 options, which are listed below.

Name	Default	Java Type	Description
trim	true	Boolean	Whether to trim the value to remove leading and trailing whitespaces and line breaks

66.2. EXAMPLE USAGE

The `setHeader` element of the Spring DSL can utilize a constant expression like:

```
<route>
  <from uri="seda:a"/>
  <setHeader headerName="theHeader">
    <constant>the value</constant>
  </setHeader>
  <to uri="mock:b"/>
</route>
```

in this case, the Message coming from the `seda:a` Endpoint will have 'theHeader' header set to the constant value 'the value'.

And the same example using Java DSL:

```
from("seda:a")
  .setHeader("theHeader", constant("the value"))
  .to("mock:b");
```

66.3. DEPENDENCIES

The Constant language is part of `camel-core`.

CHAPTER 67. COMETD COMPONENT

Available as of Camel version 2.0

The **cometd**: component is a transport for working with the [jetty](#) implementation of the [cometd/bayeux protocol](#).

Using this component in combination with the dojo toolkit library it's possible to push Camel messages directly into the browser using an AJAX based mechanism.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cometd</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

67.1. URI FORMAT

```
cometd://host:port/channelName[?options]
```

The **channelName** represents a topic that can be subscribed to by the Camel endpoints.

67.2. EXAMPLES

```
cometd://localhost:8080/service/mychannel
cometds://localhost:8443/service/mychannel
```

where **cometds**: represents an SSL configured endpoint.

67.3. OPTIONS

The CometD component supports 8 options, which are listed below.

Name	Description	Default	Type
sslKeyPassword (security)	The password for the keystore when using SSL.		String
sslPassword (security)	The password when using SSL.		String
sslKeystore (security)	The path to the keystore.		String
securityPolicy (security)	To use a custom configured SecurityPolicy to control authorization		SecurityPolicy

Name	Description	Default	Type
extensions (common)	To use a list of custom BayeuxServer.Extension that allows modifying incoming and outgoing requests.		List
sslContextParameters (security)	To configure security using SSLContextParameters		SSLContextParameters
useGlobalSslContextParameters (security)	Enable usage of global SSL context parameters.	false	boolean
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The CometD endpoint is configured using URI syntax:

```
cometd:host:port/channelName
```

with the following path and query parameters:

67.3.1. Path Parameters (3 parameters):

Name	Description	Default	Type
host	Required Hostname		String
port	Required Host port number		int
channelName	Required The channelName represents a topic that can be subscribed to by the Camel endpoints.		String

67.3.2. Query Parameters (16 parameters):

Name	Description	Default	Type
allowedOrigins (common)	The origins domain that support to cross, if the crossOriginFilterOn is true	*	String

Name	Description	Default	Type
baseResource (common)	The root directory for the web resources or classpath. Use the protocol file: or classpath: depending if you want that the component loads the resource from file system or classpath. Classpath is required for OSGI deployment where the resources are packaged in the jar		String
crossOriginFilterOn (common)	If true, the server will support for cross-domain filtering	false	boolean
filterPath (common)	The filterPath will be used by the CrossOriginFilter, if the crossOriginFilterOn is true		String
interval (common)	The client side poll timeout in milliseconds. How long a client will wait between reconnects		int
jsonCommented (common)	If true, the server will accept JSON wrapped in a comment and will generate JSON wrapped in a comment. This is a defence against Ajax Hijacking.	true	boolean
logLevel (common)	Logging level. 0=none, 1=info, 2=debug.	1	int
maxInterval (common)	The max client side poll timeout in milliseconds. A client will be removed if a connection is not received in this time.	30000	int
multiFrameInterval (common)	The client side poll timeout, if multiple connections are detected from the same browser.	1500	int
timeout (common)	The server side poll timeout in milliseconds. This is how long the server will hold a reconnect request before responding.	24000 0	int
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sessionHeadersEnabled (consumer)	Whether to include the server session headers in the Camel message when creating a Camel Message for incoming requests.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
disconnectLocalSession (producer)	Whether to disconnect local sessions after publishing a message to its channel. Disconnecting local session is needed as they are not swept by default by CometD, and therefore you can run out of memory.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

67.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
camel.component.cometd.enabled	Enable cometd component	true	Boolean
camel.component.cometd.extensions	To use a list of custom BayeuxServer.Extension that allows modifying incoming and outgoing requests.		List
camel.component.cometd.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.component.cometd.security-policy	To use a custom configured SecurityPolicy to control authorization. The option is a <code>org.cometd.bayeux.server.SecurityPolicy</code> type.		String
camel.component.cometd.ssl-context-parameters	To configure security using SSLContextParameters. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type.		String

Name	Description	Default	Type
<code>camel.component.cometd.ssl-key-password</code>	The password for the keystore when using SSL.		String
<code>camel.component.cometd.ssl-keystore</code>	The path to the keystore.		String
<code>camel.component.cometd.ssl-password</code>	The password when using SSL.		String
<code>camel.component.cometd.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

Here is some examples on How to pass the parameters

For file (for webapp resources located in the Web Application directory → `cometd://localhost:8080?resourceBase=file./webapp`)

For classpath (when by example the web resources are packaged inside the webapp folder → `cometd://localhost:8080?resourceBase=classpath:webapp`)

67.5. AUTHENTICATION

Available as of Camel 2.8

You can configure custom **SecurityPolicy** and **Extension's to the `CometdComponent`** which allows you to use authentication as [documented here](#)

67.6. SETTING UP SSL FOR COMETD COMPONENT

67.6.1. Using the JSSE Configuration Utility

As of Camel 2.9, the Cometd component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the Cometd component. You need to configure SSL on the CometdComponent.

Programmatic configuration of the component

```
KeyStoreParameters ksp = new KeyStoreParameters();
```

```

ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

TrustManagersParameters tmp = new TrustManagersParameters();
tmp.setKeyStore(ksp);

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);
scp.setTrustManagers(tmp);

CometdComponent cometdComponent = getContext().getComponent("cometds",
CometdComponent.class);
cometdComponent.setSslContextParameters(scp);

```

Spring DSL based configuration of endpoint

```

...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:keyManagers
    keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  <camel:trustManagers>
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  </camel:sslContextParameters>...

<bean id="cometd" class="org.apache.camel.component.cometd.CometdComponent">
  <property name="sslContextParameters" ref="sslContextParameters"/>
</bean>

...
<to uri="cometds://127.0.0.1:443/service/test?baseResource=file:./target/test-
classes/webapp&timeout=240000&interval=0&maxInterval=30000&multiFrameInterval=1500&jsonCom
mented=true&logLevel=2"/>...

```

67.7. SEE ALSO

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 68. CONSUL COMPONENT

Available as of Camel version 2.18

The **Consul** component is a component for integrating your application with Consul.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-consul</artifactId>
  <version>${camel-version}</version>
</dependency>
```

68.1. URI FORMAT

```
consul://domain?[options]
```

You can append query options to the URI in the following format:

```
?option=value&option=value&...
```

68.2. OPTIONS

The Consul component supports 9 options, which are listed below.

Name	Description	Default	Type
url (common)	The Consul agent URL		String
datacenter (common)	The data center		String
sslContextParameters (common)	SSL configuration using an org.apache.camel.util.jsse.SSLContextParameters instance.		SSLContextParameters
useGlobalSslContextParameters (security)	Enable usage of global SSL context parameters.	false	boolean
aclToken (common)	Sets the ACL token to be used with Consul		String
userName (common)	Sets the username to be used for basic authentication		String

Name	Description	Default	Type
password (common)	Sets the password to be used for basic authentication		String
configuration (advanced)	Sets the common configuration shared among endpoints		ConsulConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Consul endpoint is configured using URI syntax:

```
consul:apiEndpoint
```

with the following path and query parameters:

68.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
apiEndpoint	Required The API endpoint		String

68.2.2. Query Parameters (4 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

68.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 90 options, which are listed below.

Name	Description	Default	Type
camel.component.consul.acl-token	Sets the ACL token to be used with Consul		String
camel.component.consul.cluster.service.acl-token			String
camel.component.consul.cluster.service.attributes	Custom service attributes.		Map
camel.component.consul.cluster.service.block-seconds			Integer
camel.component.consul.cluster.service.connect-timeout-millis			Long
camel.component.consul.cluster.service.consistency-mode			ConsistencyMode
camel.component.consul.cluster.service.datacenter			String

Name	Description	Default	Type
<code>camel.component.consul.cluster.service.enabled</code>	Sets if the consul cluster service should be enabled or not, default is false.	false	Boolean
<code>camel.component.consul.cluster.service.first-index</code>			BigInteger
<code>camel.component.consul.cluster.service.id</code>	Cluster Service ID		String
<code>camel.component.consul.cluster.service.near-node</code>			String
<code>camel.component.consul.cluster.service.node-meta</code>			List
<code>camel.component.consul.cluster.service.order</code>	Service lookup order/priority.		Integer
<code>camel.component.consul.cluster.service.password</code>			String
<code>camel.component.consul.cluster.service.ping-instance</code>			Boolean
<code>camel.component.consul.cluster.service.read-timeout-millis</code>			Long
<code>camel.component.consul.cluster.service.recursive</code>			Boolean
<code>camel.component.consul.cluster.service.root-path</code>			String

Name	Description	Default	Type
camel.component.consul.cluster.service.session-lock-delay			Integer
camel.component.consul.cluster.service.session-refresh-interval			Integer
camel.component.consul.cluster.service.session-ttl			Integer
camel.component.consul.cluster.service.ssl-context-parameters			SSLContextParameters
camel.component.consul.cluster.service.tags			Set
camel.component.consul.cluster.service.url			String
camel.component.consul.cluster.service.user-name			String
camel.component.consul.cluster.service.write-timeout-millis			Long
camel.component.consul.configuration.acl-token	Sets the ACL token to be used with Consul		String
camel.component.consul.configuration.action	The default action. Can be overridden by CamelConsulAction		String
camel.component.consul.configuration.block-seconds	The second to wait for a watch event, default 10 seconds		Integer

Name	Description	Default	Type
<code>camel.component.consul.configuration.connect-timeout-millis</code>	Connect timeout for OkHttpClient		Long
<code>camel.component.consul.configuration.consistency-mode</code>	The consistencyMode used for queries, default ConsistencyMode.DEFAULT		ConsistencyMode
<code>camel.component.consul.configuration.consul-client</code>	Reference to a com.orbitz.consul.Consul in the registry.		Consul
<code>camel.component.consul.configuration.datacenter</code>	The data center		String
<code>camel.component.consul.configuration.first-index</code>	The first index for watch for, default 0		BigInteger
<code>camel.component.consul.configuration.key</code>	The default key. Can be overridden by CamelConsulKey		String
<code>camel.component.consul.configuration.near-node</code>	The near node to use for queries.		String
<code>camel.component.consul.configuration.node-meta</code>	The note meta-data to use for queries.		List
<code>camel.component.consul.configuration.password</code>	Sets the password to be used for basic authentication		String
<code>camel.component.consul.configuration.ping-instance</code>	Configure if the AgentClient should attempt a ping before returning the Consul instance		Boolean
<code>camel.component.consul.configuration.read-timeout-millis</code>	Read timeout for OkHttpClient		Long

Name	Description	Default	Type
<code>camel.component.consul.configuration.recursive</code>	Recursively watch, default false		Boolean
<code>camel.component.consul.configuration.ssl-context-parameters</code>	SSL configuration using an <code>org.apache.camel.util.jsse.SSLContextParameters</code> instance.		SSLContextParameters
<code>camel.component.consul.configuration.tags</code>	Set tags. You can separate multiple tags by comma.		Set
<code>camel.component.consul.configuration.url</code>	The Consul agent URL		String
<code>camel.component.consul.configuration.user-name</code>	Sets the username to be used for basic authentication		String
<code>camel.component.consul.configuration.value-as-string</code>	Default to transform values retrieved from Consul i.e. on KV endpoint to string.		Boolean
<code>camel.component.consul.configuration.write-timeout-millis</code>	Write timeout for OkHttpClient		Long
<code>camel.component.consul.datacenter</code>	The data center		String
<code>camel.component.consul.enabled</code>	Enable consul component	true	Boolean
<code>camel.component.consul.health.check.repository.checks</code>	Define the checks to include.		List

Name	Description	Default	Type
<code>camel.component.consul.health.check.repository.configurations</code>	Health check configurations.		Map
<code>camel.component.consul.health.check.repository.enabled</code>			Boolean
<code>camel.component.consul.health.check.repository.failure-threshold</code>			Integer
<code>camel.component.consul.health.check.repository.interval</code>			String
<code>camel.component.consul.password</code>	Sets the password to be used for basic authentication		String
<code>camel.component.consul.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.consul.service-registry.acl-token</code>			String
<code>camel.component.consul.service-registry.attributes</code>	Custom service attributes.		Map
<code>camel.component.consul.service-registry.block-seconds</code>			Integer
<code>camel.component.consul.service-registry.check-interval</code>			Integer

Name	Description	Default	Type
camel.component.consul.service-registry.check-ttl			Integer
camel.component.consul.service-registry.connect-timeout-millis			Long
camel.component.consul.service-registry.consistency-mode			ConsistencyMode
camel.component.consul.service-registry.datacenter			String
camel.component.consul.service-registry.deregister-after			Integer
camel.component.consul.service-registry.deregister-services-on-stop			Boolean
camel.component.consul.service-registry.enabled	Sets if the consul service registry should be enabled or not, default is false.	false	Boolean
camel.component.consul.service-registry.first-index			BigInteger
camel.component.consul.service-registry.id	Service Registry ID		String
camel.component.consul.service-registry.near-node			String

Name	Description	Default	Type
camel.component.consul.service-registry.node-meta			List
camel.component.consul.service-registry.order	Service lookup order/priority.		Integer
camel.component.consul.service-registry.override-service-host			Boolean
camel.component.consul.service-registry.password			String
camel.component.consul.service-registry.ping-instance			Boolean
camel.component.consul.service-registry.read-timeout-millis			Long
camel.component.consul.service-registry.recursive			Boolean
camel.component.consul.service-registry.service-host			String
camel.component.consul.service-registry.ssl-context-parameters			SSLContextParameters
camel.component.consul.service-registry.tags			Set

Name	Description	Default	Type
camel.component.consul.service-registry.url			String
camel.component.consul.service-registry.user-name			String
camel.component.consul.service-registry.write-timeout-millis			Long
camel.component.consul.ssl-context-parameters	SSL configuration using an org.apache.camel.util.jsse.SSLContextParameters instance. The option is a org.apache.camel.util.jsse.SSLContextParameters type.		String
camel.component.consul.url	The Consul agent URL		String
camel.component.consul.use-global-ssl-context-parameters	Enable usage of global SSL context parameters.	false	Boolean
camel.component.consul.user-name	Sets the username to be used for basic authentication		String
camel.component.consul.cluster.service.dc			String
camel.component.consul.configuration.dc	The data center @deprecated replaced by {@link #setDatacenter(String)} ()}		String
camel.component.consul.service-registry.dc			String

68.4. HEADERS

Name	Type	Description
Camel Consul Action	String	The Producer action
Camel Consul Key	String	The Key on which the action should applied
Camel Consul EventId	String	The event id (consumer only)
Camel Consul EventName	String	The event name (consumer only)
Camel Consul EventLTime	Long	The event LTime
Camel Consul NodeFilter	String	The Node filter
Camel Consul TagFilter	String	The tag filter
Camel Consul Session Filter	String	The session filter
Camel Consul Version	int	The data version
Camel Consul Flags	Long	Flags associated with a value
Camel Consul CreateIndex	Long	The internal index value that represents when the entry was created

Name	Type	Description
Camel Consul LockIndex	Long	The number of times this key has successfully been acquired in a lock
Camel Consul ModifyIndex	Long	The last index that modified this key
Camel Consul Options	Object	Options associated to the request
Camel Consul Result	boolean	true if the response has a result
Camel Consul Session	String	The session id
Camel Consul ValueAsString	boolean	To transform values retrieved from Consul i.e. on KV endpoint to string.

CHAPTER 69. CONTROL BUS COMPONENT

Available as of Camel version 2.11

The [Control Bus](#) from the EIP patterns allows for the integration system to be monitored and managed from within the framework.

Use a Control Bus to manage an enterprise integration system. The Control Bus uses the same messaging mechanism used by the application data, but uses separate channels to transmit data that is relevant to the management of components involved in the message flow.

In Camel you can manage and monitor using JMX, or by using a Java API from the **CamelContext**, or from the **org.apache.camel.api.management** package, or use the event notifier which has an example here.

From Camel 2.11 onwards we have introduced a new [ControlBus Component](#) that allows you to send messages to a control bus Endpoint that reacts accordingly.

69.1. CONTROLBUS COMPONENT

Available as of Camel 2.11

The **controlbus:** component provides easy management of Camel applications based on the [Control Bus](#) EIP pattern. For example, by sending a message to an Endpoint you can control the lifecycle of routes, or gather performance statistics.

```
controlbus:command[?options]
```

Where **command** can be any string to identify which type of command to use.

69.2. COMMANDS

Command	Description
route	To control routes using the routeld and action parameter.

Command	Description
language	Allows you to specify a Language to use for evaluating the message body. If there is any result from the evaluation, then the result is put in the message body.

69.3. OPTIONS

The Control Bus component has no options.

The Control Bus endpoint is configured using URI syntax:

```
controlbus:command:language
```

with the following path and query parameters:

69.3.1. Path Parameters (2 parameters):

Name	Description	Default	Type
command	Required Command can be either route or language		String
language	Allows you to specify the name of a Language to use for evaluating the message body. If there is any result from the evaluation, then the result is put in the message body.		Language

69.3.2. Query Parameters (6 parameters):

Name	Description	Default	Type
action (producer)	To denote an action that can be either: start, stop, or status. To either start or stop a route, or to get the status of the route as output in the message body. You can use suspend and resume from Camel 2.11.1 onwards to either suspend or resume a route. And from Camel 2.11.1 onwards you can use stats to get performance statistics returned in XML format; the routeld option can be used to define which route to get the performance stats for, if routeld is not defined, then you get statistics for the entire CamelContext. The restart action will restart the route.		String

Name	Description	Default	Type
async (producer)	Whether to execute the control bus task asynchronously. Important: If this option is enabled, then any result from the task is not set on the Exchange. This is only possible if executing tasks synchronously.	false	boolean
loggingLevel (producer)	Logging level used for logging when task is done, or if any exceptions occurred during processing the task.	INFO	LoggingLevel
restartDelay (producer)	The delay in millis to use when restarting a route.	1000	int
routeId (producer)	To specify a route by its id. The special keyword current indicates the current route.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

69.4. USING ROUTE COMMAND

The route command allows you to do common tasks on a given route very easily, for example to start a route, you can send an empty message to this endpoint:

```
template.sendBody("controlbus:route?routeId=foo&action=start", null);
```

To get the status of the route, you can do:

```
String status = template.requestBody("controlbus:route?routeId=foo&action=status", null, String.class);
```

69.5. GETTING PERFORMANCE STATISTICS

Available as of Camel 2.11.1

This requires JMX to be enabled (is by default) then you can get the performance statics per route, or for the CamelContext. For example to get the statics for a route named foo, we can do:

```
String xml = template.requestBody("controlbus:route?routeId=foo&action=stats", null, String.class);
```

The returned statics is in XML format. Its the same data you can get from JMX with the **dumpRouteStatsAsXml** operation on the **ManagedRouteMBean**.

To get statics for the entire CamelContext you just omit the routeId parameter as shown below:

```
String xml = template.requestBody("controlbus:route?action=stats", null, String.class);
```

69.6. USING SIMPLE LANGUAGE

You can use the [Simple](#) language with the control bus, for example to stop a specific route, you can send a message to the "**controlbus:language:simple**" endpoint containing the following message:

```
template.sendBody("controlbus:language:simple", "${camelContext.stopRoute('myRoute')}");
```

As this is a void operation, no result is returned. However, if you want the route status you can do:

```
String status = template.requestBody("controlbus:language:simple",  
    "${camelContext.getRouteStatus('myRoute')}", String.class);
```

It's easier to use the **route** command to control lifecycle of routes. The **language** command allows you to execute a language script that has stronger powers such as [Groovy](#) or to some extend the [Simple](#) language.

For example to shutdown Camel itself you can do:

```
template.sendBody("controlbus:language:simple?async=true", "${camelContext.stop()}");
```

We use **async=true** to stop Camel asynchronously as otherwise we would be trying to stop Camel while it was in-flight processing the message we sent to the control bus component.

TIP

You can also use other languages such as [Groovy](#), etc.

CHAPTER 70. COUCHBASE COMPONENT

Available as of Camel version 2.19

The `couchbase:` component allows you to treat [CouchBase](#) instances as a producer or consumer of messages.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchbase</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

70.1. URI FORMAT

```
couchbase:url
```

70.2. OPTIONS

The Couchbase component has no options.

The Couchbase endpoint is configured using URI syntax:

```
couchbase:protocol:hostname:port
```

with the following path and query parameters:

70.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
<code>protocol</code>	Required The protocol to use		String
<code>hostname</code>	Required The hostname to use		String
<code>port</code>	The port number to use	8091	int

70.2.2. Query Parameters (47 parameters):

Name	Description	Default	Type
<code>bucket</code> (common)	The bucket to use		String

Name	Description	Default	Type
key (common)	The key to use		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
consumerProcessedStrategy (consumer)	Define the consumer Processed strategy to use	none	String
descending (consumer)	Define if this operation is descending or not	false	boolean
designDocumentName (consumer)	The design document name to use	beer	String
limit (consumer)	The output limit to use	-1	int
rangeEndKey (consumer)	Define a range for the end key		String
rangeStartKey (consumer)	Define a range for the start key		String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
skip (consumer)	Define the skip to use	-1	int
viewName (consumer)	The view name to use	brewery_beers	String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
autoStartIdForInserts (producer)	Define if we want an autostart Id when we are doing an insert operation	false	boolean
operation (producer)	The operation to do	CCB_PUT	String
persistTo (producer)	Where to persist the data	0	int
producerRetryAttempts (producer)	Define the number of retry attempts	2	int
producerRetryPause (producer)	Define the retry pause between different attempts	5000	int
replicateTo (producer)	Where to replicate the data	0	int
startingIdForInsertsFrom (producer)	Define the starting Id where we are doing an insert operation		long
additionalHosts (advanced)	The additional hosts		String
maxReconnectDelay (advanced)	Define the max delay during a reconnection	30000	long
obsPollInterval (advanced)	Define the observation polling interval	400	long
obsTimeout (advanced)	Define the observation timeout	-1	long
opQueueMaxBlockTime (advanced)	Define the max time an operation can be in queue blocked	10000	long

Name	Description	Default	Type
opTimeout (advanced)	Define the operation timeout	2500	long
readBufferSize (advanced)	Define the buffer size	16384	int
shouldOptimize (advanced)	Define if we want to use optimization or not where possible	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
timeoutExceptionThreshold (advanced)	Define the threshold for throwing a timeout Exception	998	int
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel

Name	Description	Default	Type
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
password (security)	The password to use		String
username (security)	The username to use		String

70.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.couchbase.enabled	Enable couchbase component	true	Boolean
camel.component.couchbase.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 71. COUCHDB COMPONENT

Available as of Camel version 2.11

The **couchdb**: component allows you to treat [CouchDB](#) instances as a producer or consumer of messages. Using the lightweight LightCouch API, this camel component has the following features:

- As a consumer, monitors couch changesets for inserts, updates and deletes and publishes these as messages into camel routes.
- As a producer, can save, update, from Camel 2.18 delete (by using CouchDbMethod with DELETE value) documents and from Camel 2.22 get document by id (by using CouchDbMethod with GET value) into couch.
- Can support as many endpoints as required, eg for multiple databases across multiple instances.
- Ability to have events trigger for only deletes, only inserts/updates or all (default).
- Headers set for sequenceId, document revision, document id, and HTTP method type.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

71.1. URI FORMAT

```
couchdb:http://hostname[:port]/database?[options]
```

Where **hostname** is the hostname of the running couchdb instance. Port is optional and if not specified then defaults to 5984.

71.2. OPTIONS

The CouchDB component has no options.

The CouchDB endpoint is configured using URI syntax:

```
couchdb:protocol:hostname:port/database
```

with the following path and query parameters:

71.2.1. Path Parameters (4 parameters):

Name	Description	Default	Type
		t	

Name	Description	Default	Type
protocol	Required The protocol to use for communicating with the database.		String
hostname	Required Hostname of the running couchdb instance		String
port	Port number for the running couchdb instance	5984	int
database	Required Name of the database to use		String

71.2.2. Query Parameters (12 parameters):

Name	Description	Default	Type
createDatabase (common)	Creates the database if it does not already exist	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
deletes (consumer)	Document deletes are published as events	true	boolean
heartbeat (consumer)	How often to send an empty message to keep socket alive in millis	30000	long
since (consumer)	Start tracking changes immediately after the given update sequence. The default, null, will start monitoring from the latest sequence.		String
style (consumer)	Specifies how many revisions are returned in the changes array. The default, <code>main_only</code> , will only return the current winning revision; <code>all_docs</code> will return all leaf revisions (including conflicts and deleted former conflicts.)	<code>main_only</code>	String
updates (consumer)	Document inserts/updates are published as events	true	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
password (security)	Password for authenticated databases		String
username (security)	Username in case of authenticated databases		String

71.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.couchdb.enabled	Enable couchdb component	true	Boolean
camel.component.couchdb.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

71.4. HEADERS

The following headers are set on exchanges during message transport.

Property	Value
CouchDbDatabase	the database the message came from
CouchDbSeq	the couchdb changeset sequence number of the update / delete message

Property	Value
CouchDbId	the couchdb document id
CouchDbRev	the couchdb document revision
CouchDbMethod	the method (delete / update)

Headers are set by the consumer once the message is received. The producer will also set the headers for downstream processors once the insert/update has taken place. Any headers set prior to the producer are ignored. That means for example, if you set CouchDbId as a header, it will not be used as the id for insertion, the id of the document will still be used.

71.5. MESSAGE BODY

The component will use the message body as the document to be inserted. If the body is an instance of String, then it will be marshalled into a GSON object before insert. This means that the string must be valid JSON or the insert / update will fail. If the body is an instance of a com.google.gson.JsonElement then it will be inserted as is. Otherwise the producer will throw an exception of unsupported body type.

71.6. SAMPLES

For example if you wish to consume all inserts, updates and deletes from a CouchDB instance running locally, on port 9999 then you could use the following:

```
from("couchdb:http://localhost:9999").process(someProcessor);
```

If you were only interested in deletes, then you could use the following

```
from("couchdb:http://localhost:9999?updates=false").process(someProcessor);
```

If you wanted to insert a message as a document, then the body of the exchange is used

```
from("someProducingEndpoint").process(someProcessor).to("couchdb:http://localhost:9999")
```

CHAPTER 72. CASSANDRA CQL COMPONENT

Available as of Camel version 2.15

[Apache Cassandra](#) is an open source NoSQL database designed to handle large amounts on commodity hardware. Like Amazon's DynamoDB, Cassandra has a peer-to-peer and master-less architecture to avoid single point of failure and garanty high availability. Like Google's BigTable, Cassandra data is structured using column families which can be accessed through the Thrift RPC API or a SQL-like API called CQL.

This component aims at integrating Cassandra 2.0+ using the CQL3 API (not the Thrift API). It's based on [Cassandra Java Driver](#) provided by DataStax.

Maven users will need to add the following dependency to their **pom.xml**:

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cassandraql</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

72.1. URI FORMAT

The endpoint can initiate the Cassandra connection or use an existing one.

URI	Description
cql:localhost/keyspace	Single host, default port, usual for testing
cql:host1,host2/keyspace	Multi host, default port
cql:host1,host2:9042/keyspace	Multi host, custom port
cql:host1,host2	Default port and keyspace
cql:bean:sessionRef	Provided Session reference
cql:bean:clusterRef/keyspace	Provided Cluster reference

To fine tune the Cassandra connection (SSL options, pooling options, load balancing policy, retry policy, reconnection policy...), create your own Cluster instance and give it to the Camel endpoint.

72.2. CASSANDRA OPTIONS

The Cassandra CQL component has no options.

The Cassandra CQL endpoint is configured using URI syntax:

■

`cql:beanRef:hosts:port/keyspace`

with the following path and query parameters:

72.2.1. Path Parameters (4 parameters):

Name	Description	Default	Type
beanRef	beanRef is defined using bean:id		String
hosts	Hostname(s) cassandra server(s). Multiple hosts can be separated by comma.		String
port	Port number of cassandra server(s)		Integer
keyspace	Keyspace to use		String

72.2.2. Query Parameters (29 parameters):

Name	Description	Default	Type
cluster (common)	To use the Cluster instance (you would normally not use this option)		Cluster
clusterName (common)	Cluster name		String
consistencyLevel (common)	Consistency level to use		ConsistencyLevel
cql (common)	CQL query to perform. Can be overridden with the message header with key CamelCqlQuery.		String
loadBalancingPolicy (common)	To use a specific LoadBalancingPolicy		String
password (common)	Password for session authentication		String
prepareStatements (common)	Whether to use PreparedStatements or regular Statements	true	boolean
resultSetConversionStrategy (common)	To use a custom class that implements logic for converting ResultSet into message body ALL, ONE, LIMIT_10, LIMIT_100...		String

Name	Description	Default	Type
session (common)	To use the Session instance (you would normally not use this option)		Session
username (common)	Username for session authentication		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int

Name	Description	Default	Type
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for <code>initialDelay</code> and <code>delay</code> options.	MILLISECONDS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean

72.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.cql.enabled</code>	Enable cql component	true	Boolean
<code>camel.component.cql.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

72.4. MESSAGES

72.4.1. Incoming Message

The Camel Cassandra endpoint expects a bunch of simple objects (**Object** or **Object[]** or **Collection<Object>**) which will be bound to the CQL statement as query parameters. If message body is null or empty, then CQL query will be executed without binding parameters.

Headers:

- **CamelCqlQuery** (optional, **String** or **RegularStatement**): CQL query either as a plain String or built using the **QueryBuilder**.

72.4.2. Outgoing Message

The Camel Cassandra endpoint produces one or many a Cassandra Row objects depending on the **resultSetConversionStrategy**:

- **List<Row>** if **resultSetConversionStrategy** is **ALL** or **LIMIT_[0-9]+**
- **Single `Row`** if **resultSetConversionStrategy** is **ONE**
- Anything else, if **resultSetConversionStrategy** is a custom implementation of the **ResultSetConversionStrategy**

72.5. REPOSITORIES

Cassandra can be used to store message keys or messages for the idempotent and aggregation EIP.

Cassandra might not be the best tool for queuing use cases yet, read [Cassandra anti-patterns queues and queue like datasets](#). It's advised to use LeveledCompaction and a small GC grace setting for these tables to allow tombstoned rows to be removed quickly.

72.6. IDEMPOTENT REPOSITORY

The **NamedCassandraIdempotentRepository** stores messages keys in a Cassandra table like this:

CAMEL_IDEMPOTENT.cql

```
CREATE TABLE CAMEL_IDEMPOTENT (
  NAME varchar, -- Repository name
  KEY varchar, -- Message key
  PRIMARY KEY (NAME, KEY)
) WITH compaction = {'class':'LeveledCompactionStrategy'}
AND gc_grace_seconds = 86400;
```

This repository implementation uses lightweight transactions (also known as Compare and Set) and requires Cassandra 2.0.7+.

Alternatively, the **CassandraIdempotentRepository** does not have a **NAME** column and can be extended to use a different data model.

Option	Default	Description
table	CAMEL_IDEMPOTENT	Table name
pkColumns	NAME, `KEY`	Primary key columns
name		Repository name, value used for NAME column
ttl		Key time to live
writeConsistencyLevel		Consistency level used to insert/delete key: ANY, ONE, TWO, QUORUM, LOCAL_QUORUM...
readConsistencyLevel		Consistency level used to read/check key: ONE, TWO, QUORUM, LOCAL_QUORUM...

72.7. AGGREGATION REPOSITORY

The **NamedCassandraAggregationRepository** stores exchanges by correlation key in a Cassandra table like this:

CAMEL_AGGREGATION.cql

```
CREATE TABLE CAMEL_AGGREGATION (
  NAME varchar, -- Repository name
  KEY varchar, -- Correlation id
  EXCHANGE_ID varchar, -- Exchange id
  EXCHANGE blob, -- Serialized exchange
  PRIMARY KEY (NAME, KEY)
) WITH compaction = {'class':'LeveledCompactionStrategy'}
AND gc_grace_seconds = 86400;
```

Alternatively, the **CassandraAggregationRepository** does not have a **NAME** column and can be extended to use a different data model.

Option	Default	Description
table	CAMEL_AGGREGATION	Table name
pkColumns	NAME,KEY	Primary key columns
exchangeIdColumn	EXCHANGE_ID	Exchange Id column
exchangeColumn	EXCHANGE	Exchange content column
name		Repository name, value used for NAME column
ttl		Exchange time to live
writeConsistencyLevel		Consistency level used to insert/delete exchange: ANY, ONE, TWO, QUORUM, LOCAL_QUORUM...
readConsistencyLevel		Consistency level used to read/check exchange: ONE, TWO, QUORUM, LOCAL_QUORUM...

72.8. EXAMPLES

To insert something on a table you can use the following code:

```
String CQL = "insert into camel_user(login, first_name, last_name) values (?, ?, ?)";
from("direct:input")
    .to("cql://localhost/camel_ks?cql=" + CQL);
```

At this point you should be able to insert data by using a list as body

```
Arrays.asList("davsclaus", "Claus", "Ibsen")
```

The same approach can be used for updating or querying the table.

CHAPTER 73. CRYPTO (JCE) COMPONENT

Available as of Camel version 2.3

With Camel cryptographic endpoints and Java's Cryptographic extension it is easy to create Digital Signatures for Exchanges. Camel provides a pair of flexible endpoints which get used in concert to create a signature for an exchange in one part of the exchange's workflow and then verify the signature in a later part of the workflow.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

73.1. INTRODUCTION

Digital signatures make use of Asymmetric Cryptographic techniques to sign messages. From a (very) high level, the algorithms use pairs of complimentary keys with the special property that data encrypted with one key can only be decrypted with the other. One, the private key, is closely guarded and used to 'sign' the message while the other, public key, is shared around to anyone interested in verifying the signed messages. Messages are signed by using the private key to encrypting a digest of the message. This encrypted digest is transmitted along with the message. On the other side the verifier recalculates the message digest and uses the public key to decrypt the digest in the signature. If both digests match the verifier knows only the holder of the private key could have created the signature.

Camel uses the Signature service from the Java Cryptographic Extension to do all the heavy cryptographic lifting required to create exchange signatures. The following are some excellent resources for explaining the mechanics of Cryptography, Message digests and Digital Signatures and how to leverage them with the JCE.

- Bruce Schneier's Applied Cryptography
- Beginning Cryptography with Java by David Hook
- The ever insightful Wikipedia [Digital_signatures](#)

73.2. URI FORMAT

As mentioned Camel provides a pair of crypto endpoints to create and verify signatures

```
crypto:sign:name[?options]
crypto:verify:name[?options]
```

- **crypto:sign** creates the signature and stores it in the Header keyed by the constant **org.apache.camel.component.crypto.DigitalSignatureConstants.SIGNATURE**, i.e. "CamelDigitalSignature".
- **crypto:verify** will read in the contents of this header and do the verification calculation.

In order to correctly function, the sign and verify process needs a pair of keys to be shared, signing

requiring a **PrivateKey** and verifying a **PublicKey** (or a **Certificate** containing one). Using the JCE it is very simple to generate these key pairs but it is usually most secure to use a KeyStore to house and share your keys. The DSL is very flexible about how keys are supplied and provides a number of mechanisms.

Note a **crypto:sign** endpoint is typically defined in one route and the complimentary **crypto:verify** in another, though for simplicity in the examples they appear one after the other. It goes without saying that both signing and verifying should be configured identically.

73.3. OPTIONS

The Crypto (JCE) component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use the shared DigitalSignatureConfiguration as configuration		DigitalSignature Configuration
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Crypto (JCE) endpoint is configured using URI syntax:

```
crypto:cryptoOperation:name
```

with the following path and query parameters:

73.3.1. Path Parameters (2 parameters):

Name	Description	Default	Type
cryptoOperation	Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto:sign sets sign as the operation.		CryptoOperation
name	Required The logical name of this operation.		String

73.3.2. Query Parameters (19 parameters):

Name	Description	Default	Type
algorithm (producer)	Sets the JCE name of the Algorithm that should be used for the signer.	SHA1WithDSA	String

Name	Description	Default	Type
alias (producer)	Sets the alias used to query the KeyStore for keys and link java.security.cert.Certificate Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header org.apache.camel.component.crypto.DigitalSignature Constants#KEYSTORE_ALIAS		String
certificateName (producer)	Sets the reference name for a PrivateKey that can be found in the registry.		String
keystore (producer)	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStore
keystoreName (producer)	Sets the reference name for a Keystore that can be found in the registry.		String
privateKey (producer)	Set the PrivateKey that should be used to sign the exchange		PrivateKey
privateKeyName (producer)	Sets the reference name for a PrivateKey that can be found in the registry.		String
provider (producer)	Set the id of the security provider that provides the configured Signature algorithm.		String
publicKeyName (producer)	references that should be resolved when the context changes		String
secureRandomName (producer)	Sets the reference name for a SecureRandom that can be found in the registry.		String
signatureHeader Name (producer)	Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature'		String
bufferSize (advanced)	Set the size of the buffer used to read in the Exchange payload data.	2048	Integer
certificate (advanced)	Set the Certificate that should be used to verify the signature in the exchange based on its payload.		Certificate

Name	Description	Default	Type
clearHeaders (advanced)	Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset.	true	boolean
keyStoreParameters (advanced)	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStoreParameters
publicKey (advanced)	Set the PublicKey that should be used to verify the signature in the exchange.		PublicKey
secureRandom (advanced)	Set the SecureRandom used to initialize the Signature service		SecureRandom
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
password (security)	Sets the password used to access an aliased PrivateKey in the KeyStore.		String

73.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 33 options, which are listed below.

Name	Description	Default	Type
camel.component.crypto.configuration.algorithm	Sets the JCE name of the Algorithm that should be used for the signer.	SHA1WithDSA	String
camel.component.crypto.configuration.alias	Sets the alias used to query the KeyStore for keys and link java.security.cert.Certificate Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header org.apache.camel.component.crypto.DigitalSignature Constants #KEYSTORE_ALIAS		String

Name	Description	Default	Type
<code>camel.component.crypto.configuration.buffer-size</code>	Set the size of the buffer used to read in the Exchange payload data.	2048	Integer
<code>camel.component.crypto.configuration.certificate</code>	Set the Certificate that should be used to verify the signature in the exchange based on its payload.		Certificate
<code>camel.component.crypto.configuration.certificate-name</code>	Sets the reference name for a PrivateKey that can be found in the registry.		String
<code>camel.component.crypto.configuration.clear-headers</code>	Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset.	true	Boolean
<code>camel.component.crypto.configuration.crypto-operation</code>	Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto:sign sets sign as the operation.		CryptoOperation
<code>camel.component.crypto.configuration.key-store-parameters</code>	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStoreParameters
<code>camel.component.crypto.configuration.keystore</code>	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStore
<code>camel.component.crypto.configuration.keystore-name</code>	Sets the reference name for a Keystore that can be found in the registry.		String

Name	Description	Default	Type
<code>camel.component.crypto.configuration.name</code>	The logical name of this operation.		String
<code>camel.component.crypto.configuration.password</code>	Sets the password used to access an aliased PrivateKey in the KeyStore.		Character[]
<code>camel.component.crypto.configuration.private-key</code>	Set the PrivateKey that should be used to sign the exchange		PrivateKey
<code>camel.component.crypto.configuration.private-key-name</code>	Sets the reference name for a PrivateKey that can be found in the registry.		String
<code>camel.component.crypto.configuration.provider</code>	Set the id of the security provider that provides the configured Signature algorithm.		String
<code>camel.component.crypto.configuration.public-key</code>	Set the PublicKey that should be used to verify the signature in the exchange.		PublicKey
<code>camel.component.crypto.configuration.public-key-name</code>	references that should be resolved when the context changes		String
<code>camel.component.crypto.configuration.secure-random</code>	Set the SecureRandom used to initialize the Signature service		SecureRandom
<code>camel.component.crypto.configuration.secure-random-name</code>	Sets the reference name for a SecureRandom that can be found in the registry.		String
<code>camel.component.crypto.configuration.signature-header-name</code>	Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature'		String
<code>camel.component.crypto.enabled</code>	Enable crypto component	true	Boolean

Name	Description	Default	Type
<code>camel.component.crypto.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.dataformat.crypto.algorithm</code>	The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding.	DES/CBC/PKCS5Padding	String
<code>camel.dataformat.crypto.algorithm-parameter-ref</code>	A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a <code>java.security.spec.AlgorithmParameterSpec</code> type.		String
<code>camel.dataformat.crypto.buffer-size</code>	The size of the buffer used in the signature process.		Integer
<code>camel.dataformat.crypto.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.crypto.crypto-provider</code>	The name of the JCE Security Provider that should be used.		String
<code>camel.dataformat.crypto.enabled</code>	Enable crypto dataformat	true	Boolean
<code>camel.dataformat.crypto.init-vector-ref</code>	Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher.		String
<code>camel.dataformat.crypto.inline</code>	Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false.	false	Boolean
<code>camel.dataformat.crypto.key-ref</code>	Refers to the secret key to lookup from the register to use.		String
<code>camel.dataformat.crypto.mac-algorithm</code>	The JCE algorithm name indicating the Message Authentication algorithm.	HmacSHA1	String

Name	Description	Default	Type
<code>camel.dataformat.crypto.should-append-h-m-a-c</code>	Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data.	false	Boolean

73.5. USING

73.5.1. Raw keys

The most basic way to way to sign and verify an exchange is with a `KeyPair` as follows.

The same can be achieved with the [Spring XML Extensions](#) using references to keys

73.5.2. KeyStores and Aliases.

The JCE provides a very versatile keystore concept for housing pairs of private keys and certificates, keeping them encrypted and password protected. They can be retrieved by applying an alias to the retrieval APIs. There are a number of ways to get keys and Certificates into a keystore, most often this is done with the external 'keytool' application. [This](#) is a good example of using keytool to create a `KeyStore` with a self signed Cert and Private key.

The examples use a `Keystore` with a key and cert aliased by 'bob'. The password for the keystore and the key is 'letmein'

The following shows how to use a `Keystore` via the Fluent builders, it also shows how to load and initialize the keystore.

Again in Spring a ref is used to lookup an actual keystore instance.

73.5.3. Changing JCE Provider and Algorithm

Changing the Signature algorithm or the Security provider is a simple matter of specifying their names. You will need to also use Keys that are compatible with the algorithm you choose.

or

73.5.4. Changing the Signature Message Header

It may be desirable to change the message header used to store the signature. A different header name can be specified in the route definition as follows

or

73.5.5. Changing the buffersize

In case you need to update the size of the buffer...

or

73.5.6. Supplying Keys dynamically.

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may be neither feasible nor desirable. It would be useful to be able to specify signature keys dynamically on a per-exchange basis. The exchange could then be dynamically enriched with the key of its target recipient prior to signing. To facilitate this the signature mechanisms allow for keys to be supplied dynamically via the message headers below

- **Exchange.SIGNATURE_PRIVATE_KEY, "CamelSignaturePrivateKey"**
- **Exchange.SIGNATURE_PUBLIC_KEY_OR_CERT, "CamelSignaturePublicKeyOrCert"**

or

Even better would be to dynamically supply a keystore alias. Again the alias can be supplied in a message header

- **Exchange.KEYSTORE_ALIAS, "CamelSignatureKeyStoreAlias"**

or

The header would be set as follows

```
Exchange unsigned = getMandatoryEndpoint("direct:alias-sign").createExchange();
unsigned.getIn().setBody(payload);
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_ALIAS, "bob");
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_PASSWORD,
"letmein".toCharArray());
template.send("direct:alias-sign", unsigned);
Exchange signed = getMandatoryEndpoint("direct:alias-sign").createExchange();
signed.getIn().copyFrom(unsigned.getOut());
signed.getIn().setHeader(KEYSTORE_ALIAS, "bob");
template.send("direct:alias-verify", signed);
```

CHAPTER 74. CRYPTO CMS COMPONENT

Available as of Camel version 2.20

[Cryptographic Message Syntax \(CMS\)](#) is a well established standard for signing and encrypting messages. The Apache Crypto CMS component supports the following parts of this standard: * Content Type "Enveloped Data" with Key Transport (asymmetric key), * Content Type "Signed Data". You can create CMS Enveloped Data instances, decrypt CMS Enveloped Data instances, create CMS Signed Data instances, and validate CMS Signed Data instances.

The component uses the [Bouncy Castle](#) libraries `bcprov-jdk15on` and `bcpkix-jdk15on`.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto-cms</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

We recommend to register the Bouncy Castle security provider in your application before you call an endpoint of this component:

```
Security.addProvider(new BouncyCastleProvider());
```

If the Bouncy Castle security provider is not registered then the Crypto CMS component will register the provider.

74.1. OPTIONS

The Crypto CMS component supports 3 options, which are listed below.

Name	Description	Default	Type
signedDataVerifier Configuration (advanced)	To configure the shared <code>SignedDataVerifierConfiguration</code> , which determines the uri parameters for the verify operation.		<code>SignedDataVerifier Configuration</code>
envelopedDataDecryptor Configuration (advanced)	To configure the shared <code>EnvelopedDataDecryptorConfiguration</code> , which determines the uri parameters for the decrypt operation.		<code>EnvelopedDataDecryptor Configuration</code>
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Crypto CMS endpoint is configured using URI syntax:

`crypto-cms:cryptoOperation:name`

with the following path and query parameters:

74.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
<code>cryptoOperation</code>	Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. <code>crypto-cms:sign</code> sets <code>sign</code> as the operation. Possible values: <code>sign</code> , <code>verify</code> , <code>encrypt</code> , or <code>decrypt</code> .		CryptoOperation
<code>name</code>	Required The name part in the URI can be chosen by the user to distinguish between different signer/verifier/encryptor/decryptor endpoints within the camel context.		String

74.1.2. Query Parameters (15 parameters):

Name	Description	Default	Type
<code>keyStore</code> (common)	Keystore which contains signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter <code>'keyStoreParameters'</code> .		KeyStore
<code>keyStoreParameters</code> (common)	Keystore containing signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter <code>'keystore'</code> .		KeyStoreParameters
<code>synchronous</code> (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
<code>password</code> (decrypt)	Sets the password of the private keys. It is assumed that all private keys in the keystore have the same password. If not set then it is assumed that the password of the private keys is given by the keystore password given in the <code>KeyStoreParameters</code> .		Char[]
<code>fromBase64</code> (decrypt_verify)	If true then the CMS message is base 64 encoded and must be decoded during the processing. Default value is false.	false	Boolean

Name	Description	Default	Type
contentEncryptionAlgorithm (encrypt)	Encryption algorithm, for example DESede/CBC/PKCS5Padding. Further possible values: DESede/CBC/PKCS5Padding, AES/CBC/PKCS5Padding, Camellia/CBC/PKCS5Padding, CAST5/CBC/PKCS5Padding.		String
originatorInformationProvider (encrypt)	Provider for the originator info. See https://tools.ietf.org/html/rfc5652#section-6.1 . The default value is null.		OriginatorInformationProvider
recipient (encrypt)	Recipient Info: reference to a bean which implements the interface <code>org.apache.camel.component.crypto.cms.api.TransRecipientInfo</code>		List
secretKeyLength (encrypt)	Key length for the secret symmetric key used for the content encryption. Only used if the specified content-encryption algorithm allows keys of different sizes. If <code>contentEncryptionAlgorithm=AES/CBC/PKCS5Padding</code> or <code>Camellia/CBC/PKCS5Padding</code> then 128; if <code>contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding</code> then 192, 128; if strong encryption is enabled then for <code>AES/CBC/PKCS5Padding</code> and <code>Camellia/CBC/PKCS5Padding</code> also the key lengths 192 and 256 are possible.		int
unprotectedAttributesGeneratorProvider (encrypt)	Provider of the generator for the unprotected attributes. The default value is null which means no unprotected attribute is added to the Enveloped Data object. See https://tools.ietf.org/html/rfc5652#section-6.1 .		AttributesGeneratorProvider
toBase64 (encrypt_sign)	Indicates whether the Signed Data or Enveloped Data instance shall be base 64 encoded. Default value is false.	false	Boolean
includeContent (sign)	Indicates whether the signed content should be included into the Signed Data instance. If false then a detached Signed Data instance is created in the header <code>CamelCryptoCmsSignedData</code> .	true	Boolean

Name	Description	Default	Type
signer (sign)	Signer information: reference to a bean which implements <code>org.apache.camel.component.crypto.cms.api.SignerInfo</code>		List
signedDataHeaderBase64 (verify)	Indicates whether the value in the header <code>CamelCryptoCmsSignedData</code> is base64 encoded. Default value is false. Only relevant for detached signatures. In the detached signature case, the header contains the Signed Data object.	false	Boolean
verifySignaturesOfAllSigners (verify)	If true then the signatures of all signers contained in the Signed Data object are verified. If false then only one signature whose signer info matches with one of the specified certificates is verified. Default value is true.	true	Boolean

74.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
camel.component.crypto-cms.enabled	Whether to enable auto configuration of the <code>crypto-cms</code> component. This is enabled by default.		Boolean
camel.component.crypto-cms.enveloped-data-decryptor-configuration	To configure the shared <code>EnvelopedDataDecryptorConfiguration</code> , which determines the uri parameters for the decrypt operation. The option is a <code>org.apache.camel.component.crypto.cms.crypt.EnvelopedDataDecryptorConfiguration</code> type.		String
camel.component.crypto-cms.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
<code>camel.component.crypto-cms.signed-data-verifier-configuration</code>	To configure the shared <code>SignedDataVerifierConfiguration</code> , which determines the uri parameters for the verify operation. The option is a <code>org.apache.camel.component.crypto.cms.sig.SignedDataVerifierConfiguration</code> type.		String

74.3. ENVELOPED DATA

Note, that a `crypto-cms:encrypt` endpoint is typically defined in one route and the complimentary `crypto-cms:decrypt` in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create an Enveloped Data message and how you can decrypt an Enveloped Data message.

Basic Example in Java DSL

```
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry

from("direct:start")
    .to("crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding&secretKeyLength=128")
    .to("crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters")
    .to("mock:result");
```

Basic Example in Spring XML

```
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS" />
<bean id="recipient1"
    class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
```

```

    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="certificateAlias" value="rsa" />
  </bean>
  ...
  <route>
    <from uri="direct:start" />
    <to uri="crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding&secretKeyLength=128" />
    <to uri="crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters1" />
    <to uri="mock:result" />
  </route>

```

Two Recipients in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

DefaultKeyTransRecipientInfo recipient2 = new DefaultKeyTransRecipientInfo();
recipient2.setCertificateAlias("dsa");
recipient2.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry

from("direct:start")
  .to("crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&recipient=#recipient2&contentEncryptionAlgorithm=DESede/CBC
PKCS5Padding&secretKeyLength=128")
  //the decryptor will automatically choose one of the two private keys depending which one is in the
decryptor keystore
  .to("crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters")
  .to("mock:result");

```

Two Recipients in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
  id="keyStoreParameters1" resource="./keystore/keystore.jceks"
  password="some_password" type="JCEKS" />
<bean id="recipient1"
  class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="certificateAlias" value="rsa" />

```

```

</bean>
<bean id="recipient2"
  class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="certificateAlias" value="dsa" />
</bean>
...
<route>
  <from uri="direct:start" />
  <to uri="crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&recipient=#recipient2&contentEncryptionAlgorithm
=DESede/CBC/PKCS5Padding&secretKeyLength=128" />
  <!-- the decryptor will automatically choose one of the two private keys depending which one is in
the decryptor keystore -->
  <to uri="crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters1" />
  <to uri="mock:result" />
</route>

```

74.4. SIGNED DATA

Note, that a **crypto-cms:sign** endpoint is typically defined in one route and the complimentary **crypto-cms:verify** in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create a Signed Data message and how you can validate a Signed Data message.

Basic Example in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks);
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry

```

```

from("direct:start")
  .to("crypto-cms:sign://testsign?signer=#signer1&includeContent=true&toBase64=true")
  .to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters&fromBase64=true")
  .to("mock:result");

```

Basic Example in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
  id="keyStoreParameters1" resource="/keystore/keystore.jceks"
  password="some_password" type="JCEKS" />
<bean id="signer1"
  class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="privateKeyAlias" value="rsa" />
  <property name="signatureAlgorithm" value="SHA256withRSA" />
  <property name="includeCertificates" value="true" />
  <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
  be used for accessing the private key -->
  <property name="password" value="private_key_pw" />
</bean>
...
<route>
  <from uri="direct:start" />
  <to uri="crypto-cms:sign://testsign?
signer=#signer1&includeContent=true&toBase64=true" />
  <to uri="crypto-cms:verify://testverify?
keyStoreParameters=#keyStoreParameters1&fromBase64=true" />
  <to uri="mock:result" />
</route>

```

Example with two Signers in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

```

```
DefaultSignerInfo signerInfo2 = new DefaultSignerInfo();
signerInfo2.setIncludeCertificates(true);
signerInfo2.setSignatureAlgorithm("SHA256withDSA");
signerInfo2.setPrivateKeyAlias("dsa");
signerInfo2.setKeyStoreParameters(keystore);
```

```
simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry
simpleReg.put("signer2", signerInfo2); //register signer info in the registry
```

```
from("direct:start")
  .to("crypto-cms:sign://testsign?signer=#signer1&signer=#signer2&includeContent=true")
  .to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters")
  .to("mock:result");
```

Example with two Signers in Spring XML

```
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
  id="keyStoreParameters1" resource="./keystore/keystore.jceks"
  password="some_password" type="JCEKS" />
<bean id="signer1"
  class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="privateKeyAlias" value="rsa" />
  <property name="signatureAlgorithm" value="SHA256withRSA" />
  <property name="includeCertificates" value="true" />
  <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
  be used for accessing the private key -->
  <property name="password" value="private_key_pw" />
</bean>
<bean id="signer2"
  class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="privateKeyAlias" value="dsa" />
  <property name="signatureAlgorithm" value="SHA256withDSA" />
  <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
  be used for accessing the private key -->
  <property name="password" value="private_key_pw2" />
</bean>
...
<route>
  <from uri="direct:start" />
  <to uri="crypto-cms:sign://testsign?
signer=#signer1&signer=#signer2&includeContent=true" />
  <to uri="crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters1" />
  <to uri="mock:result" />
</route>
```

Detached Signature Example in Java DSL

```
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
```

```

keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks);
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry

from("direct:start")
    //with the option includeContent=false the SignedData object without the signed text will be written
into the header "CamelCryptoCmsSignedData"
    .to("crypto-cms:sign://testsign?signer=#signer1&includeContent=false&toBase64=true")
    //the verifier reads the Signed Data object form the header CamelCryptoCmsSignedData and
assumes that the signed content is in the message body
    .to("crypto-cms:verify://testverify?
keyStoreParameters=#keyStoreParameters&signedDataHeaderBase64=true")
    .to("mock:result");

```

Detached Signature Example in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS" />
<bean id="signer1"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="privateKeyAlias" value="rsa" />
    <property name="signatureAlgorithm" value="SHA256withRSA" />
    <property name="includeCertificates" value="true" />
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw" />
</bean>
...
<route>
    <from uri="direct:start" />
    <!-- with the option includeContent=false the SignedData object without the signed text will be
written into the header "CamelCryptoCmsSignedData" -->
    <to uri="crypto-cms:sign://testsign?
signer=#signer1&includeContent=false&toBase64=true" />
    <!-- the verifier reads the Signed Data object form the header CamelCryptoCmsSignedData and
assumes that the signed content is in the message body -->

```

```
<to uri="crypto-cms:verify://testverify?  
keyStoreParameters=#keyStoreParameters1&signedDataHeaderBase64=true" />  
  <to uri="mock:result" />  
</route>
```

CHAPTER 75. CRYPTO (JAVA CRYPTOGRAPHIC EXTENSION) DATAFORMAT

Available as of Camel version 2.3

The Crypto Data Format integrates the Java Cryptographic Extension into Camel, allowing simple and flexible encryption and decryption of messages using Camel's familiar marshal and unmarshal formatting mechanism. It assumes marshalling to mean encryption to cyphertext and unmarshalling to mean decryption back to the original plaintext. This data format implements only symmetric (shared-key) encryption and decryption.

75.1. CRYPTODATAFORMAT OPTIONS

The Crypto (Java Cryptographic Extension) dataformat supports 10 options, which are listed below.

Name	Default	Java Type	Description
algorithm	DES/CBC/PKCS5Padding	String	The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding.
cryptoProvider		String	The name of the JCE Security Provider that should be used.
keyRef		String	Refers to the secret key to lookup from the register to use.
initVectorRef		String	Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher.
algorithmParameterRef		String	A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a <code>java.security.spec.AlgorithmParameterSpec</code> type.
bufferSize		Integer	The size of the buffer used in the signature process.
macAlgorithm	HmacSHA1	String	The JCE algorithm name indicating the Message Authentication algorithm.
shouldAppendHMAC	false	Boolean	Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data.
inline	false	Boolean	Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false.

Name	Default	Java Type	Description
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

75.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 33 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.crypto.configuration.algorithm</code>	Sets the JCE name of the Algorithm that should be used for the signer.	SHA1WithDSA	String
<code>camel.component.crypto.configuration.alias</code>	Sets the alias used to query the KeyStore for keys and link <code>java.security.cert.Certificate</code> Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header <code>org.apache.camel.component.crypto.DigitalSignatureConstants#KEYSTORE_ALIAS</code>		String
<code>camel.component.crypto.configuration.buffer-size</code>	Set the size of the buffer used to read in the Exchange payload data.	2048	Integer
<code>camel.component.crypto.configuration.certificate</code>	Set the Certificate that should be used to verify the signature in the exchange based on its payload.		Certificate
<code>camel.component.crypto.configuration.certificate-name</code>	Sets the reference name for a PrivateKey that can be found in the registry.		String
<code>camel.component.crypto.configuration.clear-headers</code>	Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset.	true	Boolean
<code>camel.component.crypto.configuration.crypto-operation</code>	Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. <code>crypto:sign</code> sets sign as the operation.		CryptoOperation

Name	Description	Default	Type
<code>camel.component.crypto.configuration.key-store-parameters</code>	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header <code>CamelSignatureKeyStoreAlias</code> . If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStoreParameters
<code>camel.component.crypto.configuration.keystore</code>	Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header <code>CamelSignatureKeyStoreAlias</code> . If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.		KeyStore
<code>camel.component.crypto.configuration.keystore-name</code>	Sets the reference name for a Keystore that can be found in the registry.		String
<code>camel.component.crypto.configuration.name</code>	The logical name of this operation.		String
<code>camel.component.crypto.configuration.password</code>	Sets the password used to access an aliased PrivateKey in the KeyStore.		Character[]
<code>camel.component.crypto.configuration.private-key</code>	Set the PrivateKey that should be used to sign the exchange		PrivateKey
<code>camel.component.crypto.configuration.private-key-name</code>	Sets the reference name for a PrivateKey that can be found in the registry.		String
<code>camel.component.crypto.configuration.provider</code>	Set the id of the security provider that provides the configured Signature algorithm.		String
<code>camel.component.crypto.configuration.public-key</code>	Set the PublicKey that should be used to verify the signature in the exchange.		PublicKey

Name	Description	Default	Type
<code>camel.component.crypto.configuration.public-key-name</code>	references that should be resolved when the context changes		String
<code>camel.component.crypto.configuration.secure-random</code>	Set the SecureRandom used to initialize the Signature service		SecureRandom
<code>camel.component.crypto.configuration.secure-random-name</code>	Sets the reference name for a SecureRandom that can be found in the registry.		String
<code>camel.component.crypto.configuration.signature-header-name</code>	Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature'		String
<code>camel.component.crypto.enabled</code>	Enable crypto component	true	Boolean
<code>camel.component.crypto.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.dataformat.crypto.algorithm</code>	The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding.	DES/CBC/PKCS5Padding	String
<code>camel.dataformat.crypto.algorithm-parameter-ref</code>	A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a java.security.spec.AlgorithmParameterSpec type.		String
<code>camel.dataformat.crypto.buffer-size</code>	The size of the buffer used in the signature process.		Integer
<code>camel.dataformat.crypto.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.crypto.crypto-provider</code>	The name of the JCE Security Provider that should be used.		String
<code>camel.dataformat.crypto.enabled</code>	Enable crypto dataformat	true	Boolean
<code>camel.dataformat.crypto.init-vector-ref</code>	Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher.		String
<code>camel.dataformat.crypto.inline</code>	Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false.	false	Boolean
<code>camel.dataformat.crypto.key-ref</code>	Refers to the secret key to lookup from the register to use.		String
<code>camel.dataformat.crypto.mac-algorithm</code>	The JCE algorithm name indicating the Message Authentication algorithm.	HmacSHA1	String
<code>camel.dataformat.crypto.should-append-h-m-a-c</code>	Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data.	false	Boolean

ND

75.3. BASIC USAGE

At its most basic all that is required to encrypt/decrypt an exchange is a shared secret key. If one or more instances of the Crypto data format are configured with this key the format can be used to encrypt the payload in one route (or part of one) and decrypted in another. For example, using the Java DSL as follows:

```

KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());

from("direct:basic-encryption")
    .marshal(cryptoFormat)
    .to("mock:encrypted")
    .unmarshal(cryptoFormat)
    .to("mock:unencrypted");

```

In Spring the dataformat is configured first and then used in routes

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
```

```

<dataFormats>
  <crypto id="basic" algorithm="DES" keyRef="desKey" />
</dataFormats>
...
<route>
  <from uri="direct:basic-encryption" />
  <marshal ref="basic" />
  <to uri="mock:encrypted" />
  <unmarshal ref="basic" />
  <to uri="mock:unencrypted" />
</route>
</camelContext>

```

75.4. SPECIFYING THE ENCRYPTION ALGORITHM

Changing the algorithm is a matter of supplying the JCE algorithm name. If you change the algorithm you will need to use a compatible key.

```

KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");

from("direct:hmac-algorithm")
  .marshal(cryptoFormat)
  .to("mock:encrypted")
  .unmarshal(cryptoFormat)
  .to("mock:unencrypted");

```

A list of the available algorithms in Java 7 is available via the Java Cryptography Architecture Standard Algorithm Name Documentation.

75.5. SPECIFYING AN INITIALIZATION VECTOR

Some crypto algorithms, particularly block algorithms, require configuration with an initial block of data known as an Initialization Vector. In the JCE this is passed as an AlgorithmParameterSpec when the Cipher is initialized. To use such a vector with the CryptoDataFormat you can configure it with a byte[] containing the required data e.g.

```

KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding",
generator.generateKey());
cryptoFormat.setInitializationVector(initializationVector);

from("direct:init-vector")
  .marshal(cryptoFormat)
  .to("mock:encrypted")
  .unmarshal(cryptoFormat)
  .to("mock:unencrypted");

```

or with spring, supplying a reference to a byte[]

```
<crypto id="initvector" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey"
initVectorRef="initializationVector" />
```

The same vector is required in both the encryption and decryption phases. As it is not necessary to keep the IV a secret, the DataFormat allows for it to be inlined into the encrypted data and subsequently read out in the decryption phase to initialize the Cipher. To inline the IV set the /oinline flag.

```
KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};
SecretKey key = generator.generateKey();

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
cryptoFormat.setInitializationVector(initializationVector);
cryptoFormat.setShouldInlineInitializationVector(true);
CryptoDataFormat decryptFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
decryptFormat.setShouldInlineInitializationVector(true);

from("direct:inline")
    .marshal(cryptoFormat)
    .to("mock:encrypted")
    .unmarshal(decryptFormat)
    .to("mock:unencrypted");
```

or with spring.

```
<crypto id="inline" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey"
initVectorRef="initializationVector"
inline="true" />
<crypto id="inline-decrypt" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey" inline="true" />
```

For more information of the use of Initialization Vectors, consult

- http://en.wikipedia.org/wiki/Initialization_vector
- <http://www.herongyang.com/Cryptography/>
- http://en.wikipedia.org/wiki/Block_cipher_modes_of_operation

75.6. HASHED MESSAGE AUTHENTICATION CODES (HMAC)

To avoid attacks against the encrypted data while it is in transit the CryptoDataFormat can also calculate a Message Authentication Code for the encrypted exchange contents based on a configurable MAC algorithm. The calculated HMAC is appended to the stream after encryption. It is separated from the stream in the decryption phase. The MAC is recalculated and verified against the transmitted version to insure nothing was tampered with in transit. For more information on Message Authentication Codes see <http://en.wikipedia.org/wiki/HMAC>

```
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);

from("direct:hmac")
    .marshal(cryptoFormat)
```

```
.to("mock:encrypted")
.unmarshal(cryptoFormat)
.to("mock:unencrypted");
```

or with spring.

```
<crypto id="hmac" algorithm="DES" keyRef="desKey" shouldAppendHMAC="true" />
```

By default the HMAC is calculated using the HmacSHA1 mac algorithm though this can be easily changed by supplying a different algorithm name. See here for how to check what algorithms are available through the configured security providers

```
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");

from("direct:hmac-algorithm")
    .marshal(cryptoFormat)
    .to("mock:encrypted")
    .unmarshal(cryptoFormat)
    .to("mock:unencrypted");
```

or with spring.

```
<crypto id="hmac-algorithm" algorithm="DES" keyRef="desKey" macAlgorithm="HmacMD5"
shouldAppendHMAC="true" />
```

75.7. SUPPLYING KEYS DYNAMICALLY

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may neither be feasible or desirable. It would be useful to be able to specify keys dynamically on a per exchange basis. The exchange could then be dynamically enriched with the key of its target recipient before being processed by the data format. To facilitate this the DataFormat allow for keys to be supplied dynamically via the message headers below

- CryptoDataFormat.KEY "CamelCryptoKey"

```
CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", null);
/**
 * Note: the header containing the key should be cleared after
 * marshalling to stop it from leaking by accident and
 * potentially being compromised. The processor version below is
 * arguably better as the key is left in the header when you use
 * the DSL leaks the fact that camel encryption was used.
 */
from("direct:key-in-header-encrypt")
    .marshal(cryptoFormat)
    .removeHeader(CryptoDataFormat.KEY)
    .to("mock:encrypted");

from("direct:key-in-header-decrypt").unmarshal(cryptoFormat).process(new Processor() {
    public void process(Exchange exchange) throws Exception {
```

```
exchange.getIn().getHeaders().remove(CryptoDataFormat.KEY);
exchange.getOut().copyFrom(exchange.getIn());
}
}).to("mock:unencrypted");
```

or with spring.

```
<crypto id="nokey" algorithm="DES" />
```

75.8. DEPENDENCIES

To use the `Crypto` dataformat in your camel routes you need to add the following dependency to your pom.

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

75.9. SEE ALSO

CHAPTER 76. CSV DATAFORMAT

Available as of Camel version 1.3

The CSV Data Format uses [Apache Commons CSV](#) to handle CSV payloads (Comma Separated Values) such as those exported/imported by Excel.

76.1. OPTIONS

The CSV dataformat supports 28 options, which are listed below.

Name	Default	Java Type	Description
<code>formatRef</code>		String	The reference format to use, it will be updated with the other format options, the default value is <code>CSVFormat.DEFAULT</code>
<code>formatName</code>		String	The name of the format to use, the default value is <code>CSVFormat.DEFAULT</code>
<code>commentMarkerDisabled</code>	false	Boolean	Disables the comment marker of the reference format.
<code>commentMarker</code>		String	Sets the comment marker of the reference format.
<code>delimiter</code>		String	Sets the delimiter to use. The default value is <code>,</code> (comma)
<code>escapeDisabled</code>	false	Boolean	Use for disabling using escape character
<code>escape</code>		String	Sets the escape character to use
<code>headerDisabled</code>	false	Boolean	Use for disabling headers
<code>header</code>		List	To configure the CSV headers
<code>allowMissingColumnNames</code>	false	Boolean	Whether to allow missing column names.
<code>ignoreEmptyLines</code>	false	Boolean	Whether to ignore empty lines.
<code>ignoreSurroundingSpaces</code>	false	Boolean	Whether to ignore surrounding spaces
<code>nullStringDisabled</code>	false	Boolean	Used to disable null strings

Name	Default	Java Type	Description
nullString		String	Sets the null string
quoteDisabled	false	Boolean	Used to disable quotes
quote		String	Sets the quote which by default is
recordSeparatorDisabled		String	Used for disabling record separator
recordSeparator		String	Sets the record separator (aka new line) which by default is new line characters (CRLF)
skipHeaderRecord	false	Boolean	Whether to skip the header record in the output
quoteMode		String	Sets the quote mode
ignoreHeaderCase	false	Boolean	Sets whether or not to ignore case when accessing header names.
trim	false	Boolean	Sets whether or not to trim leading and trailing blanks.
trailingDelimiter	false	Boolean	Sets whether or not to add a trailing delimiter.
lazyLoad	false	Boolean	Whether the unmarshalling should produce an iterator that reads the lines on the fly or if all the lines must be read at one.
useMaps	false	Boolean	Whether the unmarshalling should produce maps (HashMap) for the lines values instead of lists. It requires to have header (either defined or collected).
useOrderedMaps	false	Boolean	Whether the unmarshalling should produce ordered maps (LinkedHashMap) for the lines values instead of lists. It requires to have header (either defined or collected).
recordConverterRef		String	Refers to a custom CsvRecordConverter to lookup from the registry to use.
contentTypeHeader	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.

76.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 29 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.csv.allow-missing-column-names</code>	Whether to allow missing column names.	false	Boolean
<code>camel.dataformat.csv.comment-marker</code>	Sets the comment marker of the reference format.		String
<code>camel.dataformat.csv.comment-marker-disabled</code>	Disables the comment marker of the reference format.	false	Boolean
<code>camel.dataformat.csv.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.csv.delimiter</code>	Sets the delimiter to use. The default value is , (comma)		String
<code>camel.dataformat.csv.enabled</code>	Enable csv dataformat	true	Boolean
<code>camel.dataformat.csv.escape</code>	Sets the escape character to use		String
<code>camel.dataformat.csv.escape-disabled</code>	Use for disabling using escape character	false	Boolean
<code>camel.dataformat.csv.format-name</code>	The name of the format to use, the default value is CSVFormat.DEFAULT		String
<code>camel.dataformat.csv.format-ref</code>	The reference format to use, it will be updated with the other format options, the default value is CSVFormat.DEFAULT		String
<code>camel.dataformat.csv.header</code>	To configure the CSV headers		List

Name	Description	Default	Type
<code>camel.dataformat.csv.header-disabled</code>	Use for disabling headers	false	Boolean
<code>camel.dataformat.csv.ignore-empty-lines</code>	Whether to ignore empty lines.	false	Boolean
<code>camel.dataformat.csv.ignore-header-case</code>	Sets whether or not to ignore case when accessing header names.	false	Boolean
<code>camel.dataformat.csv.ignore-surrounding-spaces</code>	Whether to ignore surrounding spaces	false	Boolean
<code>camel.dataformat.csv.lazy-load</code>	Whether the unmarshalling should produce an iterator that reads the lines on the fly or if all the lines must be read at one.	false	Boolean
<code>camel.dataformat.csv.null-string</code>	Sets the null string		String
<code>camel.dataformat.csv.null-string-disabled</code>	Used to disable null strings	false	Boolean
<code>camel.dataformat.csv.quote</code>	Sets the quote which by default is		String
<code>camel.dataformat.csv.quote-disabled</code>	Used to disable quotes	false	Boolean
<code>camel.dataformat.csv.quote-mode</code>	Sets the quote mode		String
<code>camel.dataformat.csv.record-converter-ref</code>	Refers to a custom <code>CsvRecordConverter</code> to lookup from the registry to use.		String
<code>camel.dataformat.csv.record-separator</code>	Sets the record separator (aka new line) which by default is new line characters (CRLF)		String

Name	Description	Default	Type
<code>camel.dataformat.csv.record-separator-disabled</code>	Used for disabling record separator		String
<code>camel.dataformat.csv.skip-header-record</code>	Whether to skip the header record in the output	false	Boolean
<code>camel.dataformat.csv.trailing-delimiter</code>	Sets whether or not to add a trailing delimiter.	false	Boolean
<code>camel.dataformat.csv.trim</code>	Sets whether or not to trim leading and trailing blanks.	false	Boolean
<code>camel.dataformat.csv.use-maps</code>	Whether the unmarshalling should produce maps (HashMap) for the lines values instead of lists. It requires to have header (either defined or collected).	false	Boolean
<code>camel.dataformat.csv.use-ordered-maps</code>	Whether the unmarshalling should produce ordered maps (LinkedHashMap) for the lines values instead of lists. It requires to have header (either defined or collected).	false	Boolean

ND

76.3. MARSHALLING A MAP TO CSV

The component allows you to marshal a Java Map (or any other message type that can be converted in a Map) into a CSV payload.

Considering the following body

```
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```
from("direct:start")
  .marshal().csv()
  .to("mock:result");
```

or this XML route definition

```
<route>
  <from uri="direct:start" />
  <marshal>
    <csv />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc,123
```

76.4. UNMARSHALLING A CSV MESSAGE INTO A JAVA LIST

Unmarshalling will transform a CSV message into a Java List with CSV file lines (containing another List with all the field values).

An example: we have a CSV file with names of persons, their IQ and their current activity.

```
Jack Dalton, 115, mad at Averell
Joe Dalton, 105, calming Joe
William Dalton, 105, keeping Joe from killing Averell
Averell Dalton, 80, playing with Rantanplan
Lucky Luke, 120, capturing the Daltons
```

We can now use the CSV component to unmarshal this file:

```
from("file:src/test/resources/?fileName=daltons.csv&noop=true")
  .unmarshal().csv()
  .to("mock:daltons");
```

The resulting message will contain a **List<List<String>>** like...

```
List<List<String>> data = (List<List<String>>) exchange.getIn().getBody();
for (List<String> line : data) {
  LOG.debug(String.format("%s has an IQ of %s and is currently %s", line.get(0), line.get(1),
line.get(2)));
}
```

76.5. MARSHALLING A LIST<MAP> TO CSV

Available as of Camel 2.1

If you have multiple rows of data you want to be marshalled into CSV format you can now store the message payload as a **List<Map<String, Object>>** object where the list contains a Map for each row.

76.6. FILE POLLER OF CSV, THEN UNMARSHALING

Given a bean which can handle the incoming data...

```
MyCsvHandler.java
```

```
// Some comments here
public void doHandleCsvData(List<List<String>> csvData)
{
    // do magic here
}
```

i. your route then looks as follows

```
<route>
  <!-- poll every 10 seconds -->
  <from uri="file:///some/path/to/pickup/csvfiles?delete=true&consumer.delay=10000" />
  <unmarshal><csv /></unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsvData" />
</route>
```

76.7. MARSHALING WITH A PIPE AS DELIMITER

Considering the following body

```
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```
// Camel version < 2.15
CsvDataFormat oldCSV = new CsvDataFormat();
oldCSV.setDelimiter("|");
from("direct:start")
    .marshal(oldCSV)
    .to("mock:result")

// Camel version >= 2.15
from("direct:start")
    .marshal(new CsvDataFormat().setDelimiter('&#39;|&#39;))
    .to("mock:result")
```

or this XML route definition

```
<route>
  <from uri="direct:start" />
  <marshal>
    <csv delimiter="|" />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc|123
```

Using `autogenColumns`, `configRef` and `strategyRef` attributes inside XML # DSL

Available as of Camel 2.9.2 / 2.10 and deleted for Camel 2.15

You can customize the CSV Data Format to make use of your own **CSVConfig** and/or **CSVStrategy**. Also note that the default value of the **autogenColumns** option is true. The following example should illustrate this customization.

```
<route>
  <from uri="direct:start" />
  <marshal>
    <!-- make use of a strategy other than the default one which is
    'org.apache.commons.csv.CSVStrategy.DEFAULT_STRATEGY' -->
    <csv autogenColumns="false" delimiter="|" configRef="csvConfig" strategyRef="excelStrategy" />
  </marshal>
  <convertBodyTo type="java.lang.String" />
  <to uri="mock:result" />
</route>

<bean id="csvConfig" class="org.apache.commons.csv.writer.CSVConfig">
  <property name="fields">
    <list>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="orderId" />
      </bean>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="amount" />
      </bean>
    </list>
  </property>
</bean>

<bean id="excelStrategy"
class="org.springframework.beans.factory.config.FieldRetrievingFactoryBean">
  <property name="staticField" value="org.apache.commons.csv.CSVStrategy.EXCEL_STRATEGY"
/>
</bean>
```

76.8. USING SKIPFIRSTLINE OPTION WHILE UNMARSHALING

Available as of Camel 2.10 and deleted for Camel 2.15

You can instruct the CSV Data Format to skip the first line which contains the CSV headers. Using the Spring/XML DSL:

```
<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv skipFirstLine="true" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>
```

Or the Java DSL:

```
CsvDataFormat csv = new CsvDataFormat();
```

```

csv.setSkipFirstLine(true);

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

76.9. UNMARSHALING WITH A PIPE AS DELIMITER

Using the Spring/XML DSL:

```

<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv delimiter="|" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>

```

Or the Java DSL:

```

CsvDataFormat csv = new CsvDataFormat();
CSVStrategy strategy = CSVStrategy.DEFAULT_STRATEGY;
strategy.setDelimiter("|");
csv.setStrategy(strategy);

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

```

CsvDataFormat csv = new CsvDataFormat();
csv.setDelimiter("|");

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

```

CsvDataFormat csv = new CsvDataFormat();
CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(";");
csv.setConfig(csvConfig);

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

Issue in CSVConfig

It looks like that

```

CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(';');

```

doesn't work. You have to set the delimiter as a String!

76.10. DEPENDENCIES

To use CSV in your Camel routes you need to add a dependency on **camel-csv**, which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-csv</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 77. CXF

CXF COMPONENT

The **cxf:** component provides integration with [Apache CXF](#) for connecting to JAX-WS services hosted in CXF.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cxf</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

NOTE

If you want to learn about CXF dependencies, see the [WHICH-JARS](#) text file.

NOTE

When using CXF in streaming modes (see `DataFormat` option), then also read about [Stream caching](#).

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

The CXF component integrates with the JBoss EAP **webservices** subsystem that also uses Apache CXF. For more information, see [JAX-WS](#).

NOTE

At present, the Camel on EAP subsystem does **not** support CXF or Restlet consumers. However, it is possible to mimic CXF consumer behaviour, using the **CamelProxy**.

URI FORMAT

```
cxf:bean:cxfEndpoint[?options]
```

Where **cxfEndpoint** represents a bean ID that references a bean in the Spring bean registry. With this URI format, most of the endpoint details are specified in the bean definition.

```
cxf://someAddress[?options]
```

Where **someAddress** specifies the CXF endpoint's address. With this URI format, most of the endpoint details are specified using options.

For either style above, you can append options to the URI as follows:

```
cx:bean:cxEndpoint?wsdlURL=wsdl/hello_world.wsdl&dataFormat=PAYLOAD
```

OPTIONS

Name	Required	Description
wsdlURL	No	<p>The location of the WSDL. WSDL is obtained from endpoint address by default. For example:</p> <p>file://local/wsdl/hello.wsdl or wsdl/hello.wsdl</p>
serviceClass	Yes	<p>The name of the SEI (Service Endpoint Interface) class. This class can have, but does not require, JSR181 annotations. Since 2.0, this option is only required by POJO mode. If the wsdlURL option is provided, serviceClass is not required for PAYLOAD and MESSAGE mode. When wsdlURL option is used without serviceClass, the serviceName and portName (endpointName for Spring configuration) options MUST be provided.</p> <p>Since 2.0, it is possible to use <code>\#</code> notation to reference a serviceClass object instance from the registry..</p> <p>Please be advised that the referenced object cannot be a Proxy (Spring AOP Proxy is OK) as it relies on Object.getClass().getName() method for non Spring AOP Proxy.</p> <p>Since 2.8, it is possible to omit both wsdlURL and serviceClass options for PAYLOAD and MESSAGE mode. When they are omitted, arbitrary XML elements can be put in CxfPayload's body in PAYLOAD mode to facilitate CXF Dispatch Mode.</p> <p>For example: org.apache.camel.Hello</p>

serviceName	Only if more than one serviceName present in WSDL	The service name this service is implementing, it maps to the wsdl:serviceName . For example: {http://org.apache.camel}ServiceName
endpointName	Only if more than one portName under the serviceName is present, and it is required for camel-cxf consumer since camel 2.2	The port name this service is implementing, it maps to the wsdl:portName . For example: {http://org.apache.camel}PortName
dataFormat	No	Which message data format the CXF endpoint supports. Possible values are: POJO (default), PAYLOAD, MESSAGE.
relayHeaders	No	Please see the Description of relayHeaders option section for this option. Should a CXF endpoint relay headers along the route. Currently only available when dataFormat=POJO Default: true Example: true, false
wrapped	No	Which kind of operation the CXF endpoint producer will invoke. Possible values are: true, false (default).
wrappedStyle	No	Since 2.5.0 The WSDL style that describes how parameters are represented in the SOAP body. If the value is false , CXF will chose the document-literal unwrapped style, If the value is true , CXF will chose the document-literal wrapped style
setDefaultBus	No	Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: true, false (default). This option is deprecated and you should use defaultBus from Camel 2.16 onwards.

defaultBus	No	Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: true, false (default) . This option is deprecated and you should use defaultBus from Camel 2.16 onwards.
bus	No	Use \# notation to reference a bus object from the registry – for example, bus=\#busName . The referenced object must be an instance of org.apache.cxf.Bus . By default, uses the default bus created by CXF Bus Factory.
cxfBinding	No	Use \# notation to reference a CXF binding object from the registry – for example, cxfBinding=\#bindingName . The referenced object must be an instance of org.apache.camel.component.cxf.CxfBinding .
headerFilterStrategy	No	Use \# notation to reference a header filter strategy object from the registry – for example, headerFilterStrategy=\#strategyName . The referenced object must be an instance of org.apache.camel.spi.HeaderFilterStrategy .
loggingFeatureEnabled	No	New in 2.3, this option enables CXF Logging Feature which writes inbound and outbound SOAP messages to log. Possible values are: true, false (default) .
defaultOperationName	No	New in 2.4, this option will set the default operationName that will be used by the CxfProducer that invokes the remote service. For example: defaultOperationName=greetMe

defaultOperationNamespace	No	<p>New in 2.4, this option will set the default operationNamespace that will be used by the CxfProducer which invokes the remote service. For example:</p> <p>defaultOperationNamespace =http://apache.org/hello_world_soap_http</p>
synchronous	No	<p>New in 2.5, this option will let CXF endpoint decide to use sync or async API to do the underlying work. The default value is false, which means camel-cxf endpoint will try to use async API by default.</p>
publishedEndpointUrl	No	<p>New in 2.5, this option overrides the endpoint URL that appears in the published WSDL that is accessed using the service address URL plus ?wsdl. For example:</p> <p>publishedEndpointUrl=http://example.com/service</p>
properties.propName	No	<p>Camel 2.8: Allows you to set custom CXF properties in the endpoint URI. For example, setting properties.mtom-enabled=true to enable MTOM. To make sure that CXF does not switch the thread when starting the invocation, you can set properties.org.apache.cxf.interceptor.OneWayProcessorInterceptor.USE_ORIGINAL_THREAD=true.</p>
allowStreaming	No	<p>New in 2.8.2. This option controls whether the CXF component, when running in PAYLOAD mode (see below), will DOM parse the incoming messages into DOM Elements or keep the payload as a javax.xml.transform.Source object that would allow streaming in some cases.</p>

skipFaultLogging	No	New in 2.11. This option controls whether the <code>PhaseInterceptorChain</code> skips logging the Fault that it catches.
cxfEndpointConfigurer	No	New in Camel 2.11 . This option could apply the implementation of <code>org.apache.camel.component.cxf.CxfEndpointConfigurer</code> which supports to configure the CXF endpoint in programmatic way. Since Camel 2.15.0 , user can configure the CXF server and client by implementing <code>configure{Server/Client}</code> method of <code>CxfEndpointConfigurer</code> .
username	No	New in Camel 2.12.3 This option is used to set the basic authentication information of username for the CXF client.
password	No	New in Camel 2.12.3 This option is used to set the basic authentication information of password for the CXF client.
continuationTimeout	No	New in Camel 2.14.0 This option is used to set the CXF continuation timeout which could be used in <code>CxfConsumer</code> by default when the CXF server is using Jetty or Servlet transport. (Before Camel 2.14.0 , <code>CxfConsumer</code> just set the continuation timeout to be 0, which means the continuation suspend operation never timeout.) Default: 30000 Example: continuation=80000

The **serviceName** and **portName** are [QNames](#), so if you provide them be sure to prefix them with their **{namespace}** as shown in the examples above.

THE DESCRIPTIONS OF THE DATAFORMATS

DataFormat	Description
------------	-------------

POJO	POJOs (plain old Java objects) are the Java parameters to the method being invoked on the target server. Both Protocol and Logical JAX-WS handlers are supported.
PAYLOAD	PAYLOAD is the message payload (the contents of the soap:body) after message configuration in the CXF endpoint is applied. Only Protocol JAX-WS handler is supported. Logical JAX-WS handler is not supported.
MESSAGE	MESSAGE is the raw message that is received from the transport layer. It is not suppose to touch or change Stream, some of the CXF interceptors will be removed if you are using this kind of DataFormat so you can't see any soap headers after the camel-cxf consumer and JAX-WS handler is not supported.
CXF_MESSAGE	New in Camel 2.8.2 , CXF_MESSAGE allows for invoking the full capabilities of CXF interceptors by converting the message from the transport layer into a raw SOAP message

You can determine the data format mode of an exchange by retrieving the exchange property, **CamelCXFDataFormat**. The exchange key constant is defined in **org.apache.camel.component.cxf.CxfConstants.DATA_FORMAT_PROPERTY**.

CONFIGURING THE CXF ENDPOINTS WITH APACHE ARIES BLUEPRINT.

Since Camel 2.8, there is support for using Aries blueprint dependency injection for your CXF endpoints. The schema is very similar to the Spring schema, so the transition is fairly transparent.

For example:

```
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xmlns:camel-cxf="http://camel.apache.org/schema/blueprint/cxf"
  xmlns:cxfcore="http://cxf.apache.org/blueprint/core"
  xsi:schemaLocation="http://www.osgi.org/xmlns/blueprint/v1.0.0
https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

  <camel-cxf:cxfEndpoint id="routerEndpoint"
    address="http://localhost:9001/router"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
    <camel-cxf:properties>
      <entry key="dataFormat" value="MESSAGE"/>
    </camel-cxf:properties>
  </camel-cxf:cxfEndpoint>

  <camel-cxf:cxfEndpoint id="serviceEndpoint"
```

```

address="http://localhost:9000/SoapContext/SoapPort"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
</camel-cxf:cxfEndpoint>

<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <route>
    <from uri="routerEndpoint"/>
    <to uri="log:request"/>
  </route>
</camelContext>

</blueprint>

```

Currently the endpoint element is the first supported CXF namespacehandler.

You can also use the bean references just as in spring

```

<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xmlns:jaxws="http://cxf.apache.org/blueprint/jaxws"
  xmlns:cxf="http://cxf.apache.org/blueprint/core"
  xmlns:camel="http://camel.apache.org/schema/blueprint"
  xmlns:camelcxf="http://camel.apache.org/schema/blueprint/cxf"
  xsi:schemaLocation="
    http://www.osgi.org/xmlns/blueprint/v1.0.0
    https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd
    http://cxf.apache.org/blueprint/jaxws http://cxf.apache.org/schemas/blueprint/jaxws.xsd
    http://cxf.apache.org/blueprint/core http://cxf.apache.org/schemas/blueprint/core.xsd
  ">

  <camelcxf:cxfEndpoint id="reportIncident"
    address="/camel-example-cxf-blueprint/webservices/incident"
    wsdlURL="META-INF/wsdl/report_incident.wsdl"
    serviceClass="org.apache.camel.example.reportincident.ReportIncidentEndpoint">
  </camelcxf:cxfEndpoint>

  <bean id="reportIncidentRoutes"
class="org.apache.camel.example.reportincident.ReportIncidentRoutes" />

  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <routeBuilder ref="reportIncidentRoutes"/>
  </camelContext>

</blueprint>

```

HOW TO ENABLE CXF'S LOGGINGOUTINTERCEPTOR IN MESSAGE MODE

CXF's **LoggingOutInterceptor** outputs outbound message that goes on the wire to logging system (**java.util.logging**). Since the **LoggingOutInterceptor** is in **PRE_STREAM** phase (but **PRE_STREAM** phase is removed in **MESSAGE** mode), you have to configure **LoggingOutInterceptor** to be run during the **WRITE** phase. The following is an example.

```

<bean id="loggingOutInterceptor" class="org.apache.cxf.interceptor.LoggingOutInterceptor">
  <!-- it really should have been user-prestream but CXF does have such phase! -->
  <constructor-arg value="target/write"/>
</bean>

<cxf:cxfEndpoint id="serviceEndpoint" address="http://localhost:9002/helloworld"
serviceClass="org.apache.camel.component.cxf.HelloService">
<cxf:outInterceptors>
  <ref bean="loggingOutInterceptor"/>
</cxf:outInterceptors>
<cxf:properties>
  <entry key="dataFormat" value="MESSAGE"/>
</cxf:properties>
</cxf:cxfEndpoint>

```

DESCRIPTION OF RELAYHEADERS OPTION

There are **in-band** and **out-of-band** on-the-wire headers from the perspective of a JAXWS WSDL-first developer.

The **in-band** headers are headers that are explicitly defined as part of the WSDL binding contract for an endpoint such as SOAP headers.

The **out-of-band** headers are headers that are serialized over the wire, but are not explicitly part of the WSDL binding contract.

Headers relaying/filtering is bi-directional.

When a route has a CXF endpoint and the developer needs to have on-the-wire headers, such as SOAP headers, be relayed along the route to be consumed say by another JAXWS endpoint, then **relayHeaders** should be set to **true**, which is the default value.

AVAILABLE ONLY IN POJO MODE

The **relayHeaders=true** setting expresses an intent to relay the headers. The actual decision on whether a given header is relayed is delegated to a pluggable instance that implements the **MessageHeadersRelay** interface. A concrete implementation of **MessageHeadersRelay** will be consulted to decide if a header needs to be relayed or not. There is already an implementation of **SoapMessageHeadersRelay** which binds itself to well-known SOAP name spaces. Currently only out-of-band headers are filtered, and in-band headers will always be relayed when **relayHeaders=true**. If there is a header on the wire, whose name space is unknown to the runtime, then a fall back **DefaultMessageHeadersRelay** will be used, which simply allows all headers to be relayed.

The **relayHeaders=false** setting asserts that all headers, in-band and out-of-band, will be dropped.

You can plugin your own **MessageHeadersRelay** implementations overriding or adding additional ones to the list of relays. In order to override a preloaded relay instance just make sure that your **MessageHeadersRelay** implementation services the same name spaces as the one you looking to override. Also note, that the overriding relay has to service all of the name spaces as the one you looking to override, or else a runtime exception on route start up will be thrown as this would introduce an ambiguity in name spaces to relay instance mappings.

```

<cxf:cxfEndpoint ...>
  <cxf:properties>

```

```

<entry key="org.apache.camel.cxf.message.headers.relays">
  <list>
    <ref bean="customHeadersRelay"/>
  </list>
</entry>
</cxf:properties>
</cxf:cxfEndpoint>
<bean id="customHeadersRelay"
class="org.apache.camel.component.cxf.soap.headers.CustomHeadersRelay"/>

```

Take a look at the tests that show how you'd be able to relay/drop headers here:

link:<https://svn.apache.org/repos/asf/camel/branches/camel-1.x/components/camel-cxf/src/test/java/org/apache/camel/component/cxf/soap/headers/CxfMessageHeadersRelayTest.java>[1.x/components/camel-cxf/src/test/java/org/apache/camel/component/cxf/soap/headers/CxfMessageHeadersRelayTest.java]

CHANGES SINCE RELEASE 2.0

- **POJO** and **PAYLOAD** modes are supported. In **POJO** mode, only out-of-band message headers are available for filtering as the in-band headers have been processed and removed from the header list by CXF. The in-band headers are incorporated into the **MessageContentList** in **POJO** mode. The **camel-cxf** component does not make any attempt to remove the in-band headers from the **MessageContentList**. If filtering of in-band headers is required, please use **PAYLOAD** mode or plug in a (pretty straightforward) CXF interceptor/JAXWS Handler to the CXF endpoint.
- The Message Header Relay mechanism has been merged into **CxfHeaderFilterStrategy**. The **relayHeaders** option, its semantics, and default value remain the same, but it is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring it.

```

<bean id="dropAllMessageHeadersStrategy"
class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">

  <!-- Set relayHeaders to false to drop all SOAP headers -->
  <property name="relayHeaders" value="false"/>

</bean>

```

Then, your endpoint can reference the **CxfHeaderFilterStrategy**.

```

<route>
  <from uri="cxf:bean:routerNoRelayEndpoint?
headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
  <to uri="cxf:bean:serviceNoRelayEndpoint?
headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
</route>

```

- The **MessageHeadersRelay** interface has changed slightly and has been renamed to **MessageHeaderFilter**. It is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring user defined Message Header Filters:

```

<bean id="customMessageFilterStrategy"
class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">

```

```

<property name="messageHeaderFilters">
  <list>
    <!-- SoapMessageHeaderFilter is the built in filter. It can be removed by omitting it. -
->
    <bean
class="org.apache.camel.component.cxf.common.header.SoopMessageHeaderFilter"/>

    <!-- Add custom filter here -->
    <bean class="org.apache.camel.component.cxf.soap.headers.CustomHeaderFilter"/>
  </list>
</property>
</bean>

```

- Other than **relayHeaders**, there are new properties that can be configured in **CxfHeaderFilterStrategy**.

Name	Description	type	Required?	Default value
relayHeaders	All message headers will be processed by Message Header Filters	boolean	No	true (1.6.1 behavior)
relayAllMessage Headers	All message headers will be propagated (without processing by Message Header Filters)	boolean	No	false (1.6.1 behavior)
allowFilterName spaceClash	If two filters overlap in activation namespace, the property control how it should be handled. If the value is true , last one wins. If the value is false , it will throw an exception	boolean	No	false (1.6.1 behavior)

CONFIGURE THE CXF ENDPOINTS WITH SPRING

You can configure the CXF endpoint with the Spring configuration file shown below, and you can also embed the endpoint into the **camelContext** tags. When you are invoking the service endpoint, you can set the **operationName** and **operationNamespace** headers to explicitly state which operation you are calling.

NOTE In Camel 2.x we change to use <http://camel.apache.org/schema/cxf> as the CXF endpoint's target namespace.

```
<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cxf="http://camel.apache.org/schema/cxf"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
    http://camel.apache.org/schema/cxf http://camel.apache.org/schema/cxf/camel-cxf.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-spring.xsd"
  >
  ..
```

NOTE

In Apache Camel 2.x, the <http://activemq.apache.org/camel/schema/cxfEndpoint> namespace was changed to <http://camel.apache.org/schema/cxf>.

Be sure to include the JAX-WS **schemaLocation** attribute specified on the root beans element. This allows CXF to validate the file and is required. Also note the namespace declarations at the end of the `<cxf:cxfEndpoint/>` tag—these are required because the combined `{namespace}localName` syntax is presently not supported for this tag's attribute values.

The `cxf:cxfEndpoint` element supports many additional attributes:

Name	Value
PortName	The endpoint name this service is implementing, it maps to the <code>wsdl:port@name</code> . In the format of <code>ns:PORT_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope.
serviceName	The service name this service is implementing, it maps to the <code>wsdl:service@name</code> . In the format of <code>ns:SERVICE_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope.
wsdlURL	The location of the WSDL. Can be on the classpath, file system, or be hosted remotely.
bindingId	The bindingId for the service model to use.
address	The service publish address.
bus	The bus name that will be used in the JAX-WS endpoint.
serviceClass	The class name of the SEI (Service Endpoint Interface) class which could have JSR181 annotation or not.

It also supports many child elements:

Name	Value
cxf:inInterceptors	The incoming interceptors for this endpoint. A list of <bean> or <ref> .
cxf:inFaultInterceptors	The incoming fault interceptors for this endpoint. A list of <bean> or <ref> .
cxf:outInterceptors	The outgoing interceptors for this endpoint. A list of <bean> or <ref> .
cxf:outFaultInterceptors	The outgoing fault interceptors for this endpoint. A list of <bean> or <ref> .
cxf:properties	A properties map which should be supplied to the JAX-WS endpoint. See below.
cxf:handlers	A JAX-WS handler list which should be supplied to the JAX-WS endpoint. See below.
cxf:dataBinding	You can specify the which DataBinding will be use in the endpoint. This can be supplied using the Spring <bean class="MyDataBinding"/> syntax.
cxf:binding	You can specify the BindingFactory for this endpoint to use. This can be supplied using the Spring <bean class="MyBindingFactory"/> syntax.
cxf:features	The features that hold the interceptors for this endpoint. A list of <bean> s or <ref> s
cxf:schemaLocations	The schema locations for endpoint to use. A list of <schemaLocation> s
cxf:serviceFactory	The service factory for this endpoint to use. This can be supplied using the Spring <bean class="MyServiceFactory"/> syntax

You can find more advanced examples which show how to provide interceptors, properties and handlers here: <http://cwiki.apache.org/CXF20DOC/jax-ws-configuration.html>

**NOTE**

You can use CXF:properties to set the CXF endpoint's **dataFormat** and **setDefaultBus** properties from a Spring configuration file, as follows:

```
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/router"
  serviceClass="org.apache.camel.component.cxf.HelloService"
  endpointName="s:PortName"
  serviceName="s:ServiceName"
  xmlns:s="http://www.example.com/test">
  <cxf:properties>
    <entry key="dataFormat" value="MESSAGE"/>
    <entry key="setDefaultBus" value="true"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

HOW TO MAKE THE CAMEL-CXF COMPONENT USE LOG4J INSTEAD OF JAVA.UTIL.LOGGING

CXF's default logger is **java.util.logging**. If you want to change it to **log4j**, proceed as follows. Create a file, in the classpath, named **META-INF/cxf/org.apache.cxf.logger**. This file should contain the fully-qualified name of the class, **org.apache.cxf.common.logging.Log4jLogger**, with no comments, on a single line.

HOW TO LET CAMEL-CXF RESPONSE MESSAGE WITH XML START DOCUMENT

If you are using some SOAP client such as PHP, you will get this kind of error, because CXF doesn't add the XML start document **<?xml version="1.0" encoding="utf-8"?>**.

```
Error:sendSms: SoapFault exception: [Client] looks like we got no XML document in [...]
```

To resolved this issue, you just need to tell StaxOutInterceptor to write the XML start document for you.

```
public class WriteXmlDeclarationInterceptor extends AbstractPhaseInterceptor<SoapMessage> {
  public WriteXmlDeclarationInterceptor() {
    super(Phase.PRE_STREAM);
    addBefore(StaxOutInterceptor.class.getName());
  }

  public void handleMessage(SoapMessage message) throws Fault {
    message.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
  }
}
```

You can add a customer interceptor like this and configure it into you **camel-cxf** endpoint

```
<cxf:cxfEndpoint id="routerEndpoint"
  address="http://localhost:${CXFTestSupport.port2}/CXFGreeterRouterTest/CamelContext/RouterPort"

  serviceClass="org.apache.hello_world_soap_http.GreeterImpl"
  skipFaultLogging="true">
```

```

<cxf:outInterceptors>
  <!-- This interceptor will force the CXF server send the XML start document to client -->
  <bean class="org.apache.camel.component.cxf.WriteXmlDeclarationInterceptor"/>
</cxf:outInterceptors>
<cxf:properties>
  <!-- Set the publishedEndpointUrl which could override the service address from generated
WSDL as you want -->
  <entry key="publishedEndpointUrl" value="http://www.simple.com/services/test" />
</cxf:properties>
</cxf:cxfEndpoint>

```

Or adding a message header for it like this if you are using **Camel 2.4**.

```

// set up the response context which force start document
Map<String, Object> map = new HashMap<String, Object>();
map.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
exchange.getOut().setHeader(Client.RESPONSE_CONTEXT, map);

```

HOW TO CONSUME A MESSAGE FROM A CAMEL-CXF ENDPOINT IN POJO DATA FORMAT

The **camel-cxf** endpoint consumer **POJO** data format is based on the [cxf invoker](#), so the message header has a property with the name of **CxfConstants.OPERATION_NAME** and the message body is a list of the SEI method parameters.

```

public class PersonProcessor implements Processor {

    private static final transient Logger LOG = LoggerFactory.getLogger(PersonProcessor.class);

    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        LOG.info("processing exchange in camel");

        BindingOperationInfo boi =
        (BindingOperationInfo)exchange.getProperty(BindingOperationInfo.class.toString());
        if (boi != null) {
            LOG.info("boi.isUnwrapped" + boi.isUnwrapped());
        }
        // Get the parameters list which element is the holder.
        MessageContentsList msgList = (MessageContentsList)exchange.getIn().getBody();
        Holder<String> personId = (Holder<String>)msgList.get(0);
        Holder<String> ssn = (Holder<String>)msgList.get(1);
        Holder<String> name = (Holder<String>)msgList.get(2);

        if (personId.value == null || personId.value.length() == 0) {
            LOG.info("person id 123, so throwing exception");
            // Try to throw out the soap fault message
            org.apache.camel.wsd1_first.types.UnknownPersonFault personFault =
                new org.apache.camel.wsd1_first.types.UnknownPersonFault();
            personFault.setPersonId("");
            org.apache.camel.wsd1_first.UnknownPersonFault fault =
                new org.apache.camel.wsd1_first.UnknownPersonFault("Get the null value of person name",
                personFault);
            // Since camel has its own exception handler framework, we can't throw the exception to

```

```

trigger it
    // We just set the fault message in the exchange for camel-cxf component handling and return
    exchange.getOut().setFault(true);
    exchange.getOut().setBody(fault);
    return;
}

name.value = "Bonjour";
ssn.value = "123";
LOG.info("setting Bonjour as the response");
// Set the response message, first element is the return value of the operation,
// the others are the holders of method parameters
exchange.getOut().setBody(new Object[] {null, personId, ssn, name});
}
}

```

HOW TO PREPARE THE MESSAGE FOR THE CAMEL-CXF ENDPOINT IN POJO DATA FORMAT

The **camel-cxf** endpoint producer is based on the [cxf client API](#). First you need to specify the operation name in the message header, then add the method parameters to a list, and initialize the message with this parameter list. The response message's body is a **messageContentsList**, you can get the result from that list.

If you don't specify the operation name in the message header, **CxfProducer** will try to use the **defaultOperationName** from **CxfEndpoint**. If there is no **defaultOperationName** set on **CxfEndpoint**, it will pick up the first operation name from the operation list.

If you want to get the object array from the message body, you can get the body using **message.getBody(Object[].class)**, as follows:

```

Exchange senderExchange = new DefaultExchange(context, ExchangePattern.InOut);
final List<String> params = new ArrayList<String>();
// Prepare the request message for the camel-cxf procedure
params.add(TEST_MESSAGE);
senderExchange.getIn().setBody(params);
senderExchange.getIn().setHeader(CxfConstants.OPERATION_NAME, ECHO_OPERATION);

Exchange exchange = template.send("direct:EndpointA", senderExchange);

org.apache.camel.Message out = exchange.getOut();
// The response message's body is an MessageContentsList which first element is the return value of
the operation,
// If there are some holder parameters, the holder parameter will be filled in the reset of List.
// The result will be extract from the MessageContentsList with the String class type
MessageContentsList result = (MessageContentsList)out.getBody();
LOG.info("Received output text: " + result.get(0));
Map<String, Object> responseContext = CastUtils.cast((Map<?, ?
>)out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("We should get the response context here", "UTF-8",
responseContext.get(org.apache.cxf.message.Message.ENCODING));
assertEquals("Reply body on Camel is wrong", "echo " + TEST_MESSAGE, result.get(0));

```

HOW TO DEAL WITH THE MESSAGE FOR A CAMEL-CXF ENDPOINT IN PAYLOAD DATA FORMAT

In Apache Camel 2.0: `CxfMessage.getBody()` will return an `org.apache.camel.component.cxf.CxfPayload` object, which has getters for SOAP message headers and Body elements. This change enables decoupling the native CXF message from the Apache Camel message.

```
protected RouteBuilder createRouteBuilder() {
    return new RouteBuilder() {
        public void configure() {
            from(SIMPLE_ENDPOINT_URI + "&dataFormat=PAYLOAD").to("log:info").process(new
Processor() {
                @SuppressWarnings("unchecked")
                public void process(final Exchange exchange) throws Exception {
                    CxfPayload<SoapHeader> requestPayload =
exchange.getIn().getBody(CxfPayload.class);
                    List<Source> inElements = requestPayload.getBodySources();
                    List<Source> outElements = new ArrayList<Source>();
                    // You can use a customer toStringConverter to turn a CxfPayload message into String
as you want
                    String request = exchange.getIn().getBody(String.class);
                    XmlConverter converter = new XmlConverter();
                    String documentString = ECHO_RESPONSE;

                    Element in = new XmlConverter().toDOMElement(inElements.get(0));
                    // Just check the element namespace
                    if (!in.getNamespaceURI().equals(ELEMENT_NAMESPACE)) {
                        throw new IllegalArgumentException("Wrong element namespace");
                    }
                    if (in.getLocalName().equals("echoBoolean")) {
                        documentString = ECHO_BOOLEAN_RESPONSE;
                        checkRequest("ECHO_BOOLEAN_REQUEST", request);
                    } else {
                        documentString = ECHO_RESPONSE;
                        checkRequest("ECHO_REQUEST", request);
                    }
                    Document outDocument = converter.toDOMDocument(documentString);
                    outElements.add(new DOMSource(outDocument.getDocumentElement()));
                    // set the payload header with null
                    CxfPayload<SoapHeader> responsePayload = new CxfPayload<SoapHeader>(null,
outElements, null);
                    exchange.getOut().setBody(responsePayload);
                }
            });
        }
    };
}
```

HOW TO GET AND SET SOAP HEADERS IN POJO MODE

POJO means that the data format is a **list of Java objects** when the CXF endpoint produces or consumes Camel exchanges. Even though Apache Camel exposes the message body as POJOs in this mode, the CXF component still provides access to read and write SOAP headers. However, since CXF

interceptors remove in-band SOAP headers from the header list after they have been processed, only out-of-band SOAP headers are available in POJO mode.

The following example illustrates how to get/set SOAP headers. Suppose we have a route that forwards from one CXF endpoint to another. That is, SOAP Client → Apache Camel → CXF service. We can attach two processors to obtain/insert SOAP headers at (1) before request goes out to the CXF service and (2) before response comes back to the SOAP Client. Processor (1) and (2) in this example are `InsertRequestOutHeaderProcessor` and `InsertResponseOutHeaderProcessor`. Our route looks like this:

```
<route>
  <from uri="cxf:bean:routerRelayEndpointWithInsertion"/>
  <process ref="InsertRequestOutHeaderProcessor" />
  <to uri="cxf:bean:serviceRelayEndpointWithInsertion"/>
  <process ref="InsertResponseOutHeaderProcessor" />
</route>
```

In 2.x SOAP headers are propagated to and from Apache Camel Message headers. The Apache Camel message header name is `org.apache.cxf.headers.Header.list`, which is a constant defined in CXF (`org.apache.cxf.headers.Header.HEADER_LIST`). The header value is a `List<>` of CXF `SoapHeader` objects (`org.apache.cxf.binding.soap.SoapHeader`). The following snippet is the `InsertResponseOutHeaderProcessor` (that inserts a new SOAP header in the response message). The way to access SOAP headers in both `InsertResponseOutHeaderProcessor` and `InsertRequestOutHeaderProcessor` are actually the same. The only difference between the two processors is setting the direction of the inserted SOAP header.

```
public static class InsertResponseOutHeaderProcessor implements Processor {

    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        // You should be able to get the header if exchange is routed from camel-cxf endpoint
        List<SoapHeader> soapHeaders = CastUtils.cast((List<?
>)exchange.getIn().getHeader(Header.HEADER_LIST));
        if (soapHeaders == null) {
            // we just create a new soap headers in case the header is null
            soapHeaders = new ArrayList<SoapHeader>();
        }

        // Insert a new header
        String xml = "<?xml version=\"1.0\" encoding=\"utf-8\"?><outofbandHeader "
            + "xmlns=\"http://cxf.apache.org/outofband/Header\" hdrAttribute=\"testHdrAttribute\" "
            + "xmlns:soap=\"http://schemas.xmlsoap.org/soap/envelope/\" soap:mustUnderstand=\"1\">"
            + "<name>New_testOobHeader</name><value>New_testOobHeaderValue</value>"
        </outofbandHeader>";
        SoapHeader newHeader = new SoapHeader(soapHeaders.get(0).getName(),
            DOMUtils.readXml(new StringReader(xml)).getDocumentElement());
        // make sure direction is OUT since it is a response message.
        newHeader.setDirection(Direction.DIRECTION_OUT);
        //newHeader.setMustUnderstand(false);
        soapHeaders.add(newHeader);
    }
}
```

HOW TO GET AND SET SOAP HEADERS IN PAYLOAD MODE

We have already shown how to access SOAP message (**CxfPayload** object) in **PAYLOAD** mode (see [the section called “How to deal with the message for a camel-cxf endpoint in PAYLOAD data format”](#)).

Once you obtain a **CxfPayload** object, you can invoke the **CxfPayload.getHeaders()** method that returns a **List** of DOM Elements (SOAP headers).

```
from(getRouterEndpointURI()).process(new Processor() {
    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        CxfPayload<SoapHeader> payload = exchange.getIn().getBody(CxfPayload.class);
        List<Source> elements = payload.getBodySources();
        assertNotNull("We should get the elements here", elements);
        assertEquals("Get the wrong elements size", 1, elements.size());

        Element el = new XmlConverter().toDOMElement(elements.get(0));
        elements.set(0, new DOMSource(el));
        assertEquals("Get the wrong namespace URI", "http://camel.apache.org/pizza/types",
            el.getNamespaceURI());

        List<SoapHeader> headers = payload.getHeaders();
        assertNotNull("We should get the headers here", headers);
        assertEquals("Get the wrong headers size", headers.size(), 1);
        assertEquals("Get the wrong namespace URI",
            ((Element)(headers.get(0).getObject())).getNamespaceURI(),
            "http://camel.apache.org/pizza/types");
    }
})
.to(getServiceEndpointURI());
```

Since Camel 2.16.0, you can use the same approach as described in [the section called “How to get and set SOAP headers in POJO mode”](#) to set or get the SOAP headers. You can now use the **org.apache.cxf.headers.Header.list** header to get and set a list of SOAP headers. This means that if you have a route that forwards from one Camel CXF endpoint to another (SOAP Client → Camel → CXF service), the SOAP headers sent by the SOAP client are now also forwarded to the CXF service. If you do not want the headers to be forwarded, remove them from the **org.apache.cxf.headers.Header.list** Camel header.

SOAP HEADERS ARE NOT AVAILABLE IN MESSAGE MODE

SOAP headers are not available in **MESSAGE** mode as SOAP processing is skipped.

HOW TO THROW A SOAP FAULT FROM APACHE CAMEL

If you are using a CXF endpoint to consume the SOAP request, you may need to throw the SOAP **Fault** from the camel context. Basically, you can use the **throwFault** DSL to do that; it works for **POJO**, **PAYLOAD** and **MESSAGE** data format. You can define the soap fault like this:

```
SOAP_FAULT = new SoapFault(EXCEPTION_MESSAGE, SoapFault.FAULT_CODE_CLIENT);
Element detail = SOAP_FAULT.getOrCreateDetail();
Document doc = detail.getOwnerDocument();
```

```
Text tn = doc.createTextNode(DETAIL_TEXT);
detail.appendChild(tn);
```

Then throw it as you like:

```
from(routerEndpointURI).setFaultBody(constant(SOAP_FAULT));
```

If your CXF endpoint is working in the **MESSAGE** data format, you could set the the SOAP Fault message in the message body and set the response code in the message header.

```
from(routerEndpointURI).process(new Processor() {

    public void process(Exchange exchange) throws Exception {
        Message out = exchange.getOut();
        // Set the message body with the
        out.setBody(this.getClass().getResourceAsStream("SoapFaultMessage.xml"));
        // Set the response code here
        out.setHeader(org.apache.cxf.message.Message.RESPONSE_CODE, new Integer(500));
    }

});
```

The same is true for the POJO data format. You can set the SOAP Fault on the **Out** body and also indicate it's a fault by calling **Message.setFault(true)**, as follows:

```
from("direct:start").onException(SoapFault.class).maximumRedeliveries(0).handled(true)
    .process(new Processor() {
        public void process(Exchange exchange) throws Exception {
            SoapFault fault = exchange
                .getProperty(Exchange.EXCEPTION_CAUGHT, SoapFault.class);
            exchange.getOut().setFault(true);
            exchange.getOut().setBody(fault);
        }
    })
    .end().to(serviceURI);
```

HOW TO PROPAGATE A CXF ENDPOINT'S REQUEST AND RESPONSE CONTEXT

[cxf client API](#) provides a way to invoke the operation with request and response context. If you are using a CXF endpoint producer to invoke the external Web service, you can set the request context and get the response context with the following code:

```
CxfExchange exchange = (CxfExchange)template.send(getJaxwsEndpointUri(), new
Processor() {
    public void process(final Exchange exchange) {
        final List<String> params = new ArrayList<String>();
        params.add(TEST_MESSAGE);
        // Set the request context to the inMessage
        Map<String, Object> requestContext = new HashMap<String, Object>();
        requestContext.put(BindingProvider.ENDPOINT_ADDRESS_PROPERTY,
JAXWS_SERVER_ADDRESS);
        exchange.getIn().setBody(params);
```

```

        exchange.getIn().setHeader(Client.REQUEST_CONTEXT , requestContext);
        exchange.getIn().setHeader(CxfConstants.OPERATION_NAME,
GREET_ME_OPERATION);
    }
});
org.apache.camel.Message out = exchange.getOut();
// The output is an object array, the first element of the array is the return value
Object[] output = out.getBody(Object[].class);
LOG.info("Received output text: " + output[0]);
// Get the response context form outMessage
Map<String, Object> responseContext =
CastUtils.cast((Map)out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("Get the wrong wsdl operation name", "
{http://apache.org/hello_world_soap_http}greetMe",
responseContext.get("javax.xml.ws.wsdl.operation").toString());

```

ATTACHMENT SUPPORT

POJO Mode: Both SOAP with Attachment and MTOM are supported (see example in Payload Mode for enabling MTOM). However, SOAP with Attachment is not tested. Since attachments are marshalled and unmarshalled into POJOs, users typically do not need to deal with the attachment themselves. Attachments are propagated to Camel message's attachments since 2.1. So, it is possible to retrieve attachments by Camel Message API

```
DataHandler Message.getAttachment(String id)
```

Payload Mode: MTOM is supported since 2.1. Attachments can be retrieved by Camel Message APIs mentioned above. SOAP with Attachment is not supported as there is no SOAP processing in this mode.

To enable MTOM, set the CXF endpoint property "mtom_enabled" to **true**. (I believe you can only do it with Spring.)

```

<cxf:cxfEndpoint id="routerEndpoint"
address="http://localhost:${CXFTestSupport.port1}/CxfMtomRouterPayloadModeTest/jaxws-
mtom/hello"
    wsdlURL="mtom.wsdl"
    serviceName="ns:HelloService"
    endpointName="ns:HelloPort"
    xmlns:ns="http://apache.org/camel/cxf/mtom_feature">

<cxf:properties>
    <!-- enable mtom by setting this property to true -->
    <entry key="mtom-enabled" value="true"/>

    <!-- set the camel-cxf endpoint data format to PAYLOAD mode -->
    <entry key="dataFormat" value="PAYLOAD"/>
</cxf:properties>

```

You can produce a Camel message with attachment to send to a CXF endpoint in Payload mode.

```
Exchange exchange = context.createProducerTemplate().send("direct:testEndpoint", new
```

```

Processor() {

    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut);
        List<Source> elements = new ArrayList<Source>();
        elements.add(new DOMSource(DOMUtils.readXml(new
StringReader(MtomTestHelper.REQ_MESSAGE)).getDocumentElement()));
        CxfPayload<SoapHeader> body = new CxfPayload<SoapHeader>(new ArrayList<SoapHeader>
(),
        elements, null);
        exchange.getIn().setBody(body);
        exchange.getIn().addAttachment(MtomTestHelper.REQ_PHOTO_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.REQ_PHOTO_DATA,
"application/octet-stream")));

        exchange.getIn().addAttachment(MtomTestHelper.REQ_IMAGE_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.requestJpeg, "image/jpeg")));

    }

});

// process response

CxfPayload<SoapHeader> out = exchange.getOut().getBody(CxfPayload.class);
Assert.assertEquals(1, out.getBody().size());

Map<String, String> ns = new HashMap<String, String>();
ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
ns.put("xop", MtomTestHelper.XOP_NS);

XPathUtils xu = new XPathUtils(ns);
Element oute = new XmlConverter().toDOMElement(out.getBody().get(0));
Element ele = (Element)xu.getValue("//ns:DetailResponse/ns:photo/xop:Include", oute,
        XPathConstants.NODE);
String photold = ele.getAttribute("href").substring(4); // skip "cid:"

ele = (Element)xu.getValue("//ns:DetailResponse/ns:image/xop:Include", oute,
        XPathConstants.NODE);
String imageld = ele.getAttribute("href").substring(4); // skip "cid:"

DataHandler dr = exchange.getOut().getAttachment(photold);
Assert.assertEquals("application/octet-stream", dr.getContentType());
MtomTestHelper.assertEquals(MtomTestHelper.RESP_PHOTO_DATA,
IOUtils.readBytesFromStream(dr.getInputStream()));

dr = exchange.getOut().getAttachment(imageld);
Assert.assertEquals("image/jpeg", dr.getContentType());

BufferedImage image = ImageIO.read(dr.getInputStream());
Assert.assertEquals(560, image.getWidth());
Assert.assertEquals(300, image.getHeight());

```

You can also consume a Camel message received from a CXF endpoint in Payload mode.

```

public static class MyProcessor implements Processor {

```

```

@SuppressWarnings("unchecked")
public void process(Exchange exchange) throws Exception {
    CxfPayload<SoapHeader> in = exchange.getIn().getBody(CxfPayload.class);

    // verify request
    assertEquals(1, in.getBody().size());

    Map<String, String> ns = new HashMap<String, String>();
    ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
    ns.put("xop", MtomTestHelper.XOP_NS);

    XPathUtils xu = new XPathUtils(ns);
    Element body = new XmlConverter().toDOMElement(in.getBody().get(0));
    Element ele = (Element)xu.getValue("//ns:Detail/ns:photo/xop:Include", body,
        XPathConstants.NODE);
    String photold = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_PHOTO_CID, photold);

    ele = (Element)xu.getValue("//ns:Detail/ns:image/xop:Include", body,
        XPathConstants.NODE);
    String imageld = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_IMAGE_CID, imageld);

    DataHandler dr = exchange.getIn().getAttachment(photold);
    assertEquals("application/octet-stream", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.REQ_PHOTO_DATA,
    IOUtils.readBytesFromStream(dr.getInputStream()));

    dr = exchange.getIn().getAttachment(imageld);
    assertEquals("image/jpeg", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.requestJpeg,
    IOUtils.readBytesFromStream(dr.getInputStream()));

    // create response
    List<Source> elements = new ArrayList<Source>();
    elements.add(new DOMSource(DOMUtils.readXml(new
    StringReader(MtomTestHelper.RESP_MESSAGE)).getDocumentElement()));
    CxfPayload<SoapHeader> sbody = new CxfPayload<SoapHeader>(new
    ArrayList<SoapHeader>(),
        elements, null);
    exchange.getOut().setBody(sbody);
    exchange.getOut().addAttachment(MtomTestHelper.RESP_PHOTO_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.RESP_PHOTO_DATA,
    "application/octet-stream"))));

    exchange.getOut().addAttachment(MtomTestHelper.RESP_IMAGE_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.responseJpeg, "image/jpeg"))));
}
}

```

Message Mode: Attachments are not supported as it does not process the message at all.

CXF_MESSAGE Mode: MTOM is supported, and Attachments can be retrieved by Camel Message APIs mentioned above. Note that when receiving a multipart (that is, MTOM) message the default

SOAPMessage to **String** converter will provide the complete multi-part payload on the body. If you require just the SOAP XML as a **String**, you can set the message body with **message.getSOAPPart()**, and Camel convert can do the rest of work for you.

HOW TO PROPAGATE STACK TRACE INFORMATION

It is possible to configure a CXF endpoint so that, when a Java exception is thrown on the server side, the stack trace for the exception is marshalled into a fault message and returned to the client. To enable this feature, set the **dataFormat** to **PAYLOAD** and set the **faultStackTraceEnabled** property to **true** in the **cxfEndpoint** element, as follows:

```
<cxf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
  wsdlURL="ship.wsdl"
  endpointName="s:TestSoapEndpoint"
  serviceName="s:TestService"
  xmlns:s="http://test">
<cxf:properties>
  <!-- enable sending the stack trace back to client; the default value is false-->
  <entry key="faultStackTraceEnabled" value="true" /> <entry key="dataFormat" value="PAYLOAD"
/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

For security reasons, the stack trace does not include the causing exception (that is, the part of a stack trace that follows **Caused by**). If you want to include the causing exception in the stack trace, set the **exceptionMessageCauseEnabled** property to **true** in the **cxfEndpoint** element, as follows:

```
<cxf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
  wsdlURL="ship.wsdl"
  endpointName="s:TestSoapEndpoint"
  serviceName="s:TestService"
  xmlns:s="http://test">
<cxf:properties>
  <!-- enable to show the cause exception message and the default value is false -->
  <entry key="exceptionMessageCauseEnabled" value="true" />
  <!-- enable to send the stack trace back to client, the default value is false-->
  <entry key="faultStackTraceEnabled" value="true" />
  <entry key="dataFormat" value="PAYLOAD" />
  </cxf:properties>
</cxf:cxfEndpoint>
```

WARNING

You should only enable the **exceptionMessageCauseEnabled** flag for testing and diagnostic purposes. It is normal practice for servers to conceal the original cause of an exception to make it harder for hostile users to probe the server.

STREAMING SUPPORT IN PAYLOAD MODE

In 2.8.2, the camel-cxf component now supports streaming of incoming messages when using PAYLOAD mode. Previously, the incoming messages would have been completely DOM parsed. For large messages, this is time consuming and uses a significant amount of memory. Starting in 2.8.2, the incoming messages can remain as a `javax.xml.transform.Source` while being routed and, if nothing modifies the payload, can then be directly streamed out to the target destination. For common "simple proxy" use cases (example: `from("cxf:...").to("cxf:...")`), this can provide very significant performance increases as well as significantly lowered memory requirements.

However, there are cases where streaming may not be appropriate or desired. Due to the streaming nature, invalid incoming XML may not be caught until later in the processing chain. Also, certain actions may require the message to be DOM parsed anyway (like WS-Security or message tracing and such) in which case the advantages of the streaming is limited. At this point, there are two ways to control the streaming:

- Endpoint property: you can add `"allowStreaming=false"` as an endpoint property to turn the streaming on/off.
- Component property: the `CxfComponent` object also has an `allowStreaming` property that can set the default for endpoints created from that component.
- Global system property: you can add a system property of `"org.apache.camel.component.cxf.streaming"` to `"false"` to turn it off. That sets the global default, but setting the endpoint property above will override this value for that endpoint.

USING THE GENERIC CXF DISPATCH MODE

From 2.8.0, the camel-cxf component supports the generic [CXF dispatch mode](#) that can transport messages of arbitrary structures (i.e., not bound to a specific XML schema). To use this mode, you simply omit specifying the `wsdlURL` and `serviceClass` attributes of the CXF endpoint.

```
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/SoapContext/SoapAnyPort">
  <cxf:properties>
    <entry key="dataFormat" value="PAYLOAD"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

It is noted that the default CXF dispatch client does not send a specific SOAPAction header. Therefore, when the target service requires a specific SOAPAction value, it is supplied in the Camel header using the key `SOAPAction` (case-insensitive).

77.1. CXF CONSUMERS ON WILDFLY

The configuration of camel-cxf consumers on WildFly is different to that of standalone Camel. Producer endpoints work as per normal.

On WildFly, camel-cxf consumers leverage the default Undertow HTTP server provided by the container. The server is defined within the undertow subsystem configuration. Here's an excerpt of the default configuration from `standalone.xml`:

```
<subsystem xmlns="urn:jboss:domain:undertow:4.0">
  <buffer-cache name="default" />
  <server name="default-server">
    <http-listener name="default" socket-binding="http" redirect-socket="https" enable-http2="true" />
    <https-listener name="https" socket-binding="https" security-realm="ApplicationRealm" enable-
http2="true" />
  </server>
</subsystem>
```

```

<host name="default-host" alias="localhost">
  <location name="/" handler="welcome-content" />
  <filter-ref name="server-header" />
  <filter-ref name="x-powered-by-header" />
  <http-invoker security-realm="ApplicationRealm" />
</host>
</server>
</subsystem>

```

In this instance, Undertow is configured to listen on interfaces / ports specified by the http and https socket-binding. By default this is port 8080 for http and 8443 for https.

For example, if you configure an endpoint consumer using different host or port combinations, a warning will appear within the server log file. For example the following host & port configurations would be ignored:

```

<cxfrsServer id="cxfrsConsumer"
  address="http://somehost:1234/path/to/resource"
  serviceClass="org.example.ServiceClass" />

```

```

<cxfcxfEndpoint id="cxfcxfConsumer"
  address="http://somehost:1234/path/to/resource"
  serviceClass="org.example.ServiceClass" />

```

```

[org.wildfly.extension.camel] (pool-2-thread-1) Ignoring configured host:
http://somehost:1234/path/to/resource

```

However, the consumer is still available on the default host & port localhost:8080 or localhost:8443.

NOTE

Applications which use camel-cxf consumers **must** be packaged as a WAR. In previous WildFly-Camel releases, other types of archive such as JAR were permitted, but this is no longer supported.

77.1.1. Configuring alternative ports

If alternative ports are to be accepted, then these must be configured via the WildFly subsystem configuration. This is explained in the server documentation:

https://access.redhat.com/documentation/en-us/red_hat_jboss_enterprise_application_platform/7.1/html/configuration_guide/configuring_the_web_ser

77.1.2. Configuring SSL

To configure SSL, refer to the WildFly SSL configuration guide:

https://access.redhat.com/documentation/en-us/red_hat_jboss_enterprise_application_platform/7.1/html-single/how_to_configure_server_security/#configure_one_way_and_two_way_ssl_tls_for_application

77.1.3. Configuring security with Elytron

WildFly-Camel supports securing camel-cxf consumer endpoints with the [Elytron](#) security framework.

77.1.3.1. Configuring a security domain

To secure a WildFly-Camel application with Elytron, an application security domain needs to be referenced within **WEB-INF/jboss-web.xml** of your WAR deployment:

```
<jboss-web>
  <security-domain>my-application-security-domain</security-domain>
</jboss-web>
```

The **<security-domain>** configuration references the name of an **<application-security-domain>** defined by the Undertow subsystem. For example, the Undertow subsystem **<application-security-domain>** is configured within the WildFly server **standalone.xml** configuration file as follows:

```
<subsystem xmlns="urn:jboss:domain:undertow:6.0">
  ...
  <application-security-domains>
    <application-security-domain name="my-application-security-domain" http-authentication-
factory="application-http-authentication"/>
  </application-security-domains>
</subsystem>
```

The **<http-authentication-factory>** **application-http-authentication** is defined within the Elytron subsystem. **application-http-authentication** is available by default in both the **standalone.xml** and **standalone-full.xml** server configuration files. For example:

```
<subsystem xmlns="urn:wildfly:elytron:1.2">
  ...
  <http>
    ...
    <http-authentication-factory name="application-http-authentication" http-server-mechanism-
factory="global" security-domain="ApplicationDomain">
      <mechanism-configuration>
        <mechanism mechanism-name="BASIC">
          <mechanism-realm realm-name="Application Realm" />
        </mechanism>
        <mechanism mechanism-name="FORM" />
      </mechanism-configuration>
    </http-authentication-factory>
    <provider-http-server-mechanism-factory name="global" />
  </http>
  ...
</subsystem>
```

The **<http-authentication-factory>** named **application-http-authentication**, holds a reference to a Elytron security domain called **ApplicationDomain**.

For more information on how to configure the Elytron subsystem, refer to the [Elytron documentation](#).

77.1.3.2. Configuring security constraints, authentication methods and security roles

Security constraints, authentication methods and security roles for camel-cxf consumer endpoints can be configured within your WAR deployment **WEB-INF/web.xml**. For example, to configure BASIC Authentication:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>/webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
  <login-config>
    <auth-method>BASIC</auth-method>
    <realm-name>my-realm</realm-name>
  </login-config>
</web-app>
```

Note that the **<url-pattern>** defined by the Servlet Specification is relative to the context path of the web application. If your application is packaged as **my-app.war**, WildFly will make it accessible under the context path **/my-app** and the **<url-pattern>** **/webservices/*** will be applied to paths relative to **/my-app**.

For example, requests against <http://my-server/my-app/webservices/my-endpoint> will match the **/webservices/*** pattern, while <http://my-server/webservices/my-endpoint> will not match.

This is important because WildFly-Camel allows the creation of camel-cxf endpoint consumers whose base path is outside of the host web application context path. For example, it is possible to create a camel-cxf consumer for <http://my-server/webservices/my-endpoint> inside **my-app.war**.

In order to define security constraints for such out-of-context endpoints, WildFly-Camel supports a custom, *non-standard* **<url-pattern>** convention where prefixing the pattern with three forward slashes **///** will be interpreted as absolute to server host name. For example, to secure <http://my-server/webservices/my-endpoint> inside **my-app.war**, you would add the following configuration to **web.xml**:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>///webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
```

```
<login-config>  
  <auth-method>BASIC</auth-method>  
  <realm-name>my-realm</realm-name>  
</login-config>  
</web-app>
```

CHAPTER 78. CXF-RS COMPONENT

Available as of Camel version 2.0

The `cxfrs` component provides integration with [Apache CXF](#) for connecting to JAX-RS 1.1 and 2.0 services hosted in CXF.

When using CXF as a consumer, the [CXF Bean Component](#) allows you to factor out how message payloads are received from their processing as a RESTful or SOAP web service. This has the potential of using a multitude of transports to consume web services. The bean component's configuration is also simpler and provides the fastest method to implement web services using Camel and CXF.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cxf</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

78.1. URI FORMAT

```
cxfrs://address?options
```

Where **address** represents the CXF endpoint's address

```
cxfrs:bean:rsEndpoint
```

Where **rsEndpoint** represents the spring bean's name which presents the CXFRS client or server

For either style above, you can append options to the URI as follows:

```
cxfrs:bean:cxfrsEndpoint?resourceClasses=org.apache.camel.rs.Example
```

78.2. OPTIONS

The CXF-RS component supports 3 options, which are listed below.

Name	Description	Default	Type
<code>useGlobalSslContextParameters</code> (security)	Enable usage of global SSL context parameters.	false	boolean
<code>headerFilterStrategy</code> (filter)	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message.		HeaderFilterStrategy

Name	Description	Default	Type
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The CXF-RS endpoint is configured using URI syntax:

```
cxfrs:beanId:address
```

with the following path and query parameters:

78.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
beanId	To lookup an existing configured CxfRsEndpoint. Must used bean: as prefix.		String
address	The service publish address.		String

78.2.2. Query Parameters (30 parameters):

Name	Description	Default	Type
features (common)	Set the feature list to the CxfRs endpoint.		List
loggingFeatureEnabled (common)	This option enables CXF Logging Feature which writes inbound and outbound REST messages to log.	false	boolean
loggingSizeLimit (common)	To limit the total size of number of bytes the logger will output when logging feature has been enabled.		int
modelRef (common)	This option is used to specify the model file which is useful for the resource class without annotation. When using this option, then the service class can be omitted, to emulate document-only endpoints		String
providers (common)	Set custom JAX-RS provider(s) list to the CxfRs endpoint. You can specify a string with a list of providers to lookup in the registry separated by comma.		String

Name	Description	Default	Type
resourceClasses (common)	The resource classes which you want to export as REST service. Multiple classes can be separated by comma.		List
schemaLocations (common)	Sets the locations of the schema(s) which can be used to validate the incoming XML or JAXB-driven JSON.		List
skipFaultLogging (common)	This option controls whether the PhaseInterceptorChain skips logging the Fault that it catches.	false	boolean
bindingStyle (consumer)	Sets how requests and responses will be mapped to/from Camel. Two values are possible: SimpleConsumer: This binding style processes request parameters, multipart, etc. and maps them to IN headers, IN attachments and to the message body. It aims to eliminate low-level processing of org.apache.cxf.message.MessageContentsList. It also adds more flexibility and simplicity to the response mapping. Only available for consumers. Default: The default style. For consumers this passes on a MessageContentsList to the route, requiring low-level processing in the route. This is the traditional binding style, which simply dumps the org.apache.cxf.message.MessageContentsList coming in from the CXF stack onto the IN message body. The user is then responsible for processing it according to the contract defined by the JAX-RS method signature. Custom: allows you to specify a custom binding through the binding option.	Default	BindingStyle
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
publishedEndpointUrl (consumer)	This option can override the endpointUrl that published from the WADL which can be accessed with resource address url plus _wadl		String

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
serviceBeans (consumer)	The service beans which you want to export as REST service. Multiple beans can be separated by comma.		List
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
hostnameVerifier (producer)	The hostname verifier to be used. Use the # notation to reference a HostnameVerifier from the registry.		HostnameVerifier
sslContextParameters (producer)	The Camel SSL setting reference. Use the # notation to reference the SSL Context.		SSLContextParameters
throwExceptionOnFailure (producer)	This option tells the CxfRsProducer to inspect return codes and will generate an Exception if the return code is larger than 207.	true	boolean
httpClientAPI (producer)	If it is true, the CxfRsProducer will use the HttpClientAPI to invoke the service. If it is false, the CxfRsProducer will use the ProxyClientAPI to invoke the service	true	boolean
ignoreDeleteMethodMessageBody (producer)	This option is used to tell CxfRsProducer to ignore the message body of the DELETE method when using HTTP API.	false	boolean
maxClientCacheSize (producer)	This option allows you to configure the maximum size of the cache. The implementation caches CXF clients or ClientFactoryBean in CxfProvider and CxfRsProvider.	10	int
binding (advanced)	To use a custom CxfBinding to control the binding between Camel Message and CXF Message.		CxfRsBinding
bus (advanced)	To use a custom configured CXF Bus.		Bus

Name	Description	Default	Type
continuationTimeout (advanced)	This option is used to set the CXF continuation timeout which could be used in CxfConsumer by default when the CXF server is using Jetty or Servlet transport.	30000	long
cxfrsEndpointConfigurer (advanced)	This option could apply the implementation of org.apache.camel.component.cxf.jaxrs.CxfRsEndpointConfigurer which supports to configure the CXF endpoint in programmatic way. User can configure the CXF server and client by implementing configureServer/Client method of CxfEndpointConfigurer.		CxfRsEndpointConfigurer
defaultBus (advanced)	Will set the default bus when CXF endpoint create a bus by itself	false	boolean
headerFilterStrategy (advanced)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
performInvocation (advanced)	When the option is true, Camel will perform the invocation of the resource class instance and put the response object into the exchange for further processing.	false	boolean
propagateContexts (advanced)	When the option is true, JAXRS UriInfo, HttpHeaders, Request and SecurityContext contexts will be available to custom CXFRS processors as typed Camel exchange properties. These contexts can be used to analyze the current requests using JAX-RS API.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

78.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
camel.component.cxfRs.enabled	Enable cxfrs component	true	Boolean

Name	Description	Default	Type
<code>camel.component.cxf.rs.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
<code>camel.component.cxf.rs.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.cxf.rs.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

You can also configure the CXF REST endpoint through the spring configuration. Since there are lots of difference between the CXF REST client and CXF REST Server, we provide different configuration for them. Please check out the [schema file](#) and [CXF JAX-RS documentation](#) for more information.

78.4. HOW TO CONFIGURE THE REST ENDPOINT IN CAMEL

In [camel-cxf schema file](#), there are two elements for the REST endpoint definition. `cxf:rsServer` for REST consumer, `cxf:rsClient` for REST producer.

You can find a Camel REST service route configuration example here.

78.5. HOW TO OVERRIDE THE CXF PRODUCER ADDRESS FROM MESSAGE HEADER

The `camel-cxf.rs` producer supports to override the services address by setting the message with the key of "CamelDestinationOverrideUrl".

```
// set up the service address from the message header to override the setting of CXF endpoint
exchange.getIn().setHeader(Exchange.DESTINATION_OVERRIDE_URL,
constant(getServiceAddress()));
```

78.6. CONSUMING A REST REQUEST - SIMPLE BINDING STYLE

Available as of Camel 2.11

The **Default** binding style is rather low-level, requiring the user to manually process the **MessageContentsList** object coming into the route. Thus, it tightly couples the route logic with the method signature and parameter indices of the JAX-RS operation. Somewhat inelegant, difficult and error-prone.

In contrast, the **SimpleConsumer** binding style performs the following mappings, in order to **make the request data more accessible** to you within the Camel Message:

- JAX-RS Parameters (@HeaderParam, @QueryParam, etc.) are injected as IN message headers. The header name matches the value of the annotation.
- The request entity (POJO or other type) becomes the IN message body. If a single entity cannot be identified in the JAX-RS method signature, it falls back to the original **MessageContentsList**.
- Binary **@Multipart** body parts become IN message attachments, supporting **DataHandler**, **InputStream**, **DataSource** and CXF's **Attachment** class.
- Non-binary **@Multipart** body parts are mapped as IN message headers. The header name matches the Body Part name.

Additionally, the following rules apply to the **Response** mapping:

- If the message body type is different to **javax.ws.rs.core.Response** (user-built response), a new **Response** is created and the message body is set as the entity (so long it's not null). The response status code is taken from the **Exchange.HTTP_RESPONSE_CODE** header, or defaults to 200 OK if not present.
- If the message body type is equal to **javax.ws.rs.core.Response**, it means that the user has built a custom response, and therefore it is respected and it becomes the final response.
- In all cases, Camel headers permitted by custom or default **HeaderFilterStrategy** are added to the HTTP response.

78.6.1. Enabling the Simple Binding Style

This binding style can be activated by setting the **bindingStyle** parameter in the consumer endpoint to value **SimpleConsumer**:

```
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
    .to("log:TEST?showAll=true");
```

78.6.2. Examples of request binding with different method signatures

Below is a list of method signatures along with the expected result from the Simple binding.

public Response doAction(BusinessObject request);

Request payload is placed in IN message body, replacing the original MessageContentsList.

public Response doAction(BusinessObject request, @HeaderParam("abcd") String abcd, @QueryParam("defg") String defg); Request payload placed in IN message body, replacing the original MessageContentsList. Both request params mapped as IN message headers with names abcd and defg.

public Response doAction(@HeaderParam("abcd") String abcd, @QueryParam("defg") String defg); Both request params mapped as IN message headers with names abcd and defg. The original MessageContentsList is preserved, even though it only contains the 2 parameters.

public Response doAction(@Multipart(value="body1") BusinessObject request, @Multipart(value="body2") BusinessObject request2); The first parameter is transferred as a header with name body1, and the second one is mapped as header body2. The original MessageContentsList is

preserved as the IN message body.

public Response doAction(InputStream abcd); The InputStream is unwrapped from the MessageContentsList and preserved as the IN message body.

public Response doAction(DataHandler abcd); The DataHandler is unwrapped from the MessageContentsList and preserved as the IN message body.

78.6.3. More examples of the Simple Binding Style

Given a JAX-RS resource class with this method:

```
@POST @Path("/customers/{type}")
public Response newCustomer(Customer customer, @PathParam("type") String type,
    @QueryParam("active") @DefaultValue("true") boolean active) {
    return null;
}
```

Serviced by the following route:

```
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
    .recipientList(simple("direct:${header.operationName}"));

from("direct:newCustomer")
    .log("Request: type=${header.type}, active=${header.active}, customerData=${body}");
```

The following HTTP request with XML payload (given that the Customer DTO is JAXB-annotated):

```
POST /customers/gold?active=true

Payload:
<Customer>
  <fullName>Raul Kripalani</fullName>
  <country>Spain</country>
  <project>Apache Camel</project>
</Customer>
```

Will print the message:

```
Request: type=gold, active=true, customerData=<Customer.toString() representation>
```

For more examples on how to process requests and write responses can be found [here](#).

78.7. CONSUMING A REST REQUEST - DEFAULT BINDING STYLE

The [CXF JAXRS front end](#) implements the [JAX-RS \(JSR-311\) API](#), so we can export the resources classes as a REST service. And we leverage the [CXF Invoker API](#) to turn a REST request into a normal Java object method invocation. Unlike the [Camel Restlet](#) component, you don't need to specify the URI template within your endpoint, CXF takes care of the REST request URI to resource class method mapping according to the JSR-311 specification. All you need to do in Camel is delegate this method request to a right processor or endpoint.

Here is an example of a CXFRS route...

■

```

private static final String CXF_RS_ENDPOINT_URI =
    "cxfrs://http://localhost:" + CXT + "/rest?
resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerServiceResource";
private static final String CXF_RS_ENDPOINT_URI2 =
    "cxfrs://http://localhost:" + CXT + "/rest2?
resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerService";
private static final String CXF_RS_ENDPOINT_URI3 =
    "cxfrs://http://localhost:" + CXT + "/rest3?"
    +
    "resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerServiceNoAnnotations&"

    + "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceModel.xml";
private static final String CXF_RS_ENDPOINT_URI4 =
    "cxfrs://http://localhost:" + CXT + "/rest4?"
    +
    "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceDefaultHandlerModel.xml";
private static final String CXF_RS_ENDPOINT_URI5 =
    "cxfrs://http://localhost:" + CXT + "/rest5?"
    + "propagateContexts=true&"
    +
    "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceDefaultHandlerModel.xml";
protected RouteBuilder createRouteBuilder() throws Exception {
    final Processor testProcessor = new TestProcessor();
    final Processor testProcessor2 = new TestProcessor2();
    final Processor testProcessor3 = new TestProcessor3();
    return new RouteBuilder() {
        public void configure() {
            errorHandler(new NoErrorHandlerBuilder());
            from(CXF_RS_ENDPOINT_URI).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI2).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI3).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI4).process(testProcessor2);
            from(CXF_RS_ENDPOINT_URI5).process(testProcessor3);
        }
    };
}

```

And the corresponding resource class used to configure the endpoint...

INFO:*Note about resource classes*

By default, JAX-RS resource classes are **only*used to configure JAX-RS properties. Methods will *not** be executed during routing of messages to the endpoint. Instead, it is the responsibility of the route to do all processing.

Note that starting from Camel 2.15 it is also sufficient to provide an interface only as opposed to a no-op service implementation class for the default mode.

Starting from Camel 2.15, if a **performInvocation** option is enabled, the service implementation will be invoked first, the response will be set on the Camel exchange and the route execution will continue as usual. This can be useful for integrating the existing JAX-RS implementations into Camel routes and for post-processing JAX-RS Responses in custom processors.

```
@Path("/customerservice/")
```

```

public interface CustomerServiceResource {

    @GET
    @Path("/customers/{id}")
    Customer getCustomer(@PathParam("id") String id);

    @PUT
    @Path("/customers/")
    Response updateCustomer(Customer customer);

    @Path("/{id}")
    @PUT()
    @Consumes({ "application/xml", "text/plain",
                "application/json" })
    @Produces({ "application/xml", "text/plain",
                "application/json" })
    Object invoke(@PathParam("id") String id,
                  String payload);
}

```

78.8. HOW TO INVOKE THE REST SERVICE THROUGH CAMEL-CXF-RS PRODUCER

The [CXF JAXRS front end](#) implements a [proxy-based client API](#), with this API you can invoke the remote REST service through a proxy. The **camel-cxf-rs** producer is based on this [proxy API](#). You just need to specify the operation name in the message header and prepare the parameter in the message body, the camel-cxf-rs producer will generate right REST request for you.

Here is an example:

```

Exchange exchange = template.send("direct://proxy", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut);
        Message inMessage = exchange.getIn();
        // set the operation name
        inMessage.setHeader(CxfConstants.OPERATION_NAME, "getCustomer");
        // using the proxy client API
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_USING_HTTP_API, Boolean.FALSE);
        // set a customer header
        inMessage.setHeader("key", "value");
        // setup the accept content type
        inMessage.setHeader(Exchange.ACCEPT_CONTENT_TYPE, "application/json");
        // set the parameters , if you just have one parameter
        // camel will put this object into an Object[] itself
        inMessage.setBody("123");
    }
});

// get the response message
Customer response = (Customer) exchange.getOut().getBody();

assertNotNull("The response should not be null ", response);
assertEquals("Get a wrong customer id ", 123, response.getId());
assertEquals("Get a wrong customer name", "John", response.getName());

```

```
assertEquals("Get a wrong response code", 200,
exchange.getOut().getHeader(Exchange.HTTP_RESPONSE_CODE));
assertEquals("Get a wrong header value", "value", exchange.getOut().getHeader("key"));
```

The [CXF JAXRS front end](#) also provides a [http centric client API](#). You can also invoke this API from **camel-cxf** producer. You need to specify the [HTTP_PATH](#) and the [HTTP_METHOD](#) and let the producer use the http centric client API by using the URI option **httpClientAPI** or by setting the message header [CxfConstants.CAMEL_CXF_RS_USING_HTTP_API](#). You can turn the response object to the type class specified with the message header [CxfConstants.CAMEL_CXF_RS_RESPONSE_CLASS](#).

```
Exchange exchange = template.send("direct://http", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut)
        Message inMessage = exchange.getIn();
        // using the http central client API
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_USING_HTTP_API, Boolean.TRUE);
        // set the Http method
        inMessage.setHeader(Exchange.HTTP_METHOD, "GET");
        // set the relative path
        inMessage.setHeader(Exchange.HTTP_PATH, "/customerservice/customers/123");
        // Specify the response class , cxf will use InputStream as the response object type
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_RESPONSE_CLASS, Customer.class);
        // set a customer header
        inMessage.setHeader("key", "value");
        // since we use the Get method, so we don't need to set the message body
        inMessage.setBody(null);
    }
});
```

From Camel 2.1, we also support to specify the query parameters from cxf uri for the CXFRS http centric client.

```
Exchange exchange = template.send("cxf://http://localhost:9003/testQuery?
httpClientAPI=true&q1=12&q2=13"
```

To support the Dynamical routing, you can override the URI's query parameters by using the [CxfConstants.CAMEL_CXF_RS_QUERY_MAP](#) header to set the parameter map for it.

```
Map<String, String> queryMap = new LinkedHashMap<>();
queryMap.put("q1", "new");
queryMap.put("q2", "world");
inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_QUERY_MAP, queryMap);
```

78.9. WHAT'S THE CAMEL TRANSPORT FOR CXF

In CXF you offer or consume a webservice by defining its address. The first part of the address specifies the protocol to use. For example address="http://localhost:9000" in an endpoint configuration means your service will be offered using the http protocol on port 9000 of localhost. When you integrate Camel Transport into CXF you get a new transport "camel". So you can specify address="camel://direct:MyEndpointName" to bind the CXF service address to a camel direct endpoint.

Technically speaking Camel transport for CXF is a component which implements the [CXF transport API](#) with the Camel core library. This allows you to easily use Camel's routing engine and integration patterns support together with your CXF services.

78.10. INTEGRATE CAMEL INTO CXF TRANSPORT LAYER

To include the Camel Transport into your CXF bus you use the CamelTransportFactory. You can do this in Java as well as in Spring.

78.10.1. Setting up the Camel Transport in Spring

You can use the following snippet in your applicationcontext if you want to configure anything special. If you only want to activate the camel transport you do not have to do anything in your application context. As soon as you include the camel-cxf-transport jar (or camel-cxf.jar if your camel version is less than 2.7.x) in your app, cxf will scan the jar and load a CamelTransportFactory for you.

```
<!-- you don't need to specify the CamelTransportFactory configuration as it is auto load by CXF bus -->
-->
<bean class="org.apache.camel.component.cxf.transport.CamelTransportFactory">
  <property name="bus" ref="cxf" />
  <property name="camelContext" ref="camelContext" />
  <!-- checkException new added in Camel 2.1 and Camel 1.6.2 -->
  <!-- If checkException is true , CamelDestination will check the outMessage's
       exception and set it into camel exchange. You can also override this value
       in CamelDestination's configuration. The default value is false.
       This option should be set true when you want to leverage the camel's error
       handler to deal with fault message -->
  <property name="checkException" value="true" />
  <property name="transportIds">
    <list>
      <value>http://cxf.apache.org/transports/camel</value>
    </list>
  </property>
</bean>
```

78.10.2. Integrating the Camel Transport in a programmatic way

Camel transport provides a setContext method that you could use to set the Camel context into the transport factory. If you want this factory take effect, you need to register the factory into the CXF bus. Here is a full example for you.

```
import org.apache.cxf.Bus;
import org.apache.cxf.BusFactory;
import org.apache.cxf.transport.ConduitInitiatorManager;
import org.apache.cxf.transport.DestinationFactoryManager;
...

BusFactory bf = BusFactory.newInstance();
Bus bus = bf.createBus();
CamelTransportFactory camelTransportFactory = new CamelTransportFactory();
// set up the CamelContext which will be use by the CamelTransportFactory
camelTransportFactory.setCamelContext(context)
// if you are using CXF higher then 2.4.x the
camelTransportFactory.setBus(bus);
```

```
// if you are lower CXF, you need to register the ConduitInitiatorManager and
// DestinationFactoryManager like below
// register the conduit initiator
ConduitInitiatorManager cim = bus.getExtension(ConduitInitiatorManager.class);
cim.registerConduitInitiator(CamelTransportFactory.TRANSPORT_ID, camelTransportFactory);
// register the destination factory
DestinationFactoryManager dfm = bus.getExtension(DestinationFactoryManager.class);
dfm.registerDestinationFactory(CamelTransportFactory.TRANSPORT_ID, camelTransportFactory);
// set or bus as the default bus for cxf
BusFactory.setDefaultBus(bus);
```

78.11. CONFIGURE THE DESTINATION AND CONDUIT WITH SPRING

78.11.1. Namespace

The elements used to configure an Camel transport endpoint are defined in the namespace <http://xf.apache.org/transports/camel>. It is commonly referred to using the prefix **camel**. In order to use the Camel transport configuration elements, you will need to add the lines shown below to the beans element of your endpoint's configuration file. In addition, you will need to add the configuration elements' namespace to the **xsi:schemaLocation** attribute.

Adding the Configuration Namespace

```
<beans ...
  xmlns:camel="http://xf.apache.org/transports/camel
  ...
  xsi:schemaLocation="...
    http://xf.apache.org/transports/camel
    http://xf.apache.org/transports/camel.xsd
  ...>
```

78.11.2. The destination element

You configure an Camel transport server endpoint using the **camel:destination** element and its children. The **camel:destination** element takes a single attribute, **name**, that specifies the WSDL port element that corresponds to the endpoint. The value for the **name** attribute takes the form `portQName` .camel-destination``. The example below shows the **camel:destination** element that would be used to add configuration for an endpoint that was specified by the WSDL fragment **<port binding="widgetSOAPBinding" name="widgetSOAPPort">** if the endpoint's target namespace was <http://widgets.widgetvendor.net>.

camel:destination Element

```
...
<camel:destination name="{http://widgets/widgetvendor.net}widgetSOAPPort.http-destination">
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```

<!-- new added feature since Camel 2.11.x
<camel:destination name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-destination"
camelContextId="context" />
...

```

The **camel:destination** element for Spring has a number of child elements that specify configuration information. They are described below.

Element

Description

camel-spring:camelContext

You can specify the camel context in the camel destination

camel:camelContextRef

The camel context id which you want inject into the camel destination

78.11.3. The conduit element

You configure a Camel transport client using the **camel:conduit** element and its children. The **camel:conduit** element takes a single attribute, **name**, that specifies the WSDL port element that corresponds to the endpoint. The value for the **name** attribute takes the form `port QName`.camel-conduit``. For example, the code below shows the **camel:conduit** element that would be used to add configuration for an endpoint that was specified by the WSDL fragment **<port binding="widgetSOAPBinding" name="widgetSOAPPort">** if the endpoint's target namespace was <http://widgets.widgetvendor.net>.

http-conf:conduit Element

```

...
<camelContext id="conduit_context" xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:EndpointA" />
    <to uri="direct:EndpointB" />
  </route>
</camelContext>

<camel:conduit name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-conduit">
  <camel:camelContextRef>conduit_context</camel:camelContextRef>
</camel:conduit>

<!-- new added feature since Camel 2.11.x
<camel:conduit name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-conduit"
camelContextId="conduit_context" />

<camel:conduit name="*.camel-conduit">
<!-- you can also using the wild card to specify the camel-conduit that you want to configure -->
...
</camel:conduit>
...

```

-

The **camel:conduit** element has a number of child elements that specify configuration information. They are described below.

Element

Description

camel-spring:camelContext

You can specify the camel context in the camel conduit

camel:camelContextRef

The camel context id which you want inject into the camel conduit

78.12. CONFIGURE THE DESTINATION AND CONDUIT WITH BLUEPRINT

From **Camel 2.11.x**, Camel Transport supports to be configured with Blueprint.

If you are using blueprint, you should use the namespace <http://cxf.apache.org/transports/camel/blueprint> and import the schema like the blow.

Adding the Configuration Namespace for blueprint

```
<beans ...
  xmlns:camel="http://cxf.apache.org/transports/camel/blueprint"
  ...
  xsi:schemaLocation="...
    http://cxf.apache.org/transports/camel/blueprint
    http://cxf.apache.org/schememas/blueprint/camel.xsd
  ...>
```

In blueprint **camel:conduit camel:destination** only has one camelContextId attribute, they doesn't support to specify the camel context in the camel destination.

```
<camel:conduit id="*.camel-conduit" camelContextId="camel1" />
<camel:destination id="*.camel-destination" camelContextId="camel1" />
```

78.13. EXAMPLE USING CAMEL AS A LOAD BALANCER FOR CXF

This example shows how to use the camel load balancing feature in CXF. You need to load the configuration file in CXF and publish the endpoints on the address "camel://direct:EndpointA" and "camel://direct:EndpointB"

78.14. COMPLETE HOWTO AND EXAMPLE FOR ATTACHING CAMEL TO CXF

[Better JMS Transport for CXF Webservice using Apache Camel](#)

CHAPTER 79. DATA FORMAT COMPONENT

Available as of Camel version 2.12

The `dataformat:` component allows to use [Data Format](#) as a Camel Component.

79.1. URI FORMAT

```
dataformat:name:(marshal|unmarshal)[?options]
```

Where **name** is the name of the Data Format. And then followed by the operation which must either be **marshal** or **unmarshal**. The options is used for configuring the [Data Format](#) in use. See the Data Format documentation for which options it support.

79.2. DATAFORMAT OPTIONS

The Data Format component has no options.

The Data Format endpoint is configured using URI syntax:

```
dataformat:name:operation
```

with the following path and query parameters:

79.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
<code>name</code>	Required Name of data format		String
<code>operation</code>	Required Operation to use either marshal or unmarshal		String

79.2.2. Query Parameters (1 parameters):

Name	Description	Default	Type
<code>synchronous</code> (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

79.3. SAMPLES

For example to use the [JAXB Data Format](#) we can do as follows:

```
from("activemq:My.Queue").  
  to("dataformat:jaxb:unmarshal?contextPath=com.acme.model").  
  to("mqseries:Another.Queue");
```

And in XML DSL you do:

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">  
  <route>  
    <from uri="activemq:My.Queue"/>  
    <to uri="dataformat:jaxb:unmarshal?contextPath=com.acme.model"/>  
    <to uri="mqseries:Another.Queue"/>  
  </route>  
</camelContext>
```

CHAPTER 80. DATASET COMPONENT

Available as of Camel version 1.3

Testing of distributed and asynchronous processing is notoriously difficult. The [Mock](#), [Test](#) and [DataSet](#) endpoints work great with the Camel Testing Framework to simplify your unit and integration testing using [Enterprise Integration Patterns](#) and Camel's large range of Components together with the powerful Bean Integration.

The DataSet component provides a mechanism to easily perform load & soak testing of your system. It works by allowing you to create [DataSet instances](#) both as a source of messages and as a way to assert that the data set is received.

Camel will use the [throughput logger](#) when sending dataset's.

80.1. URI FORMAT

```
dataset:name[?options]
```

Where **name** is used to find the [DataSet instance](#) in the Registry

Camel ships with a support implementation of **org.apache.camel.component.dataset.DataSet**, the **org.apache.camel.component.dataset.DataSetSupport** class, that can be used as a base for implementing your own DataSet. Camel also ships with some implementations that can be used for testing:

org.apache.camel.component.dataset.SimpleDataSet, **org.apache.camel.component.dataset.ListDataSet** and **org.apache.camel.component.dataset.FileDataSet**, all of which extend **DataSetSupport**.

80.2. OPTIONS

The Dataset component has no options.

The Dataset endpoint is configured using URI syntax:

```
dataset:name
```

with the following path and query parameters:

80.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required Name of DataSet to lookup in the registry		DataSet

80.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
dataSetIndex (common)	Controls the behaviour of the CamelDataSetIndex header. For Consumers: - off = the header will not be set - strict/lenient = the header will be set For Producers: - off = the header value will not be verified, and will not be set if it is not present = strict = the header value must be present and will be verified = lenient = the header value will be verified if it is present, and will be set if it is not present	lenient	String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean
initialDelay (consumer)	Time period in millis to wait before starting sending messages.	1000	long
minRate (consumer)	Wait until the DataSet contains at least this number of messages	0	int
preloadSize (consumer)	Sets how many messages should be preloaded (sent) before the route completes its initialization	0	long
produceDelay (consumer)	Allows a delay to be specified which causes a delay when a message is sent by the consumer (to simulate slow processing)	3	long
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		ExchangePattern

Name	Description	Default	Type
assertPeriod (producer)	Sets a grace period after which the mock endpoint will re-assert to ensure the preliminary assertion is still valid. This is used for example to assert that exactly a number of messages arrives. For example if <code>expectedMessageCount(int)</code> was set to 5, then the assertion is satisfied when 5 or more message arrives. To ensure that exactly 5 messages arrives, then you would need to wait a little period to ensure no further message arrives. This is what you can use this <code>setAssertPeriod(long)</code> method for. By default this period is disabled.	0	long
consumeDelay (producer)	Allows a delay to be specified which causes a delay when a message is consumed by the producer (to simulate slow processing)	0	long
expectedCount (producer)	Specifies the expected number of message exchanges that should be received by this endpoint. Beware: If you want to expect that 0 messages, then take extra care, as 0 matches when the tests starts, so you need to set a assert period time to let the test run for a while to make sure there are still no messages arrived; for that use <code>setAssertPeriod(long)</code> . An alternative is to use <code>NotifyBuilder</code> , and use the notifier to know when Camel is done routing some messages, before you call the <code>assertIsSatisfied()</code> method on the mocks. This allows you to not use a fixed assert period, to speedup testing times. If you want to assert that exactly n'th message arrives to this mock endpoint, then see also the <code>setAssertPeriod(long)</code> method for further details.	-1	int
reportGroup (producer)	A number that is used to turn on throughput logging based on groups of the size.		int
resultMinimumWaitTime (producer)	Sets the minimum expected amount of time (in millis) the <code>assertIsSatisfied()</code> will wait on a latch until it is satisfied	0	long
resultWaitTime (producer)	Sets the maximum amount of time (in millis) the <code>assertIsSatisfied()</code> will wait on a latch until it is satisfied	0	long

Name	Description	Default	Type
retainFirst (producer)	Specifies to only retain the first n'th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the first 10 Exchanges, then the <code>getReceivedCounter()</code> will still return 5000 but there is only the first 10 Exchanges in the <code>getExchanges()</code> and <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both <code>setRetainFirst(int)</code> and <code>setRetainLast(int)</code> methods, to limit both the first and last received.	-1	int
retainLast (producer)	Specifies to only retain the last n'th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the last 20 Exchanges, then the <code>getReceivedCounter()</code> will still return 5000 but there is only the last 20 Exchanges in the <code>getExchanges()</code> and <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both <code>setRetainFirst(int)</code> and <code>setRetainLast(int)</code> methods, to limit both the first and last received.	-1	int
sleepForEmptyTest (producer)	Allows a sleep to be specified to wait to check that this endpoint really is empty when <code>expectedMessageCount(int)</code> is called with zero	0	long
copyOnExchange (producer)	Sets whether to make a deep copy of the incoming Exchange when received at this mock endpoint. Is by default true.	true	boolean

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

You can append query options to the URI in the following format, **?option=value&option=value&...**

80.3. CONFIGURING DATASET

Camel will lookup in the Registry for a bean implementing the DataSet interface. So you can register your own DataSet as:

```
<bean id="myDataSet" class="com.mycompany.MyDataSet">
  <property name="size" value="100"/>
</bean>
```

80.4. EXAMPLE

For example, to test that a set of messages are sent to a queue and then consumed from the queue without losing any messages:

```
// send the dataset to a queue
from("dataset:foo").to("activemq:SomeQueue");

// now lets test that the messages are consumed correctly
from("activemq:SomeQueue").to("dataset:foo");
```

The above would look in the Registry to find the **foo** DataSet instance which is used to create the messages.

Then you create a DataSet implementation, such as using the **SimpleDataSet** as described below, configuring things like how big the data set is and what the messages look like etc.

80.5. DATASETSUPPORT (ABSTRACT CLASS)

The DataSetSupport abstract class is a nice starting point for new DataSets, and provides some useful features to derived classes.

80.5.1. Properties on DataSetSupport

Property	Type	Default	Description
defaultHeaders	Map<String, Object>	null	Specifies the default message body. For SimpleDataSet it is a constant payload; though if you want to create custom payloads per message, create your own derivation of DataSetSupport .

Property	Type	Default	Description
outputTransformer	org.apache.camel.Processor	null	
size	long	10	Specifies how many messages to send/consume.
reportCount	long	-1	Specifies the number of messages to be received before reporting progress. Useful for showing progress of a large load test. If < 0, then size / 5, if is 0 then size , else set to reportCount value.

80.6. SIMPLEDATASET

The **SimpleDataSet** extends **DataSetSupport**, and adds a default body.

80.6.1. Additional Properties on SimpleDataSet

Property	Type	Default	Description
defaultBody	Object	<hello>world!</hello>	Specifies the default message body. By default, the SimpleDataSet produces the same constant payload for each exchange. If you want to customize the payload for each exchange, create a Camel Processor and configure the SimpleDataSet to use it by setting the outputTransformer property.

80.7. LISTDATASET

Available since Camel 2.17

The List`DataSet` extends **DataSetSupport**, and adds a list of default bodies.

80.7.1. Additional Properties on ListDataSet

Property	Type	Default	Description
defaultBodies	List<Object>	emptyLinkedList<Object>	Specifies the default message body. By default, the ListDataSet selects a constant payload from the list of defaultBodies using the CamelDataSetIndex . If you want to customize the payload, create a Camel Processor and configure the ListDataSet to use it by setting the outputTransformer property.

Property	Type	Default	Description
size	long	the size of the default Bodies list	Specifies how many messages to send/consume. This value can be different from the size of the defaultBodies list. If the value is less than the size of the defaultBodies list, some of the list elements will not be used. If the value is greater than the size of the defaultBodies list, the payload for the exchange will be selected using the modulus of the CamelDataSetIndex and the size of the defaultBodies list (i.e. CamelDataSetIndex % defaultBodies.size())

80.8. FILEDATASET

Available since Camel 2.17

The **FileDataSet** extends **ListDataSet**, and adds support for loading the bodies from a file.

80.8.1. Additional Properties on FileDataSet

Property	Type	Default	Description
sourceFile	File	null	Specifies the source file for payloads
delimiter	String	\z	Specifies the delimiter pattern used by a java.util.Scanner to split the file into multiple payloads.

CHAPTER 81. DIGITALOCEAN COMPONENT

Available as of Camel version 2.19

The **DigitalOcean** component allows you to manage Droplets and resources within the DigitalOcean cloud with **Camel** by encapsulating [digitalocean-api-java] (<https://www.digitalocean.com/community/projects/api-client-in-java>). All of the functionality that you are familiar with in the DigitalOcean control panel is also available through this Camel component.

81.1. PREREQUISITES

You must have a valid DigitalOcean account and a valid OAuth token. You can generate an OAuth token by visiting the [Apps & API](<https://cloud.digitalocean.com/settings/applications>) section of the DigitalOcean control panel for your account.

81.2. URI FORMAT

The **DigitalOcean Component** uses the following URI format:

```
digitalocean://endpoint?[options]
```

where **endpoint** is a DigitalOcean resource type.

Example : to list your droplets:

```
digitalocean://droplets?operation=list&oAuthToken=XXXXXX&page=1&perPage=10
```

The DigitalOcean component only supports producer endpoints so you cannot use this component at the beginning of a route to listen to messages in a channel.

81.3. OPTIONS

The DigitalOcean component has no options.

The DigitalOcean endpoint is configured using URI syntax:

```
digitalocean:operation
```

with the following path and query parameters:

81.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
operation	The operation to perform to the given resource.	t	DigitalOceanOperations

81.3.2. Query Parameters (10 parameters):

Name	Description	Default	Type
page (producer)	Use for pagination. Force the page number.	1	Integer
perPage (producer)	Use for pagination. Set the number of item per request. The maximum number of results per page is 200.	25	Integer
resource (producer)	Required The DigitalOcean resource type on which perform the operation.		DigitalOceanResources
digitalOceanClient (advanced)	To use a existing configured DigitalOceanClient as client		DigitalOceanClient
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
httpProxyHost (proxy)	Set a proxy host if needed		String
httpProxyPassword (proxy)	Set a proxy password if needed		String
httpProxyPort (proxy)	Set a proxy port if needed		Integer
httpProxyUser (proxy)	Set a proxy host if needed		String
oAuthToken (security)	DigitalOcean OAuth Token		String

81.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.digitalocean.enabled	Enable digitalocean component	true	Boolean
camel.component.digitalocean.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

You have to provide an **operation** value for each endpoint, with the **operation** URI option or the **CamelDigitalOceanOperation** message header.

All **operation** values are defined in **DigitalOceanOperations** enumeration.

All **header** names used by the component are defined in **DigitalOceanHeaders** enumeration.

81.5. MESSAGE BODY RESULT

All message bodies returned are using objects provided by the **digitalocean-api-java** library.

81.6. API RATE LIMITS

DigitalOcean REST API encapsulated by camel-digitalocean component is subjected to API Rate Limiting. You can find the per method limits in the [API Rate Limits documentation] (<https://developers.digitalocean.com/documentation/v2/#rate-limit>).

81.7. ACCOUNT ENDPOINT

operation	Description	Headers	Result
get	get account info		com.myjeeva.digitalocean.pojo.Account

81.8. BLOCKSTORAGES ENDPOINT

operation	Description	Headers	Result
list	list all of the Block Storage volumes available on your account		List<com.myjeeva.digitalocean.pojo.Volume>
get	show information about a Block Storage volume	CamelDigitalOceanId Integer	com.myjeeva.digitalocean.pojo.Volume
get	show information about a Block Storage volume by name	CamelDigitalOceanName String CamelDigitalOceanRegion String	com.myjeeva.digitalocean.pojo.Volume
listSnapshots	retrieve the snapshots that have been created from a volume	CamelDigitalOceanId Integer	List<com.myjeeva.digitalocean.pojo.Snapshot>
create	create a new volume	CamelDigitalOceanVolumeSizeGigabytes Integer CamelDigitalOceanName String CamelDigitalOceanDescription * String CamelDigitalOceanRegion * String	com.myjeeva.digitalocean.pojo.Volume
delete	delete a Block Storage volume, destroying all data and removing it from your account	CamelDigitalOceanId Integer	com.myjeeva.digitalocean.pojo.Delete
delete	delete a Block Storage volume by name	CamelDigitalOceanName String CamelDigitalOceanRegion String	com.myjeeva.digitalocean.pojo.Delete
attach	attach a Block Storage volume to a Droplet	CamelDigitalOceanId Integer CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String	com.myjeeva.digitalocean.pojo.Action
attach	attach a Block Storage volume to a Droplet by name	CamelDigitalOceanName String CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String	com.myjeeva.digitalocean.pojo.Action
detach	detach a Block Storage volume from a Droplet	CamelDigitalOceanId Integer CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String	com.myjeeva.digitalocean.pojo.Action
detach	detach a Block Storage volume from a Droplet by name	CamelDigitalOceanName String CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String	com.myjeeva.digitalocean.pojo.Action
resize	resize a Block Storage volume	CamelDigitalOceanVolumeSizeGigabytes Integer CamelDigitalOceanRegion String	com.myjeeva.digitalocean.pojo.Action
listActions	retrieve all actions that have been executed on a volume	CamelDigitalOceanId Integer	List<com.myjeeva.digitalocean.pojo.Action>

81.9. DROPLETS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all Droplets in your account | | **List**<**com.myjeeva.digitalocean.pojo.Droplet**> | | **get** | show an individual droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Droplet** | | **create** | create a new Droplet | **CamelDigitalOceanName** *String*

81.17. EXAMPLES

Get your account info

```
from("direct:getAccountInfo")
  .setHeader(DigitalOceanConstants.OPERATION, constant(DigitalOceanOperations.get))
  .to("digitalocean:account?oAuthToken=XXXXXX")
```

Create a droplet

```
from("direct:createDroplet")
  .setHeader(DigitalOceanConstants.OPERATION, constant("create"))
  .setHeader(DigitalOceanHeaders.NAME, constant("myDroplet"))
  .setHeader(DigitalOceanHeaders.REGION, constant("fra1"))
  .setHeader(DigitalOceanHeaders.DROPLET_IMAGE, constant("ubuntu-14-04-x64"))
  .setHeader(DigitalOceanHeaders.DROPLET_SIZE, constant("512mb"))
  .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

List all your droplets

```
from("direct:getDroplets")
  .setHeader(DigitalOceanConstants.OPERATION, constant("list"))
  .to("digitalocean:droplets?oAuthToken=XXXXXX")
```

Retrieve information for the Droplet (dropletId = 34772987)

```
from("direct:getDroplet")
    .setHeader(DigitalOceanConstants.OPERATION, constant("get"))
    .setHeader(DigitalOceanConstants.ID, 34772987)
    .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

Shutdown information for the Droplet (dropletId = 34772987)

```
from("direct:shutdown")
    .setHeader(DigitalOceanConstants.ID, 34772987)
    .to("digitalocean:droplet?operation=shutdown&oAuthToken=XXXXXX")
```

CHAPTER 82. DIRECT COMPONENT

Available as of Camel version 1.0

The **direct:** component provides direct, synchronous invocation of any consumers when a producer sends a message exchange.

This endpoint can be used to connect existing routes in the **same** camel context.

TIP

Asynchronous The [SEDA](#) component provides asynchronous invocation of any consumers when a producer sends a message exchange.

TIP

Connection to other camel contextsThe [VM](#) component provides connections between Camel contexts as long they run in the same **JVM**.

82.1. URI FORMAT

```
direct:someName[?options]
```

Where **someName** can be any string to uniquely identify the endpoint

82.2. OPTIONS

The Direct component supports 3 options, which are listed below.

Name	Description	Default	Type
block (producer)	If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.	true	boolean
timeout (producer)	The timeout value to use if block is enabled.	30000	long
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Direct endpoint is configured using URI syntax:

```
direct:name
```

with the following path and query parameters:

82.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required Name of direct endpoint		String

82.2.2. Query Parameters (7 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		<code>ExchangePattern</code>
block (producer)	If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.	true	boolean
failIfNoConsumers (producer)	Whether the producer should fail by throwing an exception, when sending to a DIRECT endpoint with no active consumers.	false	boolean
timeout (producer)	The timeout value to use if block is enabled.	30000	long
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

82.3. SAMPLES

In the route below we use the direct component to link the two routes together:

```
from("activemq:queue:order.in")
```

```
.to("bean:orderServer?method=validate")
.to("direct:processOrder");

from("direct:processOrder")
.to("bean:orderService?method=process")
.to("activemq:queue:order.out");
```

And the sample using spring DSL:

```
<route>
  <from uri="activemq:queue:order.in"/>
  <to uri="bean:orderService?method=validate"/>
  <to uri="direct:processOrder"/>
</route>

<route>
  <from uri="direct:processOrder"/>
  <to uri="bean:orderService?method=process"/>
  <to uri="activemq:queue:order.out"/>
</route>
```

See also samples from the [SEDA](#) component, how they can be used together.

82.4. SEE ALSO

- [SEDA](#)
- [VM](#)

CHAPTER 83. DIRECT VM COMPONENT

Available as of Camel version 2.10

The **direct-vm**: component provides direct, synchronous invocation of any consumers in the JVM when a producer sends a message exchange.

This endpoint can be used to connect existing routes in the same camel context, as well from other camel contexts in the **same** JVM.

This component differs from the [Direct](#) component in that [Direct-VM](#) supports communication across CamelContext instances - so you can use this mechanism to communicate across web applications (provided that camel-core.jar is on the system/boot classpath).

At runtime you can swap in new consumers, by stopping the existing consumer(s) and start new consumers.

But at any given time there can be at most only one active consumer for a given endpoint.

This component allows also to connect routes deployed in different OSGI Bundles as you can see here after. Even if they are running in different bundles, the camel routes will use the same thread. That autorises to develop applications using Transactions - Tx.

83.1. URI FORMAT

`direct-vm:someName`

Where **someName** can be any string to uniquely identify the endpoint

83.2. OPTIONS

The Direct VM component supports 5 options, which are listed below.

Name	Description	Default	Type
		t	

Name	Description	Default	Type
block (producer)	If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.	true	boolean
timeout (producer)	The timeout value to use if block is enabled.	30000	long
headerFilterStrategy (advanced)	Sets a HeaderFilterStrategy that will only be applied on producer endpoints (on both directions: request and response). Default value: none.		HeaderFilterStrategy
propagateProperties (advanced)	Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true.	true	boolean
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Direct VM endpoint is configured using URI syntax:

```
direct-vm:name
```

with the following path and query parameters:

83.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required Name of direct-vm endpoint		String

83.2.2. Query Parameters (9 parameters):

Name	Description	Default	Type
------	-------------	---------	------

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		<code>ExchangePattern</code>
block (producer)	If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.	true	boolean
failIfNoConsumers (producer)	Whether the producer should fail by throwing an exception, when sending to a Direct-VM endpoint with no active consumers.	false	boolean
timeout (producer)	The timeout value to use if block is enabled.	30000	long
headerFilterStrategy (producer)	Sets a <code>HeaderFilterStrategy</code> that will only be applied on producer endpoints (on both directions: request and response). Default value: none.		<code>HeaderFilterStrategy</code>
propagateProperties (advanced)	Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

83.3. SAMPLES

In the route below we use the direct component to link the two routes together:

-

```
from("activemq:queue:order.in")
  .to("bean:orderServer?method=validate")
  .to("direct-vm:processOrder");
```

And now in another CamelContext, such as another OSGi bundle

```
from("direct-vm:processOrder")
  .to("bean:orderService?method=process")
  .to("activemq:queue:order.out");
```

And the sample using spring DSL:

```
<route>
  <from uri="activemq:queue:order.in"/>
  <to uri="bean:orderService?method=validate"/>
  <to uri="direct-vm:processOrder"/>
</route>

<route>
  <from uri="direct-vm:processOrder"/>
  <to uri="bean:orderService?method=process"/>
  <to uri="activemq:queue:order.out"/>
</route>
```

- [VM](#)

CHAPTER 84. DISRUPTOR COMPONENT

Available as of Camel version 2.12

The **disruptor**: component provides asynchronous [SEDA](#) behavior much as the standard SEDA Component, but utilizes a [Disruptor](#) instead of a [BlockingQueue](#) utilized by the standard [SEDA](#). Alternatively, a

disruptor-vm: endpoint is supported by this component, providing an alternative to the standard [VM](#). As with the SEDA component, buffers of the **disruptor**: endpoints are only visible within a **single** CamelContext and no support is provided for persistence or recovery. The buffers of the **disruptor-vm**: endpoints also provides support for communication across CamelContexts instances so you can use this mechanism to communicate across web applications (provided that **camel-disruptor.jar** is on the **system/boot** classpath).

The main advantage of choosing to use the Disruptor Component over the SEDA or the VM Component is performance in use cases where there is high contention between producer(s) and/or multicasted or concurrent Consumers. In those cases, significant increases of throughput and reduction of latency has been observed. Performance in scenarios without contention is comparable to the SEDA and VM Components.

The Disruptor is implemented with the intention of mimicing the behaviour and options of the SEDA and VM Components as much as possible. The main differences with the them are the following:

- The buffer used is always bounded in size (default 1024 exchanges).
- As a the buffer is always bouded, the default behaviour for the Disruptor is to block while the buffer is full instead of throwing an exception. This default behaviour may be configured on the component (see options).
- The Disruptor enpoints don't implement the `BrowsableEndpoint` interface. As such, the exchanges currently in the Disruptor can't be retrieved, only the amount of exchanges.
- The Disruptor requires its consumers (multicasted or otherwise) to be statically configured. Adding or removing consumers on the fly requires complete flushing of all pending exchanges in the Disruptor.
- As a result of the reconfiguration: Data sent over a Disruptor is directly processed and 'gone' if there is at least one consumer, late joiners only get new exchanges published after they've joined.
- The **pollTimeout** option is not supported by the Disruptor Component.
- When a producer blocks on a full Disruptor, it does not respond to thread interrupts.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-disruptor</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

84.1. URI FORMAT

`disruptor:someName[?options]`

or

`disruptor-vm:someName[?options]`

Where **someName** can be any string that uniquely identifies the endpoint within the current CamelContext (or across contexts in case of **disruptor-vm**).

You can append query options to the URI in the following format:

`?option=value&option=value&...`

84.2. OPTIONS

All the following options are valid for both the **disruptor**: and **disruptor-vm**: components.

The Disruptor component supports 8 options, which are listed below.

Name	Description	Default	Type
defaultConcurrentConsumers (consumer)	To configure the default number of concurrent consumers	1	int
defaultMultipleConsumers (consumer)	To configure the default value for multiple consumers	false	boolean
defaultProducerType (producer)	To configure the default value for DisruptorProducerType The default value is Multi.	Multi	DisruptorProducerType
defaultWaitStrategy (consumer)	To configure the default value for DisruptorWaitStrategy The default value is Blocking.	Blocking	DisruptorWaitStrategy
defaultBlockWhenFull (producer)	To configure the default value for block when full The default value is true.	true	boolean
queueSize (common)	Deprecated To configure the ring buffer size		int
bufferSize (common)	To configure the ring buffer size	1024	int
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Disruptor endpoint is configured using URI syntax:

```
disruptor:name
```

with the following path and query parameters:

84.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required Name of queue		String

84.2.2. Query Parameters (12 parameters):

Name	Description	Default	Type
size (common)	The maximum capacity of the Disruptors ringbuffer Will be effectively increased to the nearest power of two. Notice: Mind if you use this option, then its the first endpoint being created with the queue name, that determines the size. To make sure all endpoints use same size, then configure the size option on all of them, or the first endpoint being created.	1024	int
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
concurrentConsumers (consumer)	Number of concurrent threads processing exchanges.	1	int
multipleConsumers (consumer)	Specifies whether multiple consumers are allowed. If enabled, you can use Disruptor for Publish-Subscribe messaging. That is, you can send a message to the queue and have each consumer receive a copy of the message. When enabled, this option should be specified on every consumer endpoint.	false	boolean
waitStrategy (consumer)	Defines the strategy used by consumer threads to wait on new exchanges to be published. The options allowed are:Blocking, Sleeping, BusySpin and Yielding.	Blocking	DisruptorWaitStrategy

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
blockWhenFull (producer)	Whether a thread that sends messages to a full Disruptor will block until the ringbuffer's capacity is no longer exhausted. By default, the calling thread will block and wait until the message can be accepted. By disabling this option, an exception will be thrown stating that the queue is full.	false	boolean
producerType (producer)	Defines the producers allowed on the Disruptor. The options allowed are: Multi to allow multiple producers and Single to enable certain optimizations only allowed when one concurrent producer (on one thread or otherwise synchronized) is active.	Multi	DisruptorProducerType
timeout (producer)	Timeout (in milliseconds) before a producer will stop waiting for an asynchronous task to complete. You can disable timeout by using 0 or a negative value.	30000	long
waitForTaskToComplete (producer)	Option to specify whether the caller should wait for the async task to complete or not before continuing. The following three options are supported: Always, Never or IfReplyExpected. The first two values are self-explanatory. The last value, IfReplyExpected, will only wait if the message is Request Reply based.	IfReplyExpected	WaitForTaskToComplete
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

84.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

Name	Description	Default	Type
camel.component. .disruptor- vm.buffer-size	To configure the ring buffer size	1024	Integer

Name	Description	Default	Type
<code>camel.component.disruptor-vm.default-block-when-full</code>	To configure the default value for block when full The default value is true.	true	Boolean
<code>camel.component.disruptor-vm.default-concurrent-consumers</code>	To configure the default number of concurrent consumers	1	Integer
<code>camel.component.disruptor-vm.default-multiple-consumers</code>	To configure the default value for multiple consumers	false	Boolean
<code>camel.component.disruptor-vm.default-producer-type</code>	To configure the default value for DisruptorProducerType The default value is Multi.		DisruptorProducerType
<code>camel.component.disruptor-vm.default-wait-strategy</code>	To configure the default value for DisruptorWaitStrategy The default value is Blocking.		DisruptorWaitStrategy
<code>camel.component.disruptor-vm.enabled</code>	Enable disruptor-vm component	true	Boolean
<code>camel.component.disruptor-vm.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.disruptor.buffer-size</code>	To configure the ring buffer size	1024	Integer
<code>camel.component.disruptor.default-block-when-full</code>	To configure the default value for block when full The default value is true.	true	Boolean

Name	Description	Default	Type
<code>camel.component.disruptor.default-concurrent-consumers</code>	To configure the default number of concurrent consumers	1	Integer
<code>camel.component.disruptor.default-multiple-consumers</code>	To configure the default value for multiple consumers	false	Boolean
<code>camel.component.disruptor.default-producer-type</code>	To configure the default value for DisruptorProducerType The default value is Multi.		DisruptorProducerType
<code>camel.component.disruptor.default-wait-strategy</code>	To configure the default value for DisruptorWaitStrategy The default value is Blocking.		DisruptorWaitStrategy
<code>camel.component.disruptor.enabled</code>	Enable disruptor component	true	Boolean
<code>camel.component.disruptor.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.disruptor-vm.queue-size</code>	To configure the ring buffer size		Integer
<code>camel.component.disruptor.queue-size</code>	To configure the ring buffer size		Integer

84.4. WAIT STRATEGIES

The wait strategy effects the type of waiting performed by the consumer threads that are currently waiting for the next exchange to be published. The following strategies can be chosen:

Name	Description	Advice
Blocking	Blocking strategy that uses a lock and condition variable for Consumers waiting on a barrier.	This strategy can be used when throughput and low-latency are not as important as CPU resource.

Name	Description	Advice
Sleeping	Sleeping strategy that initially spins, then uses a <code>Thread.yield()</code> , and eventually for the minimum number of nanos the OS and JVM will allow while the Consumers are waiting on a barrier.	This strategy is a good compromise between performance and CPU resource. Latency spikes can occur after quiet periods.
BusySpin	Busy Spin strategy that uses a busy spin loop for Consumers waiting on a barrier.	This strategy will use CPU resource to avoid syscalls which can introduce latency jitter. It is best used when threads can be bound to specific CPU cores.
Yielding	Yielding strategy that uses a <code>Thread.yield()</code> for Consumers waiting on a barrier after an initially spinning.	This strategy is a good compromise between performance and CPU resource without incurring significant latency spikes.

84.5. USE OF REQUEST REPLY

The Disruptor component supports using [Request Reply](#), where the caller will wait for the Async route to complete. For instance:

```
from("mina:tcp://0.0.0.0:9876?textline=true&sync=true").to("disruptor:input");
from("disruptor:input").to("bean:processInput").to("bean:createResponse");
```

In the route above, we have a TCP listener on port 9876 that accepts incoming requests. The request is routed to the `disruptor:input` buffer. As it is a Request Reply message, we wait for the response. When the consumer on the `disruptor:input` buffer is complete, it copies the response to the original message response.

84.6. CONCURRENT CONSUMERS

By default, the Disruptor endpoint uses a single consumer thread, but you can configure it to use concurrent consumer threads. So instead of thread pools you can use:

```
from("disruptor:stageName?concurrentConsumers=5").process(...)
```

As for the difference between the two, note a thread pool can increase/shrink dynamically at runtime depending on load, whereas the number of concurrent consumers is always fixed and supported by the Disruptor internally so performance will be higher.

84.7. THREAD POOLS

Be aware that adding a thread pool to a Disruptor endpoint by doing something like:

```
from("disruptor:stageName").thread(5).process(...)
```

Can wind up with adding a normal [BlockingQueue](#) to be used in conjunction with the Disruptor, effectively negating part of the performance gains achieved by using the Disruptor. Instead, it is advised to directly configure number of threads that process messages on a Disruptor endpoint using the

concurrentConsumers option.

84.8. SAMPLE

In the route below we use the Disruptor to send the request to this async queue to be able to send a fire-and-forget message for further processing in another thread, and return a constant reply in this thread to the original caller.

```
public void configure() throws Exception {
    from("direct:start")
        // send it to the disruptor that is async
        .to("disruptor:next")
        // return a constant response
        .transform(constant("OK"));

    from("disruptor:next").to("mock:result");
}
```

Here we send a Hello World message and expects the reply to be OK.

```
Object out = template.requestBody("direct:start", "Hello World");
assertEquals("OK", out);
```

The "Hello World" message will be consumed from the Disruptor from another thread for further processing. Since this is from a unit test, it will be sent to a mock endpoint where we can do assertions in the unit test.

84.9. USING MULTIPLE CONSUMERS

In this example we have defined two consumers and registered them as spring beans.

```
<!-- define the consumers as spring beans -->
<bean id="consumer1" class="org.apache.camel.spring.example.FooEventConsumer"/>

<bean id="consumer2" class="org.apache.camel.spring.example.AnotherFooEventConsumer"/>

<camelContext xmlns="http://camel.apache.org/schema/spring">
  <!-- define a shared endpoint which the consumers can refer to instead of using url -->
  <endpoint id="foo" uri="disruptor:foo?multipleConsumers=true"/>
</camelContext>
```

Since we have specified `multipleConsumers=true` on the Disruptor `foo` endpoint we can have those two or more consumers receive their own copy of the message as a kind of pub-sub style messaging. As the beans are part of an unit test they simply send the message to a mock endpoint, but notice how we can use `@Consume` to consume from the Disruptor.

```
public class FooEventConsumer {

    @EndpointInject(uri = "mock:result")
    private ProducerTemplate destination;

    @Consume(ref = "foo")
    public void doSomething(String body) {
```

```
        destination.sendBody("foo" + body);
    }
}
```

84.10. EXTRACTING DISRUPTOR INFORMATION

If needed, information such as buffer size, etc. can be obtained without using JMX in this fashion:

```
DisruptorEndpoint disruptor = context.getEndpoint("disruptor:xxxx");
int size = disruptor.getBufferSize();
```

CHAPTER 85. DNS COMPONENT

Available as of Camel version 2.7

This is an additional component for Camel to run DNS queries, using DNSJava. The component is a thin layer on top of [DNSJava](#).

The component offers the following operations:

- `ip`, to resolve a domain by its ip
- `lookup`, to lookup information about the domain
- `dig`, to run DNS queries

INFO:*Requires SUN JVM* The DNSJava library requires running on the SUN JVM.

If you use Apache ServiceMix or Apache Karaf, you'll need to adjust the `etc/jre.properties` file, to add `sun.net.spi.nameservice` to the list of Java platform packages exported. The server will need restarting before this change takes effect.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

85.1. URI FORMAT

The URI scheme for a DNS component is as follows

```
dns://operation[?options]
```

This component only supports producers.

85.2. OPTIONS

The DNS component has no options.

The DNS endpoint is configured using URI syntax:

```
dns:dnsType
```

with the following path and query parameters:

85.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>dnsType</code>	Required The type of the lookup.		DnsType

85.2.2. Query Parameters (1 parameters):

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

85.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.dns.enabled	Enable dns component	true	Boolean
camel.component.dns.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

85.4. HEADERS

Header	Type	Operations	Description
dns.domain	String	ip	The domain name. Mandatory.
dns.name	String	lookup	The name to lookup. Mandatory.
dns.type		lookup, dig	The type of the lookup. Should match the values of org.xbill.dns.Type . Optional.
dns.class		lookup, dig	The DNS class of the lookup. Should match the values of org.xbill.dns.DClass . Optional.
dns.query	String	dig	The query itself. Mandatory.
dns.server	String	dig	The server in particular for the query. If none is given, the default one specified by the OS will be used. Optional.

85.5. EXAMPLES

85.5.1. IP lookup

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:ip"/>
</route>
```

This looks up a domain's IP. For example, `www.example.com` resolves to `192.0.32.10`. The IP address to lookup must be provided in the header with key **"dns.domain"**.

85.5.2. DNS lookup

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:lookup"/>
</route>
```

This returns a set of DNS records associated with a domain. The name to lookup must be provided in the header with key **"dns.name"**.

85.5.3. DNS Dig

Dig is a Unix command-line utility to run DNS queries.

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:dig"/>
</route>
```

The query must be provided in the header with key **"dns.query"**.

85.6. DNS ACTIVATION POLICY

`DnsActivationPolicy` can be used to dynamically start and stop routes based on dns state.

If you have instances of the same component running in different regions you can configure a route in each region to activate only if dns is pointing to its region.

i.e. You may have an instance in NYC and an instance in SFO. You would configure a service CNAME `service.example.com` to point to `nyc-service.example.com` to bring NYC instance up and SFO instance down. When you change the CNAME `service.example.com` to point to `sfo-service.example.com` – nyc instance would stop its routes and sfo will bring its routes up. This allows you to switch regions without restarting actual components.

```
<bean id="dnsActivationPolicy"
class="org.apache.camel.component.dns.policy.DnsActivationPolicy">
  <property name="hostname" value="service.example.com" />
  <property name="resolvesTo" value="nyc-service.example.com" />
  <property name="ttl" value="60000" />
  <property name="stopRoutesOnException" value="false" />
</bean>
```

```
<route id="routeId" autoStartup="false" routePolicyRef="dnsActivationPolicy">  
</route>
```

CHAPTER 86. DOCKER COMPONENT

Available as of Camel version 2.15

Camel component for communicating with Docker.

The Docker Camel component leverages the [docker-java](#) via the [Docker Remote API](#).

86.1. URI FORMAT

```
docker://[operation]?[options]
```

Where **operation** is the specific action to perform on Docker.

86.2. GENERAL OPTIONS

The Docker component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use the shared docker configuration		DockerConfigurati on
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Docker endpoint is configured using URI syntax:

```
docker:operation
```

with the following path and query parameters:

86.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
operation	Required Which operation to use		DockerOperation

86.2.2. Query Parameters (20 parameters):

Name	Description	Default	Type
email (common)	Email address associated with the user		String
host (common)	Required Docker host	localhost	String
port (common)	Required Docker port	2375	Integer
requestTimeout (common)	Request timeout for response (in seconds)		Integer
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
cmdExecFactory (advanced)	The fully qualified class name of the DockerCmdExecFactory implementation to use	com.github.dockerjava.netty.NettyDockerCmdExecFactory	String
followRedirectFilter (advanced)	Whether to follow redirect filter	false	boolean
loggingFilter (advanced)	Whether to use logging filter	false	boolean
maxPerRouteConnections (advanced)	Maximum route connections	100	Integer

Name	Description	Default	Type
maxTotalConnections (advanced)	Maximum total connections	100	Integer
serverAddress (advanced)	Server address for docker registry.	https://index.docker.io/v1/	String
socket (advanced)	Socket connection mode	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
certPath (security)	Location containing the SSL certificate chain		String
password (security)	Password to authenticate with		String
secure (security)	Use HTTPS communication	false	boolean
tlsVerify (security)	Check TLS	false	boolean
username (security)	User name to authenticate with		String

86.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 20 options, which are listed below.

Name	Description	Default	Type
camel.component.docker.configuration.cert-path	Location containing the SSL certificate chain		String

Name	Description	Default	Type
<code>camel.component.docker.configuration.cmd-exec-factory</code>	The fully qualified class name of the DockerCmdExecFactory implementation to use	<code>com.github.dockerjava.netty.NettyDockerCmdExecFactory</code>	String
<code>camel.component.docker.configuration.email</code>	Email address associated with the user		String
<code>camel.component.docker.configuration.follow-redirect-filter</code>	Whether to follow redirect filter	<code>false</code>	Boolean
<code>camel.component.docker.configuration.host</code>	Docker host	<code>localhost</code>	String
<code>camel.component.docker.configuration.logging-filter</code>	Whether to use logging filter	<code>false</code>	Boolean
<code>camel.component.docker.configuration.max-per-route-connections</code>	Maximum route connections	<code>100</code>	Integer
<code>camel.component.docker.configuration.max-total-connections</code>	Maximum total connections	<code>100</code>	Integer
<code>camel.component.docker.configuration.operation</code>	Which operation to use		DockerOperation
<code>camel.component.docker.configuration.parameters</code>	Additional configuration parameters as key/value pairs		Map

Name	Description	Default	Type
<code>camel.component.docker.configuration.password</code>	Password to authenticate with		String
<code>camel.component.docker.configuration.port</code>	Docker port	2375	Integer
<code>camel.component.docker.configuration.request-timeout</code>	Request timeout for response (in seconds)		Integer
<code>camel.component.docker.configuration.secure</code>	Use HTTPS communication	false	Boolean
<code>camel.component.docker.configuration.server-address</code>	Server address for docker registry.	https://index.docker.io/v1/	String
<code>camel.component.docker.configuration.socket</code>	Socket connection mode	true	Boolean
<code>camel.component.docker.configuration.tls-verify</code>	Check TLS	false	Boolean
<code>camel.component.docker.configuration.username</code>	User name to authenticate with		String
<code>camel.component.docker.enabled</code>	Enable docker component	true	Boolean
<code>camel.component.docker.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

86.4. HEADER STRATEGY

All URI option can be passed as Header properties. Values found in a message header take precedence over URI parameters. A header property takes the form of a URI option prefixed with **CamelDocker** as shown below

URI Option	Header Property
containerId	CamelDockerContainerId

86.5. EXAMPLES

The following example consumes events from Docker:

```
from("docker://events?host=192.168.59.103&port=2375").to("log:event");
```

The following example queries Docker for system wide information

```
from("docker://info?host=192.168.59.103&port=2375").to("log:info");
```

86.6. DEPENDENCIES

To use Docker in your Camel routes you need to add a dependency on **camel-docker**, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-docker</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 87. DOZER COMPONENT

Available as of Camel version 2.15

The **dozer**: component provides the ability to map between Java beans using the [Dozer](#) mapping framework since **Camel 2.15.0**. Camel also supports the ability to trigger Dozer mappings [as a type converter](#). The primary differences between using a Dozer endpoint and a Dozer converter are:

- The ability to manage Dozer mapping configuration on a per-endpoint basis vs. global configuration via the converter registry.
- A Dozer endpoint can be configured to marshal/unmarshal input and output data using Camel data formats to support a single, any-to-any transformation endpoint
- The Dozer component allows for fine-grained integration and extension of Dozer to support additional functionality (e.g. mapping literal values, using expressions for mappings, etc.).

In order to use the Dozer component, Maven users will need to add the following dependency to their **pom.xml**:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dozer</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

87.1. URI FORMAT

The Dozer component only supports producer endpoints.

```
dozer:endpointId[?options]
```

Where **endpointId** is a name used to uniquely identify the Dozer endpoint configuration.

An example Dozer endpoint URI:

```
from("direct:orderInput").
  to("dozer:transformOrder?mappingFile=orderMapping.xml&targetModel=example.XYZOrder").
  to("direct:orderOutput");
```

87.2. OPTIONS

The Dozer component has no options.

The Dozer endpoint is configured using URI syntax:

```
dozer:name
```

with the following path and query parameters:

87.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>name</code>	Required A human readable name of the mapping.		String

87.2.2. Query Parameters (7 parameters):

Name	Description	Default	Type
<code>mappingConfiguration</code> (producer)	The name of a DozerBeanMapperConfiguration bean in the Camel registry which should be used for configuring the Dozer mapping. This is an alternative to the <code>mappingFile</code> option that can be used for fine-grained control over how Dozer is configured. Remember to use a <code>#</code> prefix in the value to indicate that the bean is in the Camel registry (e.g. <code>#myDozerConfig</code>).		DozerBeanMapperConfiguration
<code>mappingFile</code> (producer)	The location of a Dozer configuration file. The file is loaded from the classpath by default, but you can use <code>file;</code> , <code>classpath;</code> , or <code>http:</code> to load the configuration from a specific location.	<code>dozerBeanMapping.xml</code>	String
<code>marshallId</code> (producer)	The id of a <code>dataFormat</code> defined within the Camel Context to use for marshalling the mapping output to a non-Java type.		String
<code>sourceModel</code> (producer)	Fully-qualified class name for the source type used in the mapping. If specified, the input to the mapping is converted to the specified type before being mapped with Dozer.		String
<code>targetModel</code> (producer)	Required Fully-qualified class name for the target type used in the mapping.		String
<code>unmarshallId</code> (producer)	The id of a <code>dataFormat</code> defined within the Camel Context to use for unmarshalling the mapping input from a non-Java type.		String
<code>synchronous</code> (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	<code>false</code>	boolean

87.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.dozer.enabled</code>	Enable dozer component	true	Boolean
<code>camel.component.dozer.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

87.4. USING DATA FORMATS WITH DOZER

Dozer does not support non-Java sources and targets for mappings, so it cannot, for example, map an XML document to a Java object on its own. Luckily, Camel has extensive support for marshalling between Java and a wide variety of formats using [data formats](#). The Dozer component takes advantage of this support by allowing you to specify that input and output data should be passed through a data format prior to processing via Dozer. You can always do this on your own outside the call to Dozer, but supporting it directly in the Dozer component allows you to use a single endpoints to configure any-to-any transformation within Camel.

As an example, let's say you wanted to map between an XML data structure and a JSON data structure using the Dozer component. If you had the following data formats defined in a Camel Context:

```
<dataFormats>
  <json library="Jackson" id="myjson"/>
  <jaxb contextPath="org.example" id="myjxb"/>
</dataFormats>
```

You could then configure a Dozer endpoint to unmarshal the input XML using a JAXB data format and marshal the mapping output using Jackson.

```
<endpoint uri="dozer:xml2json?
  marshallId=myjson&unmarshalId=myjxb&targetModel=org.example.Order"/>
```

87.5. CONFIGURING DOZER

All Dozer endpoints require a Dozer mapping configuration file which defines mappings between source and target objects. The component will default to a location of META-INF/dozerBeanMapping.xml if the mappingFile or mappingConfiguration options are not specified on an endpoint. If you need to supply multiple mapping configuration files for a single endpoint or specify additional configuration options (e.g. event listeners, custom converters, etc.), then you can use an instance of **org.apache.camel.converter.dozer.DozerBeanMapperConfiguration**.

```
<bean id="mapper" class="org.apache.camel.converter.dozer.DozerBeanMapperConfiguration">
  <property name="mappingFiles">
    <list>
      <value>mapping1.xml</value>
      <value>mapping2.xml</value>
    </list>
  </property>
</bean>
```

87.6. MAPPING EXTENSIONS

The Dozer component implements a number of extensions to the Dozer mapping framework as custom converters. These converters implement mapping functions that are not supported directly by Dozer itself.

87.6.1. Variable Mappings

Variable mappings allow you to map the value of a variable definition within a Dozer configuration into a target field instead of using the value of a source field. This is equivalent to constant mapping in other mapping frameworks, where you can assign a literal value to a target field. To use a variable mapping, simply define a variable within your mapping configuration and then map from the VariableMapper class into your target field of choice:

```
<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <configuration>
    <variables>
      <variable name="CUST_ID">ACME-SALES</variable>
    </variables>
  </configuration>
  <mapping>
    <class-a>org.apache.camel.component.dozer.VariableMapper</class-a>
    <class-b>org.example.Order</class-b>
    <field custom-converter-id="_variableMapping" custom-converter-param="{CUST_ID}">
      <a>literal</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>
```

87.6.2. Custom Mappings

Custom mappings allow you to define your own logic for how a source field is mapped to a target field. They are similar in function to Dozer custom converters, with two notable differences:

- You can have multiple converter methods in a single class with custom mappings.
- There is no requirement to implement a Dozer-specific interface with custom mappings.

A custom mapping is declared by using the built-in '_customMapping' converter in your mapping configuration. The parameter to this converter has the following syntax:

```
[class-name][,method-name]
```

Method name is optional - the Dozer component will search for a method that matches the input and output types required for a mapping. An example custom mapping and configuration are provided below.

```
public class CustomMapper {
  // All customer ids must be wrapped in "[ ]"
```

```

public Object mapCustomer(String customerId) {
    return "[" + customerId + "];"
}
}

```

```

<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <mapping>
    <class-a>org.example.A</class-a>
    <class-b>org.example.B</class-b>
    <field custom-converter-id="_customMapping"
      custom-converter-param="org.example.CustomMapper,mapCustomer">
      <a>header.customerNum</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>

```

87.6.3. Expression Mappings

Expression mappings allow you to use the powerful [language](#) capabilities of Camel to evaluate an expression and assign the result to a target field in a mapping. Any language that Camel supports can be used in an expression mapping. Basic examples of expressions include the ability to map a Camel message header or exchange property to a target field or to concatenate multiple source fields into a target field. The syntax of a mapping expression is:

```
[language]:[expression]
```

An example of mapping a message header into a target field:

```

<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <mapping>
    <class-a>org.apache.camel.component.dozer.ExpressionMapper</class-a>
    <class-b>org.example.B</class-b>
    <field custom-converter-id="_expressionMapping" custom-converter-
param="simple:\${header.customerNumber}">
      <a>expression</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>

```

Note that any properties within your expression must be escaped with `"\"` to prevent an error when Dozer attempts to resolve variable values defined using the EL.

CHAPTER 88. DRILL COMPONENT

Available as of Camel version 2.19

The **drill:** component gives you the ability to querying to [Apache Drill Cluster](#)

Drill is an Apache open-source SQL query engine for Big Data exploration. Drill is designed from the ground up to support high-performance analysis on the semi-structured and rapidly evolving data coming from modern Big Data applications, while still providing the familiarity and ecosystem of ANSI SQL, the industry-standard query language

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-drill</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

88.1. URI FORMAT

```
drill://host[?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

88.2. DRILL PRODUCER

The producer execute query using **CamelDrillQuery** header and put results into body.

88.3. OPTIONS

The Drill component has no options.

The Drill endpoint is configured using URI syntax:

```
drill:host
```

with the following path and query parameters:

88.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
host	Required ZooKeeper host name or IP address. Use local instead of a host name or IP address to connect to the local Drillbit		String

88.3.2. Query Parameters (5 parameters):

Name	Description	Default	Type
clusterId (producer)	Cluster ID https://drill.apache.org/docs/using-the-jdbc-driver/#determining-the-cluster-id		String
directory (producer)	Drill directory in ZooKeeper		String
mode (producer)	Connection mode: zk: Zookeeper drillbit: Drillbit direct connection https://drill.apache.org/docs/using-the-jdbc-driver/	ZK	DrillConnectionMode
port (producer)	ZooKeeper port number		Integer
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

88.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.drill.enabled	Enable drill component	true	Boolean
camel.component.drill.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

88.5. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 89. DROPBOX COMPONENT

Available as of Camel version 2.14

The **dropbox**: component allows you to treat [Dropbox](#) remote folders as a producer or consumer of messages. Using the [Dropbox Java Core API](#) (reference version for this component is 1.7.x), this camel component has the following features:

- As a consumer, download files and search files by queries
- As a producer, download files, move files between remote directories, delete files/dir, upload files and search files by queries

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dropbox</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

89.1. URI FORMAT

```
dropbox://[operation]?[options]
```

Where **operation** is the specific action (typically is a CRUD action) to perform on Dropbox remote folder.

89.2. OPERATIONS

Operation	Description
del	deletes files or directories on Dropbox
get	download files from Dropbox
move	move files from folders on Dropbox
put	upload files on Dropbox
search	search files on Dropbox based on string queries

Operations require additional options to work, some are mandatory for the specific operation.

89.3. OPTIONS

In order to work with Dropbox API you need to obtain an **accessToken** and a **clientId**. You can refer to the [Dropbox documentation](#) that explains how to get them.

The Dropbox component has no options.

The Dropbox endpoint is configured using URI syntax:

```
dropbox:operation
```

with the following path and query parameters:

89.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
operation	Required The specific action (typically is a CRUD action) to perform on Dropbox remote folder.		DropboxOperation

89.3.2. Query Parameters (12 parameters):

Name	Description	Default	Type
accessToken (common)	Required The access token to make API requests for a specific Dropbox user		String
client (common)	To use an existing DbxClient instance as DropBox client.		DbxClientV2
clientId (common)	Name of the app registered to make API requests		String
localPath (common)	Optional folder or file to upload on Dropbox from the local filesystem. If this option has not been configured then the message body is used as the content to upload.		String
newRemotePath (common)	Destination file or folder		String
query (common)	A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched.		String
remotePath (common)	Original file or folder to move		String

Name	Description	Default	Type
uploadMode (common)	Which mode to upload. in case of add the new file will be renamed if a file with the same name already exists on dropbox. in case of force if a file with the same name already exists on dropbox, this will be overwritten.		DropboxUploadMode
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

89.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.dropbox.enabled	Enable dropbox component	true	Boolean
camel.component.dropbox.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

89.5. DEL OPERATION

Delete files on Dropbox.

Works only as Camel producer.

Below are listed the options for this operation:

Property	Mandatory	Description
remotePath	true	Folder or file to delete on Dropbox

89.5.1. Samples

```
from("direct:start")
.to("dropbox://del?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
.to("mock:result");
```

```
from("direct:start")
.to("dropbox://del?accessToken=XXX&clientId=XXX&remotePath=/root/folder1/file1.tar.gz")
.to("mock:result");
```

89.5.2. Result Message Headers

The following headers are set on message result:

Property	Value
DELETED_PATH	name of the path deleted on dropbox

89.5.3. Result Message Body

The following objects are set on message body result:

Object type	Description
String	name of the path deleted on dropbox

89.6. GET (DOWNLOAD) OPERATION

Download files from Dropbox.

Works as Camel producer or Camel consumer.

Below are listed the options for this operation:

Property	Mandatory	Description
remotePath	true	Folder or file to download from Dropbox

89.6.1. Samples

```

from("direct:start")
  .to("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1/file1.tar.gz")
  .to("file:///home/kermit/?fileName=file1.tar.gz");

from("direct:start")
  .to("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
  .to("mock:result");

from("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
  .to("file:///home/kermit/");

```

89.6.2. Result Message Headers

The following headers are set on message result:

Property	Value
DOWNLOADED_FILE	in case of single file download, path of the remote file downloaded
DOWNLOADED_FILES	in case of multiple files download, path of the remote files downloaded

89.6.3. Result Message Body

The following objects are set on message body result:

Object type	Description
ByteArrayOutputStream	in case of single file download, stream representing the file downloaded
Map<String, ByteArrayOutputStream>	in case of multiple files download, a map with as key the path of the remote file downloaded and as value the stream representing the file downloaded

89.7. MOVE OPERATION

Move files on Dropbox between one folder to another.

Works only as Camel producer.

Below are listed the options for this operation:

Property	Mandatory	Description
remotePath	true	Original file or folder to move

Property	Mandatory	Description
newRemotePath	true	Destination file or folder

89.7.1. Samples

```
from("direct:start")
  .to("dropbox://move?
accessToken=XXX&clientId=XXX&remotePath=/root/folder1&newRemotePath=/root/folder2")
  .to("mock:result");
```

89.7.2. Result Message Headers

The following headers are set on message result:

Property	Value
MOVED_PATH	name of the path moved on dropbox

89.7.3. Result Message Body

The following objects are set on message body result:

Object type	Description
String	name of the path moved on dropbox

89.8. PUT (UPLOAD) OPERATION

Upload files on Dropbox.

Works as Camel producer.

Below are listed the options for this operation:

Property	Mandatory	Description
uploadMode	true	add or force this option specifies how a file should be saved on dropbox: in case of "add" the new file will be renamed if a file with the same name already exists on dropbox. In case of "force" if a file with the same name already exists on dropbox, this will be overwritten.
localPath	false	Folder or file to upload on Dropbox from the local filesystem. If this option has been configured then it takes precedence over uploading as a single file with content from the Camel message body (message body is converted into a byte array).

Property	Mandatory	Description
remotePath	false	<p>Folder destination on Dropbox. If the property is not set, the component will upload the file on a remote path equal to the local path. With Windows or without an absolute localPath you may run into an exception like the following:</p> <p>Caused by: java.lang.IllegalArgumentException: 'path': bad path: must start with "/": "C:/My/File" OR Caused by: java.lang.IllegalArgumentException: 'path': bad path: must start with "/": "MyFile"</p>

89.8.1. Samples

```
from("direct:start").to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&localPath=/root/folder1")
.to("mock:result");
```

```
from("direct:start").to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&localPath=/root/folder1&remotePath=/root/fo
lder2")
.to("mock:result");
```

And to upload a single file with content from the message body

```
from("direct:start")
.setHeader(DropboxConstants.HEADER_PUT_FILE_NAME, constant("myfile.txt"))
.to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&remotePath=/root/folder2")
.to("mock:result");
```

The name of the file can be provided in the header **DropboxConstants.HEADER_PUT_FILE_NAME** or **Exchange.FILE_NAME** in that order of precedence. If no header has been provided then the message id (uuid) is used as the file name.

89.8.2. Result Message Headers

The following headers are set on message result:

Property	Value
UPLOADED_FILE	in case of single file upload, path of the remote path uploaded
UPLOADED_FILES	in case of multiple files upload, string with the remote paths uploaded

89.8.3. Result Message Body

The following objects are set on message body result:

Object type	Description
String	in case of single file upload, result of the upload operation, OK or KO
Map<String, DropboxResultCode>	in case of multiple files upload, a map with as key the path of the remote file uploaded and as value the result of the upload operation, OK or KO

89.9. SEARCH OPERATION

Search inside a remote Dropbox folder including its sub directories.

Works as Camel producer and as Camel consumer.

Below are listed the options for this operation:

Property	Mandatory	Description
remotePath	true	Folder on Dropbox where to search in.
query	true	A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched. The query is required to be provided in either the endpoint configuration or as a header CamelDropboxQuery on the Camel message.

89.9.1. Samples

```
from("dropbox://search?accessToken=XXX&clientId=XXX&remotePath=/XXX&query=XXX")
    .to("mock:result");

from("direct:start")
    .setHeader("CamelDropboxQuery", constant("XXX"))
    .to("dropbox://search?accessToken=XXX&clientId=XXX&remotePath=/XXX")
    .to("mock:result");
```

89.9.2. Result Message Headers

The following headers are set on message result:

Property	Value
FOUNDED_FILES	list of file path founded

89.9.3. Result Message Body

The following objects are set on message body result:

Object type	Description
List<DbxEntry>	list of file path founded. For more information on this object refer to Dropbox documentation,

CHAPTER 90. EHCACHE COMPONENT

Available as of Camel version 2.18

The **ehcache** component enables you to perform caching operations using Ehcache 3 as the Cache Implementation.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ehcache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

90.1. URI FORMAT

```
ehcache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

90.2. OPTIONS

The Ehcache component supports 7 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	Sets the global component configuration		EhcacheConfigura tion
cacheManager (common)	The cache manager		CacheManager
cacheManager Configuration (common)	The cache manager configuration		Configuration
cacheConfigurati on (common)	The default cache configuration to be used to create caches.		CacheConfigurati on
cachesConfigurat ions (common)	A map of caches configurations to be used to create caches.		Map

Name	Description	Default	Type
cacheConfigurationUri (common)	URI pointing to the Ehcache XML configuration file's location		String
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ehcache endpoint is configured using URI syntax:

```
ehcache:cacheName
```

with the following path and query parameters:

90.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required the cache name		String

90.2.2. Query Parameters (17 parameters):

Name	Description	Default	Type
cacheManager (common)	The cache manager		CacheManager
cacheManagerConfiguration (common)	The cache manager configuration		Configuration
configurationUri (common)	URI pointing to the Ehcache XML configuration file's location		String
createCacheIfNotExist (common)	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	boolean

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
eventFiring (consumer)	Set the delivery mode (synchronous, asynchronous)	ASYNCHRONOUS	EventFiring
eventOrdering (consumer)	Set the delivery mode (ordered, unordered)	ORDERED	EventOrdering
eventTypes (consumer)	Set the type of events to listen for	EVICTED, EXPIRED, REMOVED, CREATED, UPDATED	Set
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
action (producer)	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String
key (producer)	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object
configuration (advanced)	The default cache configuration to be used to create caches.		CacheConfiguration

Name	Description	Default	Type
configurations (advanced)	A map of cache configuration to be used to create caches.		Map
keyType (advanced)	The cache key type, default java.lang.Object	java.lang.Object	String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
valueType (advanced)	The cache value type, default java.lang.Object	java.lang.Object	String

90.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 25 options, which are listed below.

Name	Description	Default	Type
camel.component.ehcache.cache-configuration	The default cache configuration to be used to create caches. The option is a <code>org.ehcache.config.CacheConfiguration<?,?></code> type.		String
camel.component.ehcache.cache-configuration-uri	URI pointing to the Ehcache XML configuration file's location		String
camel.component.ehcache.cache-manager	The cache manager. The option is a <code>org.ehcache.CacheManager</code> type.		String
camel.component.ehcache.cache-manager-configuration	The cache manager configuration. The option is a <code>org.ehcache.config.Configuration</code> type.		String
camel.component.ehcache.caches-configurations	A map of caches configurations to be used to create caches.		Map

Name	Description	Default	Type
<code>camel.component.ehcache.configuration.action</code>	To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.		String
<code>camel.component.ehcache.configuration.cache-manager</code>	The cache manager		CacheManager
<code>camel.component.ehcache.configuration.cache-manager-configuration</code>	The cache manager configuration		Configuration
<code>camel.component.ehcache.configuration.configuration</code>	The default cache configuration to be used to create caches.		CacheConfiguration
<code>camel.component.ehcache.configuration.configuration-uri</code>	URI pointing to the Ehcache XML configuration file's location		String
<code>camel.component.ehcache.configuration.configurations</code>	A map of cache configuration to be used to create caches.		Map
<code>camel.component.ehcache.configuration.create-cache-if-not-exist</code>	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	Boolean
<code>camel.component.ehcache.configuration.event-firing</code>	Set the delivery mode (synchronous, asynchronous)		EventFiring
<code>camel.component.ehcache.configuration.event-ordering</code>	Set the delivery mode (ordered, unordered)		EventOrdering

Name	Description	Default	Type
<code>camel.component.ehcache.configuration.event-types</code>	Set the type of events to listen for		Set
<code>camel.component.ehcache.configuration.key</code>	To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.		Object
<code>camel.component.ehcache.configuration.key-type</code>	The cache key type, default <code>java.lang.Object</code>	<code>java.lang.Object</code>	String
<code>camel.component.ehcache.configuration.value-type</code>	The cache value type, default <code>java.lang.Object</code>	<code>java.lang.Object</code>	String
<code>camel.component.ehcache.customizer.cache-configuration.enabled</code>	Enable or disable the cache-configuration customizer.	<code>true</code>	Boolean
<code>camel.component.ehcache.customizer.cache-configuration.mode</code>	Configure if the cache configurations have be added or they have to replace those already configured on the component.		<code>CacheConfigurationCustomizerConfiguration\$Mode</code>
<code>camel.component.ehcache.customizer.cache-manager.enabled</code>	Enable or disable the cache-manager customizer.	<code>true</code>	Boolean
<code>camel.component.ehcache.customizer.cache-manager.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	<code>false</code>	Boolean
<code>camel.component.ehcache.enabled</code>	Enable ehcache component	<code>true</code>	Boolean
<code>camel.component.ehcache.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	<code>true</code>	Boolean

Name	Description	Default	Type
<code>camel.component.ehcache.configuration.config-uri</code>	URI pointing to the Ehcache XML configuration file's location @deprecated use <code>{@link #setConfigurationUri(String)}</code> instead		String

90.3.1. Message Headers Camel

Header	Type	Description
CamelEhcacheAction	String	The operation to be performed on the cache, valid options are: * CLEAR * PUT * PUT_ALL * PUT_IF_ABSENT * GET * GET_ALL * REMOVE * REMOVE_ALL * REPLACE
CamelEhcacheActionHasResult	Boolean	Set to true if the action has a result
CamelEhcacheActionSucceeded	Boolean	Set to true if the actionsucceeded
CamelEhcacheKey	Object	The cache key used for an action
CamelEhcacheKeys	Set<Object>	A list of keys, used in * PUT_ALL * GET_ALL * REMOVE_ALL
CamelEhcacheValue	Object	The value to put in the cache or the result of an operation
CamelEhcacheOldValue	Object	The old value associated to a key for actions like PUT_IF_ABSENT or the Object used for comparison for actions like REPLACE

Header	Type	Description
CamelEhcacheEventType	EventType	The type of event received

90.4. EHCACHE BASED IDEMPOTENT REPOSITORY EXAMPLE:

```
CacheManager manager = CacheManagerBuilder.newCacheManager(new
XmlConfiguration("ehcache.xml"));
EhcacheIdempotentRepository repo = new EhcacheIdempotentRepository(manager, "idempotent-
cache");

from("direct:in")
    .idempotentConsumer(header("messageId"), idempotentRepo)
    .to("mock:out");
```

90.5. EHCACHE BASED AGGREGATION REPOSITORY EXAMPLE:

```
public class EhcacheAggregationRepositoryRoutesTest extends CamelTestSupport {
    private static final String ENDPOINT_MOCK = "mock:result";
    private static final String ENDPOINT_DIRECT = "direct:one";
    private static final int[] VALUES = generateRandomArrayOfInt(10, 0, 30);
    private static final int SUM = IntStream.of(VALUES).reduce(0, (a, b) -> a + b);
    private static final String CORRELATOR = "CORRELATOR";

    @EndpointInject(uri = ENDPOINT_MOCK)
    private MockEndpoint mock;

    @Produce(uri = ENDPOINT_DIRECT)
    private ProducerTemplate producer;

    @Test
    public void checkAggregationFromOneRoute() throws Exception {
        mock.expectedMessageCount(VALUES.length);
        mock.expectedBodiesReceived(SUM);

        IntStream.of(VALUES).forEach(
            i -> producer.sendBodyAndHeader(i, CORRELATOR, CORRELATOR)
        );

        mock.assertIsSatisfied();
    }

    private Exchange aggregate(Exchange oldExchange, Exchange newExchange) {
        if (oldExchange == null) {
            return newExchange;
        } else {
            Integer n = newExchange.getIn().getBody(Integer.class);

```

```

Integer o = oldExchange.getIn().getBody(Integer.class);
Integer v = (o == null ? 0 : o) + (n == null ? 0 : n);

oldExchange.getIn().setBody(v, Integer.class);

return oldExchange;
}
}

@Override
protected RoutesBuilder createRouteBuilder() throws Exception {
return new RouteBuilder() {
@Override
public void configure() throws Exception {
from(ENDPOINT_DIRECT)
.routeId("AggregatingRouteOne")
.aggregate(header(CORRELATOR))
.aggregationRepository(createAggregateRepository())
.aggregationStrategy(EhcacheAggregationRepositoryRoutesTest.this::aggregate)
.completionSize(VALUE_LENGTH);

.to("log:org.apache.camel.component.ehcache.processor.aggregate.level=INFO&showAll=true&multiline=true")
.to(ENDPOINT_MOCK);
}
};
}

protected EhcacheAggregationRepository createAggregateRepository() throws Exception {
CacheManager cacheManager = CacheManagerBuilder.newCacheManager(new
XmlConfiguration("ehcache.xml"));
cacheManager.init();

EhcacheAggregationRepository repository = new EhcacheAggregationRepository();
repository.setCacheManager(cacheManager);
repository.setCacheName("aggregate");

return repository;
}
}

```

CHAPTER 91. EJB COMPONENT

Available as of Camel version 2.4

The **ejb:** component binds EJBs to Camel message exchanges.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ejb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

91.1. URI FORMAT

```
ejb:ejbName[?options]
```

Where **ejbName** can be any string which is used to look up the EJB in the Application Server JNDI Registry

91.2. OPTIONS

The EJB component supports 4 options, which are listed below.

Name	Description	Default	Type
context (producer)	The Context to use for looking up the EJBs		Context
properties (producer)	Properties for creating javax.naming.Context if a context has not been configured.		Properties
cache (advanced)	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The EJB endpoint is configured using URI syntax:

```
ejb:beanName
```

with the following path and query parameters:

91.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>beanName</code>	Required Sets the name of the bean to invoke		String

91.2.2. Query Parameters (5 parameters):

Name	Description	Default	Type
<code>method (producer)</code>	Sets the name of the method to invoke on the bean		String
<code>cache (advanced)</code>	If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.		Boolean
<code>multiParameterArray (advanced)</code>	Deprecated How to treat the parameters which are passed from the message body.true means the message body should be an array of parameters.. Deprecation note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use.	false	boolean
<code>parameters (advanced)</code>	Used for configuring additional properties on the bean		Map
<code>synchronous (advanced)</code>	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

91.3. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the **method** parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

91.4. EXAMPLES

In the following examples we use the Greater EJB which is defined as follows:

GreaterLocal.java

```
public interface GreaterLocal {
    String hello(String name);
}
```

```
String bye(String name);
}
```

And the implementation

GreaterImpl.java

```
@Stateless
public class GreaterImpl implements GreaterLocal {

    public String hello(String name) {
        return "Hello " + name;
    }

    public String bye(String name) {
        return "Bye " + name;
    }
}
```

91.4.1. Using Java DSL

In this example we want to invoke the **hello** method on the EJB. Since this example is based on an unit test using Apache OpenEJB we have to set a **JndiContext** on the **EJB** component with the OpenEJB settings.

```
@Override
protected CamelContext createCamelContext() throws Exception {
    CamelContext answer = new DefaultCamelContext();

    // enlist EJB component using the JndiContext
    EjbComponent ejb = answer.getComponent("ejb", EjbComponent.class);
    ejb.setContext(createEjbContext());

    return answer;
}

private static Context createEjbContext() throws NamingException {
    // here we need to define our context factory to use OpenEJB for our testing
    Properties properties = new Properties();
    properties.setProperty(Context.INITIAL_CONTEXT_FACTORY,
        "org.apache.openejb.client.LocalInitialContextFactory");

    return new InitialContext(properties);
}
```

Then we are ready to use the EJB in the Camel route:

```
from("direct:start")
    // invoke the greeter EJB using the local interface and invoke the hello method
    .to("ejb:GreaterImplLocal?method=hello")
    .to("mock:result");
```

In a real application server

In a real application server you most likely do not have to setup a **JndiContext** on the [EJB](#) component as it will create a default **JndiContext** on the same JVM as the application server, which usually allows it to access the JNDI registry and lookup the [EJBs](#). However if you need to access a application server on a remote JVM or the likes, you have to prepare the properties beforehand.

91.4.2. Using Spring XML

And this is the same example using Spring XML instead:

Again since this is based on an unit test we need to setup the [EJB](#) component:

```
<!-- setup Camel EJB component -->
<bean id="ejb" class="org.apache.camel.component.ejb.EjbComponent">
  <property name="properties" ref="jndiProperties"/>
</bean>

<!-- use OpenEJB context factory -->
<p:properties id="jndiProperties">
  <prop
key="java.naming.factory.initial">org.apache.openejb.client.LocalInitialContextFactory</prop>
</p:properties>
```

Before we are ready to use [EJB](#) in the Camel routes:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ejb:GreaterImplLocal?method=hello"/>
    <to uri="mock:result"/>
  </route>
</camelContext>
```

CHAPTER 92. ELASTICSEARCH COMPONENT (DEPRECATED)

Available as of Camel version 2.11

The ElasticSearch component allows you to interface with an [ElasticSearch](#) server.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

92.1. URI FORMAT

```
elasticsearch://clusterName[?options]
```

92.2. ENDPOINT OPTIONS

The Elasticsearch component supports 2 options, which are listed below.

Name	Description	Default	Type
client (advanced)	To use an existing configured Elasticsearch client, instead of creating a client per endpoint.		Client
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Elasticsearch endpoint is configured using URI syntax:

```
elasticsearch:clusterName
```

with the following path and query parameters:

92.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
clusterName	Required Name of cluster or use local for local mode		String

92.2.2. Query Parameters (11 parameters):

Name	Description	Default	Type
clientTransportSniff (producer)	Is the client allowed to sniff the rest of the cluster or not (default true). This setting map to the client.transport.sniff setting.	true	Boolean
consistencyLevel (producer)	The write consistency level to use with INDEX and BULK operations (can be any of ONE, QUORUM, ALL or DEFAULT)	DEFAULT	WriteConsistencyLevel
data (producer)	Is the node going to be allowed to allocate data (shards) to it or not. This setting map to the node.data setting.		Boolean
indexName (producer)	The name of the index to act against		String
indexType (producer)	The type of the index to act against		String
ip (producer)	The TransportClient remote host ip to use		String
operation (producer)	What operation to perform		String
pathHome (producer)	The path.home property of ElasticSearch configuration. You need to provide a valid path, otherwise the default, \$user.home/.elasticsearch, will be used.	`\${user.home}/.elasticsearch	String
port (producer)	The TransportClient remote port to use (defaults to 9300)	9300	int
transportAddresses (producer)	Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

92.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.elasticsearch.client</code>	To use an existing configured Elasticsearch client, instead of creating a client per endpoint. The option is a <code>org.elasticsearch.client.Client</code> type.		String
<code>camel.component.elasticsearch.enabled</code>	Enable elasticsearch component	true	Boolean
<code>camel.component.elasticsearch.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

92.4. LOCAL TESTING

If you want to run against a local (in JVM/classloader) ElasticSearch server, just set the `clusterName` value in the URI to "local". See the [client guide](#) for more details.

92.5. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

operation	message body	description
INDEX	Map, String, byte[] or XContentBuilder content to index	adds content to an index and returns the content's indexId in the body. Camel 2.15 , you can set the indexId by setting the message header with the key "indexId".
GET_BODY_ID	index id of content to retrieve	retrieves the specified index and returns a GetResult object in the body

operation	message body	description
DELETE	index id of content to delete	deletes the specified indexId and returns a DeleteResult object in the body
BULK_INDEX	a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	*Camel 2.14,*adds content to an index and return a List of the id of the successfully indexed documents in the body
BULK	a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	Camel 2.15: Adds content to an index and returns the BulkResponse object in the body
SEARCH	Map or Search Request Object	Camel 2.15: search the content with the map of query string

operation	message body	description
MULTI GET	List of MultigetRequest.Item object	Camel 2.17: retrieves the specified indexes, types etc. in MultigetRequest and returns a MultigetResponse object in the body
MULTI SEARCH	List of SearchRequest object	Camel 2.17: search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body
EXISTS	Index name as header	Camel 2.17: Returns a Boolean object in the body
UPDATE	Map, String, byte[] or XContentBuilder content to update	Camel 2.17: Updates content to an index and returns the content's indexId in the body.

92.6. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
.to("elasticsearch://local?operation=INDEX&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch://local?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```

A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 93. ELASTICSEARCH5 COMPONENT (DEPRECATED)

Available as of Camel version 2.19

The ElasticSearch component allows you to interface with an [ElasticSearch 5.x API](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch5</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

93.1. URI FORMAT

```
elasticsearch5://clusterName[?options]
```

93.2. ENDPOINT OPTIONS

The Elasticsearch5 component supports 2 options, which are listed below.

Name	Description	Default	Type
client (advanced)	To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings.		TransportClient
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Elasticsearch5 endpoint is configured using URI syntax:

```
elasticsearch5:clusterName
```

with the following path and query parameters:

93.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
clusterName	Required Name of the cluster		String

93.2.2. Query Parameters (16 parameters):

Name	Description	Default	Type
clientTransportSniff (producer)	Is the client allowed to sniff the rest of the cluster or not. This setting map to the client.transport.sniff setting.	false	boolean
indexName (producer)	The name of the index to act against		String
indexType (producer)	The type of the index to act against		String
ip (producer)	The TransportClient remote host ip to use		String
operation (producer)	What operation to perform		ElasticsearchOperation
pingSchedule (producer)	The time(in unit) the client ping the cluster.	5s	String
pingTimeout (producer)	The time(in unit) to wait for a ping response from a node too return.	5s	String
port (producer)	The TransportClient remote port to use (defaults to 9300)	9300	int
tcpCompress (producer)	true if compression (LZF) enable between all nodes.	false	boolean
tcpConnectTimeout (producer)	The time(in unit) to wait for connection timeout.	30s	String
transportAddresses (producer)	Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead.		String
waitForActiveShards (producer)	Index creation waits for the write consistency number of shards to be available	1	int
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
enableSSL (security)	Enable SSL. Require XPack client jar on the classpath	false	boolean

Name	Description	Default	Type
password (authentication)	Password for authenticate against the cluster. Require XPack client jar on the classpath		String
user (authentication)	User for authenticate against the cluster. Requires transport_client role for accessing the cluster. Require XPack client jar on the classpath		String

93.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.elasticsearch5.client	To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. The option is a <code>org.elasticsearch.client.transport.TransportClient</code> type.		String
camel.component.elasticsearch5.enabled	Enable elasticsearch5 component	true	Boolean
camel.component.elasticsearch5.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

93.4. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

operation	message body	description
-----------	--------------	-------------

operation	message body	description
INDEX	Map, String, byte[] or XContentBuilder content to index	Adds content to an index and returns the content's indexId in the body. You can set the indexId by setting the message header with the key "indexId".
GET_BODY_ID	index id of content to retrieve	Retrieves the specified index and returns a GetResult object in the body
DELETE	index name and type of content to delete	Deletes the specified indexName and indexType and returns a DeleteResponse object in the body
DELETE_INDEX	index name of content to delete	Deletes the specified indexName and returns a DeleteIndexResponse object in the body
BULK_INDEX	a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	Adds content to an index and return a List of the id of the successfully indexed documents in the body

operation	message body	description
-----------	--------------	-------------

BULK	a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	Adds content to an index and returns the BulkResponse object in the body
SEARCH	Map, String or SearchRequest Object	Search the content with the map of query string
MULTI GET	List of MultigetRequest.Item object	Retrieves the specified indexes, types etc. in MultigetRequest and returns a MultigetResponse object in the body

operation	message body	description
MULTI SEARCH	List of Search Request object	Search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body
EXISTS	Index name as header	Checks the index exists or not and returns a Boolean flag in the body
UPDATE	Map, String, byte[] or XContentBuilder content to update	Updates content to an index and returns the content's indexId in the body.

93.5. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
.to("elasticsearch5://elasticsearch?operation=INDEX&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch5://elasticsearch?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```

A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

CHAPTER 94. ELASTICSEARCH REST COMPONENT

Available as of Camel version 2.21

The ElasticSearch component allows you to interface with an [ElasticSearch 6.x API](#) using the REST Client library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch-rest</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

94.1. URI FORMAT

```
elasticsearch-rest://clusterName[?options]
```

94.2. ENDPOINT OPTIONS

The Elastichsearch Rest component supports 12 options, which are listed below.

Name	Description	Default	Type
client (advanced)	To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings.		RestClient
hostAddresses (advanced)	Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead.		String
socketTimeout (advanced)	The timeout in ms to wait before the socket will timeout.	30000	int
connectionTimeout (advanced)	The time in ms to wait before connection will timeout.	30000	int
user (security)	Basic authenticate user		String
password (security)	Password for authenticate		String
enableSSL (security)	Enable SSL	false	Boolean

Name	Description	Default	Type
maxRetryTimeout (advanced)	The time in ms before retry	30000	int
enableSniffer (advanced)	Enable automatically discover nodes from a running Elasticsearch cluster	false	Boolean
snifferInterval (advanced)	The interval between consecutive ordinary sniff executions in milliseconds. Will be honoured when sniffOnFailure is disabled or when there are no failures between consecutive sniff executions	30000 0	int
sniffAfterFailure Delay (advanced)	The delay of a sniff execution scheduled after a failure (in milliseconds)	60000	int
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Elasticsearch Rest endpoint is configured using URI syntax:

```
elasticsearch-rest:clusterName
```

with the following path and query parameters:

94.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
clusterName	Required Name of the cluster		String

94.2.2. Query Parameters (11 parameters):

Name	Description	Default	Type
connectionTimeout (producer)	The time in ms to wait before connection will timeout.	30000	int
disconnect (producer)	Disconnect after it finish calling the producer	false	boolean

Name	Description	Default	Type
enableSSL (producer)	Enable SSL	false	boolean
hostAddresses (producer)	Required Comma separated list with ip:port formatted remote transport addresses to use.		String
indexName (producer)	The name of the index to act against		String
indexType (producer)	The type of the index to act against		String
maxRetryTimeout (producer)	The time in ms before retry	30000	int
operation (producer)	What operation to perform		ElasticsearchOperation
socketTimeout (producer)	The timeout in ms to wait before the socket will timeout.	30000	int
waitForActiveShards (producer)	Index creation waits for the write consistency number of shards to be available	1	int
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

94.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

Name	Description	Default	Type
camel.component.elasticsearch-rest.client	To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. The option is a org.elasticsearch.client.RestClient type.		String
camel.component.elasticsearch-rest.connection-timeout	The time in ms to wait before connection will timeout.	30000	Integer

Name	Description	Default	Type
<code>camel.component.elasticsearch-rest.enable-s-s-l</code>	Enable SSL	false	Boolean
<code>camel.component.elasticsearch-rest.enable-sniffer</code>	Enable automatically discover nodes from a running Elasticsearch cluster	false	Boolean
<code>camel.component.elasticsearch-rest.enabled</code>	Whether to enable auto configuration of the elasticsearch-rest component. This is enabled by default.		Boolean
<code>camel.component.elasticsearch-rest.host-addresses</code>	Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead.		String
<code>camel.component.elasticsearch-rest.max-retry-timeout</code>	The time in ms before retry	30000	Integer
<code>camel.component.elasticsearch-rest.password</code>	Password for authenticate		String
<code>camel.component.elasticsearch-rest.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.elasticsearch-rest.sniff-after-failure-delay</code>	The delay of a sniff execution scheduled after a failure (in milliseconds)	60000	Integer
<code>camel.component.elasticsearch-rest.sniffer-interval</code>	The interval between consecutive ordinary sniff executions in milliseconds. Will be honoured when sniffOnFailure is disabled or when there are no failures between consecutive sniff executions	30000 0	Integer
<code>camel.component.elasticsearch-rest.socket-timeout</code>	The timeout in ms to wait before the socket will timeout.	30000	Integer

Name	Description	Default	Type
camel.component.elasticsearch-rest.user	Basic authenticate user		String

94.4. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

operation	message body	description
Index	Map , String , byte[] , XContentBuilder or IndexRequest content to index	Adds content to an index and returns the content's indexId in the body. You can set the indexId by setting the message header with the key "indexId".
GetById	String or GetRequest index id of content to retrieve	Retrieves the specified index and returns a GetResult object in the body
Delete	String or DeleteRequest index name and type of content to delete	Deletes the specified indexName and indexType and returns a DeleteResponse object in the body

operation	message body	description
-----------	--------------	-------------

DeleteIndex	String or DeleteRequest index name of the index to delete	Deletes the specified indexName and returns a status code the body
BulkIndex	a List , BulkRequest , or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	Adds content to an index and return a List of the id of the successfully indexed documents in the body

operation	message body	description
Bulk	a List , BulkRequest , or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)	Adds content to an index and returns the BulkItemResponse[] object in the body
Search	Map , String or SearchRequest	Search the content with the map of query string
MultiSearch	MultiSearchRequest	Multiple search in one
Exists	Index name(indexName) as header	Checks the index exists or not and returns a Boolean flag in the body

operation	message body	description
Update	Map, UpdateRequest, String, byte[] or XContentBuilder content to update	Updates content to an index and returns the content's indexId in the body.
Ping	None	Pings the remote Elasticsearch cluster and returns true if the ping succeeded, false otherwise
Info	None	Get the info of the Elasticsearch cluster and returns them as MainResponse class instance

94.5. CONFIGURE THE COMPONENT AND ENABLE BASIC AUTHENTICATION

To use the Elasticsearch component it has to be configured with a minimum configuration.

```
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

For basic authentication with elasticsearch or using reverse http proxy in front of the elasticsearch cluster, simply setup basic authentication and SSL on the component like the example below

```
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
elasticsearchComponent.setUser("elkuser");
elasticsearchComponent.setPassword("secure!!!");
elasticsearchComponent.setEnableSSL(true);

camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

94.6. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
    .to("elasticsearch-rest://elasticsearch?operation=Index&indexName=twitter&indexType=tweet");
```

```

<route>
  <from uri="direct:index" />
  <to uri="elasticsearch-rest://elasticsearch?
operation=Index&indexName=twitter&indexType=tweet"/>
</route>

```

For this operation you'll need to specify a `indexId` header.

A client would simply need to pass a body message containing a `Map` to the route. The result body contains the `indexId` created.

```

Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);

```

94.7. SEARCH EXAMPLE

Searching on specific field(s) and value use the Operation `Search`. Pass in the query JSON String or the `Map`

```

from("direct:search")
  .to("elasticsearch-rest://elasticsearch?operation=Search&indexName=twitter&indexType=tweet");

```

```

<route>
  <from uri="direct:search" />
  <to uri="elasticsearch-rest://elasticsearch?
operation=Search&indexName=twitter&indexType=tweet"/>
</route>

```

```

String query = "{\"query\":{\"match\":{\"content\":\"new release of ApacheCamel\"}}}";
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);

```

Search on specific field(s) using `Map`.

```

Map<String, Object> actualQuery = new HashMap<>();
actualQuery.put("content", "new release of ApacheCamel");

Map<String, Object> match = new HashMap<>();
match.put("match", actualQuery);

Map<String, Object> query = new HashMap<>();
query.put("query", match);
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);

```

94.8. MULTISEARCH EXAMPLE

MultiSearching on specific field(s) and value use the Operation `MultiSearch`. Pass in the `MultiSearchRequest` instance

```

from("direct:multiSearch")
  .to("elasticsearch-rest://elasticsearch?operation=MultiSearch");

```

```
<route>
  <from uri="direct:multiSearch" />
  <to uri="elasticsearch-rest://elasticsearch?operation=MultiSearch"/>
</route>
```

MultiSearch on specific field(s)

```
SearchRequest req = new SearchRequest();
req.indices("twitter");
req.types("tweet");
SearchRequest req1 = new SearchRequest();
req1.indices("twitter");
req1.types("tweets");
MultiSearchRequest request = new MultiSearchRequest().add(req1).add(req);
Item[] response = template.requestBody("direct:search", request, Item[].class);
```

CHAPTER 95. ELSQL COMPONENT

Available as of Camel version 2.16

The `elsql` component is an extension to the existing [SQL Component](#) that uses [EISql](#) to define the SQL queries.

This component uses `spring-jdbc` behind the scenes for the actual SQL handling.

This component can be used as a [Transactional Client](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elsql</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The SQL component uses the following endpoint URI notation:

```
sql:elSqlName:resourceUri[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

The parameters to the SQL queries are named parameters in the `elsql` mapping files, and maps to corresponding keys from the Camel message, in the given precedence:

1. **Camel 2.16.1:** from message body if [Simple](#) expression.
2. from message body if its a `java.util.Map`
3. from message headers

If a named parameter cannot be resolved, then an exception is thrown.

95.1. OPTIONS

The EISQL component supports 5 options, which are listed below.

Name	Description	Default	Type
<code>databaseVendor</code> (common)	To use a vendor specific <code>com.opengamma.elsql.EISqlConfig</code>		<code>EISqlDatabaseVendor</code>
<code>dataSource</code> (common)	Sets the <code>DataSource</code> to use to communicate with the database.		<code>DataSource</code>
<code>elSqlConfig</code> (advanced)	To use a specific configured <code>EISqlConfig</code> . It may be better to use the <code>databaseVendor</code> option instead.		<code>EISqlConfig</code>

Name	Description	Default	Type
resourceUri (common)	The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint.		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The EISQL endpoint is configured using URI syntax:

```
elsql:elsqlName:resourceUri
```

with the following path and query parameters:

95.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
elsqlName	Required The name of the elsql to use (is NAMED in the elsql file)		String
resourceUri	The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint.		String

95.1.2. Query Parameters (47 parameters):

Name	Description	Default	Type
allowNamedParameters (common)	Whether to allow using named parameters in the queries.	true	boolean

Name	Description	Default	Type
databaseVendor (common)	To use a vendor specific com.opengamma.elsql.EISqlConfig		EISqlDatabaseVendor
dataSource (common)	Sets the DataSource to use to communicate with the database.		DataSource
dataSourceRef (common)	Deprecated Sets the reference to a DataSource to lookup from the registry, to use for communicating with the database.		String
outputClass (common)	Specify the full package and class name to use as conversion when outputType=SelectOne.		String
outputHeader (common)	Store the query result in a header instead of the message body. By default, outputHeader == null and the query result is stored in the message body, any existing content in the message body is discarded. If outputHeader is set, the value is used as the name of the header to store the query result and the original message body is preserved.		String
outputType (common)	Make the output of consumer or producer to SelectList as List of Map, or SelectOne as single Java object in the following way:a) If the query has only single column, then that JDBC Column object is returned. (such as SELECT COUNT() FROM PROJECT will return a Long object.b) If the query has more than one column, then it will return a Map of that result.c) If the outputClass is set, then it will convert the query result into an Java bean object by calling all the setters that match the column names.It will assume your class has a default constructor to create instance with.d) If the query resulted in more than one rows, it throws an non-unique result exception.StreamList streams the result of the query using an Iterator. This can be used with the Splitter EIP in streaming mode to process the ResultSet in streaming fashion.	Select List	SqlOutputType
separator (common)	The separator to use when parameter values is taken from message body (if the body is a String type), to be inserted at # placeholders.Notice if you use named parameters, then a Map type is used instead. The default value is comma	,	char
breakBatchOnConsumeFail (consumer)	Sets whether to break batch if onConsume failed.	false	boolean

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
expectedUpdateCount (consumer)	Sets an expected update count to validate when using <code>onConsume</code> .	-1	int
maxMessagesPerPoll (consumer)	Sets the maximum number of messages to poll		int
onConsume (consumer)	After processing each row then this query can be executed, if the Exchange was processed successfully, for example to mark the row as processed. The query can have parameter.		String
onConsumeBatchComplete (consumer)	After processing the entire batch, this query can be executed to bulk update rows etc. The query cannot have parameters.		String
onConsumeFailed (consumer)	After processing each row then this query can be executed, if the Exchange failed, for example to mark the row as failed. The query can have parameter.		String
routeEmptyResultSet (consumer)	Sets whether empty resultset should be allowed to be sent to the next hop. Defaults to false. So the empty resultset will be filtered out.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
transacted (consumer)	Enables or disables transaction. If enabled then if processing an exchange failed then the consumer break out processing any further exchanges to cause a rollback eager.	false	boolean
useliterator (consumer)	Sets how resultset should be delivered to route. Indicates delivery as either a list or individual object. defaults to true.	true	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
processingStrategy (consumer)	Allows to plugin to use a custom org.apache.camel.component.sql.SqlProcessingStrategy to execute queries when the consumer has processed the rows/batch.		SqlProcessingStrategy
batch (producer)	Enables or disables batch mode	false	boolean
noop (producer)	If set, will ignore the results of the SQL query and use the existing IN message as the OUT message for the continuation of processing	false	boolean
useMessageBodyForSql (producer)	Whether to use the message body as the SQL and then headers for parameters. If this option is enabled then the SQL in the uri is not used.	false	boolean
alwaysPopulateStatement (advanced)	If enabled then the populateStatement method from org.apache.camel.component.sql.SqlPrepareStatementStrategy is always invoked, also if there is no expected parameters to be prepared. When this is false then the populateStatement is only invoked if there is 1 or more expected parameters to be set; for example this avoids reading the message body/headers for SQL queries with no parameters.	false	boolean
elSqlConfig (advanced)	To use a specific configured ElSqlConfig. It may be better to use the databaseVendor option instead.		ElSqlConfig
parametersCount (advanced)	If set greater than zero, then Camel will use this count value of parameters to replace instead of querying via JDBC metadata API. This is useful if the JDBC vendor could not return correct parameters count, then user may override instead.		int

Name	Description	Default	Type
placeholder (advanced)	Specifies a character that will be replaced to in SQL query. Notice, that it is simple <code>String.replaceAll()</code> operation and no SQL parsing is involved (quoted strings will also change).	#	String
prepareStatementStrategy (advanced)	Allows to plugin to use a custom <code>org.apache.camel.component.sql.SqlPreparedStatementStrategy</code> to control preparation of the query and prepared statement.		SqlPreparedStatementStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
templateOptions (advanced)	Configures the Spring <code>JdbcTemplate</code> with the key/values from the Map		Map
usePlaceholder (advanced)	Sets whether to use placeholder and replace all placeholder characters with sign in the SQL queries.	true	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long

Name	Description	Default	Type
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

95.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.elsql.data-source	Sets the DataSource to use to communicate with the database. The option is a javax.sql.DataSource type.		String
camel.component.elsql.database-vendor	To use a vendor specific com.opengamma.elsql.EISqlConfig		EISqlDatabaseVendor
camel.component.elsql.el-sql-config	To use a specific configured EISqlConfig. It may be better to use the databaseVendor option instead. The option is a com.opengamma.elsql.EISqlConfig type.		String

Name	Description	Default	Type
<code>camel.component.elsql.enabled</code>	Enable elsql component	true	Boolean
<code>camel.component.elsql.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.elsql.resource-uri</code>	The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint.		String

95.3. RESULT OF THE QUERY

For **select** operations, the result is an instance of `List<Map<String, Object>>` type, as returned by the `JdbcTemplate.queryForList()` method. For **update** operations, the result is the number of updated rows, returned as an **Integer**.

By default, the result is placed in the message body. If the `outputHeader` parameter is set, the result is placed in the header. This is an alternative to using a full message enrichment pattern to add headers, it provides a concise syntax for querying a sequence or some other small value into a header. It is convenient to use `outputHeader` and `outputType` together:

95.4. HEADER VALUES

When performing **update** operations, the SQL Component stores the update count in the following message headers:

Header	Description
Camel SqlUpdateCount	The number of rows updated for update operations, returned as an Integer object.
Camel SqlRowCount	The number of rows returned for select operations, returned as an Integer object.

95.4.1. Sample

In the given route below, we want to get all the projects from the projects table. Notice the SQL query has 2 named parameters, `:#lic` and `:#min`.

Camel will then lookup for these parameters from the message body or message headers. Notice in the example above we set two headers with constant value for the named parameters:

```
from("direct:projects")
  .setHeader("lic", constant("ASF"))
  .setHeader("min", constant(123))
  .to("elsql:projects:com/foo/orders.elsql")
```

And the `elsql` mapping file

```
@NAME(projects)
SELECT *
FROM projects
WHERE license = :lic AND id > :min
ORDER BY id
```

Though if the message body is a `java.util.Map` then the named parameters will be taken from the body.

```
from("direct:projects")
  .to("elsql:projects:com/foo/orders.elsql")
```

95.5. USING EXPRESSION PARAMETERS IN PRODUCERS

In from Camel 2.16.1 onwards you can use Simple expressions as well, which allows to use an OGNL like notation on the message body, where it assumes to have `getLicense` and `getMinimum` methods:

```
@NAME(projects)
SELECT *
FROM projects
WHERE license = :${body.license} AND id > :${body.minimum}
ORDER BY id
```

95.5.1. Using expression parameters in consumers

Available as of Camel 2.23

When using the EISql component as consumer, you can now also use expression parameters (simple language) to build dynamic query parameters, such as calling a method on a bean to retrieve an id, date or something.

For example in the sample below we call the `nextId` method on the bean `myIdGenerator`:

```
@NAME(projectsByIdBean)
SELECT *
FROM projects
WHERE id = :${bean#myIdGenerator.nextId}
```

IMPORTANT

Notice in the bean syntax above, we must use **#** instead of **:** in the simple expression. This is because Spring query parameter parser is in-use which will separate parameters on colon. Also pay attention that Spring query parser will invoke the bean twice for each query.

And the bean has the following method:

```
public static class MyIdGenerator {  
    private int id = 1;  
  
    public int nextId() {  
        // spring will call this twice, one for initializing query and 2nd for actual value  
        id++;  
        return id / 2;  
    }  
}
```

Notice that there is no existing **Exchange** with message body and headers, so the simple expression you can use in the consumer are most useable for calling bean methods as in this example.

CHAPTER 96. ETCD COMPONENT

Available as of Camel version 2.18

The camel etcd component allows you to work with Etcd, a distributed reliable key-value store.

96.1. URI FORMAT

```
etcd:namespace/path[?options]
```

96.2. URI OPTIONS

The etcd component supports 7 options, which are listed below.

Name	Description	Default	Type
uris (common)	To set the URIs the client connects.		String
sslContextParameters (common)	To configure security using SSLContextParameters.		SSLContextParameters
userName (common)	The user name to use for basic authentication.		String
password (common)	The password to use for basic authentication.		String
configuration (advanced)	Sets the common configuration shared among endpoints		EtcdConfiguration
useGlobalSslContextParameters (security)	Enable usage of global SSL context parameters.	false	boolean
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The etcd endpoint is configured using URI syntax:

```
etcd:namespace/path
```

with the following path and query parameters:

96.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
namespace	Required The API namespace to use		EtcNamespace
path	The path the endpoint refers to		String

96.2.2. Query Parameters (29 parameters):

Name	Description	Default	Type
recursive (common)	To apply an action recursively.	false	boolean
servicePath (common)	The path to look for for service discovery	/services/	String
timeout (common)	To set the maximum time an action could take to complete.		Long
uris (common)	To set the URIs the client connects.	http://localhost:2379 , http://localhost:4001	String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendEmptyExchangeOnTimeout (consumer)	To send an empty message in case of timeout watching for a key.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
fromIndex (consumer)	The index to watch from	0	Long
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
timeToLive (producer)	To set the lifespan of a key in milliseconds.		Integer
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long

Name	Description	Default	Type
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
password (security)	The password to use for basic authentication.		String
sslContextParameters (security)	To configure security using SSLContextParameters.		SSLContextParameters
userName (security)	The user name to use for basic authentication.		String

96.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.etcd.configuration.from-index</code>	The index to watch from	0	Long
<code>camel.component.etcd.configuration.password</code>	The password to use for basic authentication.		String
<code>camel.component.etcd.configuration.recursive</code>	To apply an action recursively.	false	Boolean
<code>camel.component.etcd.configuration.send-empty-exchange-on-timeout</code>	To send an empty message in case of timeout watching for a key.	false	Boolean
<code>camel.component.etcd.configuration.service-path</code>	The path to look for for service discovery	/services/	String
<code>camel.component.etcd.configuration.ssl-context-parameters</code>	To configure security using SSLContextParameters.		SSLContextParameters
<code>camel.component.etcd.configuration.time-to-live</code>	To set the lifespan of a key in milliseconds.		Integer
<code>camel.component.etcd.configuration.timeout</code>	To set the maximum time an action could take to complete.		Long
<code>camel.component.etcd.configuration.uris</code>	To set the URIs the client connects.	http://localhost:2379 , http://localhost:4001	String
<code>camel.component.etcd.configuration.user-name</code>	The user name to use for basic authentication.		String

Name	Description	Default	Type
<code>camel.component.etcd.enabled</code>	Enable etcd component	true	Boolean
<code>camel.component.etcd.password</code>	The password to use for basic authentication.		String
<code>camel.component.etcd.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.etcd.ssl-context-parameters</code>	To configure security using SSLContextParameters. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type.		String
<code>camel.component.etcd.uris</code>	To set the URIs the client connects.		String
<code>camel.component.etcd.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean
<code>camel.component.etcd.user-name</code>	The user name to use for basic authentication.		String

CHAPTER 97. OSGI EVENTADMIN COMPONENT

Available as of Camel version 2.6

The **eventadmin** component can be used in an OSGi environment to receive OSGi EventAdmin events and process them.

97.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-eventadmin</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.6.0 or higher).

97.2. URI FORMAT

```
eventadmin:topic[?options]
```

where **topic** is the name of the topic to listen too.

97.3. URI OPTIONS

The OSGi EventAdmin component supports 2 options, which are listed below.

Name	Description	Default	Type
bundleContext (common)	The OSGi BundleContext is automatic injected by Camel		BundleContext
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The OSGi EventAdmin endpoint is configured using URI syntax:

```
eventadmin:topic
```

with the following path and query parameters:

97.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
topic	Name of topic to listen or send to		String

97.3.2. Query Parameters (5 parameters):

Name	Description	Default	Type
send (common)	Whether to use 'send' or 'synchronous' deliver. Default false (async delivery)	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

97.4. MESSAGE HEADERS

Name	Type	Message
Description		

97.5. MESSAGE BODY

The **in** message body will be set to the received Event.

97.6. EXAMPLE USAGE

```
<route>  
  <from uri="eventadmin:*/>  
  <to uri="stream:out"/>  
</route>
```

CHAPTER 98. EXEC COMPONENT

Available as of Camel version 2.3

The **exec** component can be used to execute system commands.

98.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-exec</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.3.0 or higher).

98.2. URI FORMAT

```
exec://executable[?options]
```

where **executable** is the name, or file path, of the system command that will be executed. If executable name is used (e.g. **exec:java**), the executable must in the system path.

98.3. URI OPTIONS

The Exec component has no options.

The Exec endpoint is configured using URI syntax:

```
exec:executable
```

with the following path and query parameters:

98.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
executable	Required Sets the executable to be executed. The executable must not be empty or null.		String

98.3.2. Query Parameters (8 parameters):

Name	Description	Default	Type
------	-------------	---------	------

Name	Description	Default	Type
args (producer)	The arguments may be one or many whitespace-separated tokens.		String
binding (producer)	A reference to a <code>org.apache.commons.exec.ExecBinding</code> in the Registry.		ExecBinding
commandExecutor (producer)	A reference to a <code>org.apache.commons.exec.ExecCommandExecutor</code> in the Registry that customizes the command execution. The default command executor utilizes the <code>commons-exec</code> library, which adds a shutdown hook for every executed command.		ExecCommandExecutor
outFile (producer)	The name of a file, created by the executable, that should be considered as its output. If no <code>outFile</code> is set, the standard output (<code>stdout</code>) of the executable will be used instead.		String
timeout (producer)	The timeout, in milliseconds, after which the executable should be terminated. If execution has not completed within the timeout, the component will send a termination request.		long
useStderrOnEmptyStdout (producer)	A boolean indicating that when <code>stdout</code> is empty, this component will populate the Camel Message Body with <code>stderr</code> . This behavior is disabled (<code>false</code>) by default.	false	boolean
workingDir (producer)	The directory in which the command should be executed. If null, the working directory of the current process will be used.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

98.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.exec.enabled	Enable exec component	true	Boolean

Name	Description	Default	Type
<code>camel.component.exec.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

98.5. MESSAGE HEADERS

The supported headers are defined in `org.apache.camel.component.exec.ExecBinding`.

Name	Type	Message	Description
<code>ExecBinding.EXEC_COMMAND_EXECUTABLE</code>	String	in	The name of the system command that will be executed. Overrides executable in the URI.
<code>ExecBinding.EXEC_COMMAND_ARGS</code>	java.util.List<String>	in	Command-line arguments to pass to the executed process. The arguments are used literally - no quoting is applied. Overrides any existing args in the URI.
<code>ExecBinding.EXEC_COMMAND_ARGS</code>	String	in	Camel 2.5: The arguments of the executable as a Single string where each argument is whitespace separated (see args in URI option). The arguments are used literally, no quoting is applied. Overrides any existing args in the URI.
<code>ExecBinding.EXEC_COMMAND_OUT_FILE</code>	String	in	The name of a file, created by the executable, that should be considered as its output. Overrides any existing outFile in the URI.

Name	Type	Message	Description
ExecBinding .EXEC_COMMAND_TIMEOUT	long	in	The timeout, in milliseconds, after which the executable should be terminated. Overrides any existing timeout in the URI.
ExecBinding .EXEC_COMMAND_WORKING_DIR	String	in	The directory in which the command should be executed. Overrides any existing workingDir in the URI.
ExecBinding .EXEC_EXIT_VALUE	int	out	The value of this header is the <i>exit value</i> of the executable. Non-zero exit values typically indicate abnormal termination. Note that the exit value is OS-dependent.
ExecBinding .EXEC_STDERR	java.io.InputStream	out	The value of this header points to the standard error stream (stderr) of the executable. If no stderr is written, the value is null .
ExecBinding .EXEC_USE_STDERR_ON_EMPTY_STDOUT	boolean	in	Indicates that when stdout is empty, this component will populate the Camel Message Body with stderr . This behavior is disabled (false) by default.

98.6. MESSAGE BODY

If the **Exec** component receives an **in** message body that is convertible to **java.io.InputStream**, it is used to feed input to the executable via its stdin. After execution, [the message body](#) is the result of the execution, - that is, an **org.apache.camel.components.exec.ExecResult** instance containing the stdout, stderr, exit value, and out file. This component supports the following **ExecResult** [type converters](#) for convenience:

From	To
ExecResult	java.io.InputStream
ExecResult	String
ExecResult	byte []
ExecResult	org.w3c.dom.Document

If an out file is specified (in the endpoint via **outFile** or the message headers via **ExecBinding.EXEC_COMMAND_OUT_FILE**), converters will return the content of the out file. If no out file is used, then this component will convert the stdout of the process to the target type. For more details, please refer to the [usage examples](#) below.

98.7. USAGE EXAMPLES

98.7.1. Executing word count (Linux)

The example below executes **wc** (word count, Linux) to count the words in file **/usr/share/dict/words**. The word count (output) is written to the standard output stream of **wc**.

```
from("direct:exec")
.to("exec:wc?args=--words /usr/share/dict/words")
.process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        // By default, the body is ExecResult instance
        assertInstanceOf(ExecResult.class, exchange.getIn().getBody());
        // Use the Camel Exec String type converter to convert the ExecResult to String
        // In this case, the stdout is considered as output
        String wordCountOutput = exchange.getIn().getBody(String.class);
        // do something with the word count
    }
});
```

98.7.2. Executing java

The example below executes **java** with 2 arguments: **-server** and **-version**, provided that **java** is in the system path.

```
from("direct:exec")
.to("exec:java?args=-server -version")
```

The example below executes **java** in **c:\temp** with 3 arguments: **-server**, **-version** and the system property **user.name**.

```
from("direct:exec")
.to("exec:c:/program files/jdk/bin/java?args=-server -version -
Duser.name=Camel&workingDir=c:/temp")
```

98.7.3. Executing Ant scripts

The following example executes [Apache Ant](#) (Windows only) with the build file **CamelExecBuildFile.xml**, provided that **ant.bat** is in the system path, and that **CamelExecBuildFile.xml** is in the current directory.

```
from("direct:exec")
.to("exec:ant.bat?args=-f CamelExecBuildFile.xml")
```

In the next example, the **ant.bat** command redirects its output to **CamelExecOutFile.txt** with **-l**. The file **CamelExecOutFile.txt** is used as the out file with **outFile=CamelExecOutFile.txt**. The example assumes that **ant.bat** is in the system path, and that **CamelExecBuildFile.xml** is in the current directory.

```
from("direct:exec")
.to("exec:ant.bat?args=-f CamelExecBuildFile.xml -l
CamelExecOutFile.txt&outFile=CamelExecOutFile.txt")
.process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        InputStream outFile = exchange.getIn().getBody(InputStream.class);
        assertInstanceOf(InputStream.class, outFile);
        // do something with the out file here
    }
});
```

98.7.4. Executing echo (Windows)

Commands such as **echo** and **dir** can be executed only with the command interpreter of the operating system. This example shows how to execute such a command - **echo** - in Windows.

```
from("direct:exec").to("exec:cmd?args=/C echo echoString")
```

98.8. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 99. FACEBOOK COMPONENT

Available as of Camel version 2.14

The Facebook component provides access to all of the Facebook APIs accessible using [Facebook4J](#). It allows producing messages to retrieve, add, and delete posts, likes, comments, photos, albums, videos, photos, checkins, locations, links, etc. It also supports APIs that allow polling for posts, users, checkins, groups, locations, etc.

Facebook requires the use of OAuth for all client application authentication. In order to use camel-facebook with your account, you'll need to create a new application within Facebook at <https://developers.facebook.com/apps> and grant the application access to your account. The Facebook application's id and secret will allow access to Facebook APIs which do not require a current user. A user access token is required for APIs that require a logged in user. More information on obtaining a user access token can be found at <https://developers.facebook.com/docs/facebook-login/access-tokens/>.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-facebook</artifactId>
  <version>${camel-version}</version>
</dependency>
```

99.1. URI FORMAT

```
facebook://[endpoint]?[options]
```

99.2. FACEBOOKCOMPONENT

The facebook component can be configured with the Facebook account settings below, which are mandatory. The values can be provided to the component using the bean property **configuration** of type **org.apache.camel.component.facebook.config.FacebookConfiguration**. The **oAuthAccessToken** option may be omitted but that will only allow access to application APIs.

The Facebook component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use the shared configuration		FacebookConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Facebook endpoint is configured using URI syntax:

facebook:methodName

with the following path and query parameters:

99.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
methodName	Required What operation to perform		String

99.2.2. Query Parameters (102 parameters):

Name	Description	Default	Type
achievementURL (common)	The unique URL of the achievement		URL
albumId (common)	The album ID		String
albumUpdate (common)	The facebook Album to be created or updated		AlbumUpdate
appId (common)	The ID of the Facebook Application		String
center (common)	Location latitude and longitude		GeoLocation
checkinId (common)	The checkin ID		String
checkinUpdate (common)	Deprecated The checkin to be created. Deprecated, instead create a Post with an attached location		CheckinUpdate
clientURL (common)	Facebook4J API client URL		String
clientVersion (common)	Facebook4J client API version		String
commentId (common)	The comment ID		String
commentUpdate (common)	The facebook Comment to be created or updated		CommentUpdate

Name	Description	Default	Type
debugEnabled (common)	Enables debug output. Effective only with the embedded logger	false	Boolean
description (common)	The description text		String
distance (common)	Distance in meters		Integer
domainId (common)	The domain ID		String
domainName (common)	The domain name		String
domainNames (common)	The domain names		List
eventId (common)	The event ID		String
eventUpdate (common)	The event to be created or updated		EventUpdate
friendId (common)	The friend ID		String
friendlistId (common)	The friend list ID		String
friendlistName (common)	The friend list Name		String
friendUserId (common)	The friend user ID		String
groupId (common)	The group ID		String
gzipEnabled (common)	Use Facebook GZIP encoding	true	Boolean
httpConnectionTimeout (common)	Http connection timeout in milliseconds	20000	Integer

Name	Description	Default	Type
httpDefaultMaxPerRoute (common)	HTTP maximum connections per route	2	Integer
httpMaxTotalConnections (common)	HTTP maximum total connections	20	Integer
httpReadTimeout (common)	Http read timeout in milliseconds	120000	Integer
httpRetryCount (common)	Number of HTTP retries	0	Integer
httpRetryIntervalSeconds (common)	HTTP retry interval in seconds	5	Integer
httpStreamingReadTimeout (common)	HTTP streaming read timeout in milliseconds	40000	Integer
ids (common)	The ids of users		List
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
includeRead (common)	Enables notifications that the user has already read in addition to unread ones		Boolean
isHidden (common)	Whether hidden		Boolean
jsonStoreEnabled (common)	If set to true, raw JSON forms will be stored in DataObjectFactory	false	Boolean
link (common)	Link URL		URL
linkId (common)	Link ID		String
locale (common)	Desired FQL locale		Locale
mbeanEnabled (common)	If set to true, Facebook4J mbean will be registerd	false	Boolean

Name	Description	Default	Type
message (common)	The message text		String
messageld (common)	The message ID		String
metric (common)	The metric name		String
milestoneld (common)	The milestone id		String
name (common)	Test user name, must be of the form 'first last'		String
noteld (common)	The note ID		String
notificationId (common)	The notification ID		String
objectId (common)	The insight object ID		String
offerId (common)	The offer id		String
optionDescription (common)	The question's answer option description		String
pageId (common)	The page id		String
permissionName (common)	The permission name		String
permissions (common)	Test user permissions in the format perm1,perm2,...		String
photold (common)	The photo ID		String
pictureId (common)	The picture id		Integer
pictureId2 (common)	The picture2 id		Integer
pictureSize (common)	The picture size		PictureSize

Name	Description	Default	Type
placeId (common)	The place ID		String
postId (common)	The post ID		String
postUpdate (common)	The post to create or update		PostUpdate
prettyDebugEnabled (common)	Prettify JSON debug output if set to true	false	Boolean
queries (common)	FQL queries		Map
query (common)	FQL query or search terms for search endpoints		String
questionId (common)	The question id		String
reading (common)	Optional reading parameters. See Reading Options(#reading)		Reading
readingOptions (common)	To configure Reading using key/value pairs from the Map.		Map
restBaseURL (common)	API base URL	https://graph.facebook.com/	String
scoreValue (common)	The numeric score with value		Integer
size (common)	The picture size, one of large, normal, small or square		PictureSize
source (common)	The media content from either a java.io.File or java.io.InputStream		Media
subject (common)	The note of the subject		String
tabId (common)	The tab id		String
tagUpdate (common)	Photo tag information		TagUpdate
testUser1 (common)	Test user 1		TestUser

Name	Description	Default	Type
testUser2 (common)	Test user 2		TestUser
testUserId (common)	The ID of the test user		String
title (common)	The title text		String
toUserId (common)	The ID of the user to tag		String
toUserIds (common)	The IDs of the users to tag		List
userId (common)	The Facebook user ID		String
userId1 (common)	The ID of a user 1		String
userId2 (common)	The ID of a user 2		String
userIds (common)	The IDs of users to invite to event		List
userLocale (common)	The test user locale		String
useSSL (common)	Use SSL	true	Boolean
videoBaseURL (common)	Video API base URL	https://graph-video.facebook.com/	String
videoid (common)	The video ID		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
httpProxyHost (proxy)	HTTP proxy server host name		String
httpProxyPassword (proxy)	HTTP proxy server password		String
httpProxyPort (proxy)	HTTP proxy server port		Integer
httpProxyUser (proxy)	HTTP proxy server user name		String
oAuthAccessToken (security)	The user access token		String
oAuthAccessTokenURL (security)	OAuth access token URL	https://graph.facebook.com/oauth/access_token	String
oAuthAppId (security)	The application Id		String
oAuthAppSecret (security)	The application Secret		String

Name	Description	Default	Type
<code>oAuthAuthorizationURL</code> (security)	OAuth authorization URL	https://www.facebook.com/dialog/oauth	String
<code>oAuthPermissions</code> (security)	Default OAuth permissions. Comma separated permission names. See https://developers.facebook.com/docs/reference/login/#permissions for the detail		String

99.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 29 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.facebook.configuration.client-u-r-l</code>	Facebook4J API client URL		String
<code>camel.component.facebook.configuration.client-version</code>	Facebook4J client API version		String
<code>camel.component.facebook.configuration.debug-enabled</code>	Enables debug output. Effective only with the embedded logger	false	Boolean
<code>camel.component.facebook.configuration.gzip-enabled</code>	Use Facebook GZIP encoding	true	Boolean
<code>camel.component.facebook.configuration.http-connection-timeout</code>	Http connection timeout in milliseconds	20000	Integer

Name	Description	Default	Type
<code>camel.component.facebook.configuration.http-default-max-per-route</code>	HTTP maximum connections per route	2	Integer
<code>camel.component.facebook.configuration.http-max-total-connections</code>	HTTP maximum total connections	20	Integer
<code>camel.component.facebook.configuration.http-proxy-host</code>	HTTP proxy server host name		String
<code>camel.component.facebook.configuration.http-proxy-password</code>	HTTP proxy server password		String
<code>camel.component.facebook.configuration.http-proxy-port</code>	HTTP proxy server port		Integer
<code>camel.component.facebook.configuration.http-proxy-user</code>	HTTP proxy server user name		String
<code>camel.component.facebook.configuration.http-read-timeout</code>	Http read timeout in milliseconds	12000 0	Integer
<code>camel.component.facebook.configuration.http-retry-count</code>	Number of HTTP retries	0	Integer
<code>camel.component.facebook.configuration.http-retry-interval-seconds</code>	HTTP retry interval in seconds	5	Integer

Name	Description	Default	Type
<code>camel.component.facebook.configuration.http-streaming-read-timeout</code>	HTTP streaming read timeout in milliseconds	40000	Integer
<code>camel.component.facebook.configuration.json-store-enabled</code>	If set to true, raw JSON forms will be stored in DataObjectFactory	false	Boolean
<code>camel.component.facebook.configuration.mbean-enabled</code>	If set to true, Facebook4J mbean will be registered	false	Boolean
<code>camel.component.facebook.configuration.o-auth-access-token</code>	The user access token		String
<code>camel.component.facebook.configuration.o-auth-access-token-url</code>	OAuth access token URL	https://graph.facebook.com/oauth/access_token	String
<code>camel.component.facebook.configuration.o-auth-app-id</code>	The application Id		String
<code>camel.component.facebook.configuration.o-auth-app-secret</code>	The application Secret		String
<code>camel.component.facebook.configuration.o-auth-authorization-url</code>	OAuth authorization URL	https://www.facebook.com/dialog/oauth	String

Name	Description	Default	Type
<code>camel.component.facebook.configuration.o-auth-permissions</code>	Default OAuth permissions. Comma separated permission names. See https://developers.facebook.com/docs/reference/login/#permissions for the detail		String
<code>camel.component.facebook.configuration.pretty-debug-enabled</code>	Prettify JSON debug output if set to true	false	Boolean
<code>camel.component.facebook.configuration.rest-base-url</code>	API base URL	https://graph.facebook.com/	String
<code>camel.component.facebook.configuration.use-ssl</code>	Use SSL	true	Boolean
<code>camel.component.facebook.configuration.video-base-url</code>	Video API base URL	https://graph-video.facebook.com/	String
<code>camel.component.facebook.enabled</code>	Enable facebook component	true	Boolean
<code>camel.component.facebook.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

99.4. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint names and options from the table below. Endpoints can also use the short name without the **get** or **search** prefix, except **checkin** due to ambiguity between **getCheckin** and **searchCheckin**. Endpoint options that are not mandatory are denoted by [].

Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message. For example, the facebook endpoint in the following route retrieves activities for the user id value in the incoming message body.

```
from("direct:test").to("facebook://activities?inBody=userId")...
```

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format

CamelFacebook.https://cwiki.apache.org/confluence/pages/createpage.action?

spaceKey=CAMEL&title=option&linkCreation=true&fromPageId=34020899[option]. For example, the **userId** option value in the previous route could alternately be provided in the message header

CamelFacebook.userId. Note that the **inBody** option overrides message header, e.g. the endpoint

option **inBody=user** would override a **CamelFacebook.userId** header.

Endpoints that return a String return an Id for the created or modified entity, e.g. **addAlbumPhoto** returns the new album Id. Endpoints that return a boolean, return true for success and false otherwise. In case of Facebook API errors the endpoint will throw a **RuntimeCamelException** with a **facebook4j.FacebookException** cause.

99.5. CONSUMER ENDPOINTS:

Any of the producer endpoints that take a [reading#reading](#) parameter can be used as a consumer endpoint. The polling consumer uses the **since** and **until** fields to get responses within the polling interval. In addition to other reading fields, an initial **since** value can be provided in the endpoint for the first poll.

Rather than the endpoints returning a List (or **facebook4j.ResponseList**) through a single route exchange, camel-facebook creates one route exchange per returned object. As an example, if **"facebook://home"** results in five posts, the route will be executed five times (once for each Post).

99.6. READING OPTIONS

The **reading** option of type **facebook4j.Reading** adds support for reading parameters, which allow selecting specific fields, limits the number of results, etc. For more information see [Graph API#reading - Facebook Developers](#).

It is also used by consumer endpoints to poll Facebook data to avoid sending duplicate messages across polls.

The reading option can be a reference or value of type **facebook4j.Reading**, or can be specified using the following reading options in either the endpoint URI or exchange header with **CamelFacebook.** prefix.

99.7. MESSAGE HEADER

Any of the [URI options#urioptions](#) can be provided in a message header for producer endpoints with **CamelFacebook.** prefix.

99.8. MESSAGE BODY

All result message bodies utilize objects provided by the Facebook4J API. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

For endpoints that return an array, or **facebook4j.ResponseList**, or **java.util.List**, a consumer endpoint will map every elements in the list to distinct messages.

99.9. USE CASES

To create a post within your Facebook profile, send this producer a `facebook4j.PostUpdate` body.

```
from("direct:foo")
  .to("facebook://postFeed/inBody=postUpdate");
```

To poll, every 5 sec (You can set the [polling consumer](#) options by adding a prefix of "consumer"), all statuses on your home feed:

```
from("facebook://home?consumer.delay=5000")
  .to("bean:blah");
```

Searching using a producer with dynamic options from header.

In the bar header we have the Facebook search string we want to execute in public posts, so we need to assign this value to the `CamelFacebook.query` header.

```
from("direct:foo")
  .setHeader("CamelFacebook.query", header("bar"))
  .to("facebook://posts");
```

CHAPTER 100. FHIR COMPONENT

Available as of Camel version 2.23

The FHIR component integrates with the [HAPI-FHIR](#) library which is an open-source implementation of the [FHIR](#) (Fast Healthcare Interoperability Resources) specification in Java.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-fhir</artifactId>
  <version>${camel-version}</version>
</dependency>
```

100.1. URI FORMAT

The FHIR Component uses the following URI format:

```
fhir://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- capabilities
- create
- delete
- history
- load-page
- meta
- operation
- patch
- read
- search
- transaction
- update
- validate

The FHIR component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		FhirConfiguration
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The FHIR endpoint is configured using URI syntax:

```
fhir:apiName/methodName
```

with the following path and query parameters:

100.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		FhirApiName
methodName	Required What sub operation to use for the selected operation		String

100.1.2. Query Parameters (26 parameters):

Name	Description	Default	Type
encoding (common)	Encoding to use for all request		String
fhirVersion (common)	The FHIR Version to use	DSTU3	String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
log (common)	Will log every requests and responses	false	boolean
prettyPrint (common)	Pretty print all request	false	boolean

Name	Description	Default	Type
serverUrl (common)	The FHIR server base URL		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
compress (advanced)	Compresses outgoing (POST/PUT) contents to the GZIP format	false	boolean
connectionTimeout (advanced)	How long to try and establish the initial TCP connection (in ms)	10000	Integer
deferModelScanning (advanced)	When this option is set, model classes will not be scanned for children until the child list for the given type is actually accessed.	false	boolean
fhirContext (advanced)	<code>FhirContext</code> is an expensive object to create. To avoid creating multiple instances, it can be set directly.		<code>FhirContext</code>
forceConformanceCheck (advanced)	Force conformance check	false	boolean
sessionCookie (advanced)	HTTP session cookie to add to every request		String
socketTimeout (advanced)	How long to block for individual read/write operations (in ms)	10000	Integer
summary (advanced)	Request that the server modify the response using the <code>_summary</code> param		String

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
validationMode (advanced)	When should Camel validate the FHIR Server's conformance statement	ONCE	String
proxyHost (proxy)	The proxy host		String
proxyPassword (proxy)	The proxy password		String
proxyPort (proxy)	The proxy port		Integer
proxyUser (proxy)	The proxy username		String
accessToken (security)	OAuth access token		String
password (security)	Username to use for basic authentication		String
username (security)	Username to use for basic authentication		String

100.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 23 options, which are listed below.

Name	Description	Default	Type
camel.component.fhir.configuration.access-token	OAuth access token		String
camel.component.fhir.configuration.api-name	What kind of operation to perform		FhirApiName
camel.component.fhir.configuration.client	To use the custom client		IGenericClient

Name	Description	Default	Type
<code>camel.component.fhir.configuration.client-factory</code>	To use the custom client factory		<code>IRestfulClientFactory</code>
<code>camel.component.fhir.configuration.compress</code>	Compresses outgoing (POST/PUT) contents to the GZIP format	false	Boolean
<code>camel.component.fhir.configuration.connection-timeout</code>	How long to try and establish the initial TCP connection (in ms)	10000	Integer
<code>camel.component.fhir.configuration.defer-model-scanning</code>	When this option is set, model classes will not be scanned for children until the child list for the given type is actually accessed.	false	Boolean
<code>camel.component.fhir.configuration.fhir-context</code>	<code>FhirContext</code> is an expensive object to create. To avoid creating multiple instances, it can be set directly.		<code>FhirContext</code>
<code>camel.component.fhir.configuration.force-conformance-check</code>	Force conformance check	false	Boolean
<code>camel.component.fhir.configuration.log</code>	Will log every requests and responses	false	Boolean
<code>camel.component.fhir.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.fhir.configuration.password</code>	Username to use for basic authentication		String
<code>camel.component.fhir.configuration.pretty-print</code>	Pretty print all request	false	Boolean

Name	Description	Default	Type
<code>camel.component.fhir.configuration.proxy-host</code>	The proxy host		String
<code>camel.component.fhir.configuration.proxy-password</code>	The proxy password		String
<code>camel.component.fhir.configuration.proxy-port</code>	The proxy port		Integer
<code>camel.component.fhir.configuration.proxy-user</code>	The proxy username		String
<code>camel.component.fhir.configuration.server-url</code>	The FHIR server base URL		String
<code>camel.component.fhir.configuration.session-cookie</code>	HTTP session cookie to add to every request		String
<code>camel.component.fhir.configuration.socket-timeout</code>	How long to block for individual read/write operations (in ms)	10000	Integer
<code>camel.component.fhir.configuration.username</code>	Username to use for basic authentication		String
<code>camel.component.fhir.enabled</code>	Whether to enable auto configuration of the fhir component. This is enabled by default.		Boolean
<code>camel.component.fhir.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 101. FHIR JSON DATAFORMAT

Available as of Camel version 2.21 Available as of Camel version 2.21

The FHIR-JSON Data Format leverages [HAPI-FHIR's](#) JSON parser to parse to/from JSON format to/from a HAPI-FHIR's **IBaseResource**.

101.1. FHIR JSON FORMAT OPTIONS

The FHIR JSon dataformat supports 14 options, which are listed below.

Name	Default	Java Type	Description
fhirVersion	DSTU3	String	The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4
prettyPrint	false	Boolean	Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible.
serverBaseUrl		String	Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base.
omitResourceId	false	Boolean	If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID.
encodeElementsAppliesToResourceTypes		Set	If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded.
encodeElementsAppliesToChildResourcesOnly	false	Boolean	If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle)
encodeElements		Set	If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) (mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded

Name	Default	Java Type	Description
<code>dontEncodeElements</code>		Set	If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as Patient.meta will work for DSTU2 parsers, but values with subelements on meta such as Patient.meta.lastUpdated will only work in DSTU3 mode.
<code>stripVersionsFromReferences</code>	false	Boolean	If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code>
<code>overrideResourceIdWithBundleEntryFullUrl</code>	false	Boolean	If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource</code> 's resource id if the <code>fullUrl</code> is defined. This behavior happens when parsing the source data into a <code>Bundle</code> object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the <code>fullUrl</code> and the resource id).
<code>summaryMode</code>	false	Boolean	If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included.
<code>suppressNarratives</code>	false	Boolean	If set to true (default is false), narratives will not be included in the encoded values.
<code>dontStripVersionsFromReferencesAtPath</code>		List	If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default)

Name	Default	Java Type	Description
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc.

101.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.fhirjson.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.fhirjson.dont-encode-elements</code>	If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as Patient.meta will work for DSTU2 parsers, but values with subelements on meta such as Patient.meta.lastUpdated will only work in DSTU3 mode.		Set
<code>camel.dataformat.fhirjson.dont-strip-versions-from-references-at-paths</code>	If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default)		List
<code>camel.dataformat.fhirjson.enabled</code>	Whether to enable auto configuration of the fhirJson data format. This is enabled by default.		Boolean

Name	Description	Default	Type
camel.dataformat.fhirjson.encode-elements	If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) .(mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded		Set
camel.dataformat.fhirjson.encode-elements-applies-to-child-resources-only	If set to true (default is false), the values supplied to setEncodeElements(Set) will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle)	false	Boolean
camel.dataformat.fhirjson.encode-elements-applies-to-resource-types	If provided, tells the parse which resource types to apply link #setEncodeElements(Set) encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded.		Set
camel.dataformat.fhirjson.fhir-version	The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4	DSTU3	String
camel.dataformat.fhirjson.omit-resource-id	If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID.	false	Boolean
camel.dataformat.fhirjson.override-resource-id-with-bundle-entry-full-url	If set to true (which is the default), the Bundle.entry.fullUrl will override the Bundle.entry.resource's resource id if the fullUrl is defined. This behavior happens when parsing the source data into a Bundle object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the fullUrl and the resource id).	false	Boolean
camel.dataformat.fhirjson.pretty-print	Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.fhirjson.server-base-url</code>	Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base.		String
<code>camel.dataformat.fhirjson.strip-versions-from-references</code>	If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code>	false	Boolean
<code>camel.dataformat.fhirjson.summary-mode</code>	If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included.	false	Boolean
<code>camel.dataformat.fhirjson.suppress-narratives</code>	If set to true (default is false), narratives will not be included in the encoded values.	false	Boolean

CHAPTER 102. FHIR XML DATAFORMAT

Available as of Camel version 2.21 Available as of Camel version 2.21

The FHIR-XML Data Format leverages [HAPI-FHIR's](#) XML parser to parse to/from XML format to/from a HAPI-FHIR's **IBaseResource**.

102.1. FHIR XML FORMAT OPTIONS

The FHIR XML dataformat supports 14 options, which are listed below.

Name	Default	Java Type	Description
fhirVersion	DSTU3	String	The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4
prettyPrint	false	Boolean	Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible.
serverBaseUrl		String	Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base.
omitResourceId	false	Boolean	If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID.
encodeElementsAppliesToResourceTypes		Set	If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded.
encodeElementsAppliesToChildResourcesOnly	false	Boolean	If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle)
encodeElements		Set	If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) .(mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded

Name	Default	Java Type	Description
dontEncodeElements		Set	If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as Patient.meta will work for DSTU2 parsers, but values with subelements on meta such as Patient.meta.lastUpdated will only work in DSTU3 mode.
stripVersionsFromReferences	false	Boolean	If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code>
overrideResourceIdWithBundleEntryFullUrl	false	Boolean	If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource</code> 's resource id if the <code>fullUrl</code> is defined. This behavior happens when parsing the source data into a <code>Bundle</code> object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the <code>fullUrl</code> and the resource id).
summaryMode	false	Boolean	If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included.
suppressNarratives	false	Boolean	If set to true (default is false), narratives will not be included in the encoded values.
dontStripVersionsFromReferencesAtPath		List	If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default)

Name	Default	Java Type	Description
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

102.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.fhirxml.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.fhirxml.dont-encode-elements</code>	If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as <code>Patient.meta</code> will work for DSTU2 parsers, but values with subelements on meta such as <code>Patient.meta.lastUpdated</code> will only work in DSTU3 mode.		Set
<code>camel.dataformat.fhirxml.dont-strip-versions-from-references-at-paths</code>	If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default)		List
<code>camel.dataformat.fhirxml.enabled</code>	Whether to enable auto configuration of the <code>fhirXml</code> data format. This is enabled by default.		Boolean

Name	Description	Default	Type
<code>camel.dataformat.fhirxml.encode-elements</code>	If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) .(mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded		Set
<code>camel.dataformat.fhirxml.encode-elements-applies-to-child-resources-only</code>	If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle)	false	Boolean
<code>camel.dataformat.fhirxml.encode-elements-applies-to-resource-types</code>	If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded.		Set
<code>camel.dataformat.fhirxml.fhir-version</code>	The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4	DSTU3	String
<code>camel.dataformat.fhirxml.omit-resource-id</code>	If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID.	false	Boolean
<code>camel.dataformat.fhirxml.override-resource-id-with-bundle-entry-full-url</code>	If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource</code> 's resource id if the fullUrl is defined. This behavior happens when parsing the source data into a Bundle object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the fullUrl and the resource id).	false	Boolean
<code>camel.dataformat.fhirxml.pretty-print</code>	Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible.	false	Boolean

Name	Description	Default	Type
camel.dataformat.fhirxml.server-base-url	Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base.		String
camel.dataformat.fhirxml.strip-versions-from-references	If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code>	false	Boolean
camel.dataformat.fhirxml.summary-mode	If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included.	false	Boolean
camel.dataformat.fhirxml.suppress-narratives	If set to true (default is false), narratives will not be included in the encoded values.	false	Boolean

CHAPTER 103. FILE COMPONENT

Available as of Camel version 1.0

The File component provides access to file systems, allowing files to be processed by any other Camel Components or messages from other components to be saved to disk.

103.1. URI FORMAT

```
file:directoryName[?options]
```

or

```
file://directoryName[?options]
```

Where **directoryName** represents the underlying file directory.

You can append query options to the URI in the following format, **?option=value&option=value&...**

Only directories

Camel supports only endpoints configured with a starting directory. So the **directoryName** must be a directory.

If you want to consume a single file only, you can use the **fileName** option, e.g. by setting **fileName=thefilename**.

Also, the starting directory must not contain dynamic expressions with `${ }` placeholders. Again use the **fileName** option to specify the dynamic part of the filename.

WARNING

Avoid reading files currently being written by another application Beware the JDK File IO API is a bit limited in detecting whether another application is currently writing/copying a file. And the implementation can be different depending on OS platform as well. This could lead to that Camel thinks the file is not locked by another process and start consuming it. Therefore you have to do your own investigation what suits your environment. To help with this Camel provides different **readLock** options and **doneFileName** option that you can use. See also the section *Consuming files from folders where others drop files directly* .

103.2. URI OPTIONS

The File component has no options.

The File endpoint is configured using URI syntax:

```
file:directoryName
```

with the following path and query parameters:

103.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
directoryName	Required The starting directory		File

103.2.2. Query Parameters (87 parameters):

Name	Description	Default	Type
charset (common)	This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.		String
doneFileName (common)	Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders.		String

Name	Description	Default	Type
fileName (common)	Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.	false	boolean
delete (consumer)	If true, the file will be deleted after it is processed successfully.	false	boolean
moveFailed (consumer)	Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.		String
noop (consumer)	If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.	false	boolean

Name	Description	Default	Type
preMove (consumer)	Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.		String
preSort (consumer)	When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.	false	boolean
recursive (consumer)	If a directory, will look for files in all the sub-directories as well.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
directoryMustExist (consumer)	Similar to startingDirectoryMustExist but this applies during polling recursive sub directories.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the default exchange pattern when creating an exchange.		ExchangePattern
extendedAttributes (consumer)	To define which file attributes of interest. Like posix:permissions,posix:owner,basic:lastAccessTime, it supports basic wildcard like posix;, basic:lastAccessTime		String
inProgressRepository (consumer)	A pluggable in-progress repository org.apache.camel.spi.IdempotentRepository. The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used.		IdempotentRepository

Name	Description	Default	Type
localWorkDirectory (consumer)	When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory.		String
onCompletionExceptionHandler (consumer)	To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore.		ExceptionHandler
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. In other words the error occurred while the polling was gathering information, for instance access to a file network failed so Camel cannot access it to scan for files. The default implementation will log the caused exception at WARN level and ignore it.		PollingConsumerPollStrategy
probeContentType (consumer)	Whether to enable probing of the content type. If enable then the consumer uses <code>Files#probeContentType(java.nio.file.Path)</code> to determine the content-type of the file, and store that as a header with key <code>Exchange#FILE_CONTENT_TYPE</code> on the Message.	false	boolean
processStrategy (consumer)	A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply.		GenericFileProcessStrategy

Name	Description	Default	Type
startingDirectoryMustExist (consumer)	Whether the starting directory must exist. Mind that the autoCreate option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable autoCreate and enable this to ensure the starting directory must exist. Will thrown an exception if the directory doesn't exist.	false	boolean
fileExist (producer)	What to do if a file already exists with the same name. Override, which is the default, replaces the existing file. Append - adds content to the existing file. Fail - throws a GenericFileOperationException, indicating that there is already an existing file. Ignore - silently ignores the problem and does not override the existing file, but assumes everything is okay. Move - option requires to use the moveExisting option to be configured as well. The option eagerDeleteTargetFile can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The Move option will move any existing files, before writing the target file. TryRename is only applicable if tempFileName option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.	Override	GenericFileExist
flatten (producer)	Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.	false	boolean
jailStartingDirectory (producer)	Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders.	true	boolean

Name	Description	Default	Type
moveExisting (producer)	Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base.		String
tempFileName (producer)	The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language.		String
tempPrefix (producer)	This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files.		String
allowNullBody (producer)	Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged.	false	boolean
chmod (producer)	Specify the file permissions which is sent by the producer, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it.		String
chmodDirectory (producer)	Specify the directory permissions used when the producer creates missing directories, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it.		String

Name	Description	Default	Type
eagerDeleteTargetFile (producer)	Whether or not to eagerly delete any existing target file. This option only applies when you use <code>fileExists=Override</code> and the <code>tempFileName</code> option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensures the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when <code>fileExist=Move</code> is enabled, and an existing file exists. If this option <code>copyAndDeleteOnRenameFails</code> is false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation.	true	boolean
forceWrites (producer)	Whether to force syncing writes to the file system. You can turn this off if you do not want this level of guarantee, for example if writing to logs / audit logs etc; this would yield better performance.	true	boolean
keepLastModified (producer)	Will keep the last modified timestamp from the source file (if any). Will use the <code>Exchange.FILE_LAST_MODIFIED</code> header to locate the timestamp. This header can contain either a <code>java.util.Date</code> or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers.	false	boolean
moveExistingFileStrategy (producer)	Strategy (Custom Strategy) used to move file with special naming token to use when <code>fileExist=Move</code> is configured. By default, there is an implementation used if no custom strategy is provided		FileMoveExistingStrategy
autoCreate (advanced)	Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to.	true	boolean
bufferSize (advanced)	Write buffer sized in bytes.	131072	int
copyAndDeleteOnRenameFail (advanced)	Whether to fallback and do a copy and delete file, in case the file could not be renamed directly. This option is not available for the FTP component.	true	boolean

Name	Description	Default	Type
renameUsingCopy (advanced)	Perform rename operations using a copy and delete strategy. This is primarily used in environments where the regular rename operation is unreliable (e.g. across different file systems or networks). This option takes precedence over the <code>copyAndDeleteOnRenameFail</code> parameter that will automatically fall back to the copy and delete strategy, but only after additional delays.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
antExclude (filter)	Ant style filter exclusion. If both <code>antInclude</code> and <code>antExclude</code> are used, <code>antExclude</code> takes precedence over <code>antInclude</code> . Multiple exclusions may be specified in comma-delimited format.		String
antFilterCaseSensitive (filter)	Sets case sensitive flag on ant filter	true	boolean
antInclude (filter)	Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format.		String
eagerMaxMessagesPerPoll (filter)	Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If <code>eager</code> then the limit is during the scanning of files. Where as <code>false</code> would scan all files, and then perform sorting. Setting this option to <code>false</code> allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting.	true	boolean
exclude (filter)	Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String
filter (filter)	Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns <code>false</code> in its <code>accept()</code> method.		GenericFileFilter
filterDirectory (filter)	Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyMMdd</code>		String

Name	Description	Default	Type
filterFile (filter)	Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code>		String
idempotent (filter)	Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again.	false	Boolean
idempotentKey (filter)	To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code>		String
idempotentRepository (filter)	A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true.		IdempotentRepository
include (filter)	Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String
maxDepth (filter)	The maximum depth to traverse when recursively processing a directory.	2147483647	int
maxMessagesPerPoll (filter)	To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards.		int
minDepth (filter)	The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory.		int

Name	Description	Default	Type
move (filter)	Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a .done subdirectory just enter .done.		String
exclusiveReadLockStrategy (lock)	Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation.		<code>GenericFileExclusiveReadLockStrategy</code>

Name	Description	Default	Type
readLock (lock)	<p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail for the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p>	none	String

Name	Description	Default	Type
readLockCheckInterval (lock)	Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	1000	long
readLockDeleteOrphanLock Files (lock)	Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.	true	boolean
readLockIdempotentRelease Async (lock)	Whether the delayed release task should be synchronous or asynchronous. See more details at the readLockIdempotentReleaseDelay option.	false	boolean
readLockIdempotentRelease AsyncPoolSize (lock)	The number of threads in the scheduled thread pool when using asynchronous release tasks. Using a default of 1 core threads should be sufficient in almost all use-cases, only set this to a higher value if either updating the idempotent repository is slow, or there are a lot of files to process. This option is not in-use if you use a shared thread pool by configuring the readLockIdempotentReleaseExecutorService option. See more details at the readLockIdempotentReleaseDelay option.		int
readLockIdempotentRelease Delay (lock)	Whether to delay the release task for a period of millis. This can be used to delay the release tasks to expand the window when a file is regarded as read-locked, in an active/active cluster scenario with a shared idempotent repository, to ensure other nodes cannot potentially scan and acquire the same file, due to race-conditions. By expanding the time-window of the release tasks helps prevents these situations. Note delaying is only needed if you have configured readLockRemoveOnCommit to true.		int

Name	Description	Default	Type
readLockIdempotentReleaseExecutorService (lock)	To use a custom and shared thread pool for asynchronous release tasks. See more details at the <code>readLockIdempotentReleaseDelay</code> option.		ScheduledExecutorService
readLockLoggingLevel (lock)	Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.	DEBUG	LogLevel
readLockMarkerFile (lock)	Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.	true	boolean
readLockMinAge (lock)	This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use <code>readLockMinAge=300s</code> to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.	0	long
readLockMinLength (lock)	This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files.	1	long
readLockRemoveOnCommit (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the <code>readLockIdempotentReleaseDelay</code> option.	false	boolean

Name	Description	Default	Type
readLockRemoveOnRollback (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit).	true	boolean
readLockTimeout (lock)	Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	10000	long
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. The default value is 500. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean

Name	Description	Default	Type
initialDelay (scheduler)	Milliseconds before the first poll starts. The default value is 1000. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. This option allows you to share a thread pool among multiple consumers.		ScheduledExecutorService
scheduler (scheduler)	Allow to plugin a custom <code>org.apache.camel.spi.ScheduledPollConsumerScheduler</code> to use as the scheduler for firing when the polling consumer runs. The default implementation uses the <code>ScheduledExecutorService</code> and there is a Quartz2, and Spring based which supports CRON expressions. Notice: If using a custom scheduler then the options for <code>initialDelay</code> , <code>useFixedDelay</code> , <code>timeUnit</code> , and <code>scheduledExecutorService</code> may not be in use. Use the text <code>quartz2</code> to refer to use the Quartz2 scheduler; and use the text <code>spring</code> to use the Spring based; and use the text <code>#myScheduler</code> to refer to a custom scheduler by its id in the Registry. See Quartz2 page for an example.	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for <code>initialDelay</code> and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean
shuffle (sort)	To shuffle the list of files (sort in random order)	false	boolean

Name	Description	Default	Type
<code>sortBy</code> (sort)	Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date.		String
<code>sorter</code> (sort)	Pluggable sorter as a <code>java.util.Comparator</code> class.		Comparator

TIP

Default behavior for file producer By default it will override any existing file, if one exist with the same name.

103.3. MOVE AND DELETE OPERATIONS

Any move or delete operations is executed after (post command) the routing has completed; so during processing of the **Exchange** the file is still located in the inbox folder.

Lets illustrate this with an example:

```
from("file://inbox?move=.done").to("bean:handleOrder");
```

When a file is dropped in the **inbox** folder, the file consumer notices this and creates a new **FileExchange** that is routed to the **handleOrder** bean. The bean then processes the **File** object. At this point in time the file is still located in the **inbox** folder. After the bean completes, and thus the route is completed, the file consumer will perform the move operation and move the file to the **.done** sub-folder.

The **move** and the **preMove** options are considered as a directory name (though if you use an expression such as [File Language](#), or [Simple](#) then the result of the expression evaluation is the file name to be used - eg if you set

```
move=../backup/copy-of-${file:name}
```

then that's using the [File Language](#) which we use return the file name to be used), which can be either relative or absolute. If relative, the directory is created as a sub-folder from within the folder where the file was consumed.

By default, Camel will move consumed files to the **.camel** sub-folder relative to the directory where the file was consumed.

If you want to delete the file after processing, the route should be:

```
from("file://inbox?delete=true").to("bean:handleOrder");
```

We have introduced a **pre** move operation to move files **before** they are processed. This allows you to mark which files have been scanned as they are moved to this sub folder before being processed.

```
from("file://inbox?preMove=inprogress").to("bean:handleOrder");
```

You can combine the **pre** move and the regular move:

```
from("file://inbox?preMove=inprogress&move=.done").to("bean:handleOrder");
```

So in this situation, the file is in the **inprogress** folder when being processed and after it's processed, it's moved to the **.done** folder.

103.4. FINE GRAINED CONTROL OVER MOVE AND PREMOVE OPTION

The **move** and **preMove** options are Expression-based, so we have the full power of the [File Language](#) to do advanced configuration of the directory and name pattern.

Camel will, in fact, internally convert the directory name you enter into a [File Language](#) expression. So when we enter **move=.done** Camel will convert this into: **\${file:parent}/.done/\${file:onlyname}**. This is only done if Camel detects that you have not provided a `${ }` in the option value yourself. So when you enter a `${ }` Camel will **not** convert it and thus you have the full power.

So if we want to move the file into a backup folder with today's date as the pattern, we can do:

```
move=backup/${date:now:yyyyMMdd}/${file:name}
```

103.5. ABOUT MOVEFAILED

The **moveFailed** option allows you to move files that **could not** be processed successfully to another location such as an error folder of your choice. For example to move the files in an error folder with a timestamp you can use **moveFailed=/error/\${file:name.noext}-\${date:now:yyyyMMddHHmmssSSS}.\${file:ext}**.

See more examples at [File Language](#)

103.6. MESSAGE HEADERS

The following headers are supported by this component:

103.6.1. File producer only

Header	Description
Camel FileName	Specifies the name of the file to write (relative to the endpoint directory). This name can be a String ; a String with a File Language or Simple expression; or an Expression object. If it's null then Camel will auto-generate a filename based on the message unique ID.
Camel FileNameProduced	The actual absolute filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users with the name of the file that was written.
Camel OverrideFileName	Camel 2.11: Is used for overruling CamelFileName header and use the value instead (but only once, as the producer will remove this header after writing the file). The value can be only be a String. Notice that if the option fileName has been configured, then this is still being evaluated.

103.6.2. File consumer only

Header	Description
Camel FileName	Name of the consumed file as a relative file path with offset from the starting directory configured on the endpoint.
Camel FileNameOnly	Only the file name (the name with no leading paths).
Camel FileAbsolute	A boolean option specifying whether the consumed file denotes an absolute path or not. Should normally be false for relative paths. Absolute paths should normally not be used but we added to the move option to allow moving files to absolute paths. But can be used elsewhere as well.
Camel FileAbsolutePath	The absolute path to the file. For relative files this path holds the relative path instead.
Camel FilePath	The file path. For relative files this is the starting directory + the relative filename. For absolute files this is the absolute path.
Camel FileRelativePath	The relative path.
Camel FileParent	The parent path.
Camel FileLength	A long value containing the file size.
Camel FileLastModified	A Long value containing the last modified timestamp of the file. In Camel 2.10.3 and older the type is Date .

103.7. BATCH CONSUMER

This component implements the Batch Consumer.

103.8. EXCHANGE PROPERTIES, FILE CONSUMER ONLY

As the file consumer implements the **BatchConsumer** it supports batching the files it polls. By batching we mean that Camel will add the following additional properties to the Exchange, so you know the number of files polled, the current index, and whether the batch is already completed.

Property	Description
Camel Batch Size	The total number of files that was polled in this batch.
Camel Batch Index	The current index of the batch. Starts from 0.
Camel Batch Complete	A boolean value indicating the last Exchange in the batch. Is only true for the last entry.

This allows you for instance to know how many files exist in this batch and for instance let the `Aggregator2` aggregate this number of files.

103.9. USING CHARSET

Available as of Camel 2.9.3

The `charset` option allows for configuring an encoding of the files on both the consumer and producer endpoints. For example if you read utf-8 files, and want to convert the files to iso-8859-1, you can do:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

You can also use the **convertBodyTo** in the route. In the example below we have still input files in utf-8 format, but we want to convert the file content to a byte array in iso-8859-1 format. And then let a bean process the data. Before writing the content to the outbox folder using the current charset.

```
from("file:inbox?charset=utf-8")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .to("file:outbox");
```

If you omit the `charset` on the consumer endpoint, then Camel does not know the charset of the file, and would by default use "UTF-8". However you can configure a JVM system property to override and use a different default encoding with the key **org.apache.camel.default.charset**.

In the example below this could be a problem if the files is not in UTF-8 encoding, which would be the default encoding for read the files.

In this example when writing the files, the content has already been converted to a byte array, and thus would write the content directly as is (without any further encodings).

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
```

```
.to("bean:myBean")
.to("file:outbox");
```

You can also override and control the encoding dynamic when writing files, by setting a property on the exchange with the key **Exchange.CHARSET_NAME**. For example in the route below we set the property with a value from a message header.

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .setProperty(Exchange.CHARSET_NAME, header("someCharsetHeader"))
  .to("file:outbox");
```

We suggest to keep things simpler, so if you pickup files with the same encoding, and want to write the files in a specific encoding, then favor to use the **charset** option on the endpoints.

Notice that if you have explicit configured a **charset** option on the endpoint, then that configuration is used, regardless of the **Exchange.CHARSET_NAME** property.

If you have some issues then you can enable DEBUG logging on **org.apache.camel.component.file**, and Camel logs when it reads/write a file using a specific charset.

For example the route below will log the following:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

And the logs:

```
DEBUG GenericFileConverter      - Read file /Users/davsclaus/workspace/camel/camel-
core/target/charset/input/input.txt with charset utf-8
DEBUG FileOperations            - Using Reader to write file: target/charset/output.txt with charset:
iso-8859-1
```

103.10. COMMON GOTCHAS WITH FOLDER AND FILENAMES

When Camel is producing files (writing files) there are a few gotchas affecting how to set a filename of your choice. By default, Camel will use the message ID as the filename, and since the message ID is normally a unique generated ID, you will end up with filenames such as: **ID-MACHINENAME-2443-1211718892437-1-0**. If such a filename is not desired, then you must provide a filename in the **CamelFileName** message header. The constant, **Exchange.FILE_NAME**, can also be used.

The sample code below produces files using the message ID as the filename:

```
from("direct:report").to("file:target/reports");
```

To use **report.txt** as the filename you have to do:

```
from("direct:report").setHeader(Exchange.FILE_NAME, constant("report.txt")).to("file:target/reports");
```

- i. the same as above, but with **CamelFileName**:

```
from("direct:report").setHeader("CamelFileName", constant("report.txt")).to("file:target/reports");
```

And a syntax where we set the filename on the endpoint with the **fileName** URI option.

```
from("direct:report").to("file:target/reports/?fileName=report.txt");
```

103.11. FILENAME EXPRESSION

Filename can be set either using the **expression** option or as a string-based [File Language](#) expression in the **CamelFileName** header. See the [File Language](#) for syntax and samples.

103.12. CONSUMING FILES FROM FOLDERS WHERE OTHERS DROP FILES DIRECTLY

Beware if you consume files from a folder where other applications write files to directly. Take a look at the different readLock options to see what suits your use cases. The best approach is however to write to another folder and after the write move the file in the drop folder. However if you write files directly to the drop folder then the option changed could better detect whether a file is currently being written/copied as it uses a file changed algorithm to see whether the file size / modification changes over a period of time. The other readLock options rely on Java File API that sadly is not always very good at detecting this. You may also want to look at the doneFileName option, which uses a marker file (done file) to signal when a file is done and ready to be consumed.

103.13. USING DONE FILES

Available as of Camel 2.6

See also section *writing done files* below.

If you want only to consume files when a done file exists, then you can use the **doneFileName** option on the endpoint.

```
from("file:bar?doneFileName=done");
```

Will only consume files from the bar folder, if a done *file* exists in the same directory as the target files. Camel will automatically delete the *done file* when it's done consuming the files. From Camel **2.9.3** onwards Camel will not automatically delete the *done file* if **noop=true** is configured.

However it is more common to have one *done file* per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the **doneFileName** option. Currently Camel supports the following two dynamic tokens: **file:name** and **file:name.noext** which must be enclosed in $\${}$. The consumer only supports the static part of the *done file* name as either prefix or suffix (not both).

```
from("file:bar?doneFileName=${file:name}.done");
```

In this example only files will be polled if there exists a done file with the name *file name.done*. For example

- **hello.txt** - is the file to be consumed
- **hello.txt.done** - is the associated done file

You can also use a prefix for the done file, such as:

```
from("file:bar?doneFileName=ready-${file:name}");
```

-
- **hello.txt** - is the file to be consumed
- **ready-hello.txt** - is the associated done file

103.14. WRITING DONE FILES

Available as of Camel 2.6

After you have written a file you may want to write an additional *donefile* as a kind of marker, to indicate to others that the file is finished and has been written. To do that you can use the **doneFileName** option on the file producer endpoint.

```
.to("file:bar?doneFileName=done");
```

Will simply create a file named **done** in the same directory as the target file.

However it is more common to have one done file per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the **doneFileName** option. Currently Camel supports the following two dynamic tokens: **file:name** and **file:name.noext** which must be enclosed in `${ }`.

```
.to("file:bar?doneFileName=done-${file:name}");
```

Will for example create a file named **done-foo.txt** if the target file was **foo.txt** in the same directory as the target file.

```
.to("file:bar?doneFileName=${file:name}.done");
```

Will for example create a file named **foo.txt.done** if the target file was **foo.txt** in the same directory as the target file.

```
.to("file:bar?doneFileName=${file:name.noext}.done");
```

Will for example create a file named **foo.done** if the target file was **foo.txt** in the same directory as the target file.

103.15. SAMPLES

#=== Read from a directory and write to another directory

```
from("file://inputdir/?delete=true").to("file://outputdir")
```

103.15.1. Read from a directory and write to another directory using a overrule dynamic name

```
from("file://inputdir/?delete=true").to("file://outputdir?overruleFile=copy-of-${file:name}")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the **outputdir** and delete the file in the **inputdir**.

103.15.2. Reading recursively from a directory and writing to another

-

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the **outputdir** and delete the file in the **inputdir**. Will scan recursively into sub-directories. Will lay out the files in the same directory structure in the **outputdir** as the **inputdir**, including any sub-directories.

```
inputdir/foo.txt
inputdir/sub/bar.txt
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/sub/bar.txt
```

103.16. USING FLATTEN

If you want to store the files in the outputdir directory in the same directory, disregarding the source directory layout (e.g. to flatten out the path), you just add the **flatten=true** option on the file producer side:

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir?flatten=true")
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/bar.txt
```

103.17. READING FROM A DIRECTORY AND THE DEFAULT MOVE OPERATION

Camel will by default move any processed file into a **.camel** subdirectory in the directory the file was consumed from.

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Affects the layout as follows:

before

```
inputdir/foo.txt
inputdir/sub/bar.txt
```

after

```
inputdir/.camel/foo.txt
inputdir/sub/.camel/bar.txt
outputdir/foo.txt
outputdir/sub/bar.txt
```

103.18. READ FROM A DIRECTORY AND PROCESS THE MESSAGE IN JAVA

```

from("file://inputdir/").process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        Object body = exchange.getIn().getBody();
        // do some business logic with the input body
    }
});

```

The body will be a **File** object that points to the file that was just dropped into the **inputdir** directory.

103.19. WRITING TO FILES

Camel is of course also able to write files, i.e. produce files. In the sample below we receive some reports on the SEDA queue that we process before they are being written to a directory.

103.19.1. Write to subdirectory using `Exchange.FILE_NAME`

Using a single route, it is possible to write a file to any number of subdirectories. If you have a route setup as such:

```

<route>
  <from uri="bean:myBean"/>
  <to uri="file:/rootDirectory"/>
</route>

```

You can have **myBean** set the header **Exchange.FILE_NAME** to values such as:

```

Exchange.FILE_NAME = hello.txt => /rootDirectory/hello.txt
Exchange.FILE_NAME = foo/bye.txt => /rootDirectory/foo/bye.txt

```

This allows you to have a single route to write files to multiple destinations.

103.19.2. Writing file through the temporary directory relative to the final destination

Sometime you need to temporarily write the files to some directory relative to the destination directory. Such situation usually happens when some external process with limited filtering capabilities is reading from the directory you are writing to. In the example below files will be written to the **/var/myapp/filesInProgress** directory and after data transfer is done, they will be atomically moved to the `/var/myapp/finalDirectory`` directory.

```

from("direct:start").
  to("file:///var/myapp/finalDirectory?tempPrefix=./filesInProgress");

```

103.20. USING EXPRESSION FOR FILENAMES

In this sample we want to move consumed files to a backup folder using today's date as a sub-folder name:

```

from("file://inbox?move=backup/${date:now:yyyyMMdd}/${file:name}").to("...");

```

See [File Language](#) for more samples.

103.21. AVOIDING READING THE SAME FILE MORE THAN ONCE (IDEMPOTENT CONSUMER)

Camel supports Idempotent Consumer directly within the component so it will skip already processed files. This feature can be enabled by setting the **idempotent=true** option.

```
from("file://inbox?idempotent=true").to("...");
```

Camel uses the absolute file name as the idempotent key, to detect duplicate files. From **Camel 2.11** onwards you can customize this key by using an expression in the `idempotentKey` option. For example to use both the name and the file size as the key

```
<route>
  <from uri="file://inbox?idempotent=true&idempotentKey=${file:name}-${file:size}"/>
  <to uri="bean:processInbox"/>
</route>
```

By default Camel uses a in memory based store for keeping track of consumed files, it uses a least recently used cache holding up to 1000 entries. You can plugin your own implementation of this store by using the **idempotentRepository** option using the **#** sign in the value to indicate it's a referring to a bean in the Registry with the specified **id**.

```
<!-- define our store as a plain spring bean -->
<bean id="myStore" class="com.mycompany.MyIdempotentStore"/>

<route>
  <from uri="file://inbox?idempotent=true&idempotentRepository=#myStore"/>
  <to uri="bean:processInbox"/>
</route>
```

Camel will log at **DEBUG** level if it skips a file because it has been consumed before:

```
DEBUG FileConsumer is idempotent and the file has been consumed before. Will skip this file:
target\idempotent\report.txt
```

103.22. USING A FILE BASED IDEMPOTENT REPOSITORY

In this section we will use the file based idempotent repository **org.apache.camel.processor.idempotent.FileIdempotentRepository** instead of the in-memory based that is used as default.

This repository uses a 1st level cache to avoid reading the file repository. It will only use the file repository to store the content of the 1st level cache. Thereby the repository can survive server restarts. It will load the content of the file into the 1st level cache upon startup. The file structure is very simple as it stores the key in separate lines in the file. By default, the file store has a size limit of 1mb. When the file grows larger Camel will truncate the file store, rebuilding the content by flushing the 1st level cache into a fresh empty file.

We configure our repository using Spring XML creating our file idempotent repository and define our file consumer to use our repository with the **idempotentRepository** using **#** sign to indicate Registry lookup:

103.23. USING A JPA BASED IDEMPOTENT REPOSITORY

In this section we will use the JPA based idempotent repository instead of the in-memory based that is used as default.

First we need a persistence-unit in **META-INF/persistence.xml** where we need to use the class **org.apache.camel.processor.idempotent.jpa.MessageProcessed** as model.

```
<persistence-unit name="idempotentDb" transaction-type="RESOURCE_LOCAL">
  <class>org.apache.camel.processor.idempotent.jpa.MessageProcessed</class>

  <properties>
    <property name="openjpa.ConnectionURL" value="jdbc:derby:target/idempotentTest;create=true"/>
    <property name="openjpa.ConnectionDriverName"
value="org.apache.derby.jdbc.EmbeddedDriver"/>
    <property name="openjpa.jdbc.SynchronizeMappings" value="buildSchema"/>
    <property name="openjpa.Log" value="DefaultLevel=WARN, Tool=INFO"/>
    <property name="openjpa.Multithreaded" value="true"/>
  </properties>
</persistence-unit>
```

Next, we can create our JPA idempotent repository in the spring XML file as well:

```
<!-- we define our jpa based idempotent repository we want to use in the file consumer -->
<bean id="jpaStore" class="org.apache.camel.processor.idempotent.jpa.JpaMessageIdRepository">
  <!-- Here we refer to the entityManagerFactory -->
  <constructor-arg index="0" ref="entityManagerFactory"/>
  <!-- This 2nd parameter is the name (= a category name).
      You can have different repositories with different names -->
  <constructor-arg index="1" value="FileConsumer"/>
</bean>
```

And yes then we just need to refer to the **jpaStore** bean in the file consumer endpoint using the **idempotentRepository** using the **#** syntax option:

```
<route>
  <from uri="file://inbox?idempotent=true&idempotentRepository=#jpaStore"/>
  <to uri="bean:processInbox"/>
</route>
```

103.24. FILTER USING ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER

Camel supports pluggable filtering strategies. You can then configure the endpoint with such a filter to skip certain files being processed.

In the sample we have built our own filter that skips files starting with **skip** in the filename:

And then we can configure our route using the **filter** attribute to reference our filter (using **#** notation) that we have defined in the spring XML file:

```
<!-- define our filter as a plain spring bean -->
<bean id="myFilter" class="com.mycompany.MyFileFilter"/>

<route>
```

```

<from uri="file://inbox?filter=#myFilter"/>
<to uri="bean:processInbox"/>
</route>

```

103.25. FILTERING USING ANT PATH MATCHER

The ANT path matcher is shipped out-of-the-box in the **camel-spring** jar. So you need to depend on **camel-spring** if you are using Maven.

The reason is that we leverage Spring's [AntPathMatcher](#) to do the actual matching.

The file paths is matched with the following rules:

- **?** matches one character
- ***** matches zero or more characters
- ****** matches zero or more directories in a path

TIP

New options from Camel 2.10 onwards There are now **antInclude** and **antExclude** options to make it easy to specify ANT style include/exclude without having to define the filter. See the URI options above for more information.

The sample below demonstrates how to use it:

103.25.1. Sorting using Comparator

Camel supports pluggable sorting strategies. This strategy it to use the build in **java.util.Comparator** in Java. You can then configure the endpoint with such a comparator and have Camel sort the files before being processed.

In the sample we have built our own comparator that just sorts by file name:

And then we can configure our route using the **sorter** option to reference to our sorter (**mySorter**) we have defined in the spring XML file:

```

<!-- define our sorter as a plain spring bean -->
<bean id="mySorter" class="com.mycompany.MyFileSorter"/>

<route>
  <from uri="file://inbox?sorter=#mySorter"/>
  <to uri="bean:processInbox"/>
</route>

```

TIP

URI options can reference beans using the # syntax In the Spring DSL route above notice that we can refer to beans in the Registry by prefixing the id with **#**. So writing **sorter=#mySorter**, will instruct Camel to go look in the Registry for a bean with the ID, **mySorter**.

103.25.2. Sorting using sortBy

Camel supports pluggable sorting strategies. This strategy it to use the [File Language](#) to configure the sorting. The **sortBy** option is configured as follows:

```
sortBy=group 1;group 2;group 3;...
```

Where each group is separated with semi colon. In the simple situations you just use one group, so a simple example could be:

```
sortBy=file:name
```

This will sort by file name, you can reverse the order by prefixing **reverse:** to the group, so the sorting is now Z..A:

```
sortBy=reverse:file:name
```

As we have the full power of [File Language](#) we can use some of the other parameters, so if we want to sort by file size we do:

```
sortBy=file:length
```

You can configure to ignore the case, using **ignoreCase:** for string comparison, so if you want to use file name sorting but to ignore the case then we do:

```
sortBy=ignoreCase:file:name
```

You can combine ignore case and reverse, however reverse must be specified first:

```
sortBy=reverse:ignoreCase:file:name
```

In the sample below we want to sort by last modified file, so we do:

```
sortBy=file:modified
```

And then we want to group by name as a 2nd option so files with same modification is sorted by name:

```
sortBy=file:modified;file:name
```

Now there is an issue here, can you spot it? Well the modified timestamp of the file is too fine as it will be in milliseconds, but what if we want to sort by date only and then subgroup by name?

Well as we have the true power of [File Language](#) we can use its date command that supports patterns. So this can be solved as:

```
sortBy=date:file:yyyyMMdd;file:name
```

Yeah, that is pretty powerful, oh by the way you can also use reverse per group, so we could reverse the file names:

```
sortBy=date:file:yyyyMMdd;reverse:file:name
```

103.26. USING GENERICFILEPROCESSSTRATEGY

The option **processStrategy** can be used to use a custom **GenericFileProcessStrategy** that allows you to implement your own *begin*, *commit* and *rollback* logic.

For instance lets assume a system writes a file in a folder you should consume. But you should not start consuming the file before another *ready* file has been written as well.

So by implementing our own **GenericFileProcessStrategy** we can implement this as:

- In the **begin()** method we can test whether the special *ready* file exists. The begin method returns a **boolean** to indicate if we can consume the file or not.
- In the **abort()** method (Camel 2.10) special logic can be executed in case the **begin** operation returned **false**, for example to cleanup resources etc.
- in the **commit()** method we can move the actual file and also delete the *ready* file.

103.27. USING FILTER

The **filter** option allows you to implement a custom filter in Java code by implementing the **org.apache.camel.component.file.GenericFileFilter** interface. This interface has an **accept** method that returns a boolean. Return **true** to include the file, and **false** to skip the file. From Camel 2.10 onwards, there is a **isDirectory** method on **GenericFile** whether the file is a directory. This allows you to filter unwanted directories, to avoid traversing down unwanted directories.

For example to skip any directories which starts with **"skip"** in the name, can be implemented as follows:

103.28. USING CONSUMER.BRIDGEERRORHANDLER

Available as of Camel 2.10

If you want to use the Camel Error Handler to deal with any exception occurring in the file consumer, then you can enable the **consumer.bridgeErrorHandler** option as shown below:

```
// to handle any IOException being thrown
onException(IOException.class)
    .handled(true)
    .log("IOException occurred due: ${exception.message}")
    .transform().simple("Error ${exception.message}")
    .to("mock:error");

// this is the file route that pickup files, notice how we bridge the consumer to use the Camel routing
// error handler
// the exclusiveReadLockStrategy is only configured because this is from an unit test, so we use that
// to simulate exceptions
from("file:target/nospace?consumer.bridgeErrorHandler=true")
    .convertBodyTo(String.class)
    .to("mock:result");
```

So all you have to do is to enable this option, and the error handler in the route will take it from there.

IMPORTANT

Important when using consumer.bridgeErrorHandler When using `consumer.bridgeErrorHandler`, then interceptors, `OnCompletions` does **not** apply. The Exchange is processed directly by the Camel Error Handler, and does not allow prior actions such as interceptors, `onCompletion` to take action.

103.29. DEBUG LOGGING

This component has log level **TRACE** that can be helpful if you have problems.

103.30. SEE ALSO

CHAPTER 104. FILE LANGUAGE

Available as of Camel version 1.1

INFO:*File language is now merged with Simple language* From Camel 2.2 onwards, the file language is now merged with [Simple](#) language which means you can use all the file syntax directly within the simple language.

The File Expression Language is an extension to the [Simple](#) language, adding file related capabilities. These capabilities are related to common use cases working with file path and names. The goal is to allow expressions to be used with the File and FTP components for setting dynamic file patterns for both consumer and producer.

104.1. FILE LANGUAGE OPTIONS

The File language supports 2 options, which are listed below.

Name	Default	Java Type	Description
resultType		String	Sets the class name of the result type (type from output)
trim	true	Boolean	Whether to trim the value to remove leading and trailing whitespaces and line breaks

104.2. SYNTAX

This language is an **extension** to the [Simple](#) language so the [Simple](#) syntax applies also. So the table below only lists the additional.

As opposed to [Simple](#) language [File Language](#) also supports [Constant](#) expressions so you can enter a fixed filename.

All the file tokens use the same expression name as the method on the **java.io.File** object, for instance **file:absolute** refers to the **java.io.File.getAbsolute()** method. Notice that not all expressions are supported by the current Exchange. For instance the [FTP](#) component supports some of the options, where as the File component supports all of them.

Expression	Type	File Consumer	File Producer	FTP Consumer	FTP Producer	Description
file:name	String	yes	no	yes	no	refers to the file name (is relative to the starting directory, see note below)
file:name.ext	String	yes	no	yes	no	Camel 2.3: refers to the file extension only

Expression	Type	File Consumer	File Producer	FTP Consumer	FTP Producer	Description
file:name.ext.single	String	yes	no	yes	no	Camel 2.14.4/2.15.3: refers to the file extension. If the file extension has multiple dots, then this expression strips and only returns the last part.
file:name.noext	String	yes	no	yes	no	refers to the file name with no extension (is relative to the starting directory, see note below)
file:name.noext.single	String	yes	no	yes	no	Camel 2.14.4/2.15.3: refers to the file name with no extension (is relative to the starting directory, see note below). If the file extension has multiple dots, then this expression strips only the last part, and keep the others.
file:onlyname	String	yes	no	yes	no	refers to the file name only with no leading paths.
file:onlyname.noext	String	yes	no	yes	no	refers to the file name only with no extension and with no leading paths.
file:onlyname.noext.single	String	yes	no	yes	no	*Camel 2.14.4/2.15.3:*refers to the file name only with no extension and with no leading paths. If the file extension has multiple dots, then this expression strips only the last part, and keep the others.

Expression	Type	File Consumer	File Producer	FTP Consumer	FTP Producer	Description
file:ext	String	yes	no	yes	no	refers to the file extension only
file:parent	String	yes	no	yes	no	refers to the file parent
file:path	String	yes	no	yes	no	refers to the file path
file:absolute	Boolean	yes	no	no	no	refers to whether the file is regarded as absolute or relative
file:absolute.path	String	yes	no	no	no	refers to the absolute file path
file:length	Long	yes	no	yes	no	refers to the file length returned as a Long type
file:size	Long	yes	no	yes	no	Camel 2.5: refers to the file length returned as a Long type
file:modified	Date	yes	no	yes	no	Refers to the file last modified returned as a Date type
date:_command:pattern_	String	yes	yes	yes	yes	for date formatting using the java.text.SimpleDateFormat patterns. Is an extension to the Simple language. Additional command is: file (consumers only) for the last modified timestamp of the file. Notice: all the commands from the Simple language can also be used.

104.3. FILE TOKEN EXAMPLE

104.3.1. Relative paths

We have a **java.io.File** handle for the file **hello.txt** in the following **relative** directory: **.filelanguage\test**. And we configure our endpoint to use this starting directory **.filelanguage**. The file tokens will return as:

Expression	Returns
file:name	test\hello.txt
file:name.ext	txt
file:name.noext	test\hello
file:onlyname	hello.txt
file:onlyname.noext	hello
file:ext	txt
file:parent	filelanguage\test
file:path	filelanguage\test\hello.txt
file:absolute	false
file:absolute.path	\workspace\camel\camel-core\target\filelanguage\test\hello.txt

104.3.2. Absolute paths

We have a **java.io.File** handle for the file **hello.txt** in the following **absolute** directory: **\workspace\camel\camel-core\target\filelanguage\test**. And we configure our endpoint to use the absolute starting directory **\workspace\camel\camel-core\target\filelanguage**. The file tokens will return as:

Expression	Returns
file:name	test\hello.txt
file:name.ext	txt
file:name.noext	test\hello
file:onlyname	hello.txt
file:onlyname.noext	hello
file:ext	txt

Expression	Returns
file:parent	\workspace\camel\camel-core\target\filelanguage\test
file:path	\workspace\camel\camel-core\target\filelanguage\test\hello.txt
file:absolute	true
file:absolute.path	\workspace\camel\camel-core\target\filelanguage\test\hello.txt

104.4. SAMPLES

You can enter a fixed [Constant](#) expression such as **myfile.txt**:

```
fileName="myfile.txt"
```

Lets assume we use the file consumer to read files and want to move the read files to backup folder with the current date as a sub folder. This can be achieved using an expression like:

```
fileName="backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

relative folder names are also supported so suppose the backup folder should be a sibling folder then you can append .. as:

```
fileName="../backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

As this is an extension to the [Simple](#) language we have access to all the goodies from this language also, so in this use case we want to use the in.header.type as a parameter in the dynamic expression:

```
fileName="../backup/${date:now:yyyyMMdd}/type-${in.header.type}/backup-of-${file:name.noext}.bak"
```

If you have a custom Date you want to use in the expression then Camel supports retrieving dates from the message header.

```
fileName="orders/order-${in.header.customerId}-${date:in.header.orderDate:yyyyMMdd}.xml"
```

And finally we can also use a bean expression to invoke a POJO class that generates some String output (or convertible to String) to be used:

```
fileName="uniquefile-${bean:myguidgenerator.generateid}.txt"
```

And of course all this can be combined in one expression where you can use the [File Language](#), [Simple](#) and the [Bean](#) language in one combined expression. This is pretty powerful for those common file path patterns.

104.5. USING SPRING PROPERTYPLACEHOLDERCONFIGURER TOGETHER WITH THE FILE COMPONENT

In Camel you can use the [File Language](#) directly from the [Simple](#) language which makes a Content Based Router easier to do in Spring XML, where we can route based on file extensions as shown below:

```
<from uri="file://input/orders"/>
  <choice>
    <when>
      <simple>${file:ext} == 'txt'</simple>
      <to uri="bean:orderService?method=handleTextFiles"/>
    </when>
    <when>
      <simple>${file:ext} == 'xml'</simple>
      <to uri="bean:orderService?method=handleXmlFiles"/>
    </when>
    <otherwise>
      <to uri="bean:orderService?method=handleOtherFiles"/>
    </otherwise>
  </choice>
```

If you use the **fileName** option on the File endpoint to set a dynamic filename using the [File Language](#) then make sure you use the alternative syntax (available from Camel 2.5 onwards) to avoid clashing with Springs **PropertyPlaceholderConfigurer**.

bundle-context.xml

```
<bean id="propertyPlaceholder"
class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="location" value="classpath:bundle-context.cfg" />
</bean>

<bean id="sampleRoute" class="SampleRoute">
  <property name="fromEndpoint" value="${fromEndpoint}" />
  <property name="toEndpoint" value="${toEndpoint}" />
</bean>
```

bundle-context.cfg

```
fromEndpoint=activemq:queue:test
toEndpoint=file://fileRoute/out?fileName=test-${simple{date:now:yyyyMMdd}.txt
```

Notice how we use the `${simple{}}` syntax in the **toEndpoint** above. If you don't do this, there is a clash and Spring will throw an exception like

```
org.springframework.beans.factory.BeanDefinitionStoreException:
Invalid bean definition with name 'sampleRoute' defined in class path resource [bundle-context.xml]:
Could not resolve placeholder 'date:now:yyyyMMdd'
```

104.6. DEPENDENCIES

The File language is part of **camel-core**.

CHAPTER 105. FLATPACK COMPONENT

Available as of Camel version 1.4

The Flatpack component supports fixed width and delimited file parsing via the [FlatPack library](#).

Notice: This component only supports consuming from flatpack files to Object model. You can not (yet) write from Object model to flatpack format.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

105.1. URI FORMAT

```
flatpack:[delim|fixed]:flatPackConfig.pzmap.xml[?options]
```

Or for a delimited file handler with no configuration file just use

```
flatpack:someName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

105.2. URI OPTIONS

The Flatpack component has no options.

The Flatpack endpoint is configured using URI syntax:

```
flatpack:type:resourceUri
```

with the following path and query parameters:

105.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
type	Whether to use fixed or delimiter	delim	FlatpackType
resourceUri	Required URL for loading the flatpack mapping file from classpath or file system		String

105.2.2. Query Parameters (25 parameters):

Name	Description	Default	Type
allowShortLines (common)	Allows for lines to be shorter than expected and ignores the extra characters	false	boolean
delimiter (common)	The default character delimiter for delimited files.	,	char
ignoreExtraColumns (common)	Allows for lines to be longer than expected and ignores the extra characters	false	boolean
ignoreFirstRecord (common)	Whether the first line is ignored for delimited files (for the column headers).	true	boolean
splitRows (common)	Sets the Component to send each row as a separate exchange once parsed	true	boolean
textQualifier (common)	The text qualifier for delimited files.		char
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		<code>PollingConsumerPollStrategy</code>

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler

Name	Description	Default	Type
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

105.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
camel.component.flatpack.enabled	Enable flatpack component	true	Boolean
camel.component.flatpack.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
camel.dataformat.flatpack.allow-short-lines	Allows for lines to be shorter than expected and ignores the extra characters	false	Boolean
camel.dataformat.flatpack.content-type-header	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
camel.dataformat.flatpack.definition	The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.		String
camel.dataformat.flatpack.delimiter	The delimiter char (could be ; , or similar)	,	String

Name	Description	Default	Type
<code>camel.dataformat.flatpack.enabled</code>	Enable flatpack dataformat	true	Boolean
<code>camel.dataformat.flatpack.fixed</code>	Delimited or fixed. Is by default false = delimited	false	Boolean
<code>camel.dataformat.flatpack.ignore-extra-columns</code>	Allows for lines to be longer than expected and ignores the extra characters.	false	Boolean
<code>camel.dataformat.flatpack.ignore-first-record</code>	Whether the first line is ignored for delimited files (for the column headers). Is by default true.	true	Boolean
<code>camel.dataformat.flatpack.parser-factory-ref</code>	References to a custom parser factory to lookup in the registry		String
<code>camel.dataformat.flatpack.text-qualifier</code>	If the text is qualified with a character. Uses quote character by default.		String

105.4. EXAMPLES

- `flatpack:fixed:foo.pzmap.xml` creates a fixed-width endpoint using the `foo.pzmap.xml` file configuration.
- `flatpack:delim:bar.pzmap.xml` creates a delimited endpoint using the `bar.pzmap.xml` file configuration.
- `flatpack:foo` creates a delimited endpoint called `foo` with no file configuration.

105.5. MESSAGE HEADERS

Camel will store the following headers on the IN message:

Header	Description
<code>camelFlatpackCounter</code>	The current row index. For <code>splitRows=false</code> the counter is the total number of rows.

105.6. MESSAGE BODY

The component delivers the data in the IN message as a `org.apache.camel.component.flatpack.DataSetList` object that has converters for `java.util.Map` or `java.util.List`.

Usually you want the **Map** if you process one row at a time (**splitRows=true**). Use **List** for the entire content (**splitRows=false**), where each element in the list is a **Map**. Each **Map** contains the key for the column name and its corresponding value.

For example to get the firstname from the sample below:

```
Map row = exchange.getIn().getBody(Map.class);
String firstName = row.get("FIRSTNAME");
```

However, you can also always get it as a **List** (even for **splitRows=true**). The same example:

```
List data = exchange.getIn().getBody(List.class);
Map row = (Map)data.get(0);
String firstName = row.get("FIRSTNAME");
```

105.7. HEADER AND TRAILER RECORDS

The header and trailer notions in Flatpack are supported. However, you **must** use fixed record IDs:

- **header** for the header record (must be lowercase)
- **trailer** for the trailer record (must be lowercase)

The example below illustrates this fact that we have a header and a trailer. You can omit one or both of them if not needed.

```
<RECORD id="header" startPosition="1" endPosition="3" indicator="HBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="DATE" length="8"/>
</RECORD>

<COLUMN name="FIRSTNAME" length="35" />
<COLUMN name="LASTNAME" length="35" />
<COLUMN name="ADDRESS" length="100" />
<COLUMN name="CITY" length="100" />
<COLUMN name="STATE" length="2" />
<COLUMN name="ZIP" length="5" />

<RECORD id="trailer" startPosition="1" endPosition="3" indicator="FBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="STATUS" length="7"/>
</RECORD>
```

105.8. USING THE ENDPOINT

A common use case is sending a file to this endpoint for further processing in a separate route. For example:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="file://someDirectory"/>
    <to uri="flatpack:foo"/>
  </route>
```

```

<route>
  <from uri="flatpack:foo"/>
  ...
</route>
</camelContext>

```

You can also convert the payload of each message created to a **Map** for easy Bean Integration

105.9. FLATPACK DATAFORMAT

The [Flatpack](#) component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a **List** of rows as **Map**.

- marshal = from **List<Map<String, Object>>** to **OutputStream** (can be converted to **String**)
- unmarshal = from **java.io.InputStream** (such as a **File** or **String**) to a **java.util.List** as an **org.apache.camel.component.flatpack.DataSetList** instance.
The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using **Splitter**.

Notice: The Flatpack library does currently not support header and trailers for the marshal operation.

105.10. OPTIONS

The data format has the following options:

Option	Default	Description
definition	null	The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.
fixed	false	Delimited or fixed.
ignoreFirstRecord	true	Whether the first line is ignored for delimited files (for the column headers).
textQualifier	"	If the text is qualified with a char such as " .
delimiter	,	The delimiter char (could be ; , or similar)
parserFactory	null	Uses the default Flatpack parser factory.

Option	Default	Description
allow Short Lines	false	Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be shorter than expected and ignores the extra characters.
ignore Extra Columns	false	Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be longer than expected and ignores the extra characters.

105.11. USAGE

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
...
from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the **order/in** folder and unmarshal the input using the Flatpack configuration file **INVENTORY-Delimited.pzmap.xml** that configures the structure of the files. The result is a **DataSetList** object we store on the SEDA queue.

```
FlatpackDataFormat df = new FlatpackDataFormat();
df.setDefinition(new ClassPathResource("PEOPLE-FixedLength.pzmap.xml"));
df.setFixed(true);
df.setIgnoreFirstRecord(false);

from("seda:people").marshal(df).convertBodyTo(String.class).to("jms:queue:people");
```

In the code above we marshal the data from a Object representation as a **List** of rows as **Maps**. The rows as **Map** contains the column name as the key, and the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a **String** object and store it on a JMS queue.

105.12. DEPENDENCIES

To use Flatpack in your camel routes you need to add the a dependency on **camel-flatpack** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 106. FLATPACK DATAFORMAT

Available as of Camel version 2.1

The [Flatpack](#) component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a **List** of rows as **Map**.

- marshal = from **List<Map<String, Object>>** to **OutputStream** (can be converted to **String**)
- unmarshal = from **java.io.InputStream** (such as a **File** or **String**) to a **java.util.List** as an **org.apache.camel.component.flatpack.DataSetList** instance.
The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using `Splitter`.

Notice: The Flatpack library does currently not support header and trailers for the marshal operation.

106.1. OPTIONS

The Flatpack dataformat supports 9 options, which are listed below.

Name	Default	Java Type	Description
<code>definition</code>		String	The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.
<code>fixed</code>	false	Boolean	Delimited or fixed. Is by default false = delimited
<code>ignoreFirstRecord</code>	true	Boolean	Whether the first line is ignored for delimited files (for the column headers). Is by default true.
<code>textQualifier</code>		String	If the text is qualified with a character. Uses quote character by default.
<code>delimiter</code>	,	String	The delimiter char (could be ;, or similar)
<code>allowShortLines</code>	false	Boolean	Allows for lines to be shorter than expected and ignores the extra characters
<code>ignoreExtraColumns</code>	false	Boolean	Allows for lines to be longer than expected and ignores the extra characters.
<code>parserFactoryRef</code>		String	References to a custom parser factory to lookup in the registry
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

106.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.flatpack.enabled</code>	Enable flatpack component	true	Boolean
<code>camel.component.flatpack.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.dataformat.flatpack.allow-short-lines</code>	Allows for lines to be shorter than expected and ignores the extra characters	false	Boolean
<code>camel.dataformat.flatpack.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.flatpack.definition</code>	The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.		String
<code>camel.dataformat.flatpack.delimiter</code>	The delimiter char (could be <code>;</code> , or similar)	,	String
<code>camel.dataformat.flatpack.enabled</code>	Enable flatpack dataformat	true	Boolean
<code>camel.dataformat.flatpack.fixed</code>	Delimited or fixed. Is by default false = delimited	false	Boolean
<code>camel.dataformat.flatpack.ignore-extra-columns</code>	Allows for lines to be longer than expected and ignores the extra characters.	false	Boolean
<code>camel.dataformat.flatpack.ignore-first-record</code>	Whether the first line is ignored for delimited files (for the column headers). Is by default true.	true	Boolean
<code>camel.dataformat.flatpack.parser-factory-ref</code>	References to a custom parser factory to lookup in the registry		String

Name	Description	Default	Type
<code>camel.dataformat.flatpack.text-qualifier</code>	If the text is qualified with a character. Uses quote character by default.		String

ND

106.3. USAGE

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
...
from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the **order/in** folder and unmarshal the input using the Flatpack configuration file **INVENTORY-Delimited.pzmap.xml** that configures the structure of the files. The result is a **DataSetList** object we store on the SEDA queue.

```
FlatpackDataFormat df = new FlatpackDataFormat();
df.setDefinition(new ClassPathResource("PEOPLE-FixedLength.pzmap.xml"));
df.setFixed(true);
df.setIgnoreFirstRecord(false);

from("seda:people").marshal(df).convertBodyTo(String.class).to("jms:queue:people");
```

In the code above we marshal the data from a Object representation as a **List** of rows as **Maps**. The rows as **Map** contains the column name as the key, and the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a **String** object and store it on a JMS queue.

106.4. DEPENDENCIES

To use Flatpack in your camel routes you need to add the a dependency on **camel-flatpack** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 107. APACHE FLINK COMPONENT

Available as of Camel version 2.18

This documentation page covers the [Apache Flink](#) component for the Apache Camel. The **camel-flink** component provides a bridge between Camel connectors and Flink tasks.

This Camel Flink connector provides a way to route message from various transports, dynamically choosing a flink task to execute, use incoming message as input data for the task and finally deliver the results back to the Camel pipeline.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flink</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

107.1. URI FORMAT

Currently, the Flink Component supports only Producers. One can create DataSet, DataStream jobs.

```
flink:dataset?dataset=#myDataSet&dataSetCallback=#dataSetCallback
flink:datastream?datastream=#myDataStream&dataStreamCallback=#dataStreamCallback
```

FlinkEndpoint Options

The Apache Flink endpoint is configured using URI syntax:

```
flink:endpointType
```

with the following path and query parameters:

107.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
endpointType	Required Type of the endpoint (dataset, datastream).		EndpointType

107.1.2. Query Parameters (6 parameters):

Name	Description	Default	Type
collect (producer)	Indicates if results should be collected or counted.	true	boolean

Name	Description	Default	Type
dataSet (producer)	DataSet to compute against.		DataSet
dataSetCallback (producer)	Function performing action against a DataSet.		DataSetCallback
dataStream (producer)	DataStream to compute against.		DataStream
dataStreamCallback (producer)	Function performing action against a DataStream.		DataStreamCallback
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

107.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.flink.data-set	DataSet to compute against. The option is a <code>org.apache.flink.api.java.DataSet</code> type.		String
camel.component.flink.data-set-callback	Function performing action against a DataSet. The option is a <code>org.apache.camel.component.flink.DataSetCallback</code> type.		String
camel.component.flink.data-stream	DataStream to compute against. The option is a <code>org.apache.flink.streaming.api.datastream.DataStream</code> type.		String
camel.component.flink.data-stream-callback	Function performing action against a DataStream. The option is a <code>org.apache.camel.component.flink.DataStreamCallback</code> type.		String
camel.component.flink.enabled	Enable flink component	true	Boolean

Name	Description	Default	Type
<code>camel.component.flink.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

107.3. FLINKCOMPONENT OPTIONS

The Apache Flink component supports 5 options, which are listed below.

Name	Description	Default	Type
<code>dataSet</code> (producer)	DataSet to compute against.		DataSet
<code>dataStream</code> (producer)	DataStream to compute against.		DataStream
<code>dataSetCallback</code> (producer)	Function performing action against a DataSet.		DataSetCallback
<code>dataStreamCallback</code> (producer)	Function performing action against a DataStream.		DataStreamCallback
<code>resolvePropertyPlaceholders</code> (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

107.4. FLINK DATASET CALLBACK

```
@Bean
public DataSetCallback<Long> dataSetCallback() {
    return new DataSetCallback<Long>() {
        public Long onDataSet(DataSet dataSet, Object... objects) {
            try {
                dataSet.print();
                return new Long(0);
            } catch (Exception e) {
                return new Long(-1);
            }
        }
    };
}
```

107.5. FLINK DATASTREAM CALLBACK

```
@Bean
public VoidDataStreamCallback dataStreamCallback() {
    return new VoidDataStreamCallback() {
        @Override
        public void doOnDataStream(DataStream dataStream, Object... objects) throws Exception {
            dataStream.flatMap(new Splitter()).print();

            environment.execute("data stream test");
        }
    };
}
```

107.6. CAMEL-FLINK PRODUCER CALL

```
CamelContext camelContext = new SpringCamelContext(context);

String pattern = "foo";

try {
    ProducerTemplate template = camelContext.createProducerTemplate();
    camelContext.start();
    Long count = template.requestBody("flink:dataSet?
dataSet=#myDataSet&dataSetCallback=#countLinesContaining", pattern, Long.class);
} finally {
    camelContext.stop();
}
```

CHAPTER 108. FOP COMPONENT

Available as of Camel version 2.10

The FOP component allows you to render a message into different output formats using [Apache FOP](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-fop</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

108.1. URI FORMAT

```
fop://outputFormat?[options]
```

108.2. OUTPUT FORMATS

The primary output format is PDF but other output [formats](#) are also supported:

name	output Format	description
PDF	application/pdf	Portable Document Format
PS	application/postscript	Adobe Postscript
PCL	application/x-pcl	Printer Control Language
PNG	image/png	PNG images
JPEG	image/jpeg	JPEG images
SVG	image/svg+xml	Scalable Vector Graphics

name	output Format	description
XML	application/xhtml+xml	Area tree representation
MIF	application/mif	FrameMaker's MIF
RTF	application/rtf	Rich Text Format
TXT	text/plain	Text

The complete list of valid output formats can be found [here](#)

108.3. ENDPOINT OPTIONS

The FOP component has no options.

The FOP endpoint is configured using URI syntax:

```
fop:outputType
```

with the following path and query parameters:

108.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
outputType	Required The primary output format is PDF but other output formats are also supported.		FopOutputType

108.3.2. Query Parameters (3 parameters):

Name	Description	Default	Type
fopFactory (producer)	Allows to use a custom configured or implementation of org.apache.fop.apps.FopFactory.		FopFactory

Name	Description	Default	Type
userConfigURL (producer)	The location of a configuration file which can be loaded from classpath or file system.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

108.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.fop.enabled	Enable fop component	true	Boolean
camel.component.fop.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

The location of a configuration file with the following [structure](#). From **Camel 2.12** onwards the file is loaded from the classpath by default. You can use **file:**, or **classpath:** as prefix to load the resource from file or classpath. In previous releases the file is always loaded from file system.

fopFactory

Allows to use a custom configured or implementation of **org.apache.fop.apps.FopFactory**.

108.5. MESSAGE OPERATIONS

name	default value	description
CamelFop.Output.Format		Overrides the output format for that message

name	default value	description
CamelFop.Encrypt.userPassword		PDF user password
CamelFop.Encrypt.ownerPassword		PDF owner password
CamelFop.Encrypt.allowPrint	true	Allows printing the PDF
CamelFop.Encrypt.allowCopyContent	true	Allows copying content of the PDF
CamelFop.Encrypt.allowEditContent	true	Allows editing content of the PDF
CamelFop.Encrypt.allowEditAnnotations	true	Allows editing annotation of the PDF
CamelFop.Render.producer	Apache FOP	Metadata element for the system/software that produces the document
CamelFop.Render.creator		Metadata element for the user that created the document

name	default value	description
CamelFop.Render.creationDate		Creation Date
CamelFop.Render.author		Author of the content of the document
CamelFop.Render.title		Title of the document
CamelFop.Render.subject		Subject of the document
CamelFop.Render.keywords		Set of keywords applicable to this document

108.6. EXAMPLE

Below is an example route that renders PDFs from xml data and xslt template and saves the PDF files in target folder:

```
from("file:source/data/xml")
  .to("xslt:xslt/template.xsl")
  .to("fop:application/pdf")
  .to("file:target/data");
```

For more information, see these resources...

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 109. FREEMARKER COMPONENT

Available as of Camel version 2.10

The **freemarker**: component allows for processing a message using a [FreeMarker](#) template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-freemarker</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

109.1. URI FORMAT

```
freemarker:templateName[?options]
```

Where **templateName** is the classpath-local URI of the template to invoke; or the complete URL of the remote template (eg: [file://folder/myfile.ftl](#)).

You can append query options to the URI in the following format, **?option=value&option=value&...**

109.2. OPTIONS

The Freemarker component supports 4 options, which are listed below.

Name	Description	Default	Type
allowContextMapAll (producer)	Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API.	false	boolean
allowTemplateFromHeader (producer)	Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.	false	boolean
configuration (advanced)	To use an existing freemarker.template.Configuration instance as the configuration.		Configuration

Name	Description	Default	Type
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Freemarker endpoint is configured using URI syntax:

```
freemarker:resourceUri
```

with the following path and query parameters:

109.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
resourceUri	Required Path to the resource. You can prefix with: classpath, file, http, ref, or bean. classpath, file and http loads the resource using these protocols (classpath is default). ref will lookup the resource in the registry. bean will call a method on a bean to be used as the resource. For bean you can specify the method name after dot, eg bean:myBean.myMethod.		String

109.2.2. Query Parameters (7 parameters):

Name	Description	Default	Type
allowContextMapAll (producer)	Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API.	false	boolean
allowTemplateFromHeader (producer)	Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.	false	boolean

Name	Description	Default	Type
configuration (producer)	Sets the Freemarker configuration to use		Configuration
contentCache (producer)	Sets whether to use resource content cache or not	false	boolean
encoding (producer)	Sets the encoding to be used for loading the template file.		String
templateUpdateDelay (producer)	Number of seconds the loaded template resource will remain in the cache.		int
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

109.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.freemarker.configuration	To use an existing freemarker.template.Configuration instance as the configuration. The option is a freemarker.template.Configuration type.		String
camel.component.freemarker.enabled	Enable freemarker component	true	Boolean
camel.component.freemarker.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

109.4. HEADERS

Headers set during the FreeMarker evaluation are returned to the message and added as headers. This provides a mechanism for the FreeMarker component to return values to the Message.

An example: Set the header value of **fruit** in the FreeMarker template:

```
${request.setHeader('fruit', 'Apple')}
```

The header, **fruit**, is now accessible from the **message.out.headers**.

109.5. FREEMARKER CONTEXT

Camel will provide exchange information in the FreeMarker context (just a **Map**). The **Exchange** is transferred as:

key	value
exchange	The Exchange itself.
exchange.properties	The Exchange properties.
headers	The headers of the In message.
camelContext	The Camel Context.
request	The In message.
body	The In message body.
response	The Out message (only for InOut message exchange pattern).

From Camel 2.14, you can setup your custom FreeMarker context in the message header with the key "**CamelFreemarkerDataModel**" just like this

```
Map<String, Object> variableMap = new HashMap<String, Object>();
variableMap.put("headers", headersMap);
variableMap.put("body", "Monday");
variableMap.put("exchange", exchange);
exchange.getIn().setHeader("CamelFreemarkerDataModel", variableMap);
```

109.6. HOT RELOADING

The FreeMarker template resource is by default **not** hot reloadable for both file and classpath resources (expanded jar). If you set **contentCache=false**, then Camel will not cache the resource and hot reloading is thus enabled. This scenario can be used in development.

109.7. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

Header	Type	Description	Support Version
FreemarkerConstants.FREEMARKER_RESOURCE	org.springframework.io.Resource	The template resource	≤ 2.1
FreemarkerConstants.FREEMARKER_RESOURCE_URI	String	A URI for the template resource to use instead of the endpoint configured.	≥ 2.1
FreemarkerConstants.FREEMARKER_TEMPLATE	String	The template to use instead of the endpoint configured.	≥ 2.1

109.8. SAMPLES

For example you could use something like:

```
from("activemq:My.Queue").
  to("freemarker:com/acme/MyResponse.ftl");
```

To use a FreeMarker template to formulate a response for a message for InOut message exchanges (where there is a **JMSReplyTo** header).

If you want to use InOnly and consume the message and send it to another destination you could use:

```
from("activemq:My.Queue").
  to("freemarker:com/acme/MyResponse.ftl").
  to("activemq:Another.Queue");
```

And to disable the content cache, e.g. for development usage where the **.ftl** template should be hot reloaded:

```
from("activemq:My.Queue").
  to("freemarker:com/acme/MyResponse.ftl?contentCache=false").
  to("activemq:Another.Queue");
```

And a file-based resource:

```
from("activemq:My.Queue").
  to("freemarker:file://myfolder/MyResponse.ftl?contentCache=false").
  to("activemq:Another.Queue");
```

In **Camel 2.1** it's possible to specify what template the component should use dynamically via a header, so for example:

```
from("direct:in").

setHeader(FreemarkerConstants.FREEMARKER_RESOURCE_URI).constant("path/to/my/template.ftl").
  to("freemarker:dummy?allowTemplateFromHeader=true");
```

WARNING

Enabling the **allowTemplateFromHeader** option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.

109.9. THE EMAIL SAMPLE

In this sample we want to use FreeMarker templating for an order confirmation email. The email template is laid out in FreeMarker as:

```
Dear ${headers.lastName}, ${headers.firstName}

Thanks for the order of ${headers.item}.

Regards Camel Riders Bookstore
${body}
```

And the java code:

CHAPTER 110. FTP COMPONENT

Available as of Camel version 1.1

This component provides access to remote file systems over the FTP and SFTP protocols.

When consuming from remote FTP server make sure you read the section titled *Default when consuming files* further below for details related to consuming files.

Absolute path is **not** supported. **Camel 2.16** will translate absolute path to relative by trimming all leading slashes from **directoryname**. There'll be WARN message printed in the logs.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ftp</artifactId>
  <version>x.x.x</version>See the documentation of the Apache Commons
  <!-- use the same version as your Camel core version -->
</dependency>
```

110.1. URI FORMAT

```
ftp://[username@]hostname[:port]/directoryname[?options]
sftp://[username@]hostname[:port]/directoryname[?options]
ftps://[username@]hostname[:port]/directoryname[?options]
```

Where **directoryname** represents the underlying directory. The directory name is a relative path. Absolute path's is **not** supported. The relative path can contain nested folders, such as /inbox/us.

For Camel versions before **Camel 2.16**, the **directoryName** **must** exist already as this component does not support the **autoCreate** option (which the file component does). The reason is that its the FTP administrator (FTP server) task to properly setup user accounts, and home directories with the right file permissions etc.

For **Camel 2.16**, **autoCreate** option is supported. When consumer starts, before polling is scheduled, there's additional FTP operation performed to create the directory configured for endpoint. The default value for **autoCreate** is **true**.

If no **username** is provided, then **anonymous** login is attempted using no password.

If no **port** number is provided, Camel will provide default values according to the protocol (ftp = 21, sftp = 22, ftps = 2222).

You can append query options to the URI in the following format, **?option=value&option=value&...**

This component uses two different libraries for the actual FTP work. FTP and FTPS uses [Apache Commons Net](#) while SFTP uses [JCraft JSCH](#).

The FTPS component is only available in Camel 2.2 or newer.

FTPS (also known as FTP Secure) is an extension to FTP that adds support for the Transport Layer Security (TLS) and the Secure Sockets Layer (SSL) cryptographic protocols.

110.2. URI OPTIONS

The options below are exclusive for the FTP component.

The FTP component has no options.

The FTP endpoint is configured using URI syntax:

```
ftp:host:port/directoryName
```

with the following path and query parameters:

110.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
host	Required Hostname of the FTP server		String
port	Port of the FTP server		int
directoryName	The starting directory		String

110.2.2. Query Parameters (110 parameters):

Name	Description	Default	Type
binary (common)	Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false).	false	boolean
charset (common)	This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.		String
disconnect (common)	Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead.	false	boolean

Name	Description	Default	Type
doneFileName (common)	Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders.		String
fileName (common)	Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverrideFileName header which takes precedence over any existing CamelFileName header; the CamelOverrideFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.		String
passiveMode (common)	Sets passive mode connections. Default is active mode connections.	false	boolean
separator (common)	Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name	UNIX	PathSeparator
transferLoggingInterval Seconds (common)	Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time.	5	int

Name	Description	Default	Type
transferLoggingLevel (common)	Configure the logging level to use when logging the progress of upload and download operations.	DEBUG	LogLevel
transferLoggingVerbose (common)	Configures whether the perform verbose (fine grained) logging of the progress of upload and download operations.	false	boolean
fastExistsCheck (common)	If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
delete (consumer)	If true, the file will be deleted after it is processed successfully.	false	boolean
moveFailed (consumer)	Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.		String
noop (consumer)	If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.	false	boolean
preMove (consumer)	Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.		String

Name	Description	Default	Type
preSort (consumer)	When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.	false	boolean
recursive (consumer)	If a directory, will look for files in all the sub-directories as well.	false	boolean
resumeDownload (consumer)	Configures whether resume download is enabled. This must be supported by the FTP server (almost all FTP servers support it). In addition the options localWorkDirectory must be configured so downloaded files are stored in a local directory, and the option binary must be enabled, which is required to support resuming of downloads.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
streamDownload (consumer)	Sets the download method to use when not using a local working directory. If set to true, the remote files are streamed to the route as they are read. When set to false, the remote files are loaded into memory before being sent into the route.	false	boolean
directoryMustExist (consumer)	Similar to startingDirectoryMustExist but this applies during polling recursive sub directories.	false	boolean
download (consumer)	Whether the FTP consumer should download the file. If this option is set to false, then the message body will be null, but the consumer will still trigger a Camel Exchange that has details about the file such as file name, file size, etc. It's just that the file will not be downloaded.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option errorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
handleDirectoryParserAbsoluteResult (consumer)	Allows you to set how the consumer will handle subfolders and files in the path if the directory parser results in with absolute paths. The reason for this is that some FTP servers may return file names with absolute paths, and if so then the FTP component needs to handle this by converting the returned path into a relative path.	false	boolean
ignoreFileNotFoundOrPermissionError (consumer)	Whether to ignore when (trying to list files in directories or when downloading a file), which does not exist or due to permission error. By default when a directory or file does not exist or insufficient permission, then an exception is thrown. Setting this option to true allows to ignore that instead.	false	boolean
inProgressRepository (consumer)	A pluggable in-progress repository <code>org.apache.camel.spi.IdempotentRepository</code> . The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used.		IdempotentRepository
localWorkDirectory (consumer)	When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory.		String
onCompletionExceptionHandler (consumer)	To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore.		ExceptionHandler
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy

Name	Description	Default	Type
processStrategy (consumer)	A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply.		<code>GenericFileProcessStrategy</code>
receiveBufferSize (consumer)	The receive (download) buffer size Used only by <code>FTPClient</code>	32768	int
startingDirectoryMustExist (consumer)	Whether the starting directory must exist. Mind that the <code>autoCreate</code> option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable <code>autoCreate</code> and enable this to ensure the starting directory must exist. Will thrown an exception if the directory doesn't exist.	false	boolean
useList (consumer)	Whether to allow using <code>LIST</code> command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the <code>LIST</code> command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when <code>LIST</code> command is in use.	true	boolean
fileExist (producer)	What to do if a file already exists with the same name. <code>Override</code> , which is the default, replaces the existing file. <code>Append</code> - adds content to the existing file. <code>Fail</code> - throws a <code>GenericFileOperationException</code> , indicating that there is already an existing file. <code>Ignore</code> - silently ignores the problem and does not override the existing file, but assumes everything is okay. <code>Move</code> - option requires to use the <code>moveExisting</code> option to be configured as well. The option <code>eagerDeleteTargetFile</code> can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The <code>Move</code> option will move any existing files, before writing the target file. <code>TryRename</code> is only applicable if <code>tempFileName</code> option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.	Override	<code>GenericFileExist</code>

Name	Description	Default	Type
flatten (producer)	Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.	false	boolean
jailStartingDirectory (producer)	Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders.	true	boolean
moveExisting (producer)	Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base.		String
tempFileName (producer)	The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language.		String
tempPrefix (producer)	This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files.		String
allowNullBody (producer)	Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged.	false	boolean

Name	Description	Default	Type
chmod (producer)	Allows you to set chmod on the stored file. For example chmod=640.		String
disconnectOnBatchComplete (producer)	Whether or not to disconnect from remote FTP server right after a Batch upload is complete. disconnectOnBatchComplete will only disconnect the current connection to the FTP server.	false	boolean
eagerDeleteTargetFile (producer)	Whether or not to eagerly delete any existing target file. This option only applies when you use fileExists=Override and the tempFileName option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensure the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when fileExist=Move is enabled, and an existing file exists. If this option copyAndDeleteOnRenameFails false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation.	true	boolean
keepLastModified (producer)	Will keep the last modified timestamp from the source file (if any). Will use the Exchange.FILE_LAST_MODIFIED header to located the timestamp. This header can contain either a java.util.Date or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers.	false	boolean
moveExistingFileStrategy (producer)	Strategy (Custom Strategy) used to move file with special naming token to use when fileExist=Move is configured. By default, there is an implementation used if no custom strategy is provided		FileMoveExistingStrategy
sendNoop (producer)	Whether to send a noop command as a pre-write check before uploading files to the FTP server. This is enabled by default as a validation of the connection is still valid, which allows to silently re-connect to be able to upload the file. However if this causes problems, you can turn this option off.	true	boolean

Name	Description	Default	Type
activePortRange (advanced)	Set the client side port range in active mode. The syntax is: minPort-maxPort Both port numbers are inclusive, eg 10000-19999 to include all lxxx ports.		String
autoCreate (advanced)	Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to.	true	boolean
bufferSize (advanced)	Write buffer sized in bytes.	131072	int
connectTimeout (advanced)	Sets the connect timeout for waiting for a connection to be established Used by both FTPClient and JSCH	10000	int
ftpClient (advanced)	To use a custom instance of FTPClient		FTPClient
ftpClientConfig (advanced)	To use a custom instance of FTPClientConfig to configure the FTP client the endpoint should use.		FTPClientConfig
ftpClientConfigParameters (advanced)	Used by FtpComponent to provide additional parameters for the FTPClientConfig		Map
ftpClientParameters (advanced)	Used by FtpComponent to provide additional parameters for the FTPClient		Map
maximumReconnectAttempts (advanced)	Specifies the maximum reconnect attempts Camel performs when it tries to connect to the remote FTP server. Use 0 to disable this behavior.		int
reconnectDelay (advanced)	Delay in millis Camel will wait before performing a reconnect attempt.		long
siteCommand (advanced)	Sets optional site command(s) to be executed after successful login. Multiple site commands can be separated using a new line character.		String
soTimeout (advanced)	Sets the so timeout Used only by FTPClient	30000 0	int

Name	Description	Default	Type
stepwise (advanced)	Sets whether we should stepwise change directories while traversing file structures when downloading files, or as well when uploading a file to a directory. You can disable this if you for example are in a situation where you cannot change directory on the FTP server due security reasons.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
throwExceptionOnConnectFailed (advanced)	Should an exception be thrown if connection failed (exhausted) By default exception is not thrown and a WARN is logged. You can use this to enable exception being thrown and handle the thrown exception from the <code>org.apache.camel.spi.PollingConsumerPollStrategy</code> rollback method.	false	boolean
timeout (advanced)	Sets the data timeout for waiting for reply Used only by FTPClient	30000	int
antExclude (filter)	Ant style filter exclusion. If both <code>antInclude</code> and <code>antExclude</code> are used, <code>antExclude</code> takes precedence over <code>antInclude</code> . Multiple exclusions may be specified in comma-delimited format.		String
antFilterCaseSensitive (filter)	Sets case sensitive flag on ant filter	true	boolean
antInclude (filter)	Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format.		String
eagerMaxMessagesPerPoll (filter)	Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting.	true	boolean
exclude (filter)	Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String

Name	Description	Default	Type
filter (filter)	Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns false in its <code>accept()</code> method.		GenericFileFilter
filterDirectory (filter)	Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyyMMdd</code>		String
filterFile (filter)	Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code>		String
idempotent (filter)	Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again.	false	Boolean
idempotentKey (filter)	To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code>		String
idempotentRepository (filter)	A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true.		IdempotentRepository
include (filter)	Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String
maxDepth (filter)	The maximum depth to traverse when recursively processing a directory.	2147483647	int

Name	Description	Default	Type
maxMessagesPerPoll (filter)	To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards.		int
minDepth (filter)	The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory.		int
move (filter)	Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a <code>.done</code> subdirectory just enter <code>.done</code> .		String
exclusiveReadLockStrategy (lock)	Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation.		GenericFileExclusiveReadLockStrategy

Name	Description	Default	Type
readLock (lock)	<p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail on Windows or the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p>	none	String

Name	Description	Default	Type
readLockCheckInterval (lock)	Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	1000	long
readLockDeleteOrphanLock Files (lock)	Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.	true	boolean
readLockLogging Level (lock)	Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.	DEBUG	LogLevel
readLockMarkerFile (lock)	Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.	true	boolean
readLockMinAge (lock)	This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use readLockMinAge=300s to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.	0	long

Name	Description	Default	Type
readLockMinLength (lock)	This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files.	1	long
readLockRemoveOnCommit (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the readLockIdempotentReleaseDelay option.	false	boolean
readLockRemoveOnRollback (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit).	true	boolean
readLockTimeout (lock)	Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	10000	long
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int

Name	Description	Default	Type
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for <code>initialDelay</code> and <code>delay</code> options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean
shuffle (sort)	To shuffle the list of files (sort in random order)	false	boolean

Name	Description	Default	Type
sortBy (sort)	Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date.		String
sorter (sort)	Pluggable sorter as a java.util.Comparator class.		Comparator
account (security)	Account to use for login		String
password (security)	Password to use for login		String
username (security)	Username to use for login		String

110.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.ftp.enabled	Enable ftp component	true	Boolean
camel.component.ftp.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

110.4. FTPS COMPONENT DEFAULT TRUST STORE

When using the **ftpClient** properties related to SSL with the FTPS component, the trust store accept all certificates. If you only want trust selective certificates, you have to configure the trust store with the **ftpClient.trustStore.xxx** options or by configuring a custom **ftpClient**.

When using **sslContextParameters**, the trust store is managed by the configuration of the provided SSLContextParameters instance.

You can configure additional options on the **ftpClient** and **ftpClientConfig** from the URI directly by using the **ftpClient.** or **ftpClientConfig.** prefix.

For example to set the **setDataTimeout** on the **FTPClient** to 30 seconds you can do:

```
from("ftp://foo@myserver?password=secret&ftpClient.dataTimeout=30000").to("bean:foo");
```

You can mix and match and have use both prefixes, for example to configure date format or timezones.

```
from("ftp://foo@myserver?
password=secret&ftpClient.dataTimeout=30000&ftpClientConfig.serverLanguageCode=fr").to("bean:foo");
```

You can have as many of these options as you like.

See the documentation of the Apache Commons FTP `FTPClientConfig` for possible options and more details. And as well for Apache Commons FTP `FTPClient`.

If you do not like having many and long configuration in the url you can refer to the `ftpClient` or `ftpClientConfig` to use by letting Camel lookup in the Registry for it.

For example:

```
<bean id="myConfig" class="org.apache.commons.net.ftp.FTPClientConfig">
  <property name="lenientFutureDates" value="true"/>
  <property name="serverLanguageCode" value="fr"/>
</bean>
```

And then let Camel lookup this bean when you use the `#` notation in the url.

```
from("ftp://foo@myserver?password=secret&ftpClientConfig=#myConfig").to("bean:foo");
```

110.5. EXAMPLES

<ftp://someone@someftpserver.com/public/upload/images/holiday2008?password=secret&binary=true>

<ftp://someoneelse@someotherftpserver.co.uk:12049/reports/2008/password=secret&binary=false>
<ftp://publicftpserver.com/download>

110.6. CONCURRENCY

FTP Consumer does not support concurrency

The FTP consumer (with the same endpoint) does not support concurrency (the backing FTP client is not thread safe).

You can use multiple FTP consumers to poll from different endpoints. It is only a single endpoint that does not support concurrent consumers.

The FTP producer does **not** have this issue, it supports concurrency.

110.7. MORE INFORMATION

This component is an extension of the File component. So there are more samples and details on the File component page.

110.8. DEFAULT WHEN CONSUMING FILES

The FTP consumer will by default leave the consumed files untouched on the remote FTP server. You have to configure it explicitly if you want it to delete the files or move them to another location. For example you can use `delete=true` to delete the files, or use `move=.done` to move the files into a hidden done sub directory.

The regular File consumer is different as it will by default move files to a **.camel** sub directory. The reason Camel does **not** do this by default for the FTP consumer is that it may lack permissions by default to be able to move or delete files.

110.8.1. limitations

The option **readLock** can be used to force Camel **not** to consume files that is currently in the progress of being written. However, this option is turned off by default, as it requires that the user has write access. See the options table at File2 for more details about read locks.

There are other solutions to avoid consuming files that are currently being written over FTP; for instance, you can write to a temporary destination and move the file after it has been written.

When moving files using **move** or **preMove** option the files are restricted to the FTP_ROOT folder. That prevents you from moving files outside the FTP area. If you want to move files to another area you can use soft links and move files into a soft linked folder.

110.9. MESSAGE HEADERS

The following message headers can be used to affect the behavior of the component

Header	Description
CamelFileName	Specifies the output file name (relative to the endpoint directory) to be used for the output message when sending to the endpoint. If this is not present and no expression either, then a generated message ID is used as the filename instead.
CamelFileNameProduced	The actual filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users the name of the file that was written.
CamelFileIndex	Current index out of total number of files being consumed in this batch.
CamelFileSize	Total number of files being consumed in this batch.
CamelFileHost	The remote hostname.
CamelFileLocalWorkPath	Path to the local work file, if local work directory is used.

In addition the FTP/FTPS consumer and producer will enrich the Camel **Message** with the following headers

Header	Description
CamelFtpReplyCode	Camel 2.11.1: The FTP client reply code (the type is a integer)

Header	Description
CamelFtpReplyString	Camel 2.11.1: The FTP client reply string

110.10. ABOUT TIMEOUTS

The two set of libraries (see top) has different API for setting timeout. You can use the **connectTimeout** option for both of them to set a timeout in millis to establish a network connection. An individual **soTimeout** can also be set on the FTP/FTPS, which corresponds to using **ftpClient.soTimeout**. Notice SFTP will automatically use **connectTimeout** as its **soTimeout**. The **timeout** option only applies for FTP/FTSP as the data timeout, which corresponds to the **ftpClient.dataTimeout** value. All timeout values are in millis.

110.11. USING LOCAL WORK DIRECTORY

Camel supports consuming from remote FTP servers and downloading the files directly into a local work directory. This avoids reading the entire remote file content into memory as it is streamed directly into the local file using **FileOutputStream**.

Camel will store to a local file with the same name as the remote file, though with **.inprogress** as extension while the file is being downloaded. Afterwards, the file is renamed to remove the **.inprogress** suffix. And finally, when the Exchange is complete the local file is deleted.

So if you want to download files from a remote FTP server and store it as files then you need to route to a file endpoint such as:

```
from("ftp://someone@someserver.com?password=secret&localWorkDirectory=/tmp").to("file://inbox");
```

TIP

The route above is ultra efficient as it avoids reading the entire file content into memory. It will download the remote file directly to a local file stream. The **java.io.File** handle is then used as the Exchange body. The file producer leverages this fact and can work directly on the work file **java.io.File** handle and perform a **java.io.File.rename** to the target filename. As Camel knows it's a local work file, it can optimize and use a rename instead of a file copy, as the work file is meant to be deleted anyway.

110.12. STEPWISE CHANGING DIRECTORIES

Camel FTP can operate in two modes in terms of traversing directories when consuming files (eg downloading) or producing files (eg uploading)

- stepwise
- not stepwise

You may want to pick either one depending on your situation and security issues. Some Camel end users can only download files if they use stepwise, while others can only download if they do not. At least you have the choice to pick (from Camel 2.6 onwards).

In Camel 2.0 - 2.5 there is only one mode and it is:

- before 2.5 not stepwise

- 2.5 stepwise

From Camel 2.6 onwards there is now an option **stepwise** you can use to control the behavior.

Note that stepwise changing of directory will in most cases only work when the user is confined to it's home directory and when the home directory is reported as `"/"`.

The difference between the two of them is best illustrated with an example. Suppose we have the following directory structure on the remote FTP server we need to traverse and download files:

```

/
/one
/one/two
/one/two/sub-a
/one/two/sub-b

```

And that we have a file in each of sub-a (a.txt) and sub-b (b.txt) folder.

110.12.1. Using `stepwise=true` (default mode)

```

```

As you can see when not using stepwise, there are no CD operation invoked at all.

110.13. SAMPLES

In the sample below we set up Camel to download all the reports from the FTP server once every hour (60 min) as BINARY content and store it as files on the local file system.

And the route using Spring DSL:

```

<route>
  <from uri="ftp://scott@localhost/public/reports?
password=tiger&binary=true&delay=60000"/>
  <to uri="file://target/test-reports"/>
</route>

```

110.13.1. Consuming a remote FTPS server (implicit SSL) and client authentication

```

from("ftps://admin@localhost:2222/public/camel?
password=admin&securityProtocol=SSL&isImplicit=true

```

```
&ftpClient.keyStore.file=./src/test/resources/server.jks
&ftpClient.keyStore.password=password&ftpClient.keyStore.keyPassword=password")
.to("bean:foo");
```

110.13.2. Consuming a remote FTPS server (explicit TLS) and a custom trust store configuration

```
from("ftps://admin@localhost:2222/public/camel?
password=admin&ftpClient.trustStore.file=./src/test/resources/server.jks&ftpClient.trustStore.password=
password")
.to("bean:foo");
```

110.14. FILTER USING `ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER`

Camel supports pluggable filtering strategies. This strategy it to use the build in **org.apache.camel.component.file.GenericFileFilter** in Java. You can then configure the endpoint with such a filter to skip certain filters before being processed.

In the sample we have built our own filter that only accepts files starting with report in the filename.

And then we can configure our route using the **filter** attribute to reference our filter (using **#** notation) that we have defined in the spring XML file:

```
<!-- define our sorter as a plain spring bean -->
<bean id="myFilter" class="com.mycompany.MyFileFilter"/>

<route>
  <from uri="ftp://someuser@someftpserver.com?password=secret&filter=#myFilter"/>
  <to uri="bean:processInbox"/>
</route>
```

110.15. FILTERING USING ANT PATH MATCHER

The ANT path matcher is a filter that is shipped out-of-the-box in the **camel-spring** jar. So you need to depend on **camel-spring** if you are using Maven.

The reason is that we leverage Spring's [AntPathMatcher](#) to do the actual matching.

The file paths are matched with the following rules:

- **?** matches one character
- ***** matches zero or more characters
- ****** matches zero or more directories in a path

The sample below demonstrates how to use it:

110.16. USING A PROXY WITH SFTP

To use an HTTP proxy to connect to your remote host, you can configure your route in the following way:

```

<!-- define our sorter as a plain spring bean -->
<bean id="proxy" class="com.jcraft.jsch.ProxyHTTP">
  <constructor-arg value="localhost"/>
  <constructor-arg value="7777"/>
</bean>

<route>
  <from uri="sftp://localhost:9999/root?username=admin&password=admin&proxy=#proxy"/>
  <to uri="bean:processFile"/>
</route>

```

You can also assign a user name and password to the proxy, if necessary. Please consult the documentation for **com.jcraft.jsch.Proxy** to discover all options.

110.17. SETTING PREFERRED SFTP AUTHENTICATION METHOD

If you want to explicitly specify the list of authentication methods that should be used by **sftp** component, use **preferredAuthentications** option. If for example you would like Camel to attempt to authenticate with private/public SSH key and fallback to user/password authentication in the case when no public key is available, use the following route configuration:

```

from("sftp://localhost:9999/root?
username=admin&password=admin&preferredAuthentications=publickey,password").
to("bean:processFile");

```

110.18. CONSUMING A SINGLE FILE USING A FIXED NAME

When you want to download a single file and knows the file name, you can use **fileName=myFileName.txt** to tell Camel the name of the file to download. By default the consumer will still do a FTP LIST command to do a directory listing and then filter these files based on the **fileName** option. Though in this use-case it may be desirable to turn off the directory listing by setting **useList=false**. For example the user account used to login to the FTP server may not have permission to do a FTP LIST command. So you can turn off this with **useList=false**, and then provide the fixed name of the file to download with **fileName=myFileName.txt**, then the FTP consumer can still download the file. If the file for some reason does not exist, then Camel will by default throw an exception, you can turn this off and ignore this by setting **ignoreFileNotFoundOrPermissionError=true**.

For example to have a Camel route that pickup a single file, and delete it after use you can do

```

from("ftp://admin@localhost:21/nolist/?
password=admin&stepwise=false&useList=false&ignoreFileNotFoundOrPermissionError=true&fileName
=report.txt&delete=true")
.to("activemq:queue:report");

```

Notice that we have use all the options we talked above above.

You can also use this with **ConsumerTemplate**. For example to download a single file (if it exists) and grab the file content as a String type:

```

String data = template.retrieveBodyNoWait("ftp://admin@localhost:21/nolist/?
password=admin&stepwise=false&useList=false&ignoreFileNotFoundOrPermissionError=true&fileName
=report.txt&delete=true", String.class);

```

110.19. DEBUG LOGGING

This component has log level **TRACE** that can be helpful if you have problems.

CHAPTER 111. FTPS COMPONENT

Available as of Camel version 2.2

This component provides access to remote file systems over the FTP and SFTP protocols.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ftp</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

For more information you can look at [FTP component](#)

111.1. URI OPTIONS

The options below are exclusive for the FTPS component.

The FTPS component supports 2 options, which are listed below.

Name	Description	Default	Type
useGlobalSslContext Parameters (security)	Enable usage of global SSL context parameters.	false	boolean
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The FTPS endpoint is configured using URI syntax:

```
ftps:host:port/directoryName
```

with the following path and query parameters:

111.1.1. Path Parameters (3 parameters):

Name	Description	Default	Type
host	Required Hostname of the FTP server		String
port	Port of the FTP server		int

Name	Description	Default	Type
directoryName	The starting directory		String

111.1.2. Query Parameters (122 parameters):

Name	Description	Default	Type
binary (common)	Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false).	false	boolean
charset (common)	This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.		String
disconnect (common)	Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead.	false	boolean
doneFileName (common)	Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders.		String

Name	Description	Default	Type
fileName (common)	Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.		String
passiveMode (common)	Sets passive mode connections. Default is active mode connections.	false	boolean
separator (common)	Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name	UNIX	PathSeparator
transferLoggingInterval Seconds (common)	Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time.	5	int
transferLoggingLevel (common)	Configure the logging level to use when logging the progress of upload and download operations.	DEBUG	LogLevel
transferLoggingVerbose (common)	Configures whether the perform verbose (fine grained) logging of the progress of upload and download operations.	false	boolean

Name	Description	Default	Type
fastExistsCheck (common)	If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
delete (consumer)	If true, the file will be deleted after it is processed successfully.	false	boolean
moveFailed (consumer)	Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.		String
noop (consumer)	If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.	false	boolean
preMove (consumer)	Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.		String

Name	Description	Default	Type
preSort (consumer)	When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.	false	boolean
recursive (consumer)	If a directory, will look for files in all the sub-directories as well.	false	boolean
resumeDownload (consumer)	Configures whether resume download is enabled. This must be supported by the FTP server (almost all FTP servers support it). In addition the options localWorkDirectory must be configured so downloaded files are stored in a local directory, and the option binary must be enabled, which is required to support resuming of downloads.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
streamDownload (consumer)	Sets the download method to use when not using a local working directory. If set to true, the remote files are streamed to the route as they are read. When set to false, the remote files are loaded into memory before being sent into the route.	false	boolean
directoryMustExist (consumer)	Similar to startingDirectoryMustExist but this applies during polling recursive sub directories.	false	boolean
download (consumer)	Whether the FTP consumer should download the file. If this option is set to false, then the message body will be null, but the consumer will still trigger a Camel Exchange that has details about the file such as file name, file size, etc. It's just that the file will not be downloaded.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
handleDirectoryParserAbsoluteResult (consumer)	Allows you to set how the consumer will handle subfolders and files in the path if the directory parser results in with absolute paths. The reason for this is that some FTP servers may return file names with absolute paths, and if so then the FTP component needs to handle this by converting the returned path into a relative path.	false	boolean
ignoreFileNotFoundOrPermissionError (consumer)	Whether to ignore when (trying to list files in directories or when downloading a file), which does not exist or due to permission error. By default when a directory or file does not exist or insufficient permission, then an exception is thrown. Setting this option to true allows to ignore that instead.	false	boolean
inProgressRepository (consumer)	A pluggable in-progress repository <code>org.apache.camel.spi.IdempotentRepository</code> . The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used.		IdempotentRepository
localWorkDirectory (consumer)	When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory.		String
onCompletionExceptionHandler (consumer)	To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore.		ExceptionHandler
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy

Name	Description	Default	Type
processStrategy (consumer)	A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply.		<code>GenericFileProcessStrategy</code>
receiveBufferSize (consumer)	The receive (download) buffer size Used only by <code>FTPClient</code>	32768	int
startingDirectoryMustExist (consumer)	Whether the starting directory must exist. Mind that the <code>autoCreate</code> option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable <code>autoCreate</code> and enable this to ensure the starting directory must exist. Will throw an exception if the directory doesn't exist.	false	boolean
useList (consumer)	Whether to allow using <code>LIST</code> command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the <code>LIST</code> command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when <code>LIST</code> command is in use.	true	boolean
fileExist (producer)	What to do if a file already exists with the same name. <code>Override</code> , which is the default, replaces the existing file. <code>Append</code> - adds content to the existing file. <code>Fail</code> - throws a <code>GenericFileOperationException</code> , indicating that there is already an existing file. <code>Ignore</code> - silently ignores the problem and does not override the existing file, but assumes everything is okay. <code>Move</code> - option requires to use the <code>moveExisting</code> option to be configured as well. The option <code>eagerDeleteTargetFile</code> can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The <code>Move</code> option will move any existing files, before writing the target file. <code>TryRename</code> is only applicable if <code>tempFileName</code> option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.	Override	<code>GenericFileExist</code>

Name	Description	Default	Type
flatten (producer)	Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.	false	boolean
jailStartingDirectory (producer)	Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders.	true	boolean
moveExisting (producer)	Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base.		String
tempFileName (producer)	The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language.		String
tempPrefix (producer)	This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files.		String
allowNullBody (producer)	Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged.	false	boolean

Name	Description	Default	Type
chmod (producer)	Allows you to set chmod on the stored file. For example chmod=640.		String
disconnectOnBatchComplete (producer)	Whether or not to disconnect from remote FTP server right after a Batch upload is complete. disconnectOnBatchComplete will only disconnect the current connection to the FTP server.	false	boolean
eagerDeleteTargetFile (producer)	Whether or not to eagerly delete any existing target file. This option only applies when you use fileExists=Override and the tempFileName option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensure the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when fileExist=Move is enabled, and an existing file exists. If this option copyAndDeleteOnRenameFails false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation.	true	boolean
keepLastModified (producer)	Will keep the last modified timestamp from the source file (if any). Will use the Exchange.FILE_LAST_MODIFIED header to located the timestamp. This header can contain either a java.util.Date or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers.	false	boolean
moveExistingFileStrategy (producer)	Strategy (Custom Strategy) used to move file with special naming token to use when fileExist=Move is configured. By default, there is an implementation used if no custom strategy is provided		FileMoveExistingStrategy
sendNoop (producer)	Whether to send a noop command as a pre-write check before uploading files to the FTP server. This is enabled by default as a validation of the connection is still valid, which allows to silently re-connect to be able to upload the file. However if this causes problems, you can turn this option off.	true	boolean

Name	Description	Default	Type
activePortRange (advanced)	Set the client side port range in active mode. The syntax is: minPort-maxPort Both port numbers are inclusive, eg 10000-19999 to include all lxxx ports.		String
autoCreate (advanced)	Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to.	true	boolean
bufferSize (advanced)	Write buffer sized in bytes.	131072	int
connectTimeout (advanced)	Sets the connect timeout for waiting for a connection to be established Used by both FTPClient and JSCH	10000	int
ftpClient (advanced)	To use a custom instance of FTPClient		FTPClient
ftpClientConfig (advanced)	To use a custom instance of FTPClientConfig to configure the FTP client the endpoint should use.		FTPClientConfig
ftpClientConfigParameters (advanced)	Used by FtpComponent to provide additional parameters for the FTPClientConfig		Map
ftpClientParameters (advanced)	Used by FtpComponent to provide additional parameters for the FTPClient		Map
maximumReconnectAttempts (advanced)	Specifies the maximum reconnect attempts Camel performs when it tries to connect to the remote FTP server. Use 0 to disable this behavior.		int
reconnectDelay (advanced)	Delay in millis Camel will wait before performing a reconnect attempt.		long
siteCommand (advanced)	Sets optional site command(s) to be executed after successful login. Multiple site commands can be separated using a new line character.		String
soTimeout (advanced)	Sets the so timeout Used only by FTPClient	30000 0	int

Name	Description	Default	Type
stepwise (advanced)	Sets whether we should stepwise change directories while traversing file structures when downloading files, or as well when uploading a file to a directory. You can disable this if you for example are in a situation where you cannot change directory on the FTP server due security reasons.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
throwExceptionOnConnectFailed (advanced)	Should an exception be thrown if connection failed (exhausted) By default exception is not thrown and a WARN is logged. You can use this to enable exception being thrown and handle the thrown exception from the <code>org.apache.camel.spi.PollingConsumerPollStrategy</code> rollback method.	false	boolean
timeout (advanced)	Sets the data timeout for waiting for reply Used only by FTPClient	30000	int
antExclude (filter)	Ant style filter exclusion. If both <code>antInclude</code> and <code>antExclude</code> are used, <code>antExclude</code> takes precedence over <code>antInclude</code> . Multiple exclusions may be specified in comma-delimited format.		String
antFilterCaseSensitive (filter)	Sets case sensitive flag on ant filter	true	boolean
antInclude (filter)	Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format.		String
eagerMaxMessagesPerPoll (filter)	Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting.	true	boolean
exclude (filter)	Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String

Name	Description	Default	Type
filter (filter)	Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns false in its <code>accept()</code> method.		GenericFileFilter
filterDirectory (filter)	Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyMMdd</code>		String
filterFile (filter)	Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code>		String
idempotent (filter)	Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again.	false	Boolean
idempotentKey (filter)	To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code>		String
idempotentRepository (filter)	A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true.		IdempotentRepository
include (filter)	Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the RAW() syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris		String
maxDepth (filter)	The maximum depth to traverse when recursively processing a directory.	2147483647	int

Name	Description	Default	Type
maxMessagesPerPoll (filter)	To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards.		int
minDepth (filter)	The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory.		int
move (filter)	Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a <code>.done</code> subdirectory just enter <code>.done</code> .		String
exclusiveReadLockStrategy (lock)	Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation.		GenericFileExclusiveReadLockStrategy

Name	Description	Default	Type
readLock (lock)	<p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail on Windows or the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p>	none	String

Name	Description	Default	Type
readLockCheckInterval (lock)	Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	1000	long
readLockDeleteOrphanLock Files (lock)	Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.	true	boolean
readLockIdempotentRelease Async (lock)	Whether the delayed release task should be synchronous or asynchronous. See more details at the readLockIdempotentReleaseDelay option.	false	boolean
readLockIdempotentRelease AsyncPoolSize (lock)	The number of threads in the scheduled thread pool when using asynchronous release tasks. Using a default of 1 core threads should be sufficient in almost all use-cases, only set this to a higher value if either updating the idempotent repository is slow, or there are a lot of files to process. This option is not in-use if you use a shared thread pool by configuring the readLockIdempotentReleaseExecutorService option. See more details at the readLockIdempotentReleaseDelay option.		int
readLockIdempotentRelease Delay (lock)	Whether to delay the release task for a period of millis. This can be used to delay the release tasks to expand the window when a file is regarded as read-locked, in an active/active cluster scenario with a shared idempotent repository, to ensure other nodes cannot potentially scan and acquire the same file, due to race-conditions. By expanding the time-window of the release tasks helps prevents these situations. Note delaying is only needed if you have configured readLockRemoveOnCommit to true.		int

Name	Description	Default	Type
readLockIdempotentReleaseExecutorService (lock)	To use a custom and shared thread pool for asynchronous release tasks. See more details at the <code>readLockIdempotentReleaseDelay</code> option.		ScheduledExecutorService
readLockLoggingLevel (lock)	Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.	DEBUG	LoggingLevel
readLockMarkerFile (lock)	Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.	true	boolean
readLockMinAge (lock)	This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use <code>readLockMinAge=300s</code> to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.	0	long
readLockMinLength (lock)	This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files.	1	long
readLockRemoveOnCommit (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the <code>readLockIdempotentReleaseDelay</code> option.	false	boolean

Name	Description	Default	Type
readLockRemoveOnRollback (lock)	This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit).	true	boolean
readLockTimeout (lock)	Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.	10000	long
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean

Name	Description	Default	Type
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean
shuffle (sort)	To shuffle the list of files (sort in random order)	false	boolean
sortBy (sort)	Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date.		String
sorter (sort)	Pluggable sorter as a java.util.Comparator class.		Comparator
account (security)	Account to use for login		String
disableSecureDataChannelDefaults (security)	Use this option to disable default options when using secure data channel. This allows you to be in full control what the execPbsz and execProt setting should be used. Default is false	false	boolean
execPbsz (security)	When using secure data channel you can set the exec protection buffer size		Long

Name	Description	Default	Type
execProt (security)	The exec protection level PROT command. C - Clear S - Safe(SSL protocol only) E - Confidential(SSL protocol only) P - Private		String
ftpClientKeyStoreParameters (security)	Set the key store parameters		Map
ftpClientTrustStoreParameters (security)	Set the trust store parameters		Map
isImplicit (security)	Set the security mode(Implicit/Explicit). true - Implicit Mode / False - Explicit Mode	false	boolean
password (security)	Password to use for login		String
securityProtocol (security)	Set the underlying security protocol.	TLS	String
sslContextParameters (security)	Gets the JSSE configuration that overrides any settings in FtpsEndpoint#ftpClientKeyStoreParameters, ftpClientTrustStoreParameters, and FtpsConfiguration#getSecurityProtocol().		SSLContextParameters
username (security)	Username to use for login		String

111.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.ftp.enabled	Enable ftps component	true	Boolean
camel.component.ftp.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Name	Description	Default	Type
<code>camel.component.ftp.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

CHAPTER 112. GANGLIA COMPONENT

Available as of Camel version 2.15

Provides a mechanism to send a value (the message body) as a metric to the [Ganglia](#) monitoring system. Uses the gmetric4j library. Can be used in conjunction with standard [Ganglia](#) and [JMXetric](#) for monitoring metrics from the OS, JVM and business processes through a single platform.

You should have a Ganglia gmond agent running on the machine where your JVM runs. The gmond sends a heartbeat to the Ganglia infrastructure, camel-ganglia can't send the heartbeat itself currently.

On most Linux systems (Debian, Ubuntu, Fedora and RHEL/CentOS with EPEL) you can just install the Ganglia agent package and it runs automatically using multicast configuration. You can configure it to use regular UDP unicast if you prefer.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ganglia</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

112.1. URI FORMAT

```
ganglia:address:port[?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

112.2. GANGLIA COMPONENT AND ENDPOINT URI OPTIONS

The Ganglia component supports 2 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use the shared configuration		GangliaConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ganglia endpoint is configured using URI syntax:

```
ganglia:host:port
```

with the following path and query parameters:

112.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
host	Host name for Ganglia server	239.2.11.71	String
port	Port for Ganglia server	8649	int

112.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
dmax (producer)	Minimum time in seconds before Ganglia will purge the metric value if it expires. Set to 0 and the value will remain in Ganglia indefinitely until a gmond agent restart.	0	int
groupName (producer)	The group that the metric belongs to.	java	String
metricName (producer)	The name to use for the metric.	metric	String
mode (producer)	Send the UDP metric packets using MULTICAST or UNICAST	MULTICAST	UDPAAddressingMode
prefix (producer)	Prefix the metric name with this string and an underscore.		String
slope (producer)	The slope	BOTH	GMetricSlope
spoofHostname (producer)	Spoofing information IP:hostname		String
tmax (producer)	Maximum time in seconds that the value can be considered current. After this, Ganglia considers the value to have expired.	60	int
ttl (producer)	If using multicast, set the TTL of the packets	5	int
type (producer)	The type of value	STRING	GMetricType

Name	Description	Default	Type
units (producer)	Any unit of measurement that qualifies the metric, e.g. widgets, litres, bytes. Do not include a prefix such as k (kilo) or m (milli), other tools may scale the units later. The value should be unscaled.		String
wireFormat31x (producer)	Use the wire format of Ganglia 3.1.0 and later versions. Set this to false to use Ganglia 3.0.x or earlier.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

112.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
camel.component.ganglia.configuration.dmax	Minimum time in seconds before Ganglia will purge the metric value if it expires. Set to 0 and the value will remain in Ganglia indefinitely until a gmond agent restart.	0	Integer
camel.component.ganglia.configuration.group-name	The group that the metric belongs to.	java	String
camel.component.ganglia.configuration.host	Host name for Ganglia server	239.2.11.71	String
camel.component.ganglia.configuration.metric-name	The name to use for the metric.	metric	String
camel.component.ganglia.configuration.mode	Send the UDP metric packets using MULTICAST or UNICAST		GMetric\$UDP AddressingMode
camel.component.ganglia.configuration.port	Port for Ganglia server	8649	Integer

Name	Description	Default	Type
<code>camel.component.ganglia.configuration.prefix</code>	Prefix the metric name with this string and an underscore.		String
<code>camel.component.ganglia.configuration.slope</code>	The slope		GMetricSlope
<code>camel.component.ganglia.configuration.spoof-hostname</code>	Spoofing information IP:hostname		String
<code>camel.component.ganglia.configuration.tmax</code>	Maximum time in seconds that the value can be considered current. After this, Ganglia considers the value to have expired.	60	Integer
<code>camel.component.ganglia.configuration.ttl</code>	If using multicast, set the TTL of the packets	5	Integer
<code>camel.component.ganglia.configuration.type</code>	The type of value		GMetricType
<code>camel.component.ganglia.configuration.units</code>	Any unit of measurement that qualifies the metric, e.g. widgets, litres, bytes. Do not include a prefix such as k (kilo) or m (milli), other tools may scale the units later. The value should be unscaled.		String
<code>camel.component.ganglia.configuration.wire-format31x</code>	Use the wire format of Ganglia 3.1.0 and later versions. Set this to false to use Ganglia 3.0.x or earlier.	true	Boolean
<code>camel.component.ganglia.enabled</code>	Enable ganglia component	true	Boolean
<code>camel.component.ganglia.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

112.4. MESSAGE BODY

Any value (such as a string or numeric type) in the body is sent to the Ganglia system.

112.5. RETURN VALUE / RESPONSE

Ganglia sends metrics using unidirectional UDP or multicast. There is no response or change to the message body.

112.6. EXAMPLES

112.6.1. Sending a String metric

The message body will be converted to a String and sent as a metric value. Unlike numeric metrics, String values can't be charted but Ganglia makes them available for reporting. The `os_version` string at the top of every Ganglia host page is an example of a String metric.

```
from("direct:string.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("my_string_metric"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.STRING)
  .to("direct:ganglia.tx");

from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
```

112.6.2. Sending a numeric metric

```
from("direct:value.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("widgets_in_stock"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.UINT32)
  .setHeader(GangliaConstants.METRIC_UNITS, simple("widgets"))
  .to("direct:ganglia.tx");

from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
```

CHAPTER 113. GEOCODER COMPONENT

Available as of Camel version 2.12

The **geocoder**: component is used for looking up geocodes (latitude and longitude) for a given address, or reverse lookup. The component uses the [Java API for Google Geocoder](#) library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-geocoder</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

113.1. URI FORMAT

```
geocoder:address:name[?options]
geocoder:latlng:latitude,longitude[?options]
```

113.2. OPTIONS

The Geocoder component has no options.

The Geocoder endpoint is configured using URI syntax:

```
geocoder:address:latlng
```

with the following path and query parameters:

113.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
address	The geo address which should be prefixed with address:		String
latlng	The geo latitude and longitude which should be prefixed with latlng:		String

113.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
headersOnly (producer)	Whether to only enrich the Exchange with headers, and leave the body as-is.	false	boolean

Name	Description	Default	Type
language (producer)	The language to use.	en	String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
proxyAuthDomain (proxy)	Domain for proxy NTML authentication		String
proxyAuthHost (proxy)	Optional host for proxy NTML authentication		String
proxyAuthMethod (proxy)	Authentication method for proxy, either as Basic, Digest or NTLM.		String
proxyAuthPassword (proxy)	Password for proxy authentication		String
proxyAuthUsername (proxy)	Username for proxy authentication		String
proxyHost (proxy)	The proxy host name		String
proxyPort (proxy)	The proxy port number		Integer
apiKey (security)	To use google apiKey		String
clientId (security)	To use google premium with this client id		String
clientKey (security)	To use google premium with this client key		String

113.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.geocoder.enabled</code>	Enable geocoder component	true	Boolean
<code>camel.component.geocoder.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

113.4. EXCHANGE DATA FORMAT

Camel will deliver the body as a `com.google.code.geocoder.model.GeocodeResponse` type. And if the address is "**current**" then the response is a String type with a JSON representation of the current location.

If the option **headersOnly** is set to **true** then the message body is left as-is, and only headers will be added to the Exchange.

113.5. MESSAGE HEADERS

Header	Description
CamelGeoCoderStatus	Mandatory. Status code from the geocoder library. If status is GeocoderStatus.OK then additional headers is enriched
CamelGeoCoderAddress	The formatted address
CamelGeoCoderLat	The latitude of the location.
CamelGeoCoderLng	The longitude of the location.
CamelGeoCoderLatlng	The latitude and longitude of the location. Separated by comma.
CamelGeoCoderCity	The city long name.
CamelGeoCoderRegionCode	The region code.
CamelGeoCoderRegionName	The region name.
CamelGeoCoderCountryLong	The country long name.
CamelGeoCoderCountryShort	The country short name.

Header	Description
CamelGeoCoderPostalCode	The postal code.

Notice not all headers may be provided depending on available data and mode in use (address vs latlng).

113.6. SAMPLES

In the example below we get the latitude and longitude for Paris, France

```
from("direct:start")
  .to("geocoder:address:Paris, France")
```

If you provide a header with the **CamelGeoCoderAddress** then that overrides the endpoint configuration, so to get the location of Copenhagen, Denmark we can send a message with a headers as shown:

```
template.sendBodyAndHeader("direct:start", "Hello", GeoCoderConstants.ADDRESS, "Copenhagen, Denmark");
```

To get the address for a latitude and longitude we can do:

```
from("direct:start")
  .to("geocoder:latlng:40.714224,-73.961452")
  .log("Location ${header.CamelGeocoderAddress} is at lat/lng: ${header.CamelGeocoderLatlng}
and in country ${header.CamelGeoCoderCountryShort}")
```

Which will log

```
Location 285 Bedford Avenue, Brooklyn, NY 11211, USA is at lat/lng: 40.71412890,-73.96140740
and in country US
```

To get the current location you can use "current" as the address as shown:

```
from("direct:start")
  .to("geocoder:address:current")
```

CHAPTER 114. GIT COMPONENT

Available as of Camel version 2.16

The `git` component allows you to work with a generic Git repository.

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-git</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

URI Format

```
git://localRepositoryPath[?options]
```

114.1. URI OPTIONS

The producer allows to do operations on a specific repository.

The consumer allows consuming commits, tags and branches on a specific repository.

The Git component has no options.

The Git endpoint is configured using URI syntax:

```
git:localPath
```

with the following path and query parameters:

114.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
<code>localPath</code>	Required Local repository path		String

114.1.2. Query Parameters (13 parameters):

Name	Description	Default	Type
<code>branchName</code> (common)	The branch name to work on		String
<code>password</code> (common)	Remote repository password		String

Name	Description	Default	Type
remoteName (common)	The remote repository name to use in particular operation like pull		String
remotePath (common)	The remote repository path		String
tagName (common)	The tag name to work on		String
username (common)	Remote repository username		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
type (consumer)	The consumer type		GitType
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
allowEmpty (producer)	The flag to manage empty git commits	true	boolean
operation (producer)	The operation to do on the repository		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

114.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.git.enabled</code>	Enable git component	true	Boolean
<code>camel.component.git.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

114.3. MESSAGE HEADERS

Name	Default Value	Type	Context	Description
Camel GitOperation	null	String	Producer	The operation to do on a repository, if not specified as endpoint option
Camel GitFilename	null	String	Producer	The file name in an add operation
Camel GitCommitMessage	null	String	Producer	The commit message related in a commit operation
Camel GitCommitUsername	null	String	Producer	The commit username in a commit operation
Camel GitCommitEmail	null	String	Producer	The commit email in a commit operation
Camel GitCommitId	null	String	Producer	The commit id
Camel GitAllowEmpty	null	Boolean	Producer	The flag to manage empty git commits

114.4. PRODUCER EXAMPLE

Below is an example route of a producer that add a file test.java to a local repository, commit it with a specific message on master branch and then push it to remote repository.

```
from("direct:start")
    .setHeader(GitConstants.GIT_FILE_NAME, constant("test.java"))
    .to("git:///tmp/testRepo?operation=add")
    .setHeader(GitConstants.GIT_COMMIT_MESSAGE, constant("first commit"))
    .to("git:///tmp/testRepo?operation=commit")
    .to("git:///tmp/testRepo?
operation=push&remotePath=https://foo.com/test/test.git&username=xxx&password=xxx")
    .to("git:///tmp/testRepo?operation=createTag&tagName=myTag")
    .to("git:///tmp/testRepo?operation=pushTag&tagName=myTag&remoteName=origin")
```

114.5. CONSUMER EXAMPLE

Below is an example route of a consumer that consumes commit:

```
from("git:///tmp/testRepo?type=commit")
    .to(...)
```

CHAPTER 115. GITHUB COMPONENT

Available as of Camel version 2.15

The GitHub component interacts with the GitHub API by encapsulating [egit-github](#). It currently provides polling for new pull requests, pull request comments, tags, and commits. It is also able to produce comments on pull requests, as well as close the pull request entirely.

Rather than webhooks, this endpoint relies on simple polling. Reasons include:

- Concern for reliability/stability
- The types of payloads we're polling aren't typically large (plus, paging is available in the API)
- The need to support apps running somewhere not publicly accessible where a webhook would fail

Note that the GitHub API is fairly expansive. Therefore, this component could be easily expanded to provide additional interactions.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-github</artifactId>
  <version>${camel-version}</version>
</dependency>
```

115.1. URI FORMAT

```
github://endpoint[?options]
```

115.2. MANDATORY OPTIONS:

Note that these can be configured directly through the endpoint.

The GitHub component has no options.

The GitHub endpoint is configured using URI syntax:

```
github:type/branchName
```

with the following path and query parameters:

115.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
type	Required What git operation to execute	t	GitHubType

Name	Description	Default	Type
branchName	Name of branch		String

115.2.2. Query Parameters (12 parameters):

Name	Description	Default	Type
oauthToken (common)	GitHub OAuth token, required unless username & password are provided		String
password (common)	GitHub password, required unless oauthToken is provided		String
repoName (common)	Required GitHub repository name		String
repoOwner (common)	Required GitHub repository owner (organization)		String
username (common)	GitHub username, required unless oauthToken is provided		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
encoding (producer)	To use the given encoding when getting a git commit file		String
state (producer)	To set git commit status state		String

Name	Description	Default	Type
targetUrl (producer)	To set git commit status target url		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

115.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.github.enabled	Enable github component	true	Boolean
camel.component.github.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

115.4. CONSUMER ENDPOINTS:

Endpoint	Context	Body Type
pullRequest	polling	org.eclipse.egit.github.core.PullRequest
pullRequestComment	polling	org.eclipse.egit.github.core.Comment (comment on the general pull request discussion) or org.eclipse.egit.github.core.CommitComment (inline comment on a pull request diff)
tag	polling	org.eclipse.egit.github.core.RepositoryTag
commit	polling	org.eclipse.egit.github.core.RepositoryCommit

115.5. PRODUCER ENDPOINTS:

Endpoint	Body	Message Headers
----------	------	-----------------

Endpoint	Body	Message Headers
pullRequestComment	String (comment text)	<ul style="list-style-type: none">- GitHubPullRequest (integer) (REQUIRED): Pull request number.- GitHubInResponseTo (integer): Required if responding to another inline comment on the pull request diff. If left off, a general comment on the pull request discussion is assumed.
closePullRequest	none	<ul style="list-style-type: none">- GitHubPullRequest (integer) (REQUIRED): Pull request number.
createIssue (From Camel 2.18)	String (issue body text)	<ul style="list-style-type: none">- GitHubIssueTitle (String) (REQUIRED): Issue Title.

CHAPTER 116. GZIP DATAFORMAT

Available as of Camel version 2.0

The GZip Data Format is a message compression and de-compression format. It uses the same deflate algorithm that is used in [Zip DataFormat](#), although some additional headers are provided. This format is produced by popular **gzip/gunzip** tool. Messages marshalled using GZip compression can be unmarshalled using GZip decompression just prior to being consumed at the endpoint. The compression capability is quite useful when you deal with large XML and Text based payloads or when you read messages previously compressed using **gzip** tool.

116.1. OPTIONS

The GZip dataformat supports 1 options, which are listed below.

Name	Default	Java Type	Description
<code>contentTypeHeader</code>	<code>false</code>	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc.

116.2. MARSHAL

In this example we marshal a regular text/XML payload to a compressed payload employing gzip compression format and send it an ActiveMQ queue called MY_QUEUE.

```
from("direct:start").marshal().gzip().to("activemq:queue:MY_QUEUE");
```

116.3. UNMARSHAL

In this example we unmarshal a gzipped payload from an ActiveMQ queue called MY_QUEUE to its original format, and forward it for processing to the **UnGzippedMessageProcessor**.

```
from("activemq:queue:MY_QUEUE").unmarshal().gzip().process(new
UnGzippedMessageProcessor());
```

116.4. DEPENDENCIES

This data format is provided in **camel-core** so no additional dependencies is needed.

CHAPTER 117. GOOGLE BIGQUERY COMPONENT

Available as of Camel version 2.20

117.1. COMPONENT DESCRIPTION

The Google Bigquery component provides access to [Cloud BigQuery Infrastructure](#) via the [Google Client Services API](#).

The current implementation does not use gRPC.

The current implementation does not support querying BigQuery i.e. is a producer only.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-bigquery</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

117.2. AUTHENTICATION CONFIGURATION

Google BigQuery component authentication is targeted for use with the GCP Service Accounts. For more information please refer to [Google Cloud Platform Auth Guide](#)

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on [Application Default Credentials](#).

OBS! The location of the default credentials file is configurable - via `GOOGLE_APPLICATION_CREDENTIALS` environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as `client_email` and `private_key` respectively.

117.3. URI FORMAT

```
google-bigquery://project-id:datasetId[:tableId]?[options]
```

117.4. OPTIONS

The Google BigQuery component supports 4 options, which are listed below.

Name	Description	Default	Type
projectId (producer)	Google Cloud Project Id		String
datasetId (producer)	BigQuery Dataset Id		String
connectionFactory (producer)	ConnectionFactory to obtain connection to Bigquery Service. If non provided the default one will be used		GoogleBigQuery ConnectionFactory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google BigQuery endpoint is configured using URI syntax:

```
google-bigquery:projectId:datasetId:tableName
```

with the following path and query parameters:

117.4.1. Path Parameters (3 parameters):

Name	Description	Default	Type
projectId	Required Google Cloud Project Id		String
datasetId	Required BigQuery Dataset Id		String
tableId	BigQuery table id		String

117.4.2. Query Parameters (3 parameters):

Name	Description	Default	Type
connectionFactory (producer)	ConnectionFactory to obtain connection to Bigquery Service. If non provided the default will be used.		GoogleBigQuery ConnectionFactory
useAsInsertId (producer)	Field name to use as insert id		String

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

117.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
camel.component.google-bigquery.dataset-id	BigQuery Dataset Id		String
camel.component.google-bigquery.enabled	Whether to enable auto configuration of the google-bigquery component. This is enabled by default.		Boolean
camel.component.google-bigquery.project-id	Google Cloud Project Id		String
camel.component.google-bigquery.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

117.6. MESSAGE HEADERS

Name	Type	Description
CamelGoogleBigQueryTableSuffix	String	Table suffix to use when inserting data

Name	Type	Description
Camel Googl eBigQ uery.I nsertI d	String	InsertId to use when inserting data
Camel Googl eBigQ uery.P artitio nDeco rator	String	Partition decorator to indicate partition to use when inserting data
Camel Googl eBigQ uery.T ableId	String	Table id where data will be submitted. If specified will override endpoint configuration

117.7. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to BigQuery individual and grouped exchanges alike. Grouped exchanges have **Exchange.GROUPED_EXCHANGE** property set.

Goole BigQuery producer will send a grouped exchange in a single api call unless different table suffix or partition decorators are specified in which case it will break it down to ensure data is written with the correct suffix or partition decorator.

Google BigQuery endpoint expects the payload to be either a map or list of maps. A payload containing a map will insert a single row and a payload containing a list of map's will insert a row for each entry in the list.

117.8. TEMPLATE TABLES

Reference: <https://cloud.google.com/bigquery/streaming-data-into-bigquery#template-tables>

Templated tables can be specified using the **GoogleBigQueryConstants.TABLE_SUFFIX** header.

I.e. the following route will create tables and insert records sharded on a per day basis:

```
from("direct:start")
.header(GoogleBigQueryConstants.TABLE_SUFFIX, "_${date:now:yyyyMMdd}")
.to("google-bigquery:sampleDataset:sampleTable")
```

Note it is recommended to use partitioning for this use case.

117.9. PARTITIONING

Reference: <https://cloud.google.com/bigquery/docs/creating-partitioned-tables>

Partitioning is specified when creating a table and if set data will be automatically partitioned into separate tables. When inserting data a specific partition can be specified by setting the **GoogleBigQueryConstants.PARTITION_DECORATOR** header on the exchange.

117.10. ENSURING DATA CONSISTENCY

Reference: <https://cloud.google.com/bigquery/streaming-data-into-bigquery#dataconsistency>

An insert id can be set on the exchange with the header **GoogleBigQueryConstants.INSERT_ID** or by specifying query parameter **useAsInsertId**. As an insert id need to be specified per row inserted the exchange header can't be used when the payload is a list - if the payload is a list the **GoogleBigQueryConstants.INSERT_ID** will be ignored. In that case use the query parameter **useAsInsertId**.

CHAPTER 118. GOOGLE CALENDAR COMPONENT

Available as of Camel version 2.15

The Google Calendar component provides access to [Google Calendar](#) via the [Google Calendar Web APIs](#).

Google Calendar uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a `clientId`, `clientSecret`, and a `refreshToken`. A handy resource for generating a long-lived `refreshToken` is the [OAuth playground](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-calendar</artifactId>
  <version>2.15.0</version>
</dependency>
```

118.1.1. GOOGLE CALENDAR OPTIONS

The Google Calendar component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		GoogleCalendarConfiguration
clientFactory (advanced)	To use the <code>GoogleCalendarClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleCalendarClientFactory</code>		GoogleCalendarClientFactory
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of <code>String</code> type can use property placeholders.	true	boolean

The Google Calendar endpoint is configured using URI syntax:

```
google-calendar:apiName/methodName
```

with the following path and query parameters:

118.1.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		GoogleCalendarApiName
methodName	Required What sub operation to use for the selected operation		String

118.1.2. Query Parameters (14 parameters):

Name	Description	Default	Type
accessToken (common)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (common)	Google calendar application name. Example would be camel-google-calendar/1.0		String
clientId (common)	Client ID of the calendar application		String
clientSecret (common)	Client secret of the calendar application		String
emailAddress (common)	The emailAddress of the Google Service Account.		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
p12FileName (common)	The name of the p12 file which has the private key to use with the Google Service Account.		String
refreshToken (common)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
scopes (common)	Specifies the level of permissions you want a calendar application to have to a user account. You can separate multiple scopes by comma. See https://developers.google.com/google-apps/calendar/auth for more info.	https://www.googleapis.com/auth/calendar	String

Name	Description	Default	Type
user (common)	The email address of the user the application is trying to impersonate in the service account flow		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

118.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 14 options, which are listed below.

Name	Description	Default	Type
camel.component.google-calendar.client-factory	To use the <code>GoogleCalendarClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleCalendarClientFactory</code> . The option is a <code>org.apache.camel.component.google.calendar.GoogleCalendarClientFactory</code> type.		String
camel.component.google-calendar.configuration.access-token	OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage.		String

Name	Description	Default	Type
<code>camel.component.google-calendar.configuration.api-name</code>	What kind of operation to perform		GoogleCalendarApiName
<code>camel.component.google-calendar.configuration.application-name</code>	Google calendar application name. Example would be camel-google-calendar/1.0		String
<code>camel.component.google-calendar.configuration.client-id</code>	Client ID of the calendar application		String
<code>camel.component.google-calendar.configuration.client-secret</code>	Client secret of the calendar application		String
<code>camel.component.google-calendar.configuration.email-address</code>	The emailAddress of the Google Service Account.		String
<code>camel.component.google-calendar.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.google-calendar.configuration.p12-file-name</code>	The name of the p12 file which has the private key to use with the Google Service Account.		String
<code>camel.component.google-calendar.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String

Name	Description	Default	Type
<code>camel.component.google-calendar.configuration.scopes</code>	Specifies the level of permissions you want a calendar application to have to a user account. You can separate multiple scopes by comma. See https://developers.google.com/google-apps/calendar/auth for more info.	https://www.googleapis.com/auth/calendar	String
<code>camel.component.google-calendar.configuration.user</code>	The email address of the user the application is trying to impersonate in the service account flow		String
<code>camel.component.google-calendar.enabled</code>	Enable google-calendar component	true	Boolean
<code>camel.component.google-calendar.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

118.3. URI FORMAT

The GoogleCalendar Component uses the following URI format:

```
google-calendar://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- acl
- calendars
- channels
- colors
- events
- freebusy
- list
- settings

118.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleCalendar.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleCalendar.option** header.

118.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

118.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleCalendar.** prefix.

118.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleCalendarComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 119. GOOGLE CALENDAR STREAM COMPONENT

Available as of Camel version 2.23

The Google Calendar component provides access to [Calendar](#) via the [Google Calendar Web APIs](#).

Google Calendar uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a `clientId`, `clientSecret`, and a `refreshToken`. A handy resource for generating a long-lived `refreshToken` is the [OAuth playground](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-calendar</artifactId>
  <version>2.23.0</version>
</dependency>
```

119.1. URI FORMAT

The Google Calendar Component uses the following URI format:

```
google-calendar-stream://index?[options]
```

119.2. GOOGLECALENDARSTREAMCOMPONENT

The Google Calendar Stream component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The configuration		GoogleCalendarStreamConfiguration
clientFactory (advanced)	The client Factory		GoogleCalendarClientFactory
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Calendar Stream endpoint is configured using URI syntax:

```
google-calendar-stream:index
```

with the following path and query parameters:

119.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
index	Specifies an index for the endpoint		String

119.2.2. Query Parameters (30 parameters):

Name	Description	Default	Type
accessToken (consumer)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (consumer)	Google Calendar application name. Example would be camel-google-calendar/1.0		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
calendarId (consumer)	The calendarId to be used	primary	String
clientId (consumer)	Client ID of the calendar application		String
clientSecret (consumer)	Client secret of the calendar application		String
considerLastUpdate (consumer)	Take into account the lastUpdate of the last event polled as start date for the next poll	false	boolean
consumeFromNow (consumer)	Consume events in the selected calendar from now on	true	boolean
maxResults (consumer)	Max results to be returned	10	int
query (consumer)	The query to execute on calendar		String

Name	Description	Default	Type
refreshToken (consumer)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
scopes (consumer)	Specifies the level of permissions you want a calendar application to have to a user account. See https://developers.google.com/calendar/auth for more info.		List
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int

Name	Description	Default	Type
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

119.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.google-calendar-stream.client-factory</code>	The client Factory. The option is a <code>org.apache.camel.component.google.calendar.GoogleCalendarClientFactory</code> type.		String
<code>camel.component.google-calendar-stream.configuration.access-token</code>	OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage.		String
<code>camel.component.google-calendar-stream.configuration.application-name</code>	Google Calendar application name. Example would be <code>camel-google-calendar/1.0</code>		String
<code>camel.component.google-calendar-stream.configuration.calendar-id</code>	The <code>calendarId</code> to be used	primary	String
<code>camel.component.google-calendar-stream.configuration.client-id</code>	Client ID of the calendar application		String
<code>camel.component.google-calendar-stream.configuration.client-secret</code>	Client secret of the calendar application		String
<code>camel.component.google-calendar-stream.configuration.consider-last-update</code>	Take into account the <code>lastUpdate</code> of the last event polled as start date for the next poll	false	Boolean
<code>camel.component.google-calendar-stream.configuration.consume-from-now</code>	Consume events in the selected calendar from now on	true	Boolean
<code>camel.component.google-calendar-stream.configuration.index</code>	Specifies an index for the endpoint		String

Name	Description	Default	Type
<code>camel.component.google-calendar-stream.configuration.max-results</code>	Max results to be returned	10	Integer
<code>camel.component.google-calendar-stream.configuration.query</code>	The query to execute on calendar		String
<code>camel.component.google-calendar-stream.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-calendar-stream.configuration.scopes</code>	Specifies the level of permissions you want a calendar application to have to a user account. See https://developers.google.com/calendar/auth for more info.		List
<code>camel.component.google-calendar-stream.enabled</code>	Whether to enable auto configuration of the google-calendar-stream component. This is enabled by default.		Boolean
<code>camel.component.google-calendar-stream.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

119.4. CONSUMER

The consumer will poll by default with `maxResults` equals to 5.

For example

```
from("google-calendar-stream://test?
markAsRead=true&delay=5000&maxResults=5").to("mock:result");
```

This route will consume the next five events starting from the date of polling.

CHAPTER 120. GOOGLE DRIVE COMPONENT

Available as of Camel version 2.14

The Google Drive component provides access to the [Google Drive file storage service](#) via the [Google Drive Web APIs](#).

Google Drive uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-drive</artifactId>
  <version>2.14-SNAPSHOT</version>
</dependency>
```

120.1. URI FORMAT

The GoogleDrive Component uses the following URI format:

```
google-drive://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- drive-about
- drive-apps
- drive-changes
- drive-channels
- drive-children
- drive-comments
- drive-files
- drive-parents
- drive-permissions
- drive-properties
- drive-realtime
- drive-replies
- drive-revisions

120.2. GOOGLEDRIVECOMPONENT

The Google Drive component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		GoogleDrive Configuration
clientFactory (advanced)	To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory		GoogleDriveClient Factory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Drive endpoint is configured using URI syntax:

```
google-drive:apiName/methodName
```

with the following path and query parameters:

120.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		GoogleDriveApiName
methodName	Required What sub operation to use for the selected operation		String

120.2.2. Query Parameters (12 parameters):

Name	Description	Default	Type
accessToken (common)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (common)	Google drive application name. Example would be camel-google-drive/1.0		String

Name	Description	Default	Type
clientFactory (common)	To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory		GoogleDriveClientFactory
clientId (common)	Client ID of the drive application		String
clientSecret (common)	Client secret of the drive application		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
refreshToken (common)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
scopes (common)	Specifies the level of permissions you want a drive application to have to a user account. See https://developers.google.com/drive/web/scopes for more info.		List
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

120.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 11 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.google-drive.client-factory</code>	To use the <code>GoogleCalendarClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleDriveClientFactory</code> . The option is a <code>org.apache.camel.component.google.drive.GoogleDriveClientFactory</code> type.		String
<code>camel.component.google-drive.configuration.access-token</code>	OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage.		String
<code>camel.component.google-drive.configuration.api-name</code>	What kind of operation to perform		GoogleDriveApiName
<code>camel.component.google-drive.configuration.application-name</code>	Google drive application name. Example would be <code>camel-google-drive/1.0</code>		String
<code>camel.component.google-drive.configuration.client-id</code>	Client ID of the drive application		String
<code>camel.component.google-drive.configuration.client-secret</code>	Client secret of the drive application		String
<code>camel.component.google-drive.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.google-drive.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new <code>accessToken</code> whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-drive.configuration.scopes</code>	Specifies the level of permissions you want a drive application to have to a user account. See https://developers.google.com/drive/web/scopes for more info.		List

Name	Description	Default	Type
<code>camel.component.google-drive.enabled</code>	Enable google-drive component	true	Boolean
<code>camel.component.google-drive.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

120.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleDrive.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleDrive.option** header.

For more information on the endpoints and options see API documentation at: <https://developers.google.com/drive/v2/reference/>

120.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

120.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleDrive.** prefix.

120.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleDriveComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 121. GOOGLE MAIL COMPONENT

Available as of Camel version 2.15

The Google Mail component provides access to [Gmail](#) via the [Google Mail Web APIs](#).

Google Mail uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-mail</artifactId>
  <version>2.15-SNAPSHOT</version>
</dependency>
```

121.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
google-mail://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- attachments
- drafts
- history
- labels
- messages
- threads
- users

121.2. GOOGLEMAILCOMPONENT

The Google Mail component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		GoogleMailConfiguration

Name	Description	Default	Type
clientFactory (advanced)	To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleMailClientFactory		GoogleMailClientFactory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Mail endpoint is configured using URI syntax:

```
google-mail:apiName/methodName
```

with the following path and query parameters:

121.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		GoogleMailApiName
methodName	Required What sub operation to use for the selected operation		String

121.2.2. Query Parameters (10 parameters):

Name	Description	Default	Type
accessToken (common)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (common)	Google mail application name. Example would be camel-google-mail/1.0		String
clientId (common)	Client ID of the mail application		String
clientSecret (common)	Client secret of the mail application		String

Name	Description	Default	Type
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
refreshToken (common)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

121.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
camel.component.google-mail.client-factory	To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleMailClientFactory. The option is a org.apache.camel.component.google.mail.GoogleMailClientFactory type.		String

Name	Description	Default	Type
<code>camel.component.google-mail.configuration.access-token</code>	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
<code>camel.component.google-mail.configuration.api-name</code>	What kind of operation to perform		GoogleMailApiName
<code>camel.component.google-mail.configuration.application-name</code>	Google mail application name. Example would be camel-google-mail/1.0		String
<code>camel.component.google-mail.configuration.client-id</code>	Client ID of the mail application		String
<code>camel.component.google-mail.configuration.client-secret</code>	Client secret of the mail application		String
<code>camel.component.google-mail.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.google-mail.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-mail.enabled</code>	Enable google-mail component	true	Boolean
<code>camel.component.google-mail.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

121.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI **MUST** contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options **MUST** be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleMail.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleMail.option** header.

For more information on the endpoints and options see API documentation at: <https://developers.google.com/gmail/api/v1/reference/>

121.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

121.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleMail.** prefix.

121.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleMailComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 122. GOOGLE MAIL STREAM COMPONENT

Available as of Camel version 2.22

The Google Mail component provides access to [Gmail](#) via the [Google Mail Web APIs](#).

Google Mail uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-mail</artifactId>
  <version>2.22-SNAPSHOT</version>
</dependency>
```

122.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
google-mail-stream://index?[options]
```

122.2. GOOGLEMAILSTREAMCOMPONENT

The Google Mail Stream component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	The configuration		GoogleMailStream Configuration
clientFactory (advanced)	The client Factory		GoogleMailClient Factory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Mail Stream endpoint is configured using URI syntax:

```
google-mail-stream:index
```

with the following path and query parameters:

122.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
index	Specifies an index for the endpoint		String

122.2.2. Query Parameters (28 parameters):

Name	Description	Default	Type
accessToken (consumer)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (consumer)	Google mail application name. Example would be camel-google-mail/1.0		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
clientId (consumer)	Client ID of the mail application		String
clientSecret (consumer)	Client secret of the mail application		String
labels (consumer)	Comma separated list of labels to take into account		String
markAsRead (consumer)	Mark the message as read once it has been consumed	false	boolean
maxResults (consumer)	Max results to be returned	10	long
query (consumer)	The query to execute on gmail box	is:unread	String
refreshToken (consumer)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String

Name	Description	Default	Type
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at <code>WARN</code> or <code>ERROR</code> level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an <code>Exchange</code> have been created and being routed in Camel.		<code>PollingConsumerPollStrategy</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as <code>60s</code> (60 seconds), <code>5m30s</code> (5 minutes and 30 seconds), and <code>1h</code> (1 hour).	500	long
greedy (scheduler)	If <code>greedy</code> is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean

Name	Description	Default	Type
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LogLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

122.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

Name	Description	Default	Type
camel.component.google-mail-stream.client-factory	The client Factory. The option is a org.apache.camel.component.google.mail.GoogleMailClientFactory type.		String

Name	Description	Default	Type
<code>camel.component.google-mail-stream.configuration.access-token</code>	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
<code>camel.component.google-mail-stream.configuration.application-name</code>	Google mail application name. Example would be camel-google-mail/1.0		String
<code>camel.component.google-mail-stream.configuration.client-id</code>	Client ID of the mail application		String
<code>camel.component.google-mail-stream.configuration.client-secret</code>	Client secret of the mail application		String
<code>camel.component.google-mail-stream.configuration.index</code>	Specifies an index for the endpoint		String
<code>camel.component.google-mail-stream.configuration.labels</code>	Comma separated list of labels to take into account		String
<code>camel.component.google-mail-stream.configuration.mark-as-read</code>	Mark the message as read once it has been consumed	false	Boolean
<code>camel.component.google-mail-stream.configuration.max-results</code>	Max results to be returned	10	Long
<code>camel.component.google-mail-stream.configuration.query</code>	The query to execute on gmail box	is:unread	String

Name	Description	Default	Type
<code>camel.component.google-mail-stream.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-mail-stream.enabled</code>	Whether to enable auto configuration of the google-mail-stream component. This is enabled by default.		Boolean
<code>camel.component.google-mail-stream.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

122.4. CONSUMER

The consumer will poll by default with the query "is:unread" and maxResults equals to 10.

For example

```
from("google-mail-stream://test?
markAsRead=true&delay=5000&maxResults=5&labels=GitHub,Apache").to("mock:result");
```

This route will consume unread messages with labels Github and Apache and it will mark the messages as read.

CHAPTER 123. GOOGLE PUBSUB COMPONENT

Available as of Camel version 2.19

The Google Pubsub component provides access to [Cloud Pub/Sub Infrastructure](#) via the [Google Client Services API](#).

The current implementation does not use gRPC.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-pubsub</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

123.1. URI FORMAT

The Google Pubsub Component uses the following URI format:

```
google-pubsub://project-id:destinationName?[options]
```

Destination Name can be either a topic or a subscription name.

123.2. OPTIONS

The Google Pubsub component supports 2 options, which are listed below.

Name	Description	Default	Type
connectionFactory (common)	Sets the connection factory to use; provides the ability to explicitly manage connection credentials: - the path to the key file - the Service Account Key / Email pair		GooglePubsubConnectionFactory
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Pubsub endpoint is configured using URI syntax:

```
google-pubsub:projectId:destinationName
```

with the following path and query parameters:

123.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
projectId	Required Project Id		String
destinationName	Required Destination Name		String

123.2.2. Query Parameters (9 parameters):

Name	Description	Default	Type
ackMode (common)	AUTO = exchange gets ack'ed/nack'ed on completion. NONE = downstream process has to ack/nack explicitly	AUTO	AckMode
concurrentConsumers (common)	The number of parallel streams consuming from the subscription	1	Integer
connectionFactory (common)	ConnectionFactory to obtain connection to PubSub Service. If non provided the default will be used.		GooglePubsubConnectionFactory
loggerId (common)	Logger ID to use when a match to the parent route required		String
maxMessagesPerPoll (common)	The max number of messages to receive from the server in a single API call	1	Integer
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern

Name	Description	Default	Type
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

123.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.google-pubsub.enabled	Enable google-pubsub component	true	Boolean
camel.component.google-pubsub.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

123.4. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to PubSub individual and grouped exchanges alike. Grouped exchanges have **Exchange.GROUPED_EXCHANGE** property set.

Google PubSub expects the payload to be byte[] array, Producer endpoints will send:

- String body as byte[] encoded as UTF-8
- byte[] body as is
- Everything else will be serialised into byte[] array

A Map set as message header **GooglePubsubConstants.ATTRIBUTES** will be sent as PubSub attributes. Once exchange has been delivered to PubSub the PubSub Message ID will be assigned to the header **GooglePubsubConstants.MESSAGE_ID**.

123.5. CONSUMER ENDPOINTS

Google PubSub will redeliver the message if it has not been acknowledged within the time period set as a configuration option on the subscription.

The component will acknowledge the message once exchange processing has been completed.

If the route throws an exception, the exchange is marked as failed and the component will NACK the message - it will be redelivered immediately.

To ack/nack the message the component uses Acknowledgement ID stored as header **GooglePubsubConstants.ACK_ID**. If the header is removed or tampered with, the ack will fail and the message will be redelivered again after the ack deadline.

123.6. MESSAGE HEADERS

Headers set by the consumer endpoints:

- `GooglePubsubConstants.MESSAGE_ID`
- `GooglePubsubConstants.ATTRIBUTES`
- `GooglePubsubConstants.PUBLISH_TIME`
- `GooglePubsubConstants.ACK_ID`

123.7. MESSAGE BODY

The consumer endpoint returns the content of the message as `byte[]` - exactly as the underlying system sends it. It is up for the route to convert/unmarshall the contents.

123.8. AUTHENTICATION CONFIGURATION

Google Pubsub component authentication is targeted for use with the GCP Service Accounts. For more information please refer to [Google Cloud Platform Auth Guide](#)

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on [Application Default Credentials](#).

OBS! The location of the default credentials file is configurable - via `GOOGLE_APPLICATION_CREDENTIALS` environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as `client_email` and `private_key` respectively.

123.9. ROLLBACK AND REDELIVERY

The rollback for Google PubSub relies on the idea of the Acknowledgement Deadline - the time period where Google PubSub expects to receive the acknowledgement. If the acknowledgement has not been received, the message is redelivered.

Google provides an API to extend the deadline for a message.

More information in [Google PubSub Documentation](#)

So, rollback is effectively a deadline extension API call with zero value - i.e. deadline is reached now and message can be redelivered to the next consumer.

It is possible to delay the message redelivery by setting the acknowledgement deadline explicitly for the rollback by setting the message header **GooglePubsubConstants.ACK_DEADLINE** to the value in seconds.

CHAPTER 124. GOOGLE SHEETS COMPONENT

Available as of Camel version 2.23

The Google Sheets component provides access to [Google Sheets](#) via the [Google Sheets Web APIs](#).

Google Sheets uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-sheets</artifactId>
  <version>2.23.0</version>
</dependency>
```

124.1. URI FORMAT

The GoogleSheets Component uses the following URI format:

```
google-sheets://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- spreadsheets
- data

124.2. GOOGLESHEETSCOMPONENT

The Google Sheets component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (common)	To use the shared configuration		GoogleSheets Configuration
clientFactory (advanced)	To use the GoogleSheetsClientFactory as factory for creating the client. Will by default use BatchGoogleSheetsClientFactory		GoogleSheetsClient Factory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Sheets endpoint is configured using URI syntax:

google-sheets:apiName/methodName

with the following path and query parameters:

124.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
apiName	Required What kind of operation to perform		GoogleSheetsApiName
methodName	Required What sub operation to use for the selected operation		String

124.2.2. Query Parameters (10 parameters):

Name	Description	Default	Type
accessToken (common)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (common)	Google Sheets application name. Example would be camel-google-sheets/1.0		String
clientId (common)	Client ID of the sheets application		String
clientSecret (common)	Client secret of the sheets application		String
inBody (common)	Sets the name of a parameter to be passed in the exchange In Body		String
refreshToken (common)	OAuth 2 refresh token. Using this, the Google Sheets component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

124.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

Name	Description	Default	Type
camel.component.google-sheets.client-factory	To use the <code>GoogleSheetsClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleSheetsClientFactory</code> . The option is a <code>org.apache.camel.component.google.sheets.GoogleSheetsClientFactory</code> type.		String
camel.component.google-sheets.configuration.access-token	OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage.		String
camel.component.google-sheets.configuration.api-name	What kind of operation to perform		GoogleSheetsApi Name
camel.component.google-sheets.configuration.application-name	Google Sheets application name. Example would be <code>camel-google-sheets/1.0</code>		String
camel.component.google-sheets.configuration.client-id	Client ID of the sheets application		String

Name	Description	Default	Type
<code>camel.component.google-sheets.configuration.client-secret</code>	Client secret of the sheets application		String
<code>camel.component.google-sheets.configuration.method-name</code>	What sub operation to use for the selected operation		String
<code>camel.component.google-sheets.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Sheets component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-sheets.enabled</code>	Whether to enable auto configuration of the google-sheets component. This is enabled by default.		Boolean
<code>camel.component.google-sheets.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

124.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleSheets.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleSheets.option** header.

For more information on the endpoints and options see API documentation at: <https://developers.google.com/sheets/api/reference/rest/>

124.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer

endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

124.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleSheets.** prefix.

124.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleSheetsComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 125. GOOGLE SHEETS STREAM COMPONENT

Available as of Camel version 2.23

The Google Sheets component provides access to [Sheets](#) via the [Google Sheets Web APIs](#).

Google Sheets uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a `clientId`, `clientSecret`, and a `refreshToken`. A handy resource for generating a long-lived `refreshToken` is the [OAuth playground](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-sheets</artifactId>
  <version>2.23.0</version>
</dependency>
```

125.1. URI FORMAT

The Google Sheets Component uses the following URI format:

```
google-sheets-stream://apiName?[options]
```

125.2. GOOGLESHEETSSTREAMCOMPONENT

The Google Sheets Stream component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (consumer)	To use the shared configuration		GoogleSheetsStream Configuration
clientFactory (advanced)	To use the <code>GoogleSheetsClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleSheetsClientFactory</code>		GoogleSheetsClient Factory
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Google Sheets Stream endpoint is configured using URI syntax:

```
google-sheets-stream:apiName
```

with the following path and query parameters:

125.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
apiName	Sets the apiName.		String

125.2.2. Query Parameters (31 parameters):

Name	Description	Default	Type
accessToken (consumer)	OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.		String
applicationName (consumer)	Google sheets application name. Example would be camel-google-sheets/1.0		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
clientId (consumer)	Client ID of the sheets application		String
clientSecret (consumer)	Client secret of the sheets application		String
includeGridData (consumer)	True if grid data should be returned.	false	boolean
majorDimension (consumer)	Specifies the major dimension that results should use..	ROWS	String
maxResults (consumer)	Specify the maximum number of returned results. This will limit the number of rows in a returned value range data set or the number of returned value ranges in a batch request.	10	int
range (consumer)	Specifies the range of rows and columns in a sheet to get data from.		String

Name	Description	Default	Type
refreshToken (consumer)	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
scopes (consumer)	Specifies the level of permissions you want a sheets application to have to a user account. See https://developers.google.com/identity/protocols/googlescopes for more info.		List
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
spreadsheetId (consumer)	Specifies the spreadsheet identifier that is used to identify the target to obtain.		String
valueRenderOption (consumer)	Determines how values should be rendered in the output.	FORMATTED_VALUE	String
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option errorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int

Name	Description	Default	Type
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

125.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.google-sheets-stream.client-factory</code>	To use the <code>GoogleSheetsClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleSheetsClientFactory</code> . The option is a <code>org.apache.camel.component.google.sheets.GoogleSheetsClientFactory</code> type.		String
<code>camel.component.google-sheets-stream.configuration.access-token</code>	OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage.		String
<code>camel.component.google-sheets-stream.configuration.api-name</code>	Sets the <code>apiName</code> .		String
<code>camel.component.google-sheets-stream.configuration.application-name</code>	Google sheets application name. Example would be <code>camel-google-sheets/1.0</code>		String
<code>camel.component.google-sheets-stream.configuration.client-id</code>	Client ID of the sheets application		String
<code>camel.component.google-sheets-stream.configuration.client-secret</code>	Client secret of the sheets application		String
<code>camel.component.google-sheets-stream.configuration.include-grid-data</code>	True if grid data should be returned.	false	Boolean
<code>camel.component.google-sheets-stream.configuration.major-dimension</code>	Specifies the major dimension that results should use..	ROWS	String

Name	Description	Default	Type
<code>camel.component.google-sheets-stream.configuration.max-results</code>	Specify the maximum number of returned results. This will limit the number of rows in a returned value range data set or the number of returned value ranges in a batch request.	0	Integer
<code>camel.component.google-sheets-stream.configuration.range</code>	Specifies the range of rows and columns in a sheet to get data from.		String
<code>camel.component.google-sheets-stream.configuration.refresh-token</code>	OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.		String
<code>camel.component.google-sheets-stream.configuration.scopes</code>	Specifies the level of permissions you want a sheets application to have to a user account. See https://developers.google.com/identity/protocols/googlescopes for more info.		List
<code>camel.component.google-sheets-stream.configuration.spreadsheet-id</code>	Specifies the spreadsheet identifier that is used to identify the target to obtain.		String
<code>camel.component.google-sheets-stream.configuration.value-render-option</code>	Determines how values should be rendered in the output.	FORMATTED_VALUE	String
<code>camel.component.google-sheets-stream.enabled</code>	Whether to enable auto configuration of the google-sheets-stream component. This is enabled by default.		Boolean
<code>camel.component.google-sheets-stream.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

125.4. CONSUMER

The consumer will poll by default with `maxResults` equals to 5.

For example

```
from("google-sheets-stream://data?range=A:B&delay=5000&maxResults=5").to("mock:result");
```

This route will consume the next ten events starting from the date of polling.

CHAPTER 126. GROOVY LANGUAGE

Available as of Camel version 1.3

Camel supports [Groovy](#) among other Scripting Languages to allow an Expression or Predicate to be used in the DSL or [Xml Configuration](#).

To use a Groovy expression use the following Java code

```
... groovy("someGroovyExpression") ...
```

For example you could use the **groovy** function to create an Predicate in a [Message Filter](#) or as an Expression for a Recipient List

126.1. GROOVY OPTIONS

The Groovy language supports 1 options, which are listed below.

Name	Default	Java Type	Description
trim	true	Boolean	Whether to trim the value to remove leading and trailing whitespaces and line breaks

126.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.language.groovy.enabled	Enable groovy language	true	Boolean
camel.language.groovy.trim	Whether to trim the value to remove leading and trailing whitespaces and line breaks	true	Boolean

126.3. CUSTOMIZING GROOVY SHELL

Sometimes you may need to use custom **GroovyShell** instance in your Groovy expressions. To provide custom **GroovyShell**, add implementation of the **org.apache.camel.language.groovy.GroovyShellFactory** SPI interface to your Camel registry. For example after adding the following bean to your Spring context...

```
public class CustomGroovyShellFactory implements GroovyShellFactory {
    public GroovyShell createGroovyShell(Exchange exchange) {
        ImportCustomizer importCustomizer = new ImportCustomizer();
        importCustomizer.addStaticStars("com.example.Utils");
        CompilerConfiguration configuration = new CompilerConfiguration();
```

```

configuration.addCompilationCustomizers(importCustomizer);
return new GroovyShell(configuration);
}
}

```

...Camel will use your custom GroovyShell instance (containing your custom static imports), instead of the default one.

126.4. EXAMPLE

```

// lets route if a line item is over $100
from("queue:foo").filter(groovy("request.lineItems.any { i -> i.value > 100 }")).to("queue:bar")

```

And the Spring DSL:

```

<route>
  <from uri="queue:foo"/>
  <filter>
    <groovy>request.lineItems.any { i -> i.value > 100 }</groovy>
    <to uri="queue:bar"/>
  </filter>
</route>

```

126.5. SCRIPTCONTEXT

The JSR-223 scripting languages ScriptContext is pre configured with the following attributes all set at **ENGINE_SCOPE**:

Attribute	Type	Value
context	org.apache.camel.CamelContext	The Camel Context (It cannot be used in groovy)
camelContext	org.apache.camel.CamelContext	The Camel Context
exchange	org.apache.camel.Exchange	The current Exchange

Attribute	Type	Value
request	org.apache.camel.Message	The message (IN message)
response	org.apache.camel.Message	Deprecated: The OUT message. The OUT message if null by default. Use IN message instead.
properties	org.apache.camel.builder.PropertiesFunction	Camel 2.9: Function with a resolve method to make it easier to use Camels Properties component from scripts. See further below for example.

See Scripting Languages for the list of languages with explicit DSL support.

126.6. ADDITIONAL ARGUMENTS TO SCRIPTINGENGINE

Available as of Camel 2.8

You can provide additional arguments to the **ScriptingEngine** using a header on the Camel message with the key **CamelScriptArguments**.

See this example:

126.7. USING PROPERTIES FUNCTION

Available as of Camel 2.9

If you need to use the [Properties](#) component from a script to lookup property placeholders, then its a bit cumbersome to do so. For example to set a header name myHeader with a value from a property placeholder, which key is provided in a header named "foo".

```
.setHeader("myHeader").groovy("""context.resolvePropertyPlaceholders( + '{{' +
request.headers.get(&#39;foo&#39;) + '}' + """)
```

From Camel 2.9 onwards you can now use the properties function and the same example is simpler:

```
.setHeader("myHeader").groovy("properties.resolve(request.headers.get(&#39;foo&#39;))")
```

126.8. LOADING SCRIPT FROM EXTERNAL RESOURCE

Available as of Camel 2.11

You can externalize the script and have Camel load it from a resource such as **"classpath:"**, **"file:"**, or **"http:"**.

This is done using the following syntax: **"resource:scheme:location"**, eg to refer to a file on the classpath you can do:

```
.setHeader("myHeader").groovy("resource:classpath:mygroovy.groovy")
```

126.9. HOW TO GET THE RESULT FROM MULTIPLE STATEMENTS SCRIPT

Available as of Camel 2.14

As the `scriptengine eval` method just return a Null if it runs a multiple statements script. Camel now look up the value of script result by using the key of "result" from the value set. If you have multiple statements script, you need to make sure you set the value of result variable as the script return value.

```
bar = "baz";
# some other statements ...
# camel take the result value as the script evaluation result
result = body * 2 + 1
```

126.10. DEPENDENCIES

To use scripting languages in your camel routes you need to add a dependency on **camel-groovy**.

If you use Maven you could just add the following to your **pom.xml**, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-groovy</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 127. GRPC COMPONENT

Available as of Camel version 2.19

The gRPC component allows you to call or expose Remote Procedure Call (RPC) services using [Protocol Buffers \(protobuf\)](#) exchange format over HTTP/2 transport.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-grpc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

Starting with Camel 2.22 gRPC requires strong own of the Google Guava version. It's necessary to add following configuration property to the maven file

```
<properties>
  <google-guava-version>${grpc-guava-version}</google-guava-version>
</properties>
```

127.1. URI FORMAT

```
grpc://service[?options]
```

127.2. ENDPOINT OPTIONS

The gRPC component has no options.

The gRPC endpoint is configured using URI syntax:

```
grpc:host:port/service
```

with the following path and query parameters:

127.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
host	Required The gRPC server host name. This is localhost or 0.0.0.0 when being a consumer or remote server host name when using producer.		String
port	Required The gRPC local or remote server port		int

Name	Description	Default	Type
service	Required Fully qualified service name from the protocol buffer descriptor file (package dot service definition name)		String

127.2.2. Query Parameters (25 parameters):

Name	Description	Default	Type
flowControlWindow (common)	The HTTP/2 flow control window size (MiB)	1048576	int
maxMessageSize (common)	The maximum message size allowed to be received/sent (MiB)	4194304	int
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
consumerStrategy (consumer)	This option specifies the top-level strategy for processing service requests and responses in streaming mode. If an aggregation strategy is selected, all requests will be accumulated in the list, then transferred to the flow, and the accumulated responses will be sent to the sender. If a propagation strategy is selected, request is sent to the stream, and the response will be immediately sent back to the sender.	PROPAGATION	GrpcConsumerStrategy
forwardOnCompleted (consumer)	Determines if onCompleted events should be pushed to the Camel route.	false	boolean
forwardOnError (consumer)	Determines if onError events should be pushed to the Camel route. Exceptions will be set as message body.	false	boolean
maxConcurrentCallsPerConnection (consumer)	The maximum number of concurrent calls permitted for each incoming server connection	2147483647	int

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
method (producer)	gRPC method name		String
producerStrategy (producer)	The mode used to communicate with a remote gRPC server. In SIMPLE mode a single exchange is translated into a remote procedure call. In STREAMING mode all exchanges will be sent within the same request (input and output of the recipient gRPC service must be of type 'stream').	SIMPLE	GrpcProducerStrategy
streamRepliesTo (producer)	When using STREAMING client mode, it indicates the endpoint where responses should be forwarded.		String
userAgent (producer)	The user agent header passed to the server		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
authenticationType (security)	Authentication method type in advance to the SSL/TLS negotiation	NONE	GrpcAuthType
jwtAlgorithm (security)	JSON Web Token sign algorithm	HMAC256	JwtAlgorithm
jwtIssuer (security)	JSON Web Token issuer		String
jwtSecret (security)	JSON Web Token secret		String
jwtSubject (security)	JSON Web Token subject		String

Name	Description	Default	Type
keyCertChainResource (security)	The X.509 certificate chain file resource in PEM format link		String
keyPassword (security)	The PKCS#8 private key file password		String
keyResource (security)	The PKCS#8 private key file resource in PEM format link		String
negotiationType (security)	Identifies the security negotiation type used for HTTP/2 communication	PLAIN TEXT	NegotiationType
serviceAccountResource (security)	Service Account key file in JSON format resource link supported by the Google Cloud SDK		String
trustCertCollectionResource (security)	The trusted certificates collection file resource in PEM format for verifying the remote endpoint's certificate		String

127.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.grpc.enabled	Enable grpc component	true	Boolean
camel.component.grpc.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

127.4. TRANSPORT SECURITY AND AUTHENTICATION SUPPORT (AVAILABLE FROM CAMEL 2.20)

The following [authentication](#) mechanisms are built-in to gRPC and available in this component:

- **SSL/TLS:** gRPC has SSL/TLS integration and promotes the use of SSL/TLS to authenticate the server, and to encrypt all the data exchanged between the client and the server. Optional mechanisms are available for clients to provide certificates for mutual authentication.
- **Token-based authentication with Google:** gRPC provides a generic mechanism to attach metadata based credentials to requests and responses. Additional support for acquiring access tokens while accessing Google APIs through gRPC is provided. In general this mechanism must

be used as well as SSL/TLS on the channel.

To enable these features the following component properties combinations must be configured:

Num.	Option	Parameter	Value	Required/Optional
1	SSL/TLS	negotiationType	TLS	Required
		keyCertChainResource		Required
		keyResource		Required
		keyPassword		Optional
		trustCertCollectionResource		Optional
2	Token-based authentication with Google API	authenticationType	GOOGLE	Required
		negotiationType	TLS	Required
		serviceAccountResource		Required
3	Custom JSON Web Token implementation authentication	authenticationType	JWT	Required
		negotiationType	NONE or TLS	Optional. The TLS/SSL not checking for this type, but strongly recommended.
		jwtAlgorithm	HMAC256(default) or (HMAC384, HMAC512)	Optional
		jwtSecret		Required
		jwtIssuer		Optional
		jwtSubject		Optional

TLS with OpenSSL is currently the recommended approach for using gRPC over TLS component. Using the JDK for ALPN is generally much slower and may not support the necessary ciphers for HTTP2. This function is not implemented in the component.

127.5. GRPC PRODUCER RESOURCE TYPE MAPPING

The table below shows the types of objects in the message body, depending on the types (simple or stream) of incoming and outgoing parameters, as well as the invocation style (synchronous or asynchronous). Please note, that invocation of the procedures with incoming stream parameter in asynchronous style are not allowed.

Invocation style	Request type	Response type	Request Body Type	Result Body Type
synchronous	simple	simple	Object	Object
synchronous	simple	stream	Object	List<Object>
synchronous	stream	simple	not allowed	not allowed
synchronous	stream	stream	not allowed	not allowed
asynchronous	simple	simple	Object	List<Object>
asynchronous	simple	stream	Object	List<Object>
asynchronous	stream	simple	Object or List<Object>	List<Object>
asynchronous	stream	stream	Object or List<Object>	List<Object>

127.6. GRPC CONSUMER HEADERS (WILL BE INSTALLED AFTER THE CONSUMER INVOCATION)

Header name	Description	Possible values
CamelGrpcMethodName	Method name handled by the consumer service	
CamelGrpcEventType	Received event type from the sent request	onNext, onCompleted or onError
CamelGrpcUserAgent	If provided, the given agent will prepend the gRPC library's user agent information	

127.7. EXAMPLES

Below is a simple synchronous method invoke with host and port parameters

```
from("direct:grpc-sync")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=sendPing&synchronous=true");
```

```
<route>
  <from uri="direct:grpc-sync" />
  <to uri="grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=sendPing&synchronous=true"/>
</route>
```

An asynchronous method invoke

```
from("direct:grpc-async")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=pingAsyncResponse");
```

gRPC service consumer with propagation consumer strategy

```
from("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
consumerStrategy=PROPAGATION")
.to("direct:grpc-service");
```

gRPC service producer with streaming producer strategy (requires a service that uses "stream" mode as input and output)

```
from("direct:grpc-request-stream")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=PingAsyncAsync&producerStrategy=STREAMING&streamRepliesTo=direct:grpc-response-
stream");

from("direct:grpc-response-stream")
.log("Response received: ${body}");
```

gRPC service consumer TLS/SLL security negotiation enable

```
from("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
consumerStrategy=PROPAGATION&negotiationType=TLS&keyCertChainResource=file:src/test/resour
ces/certs/server.pem&keyResource=file:src/test/resources/certs/server.key&trustCertCollectionResource
=file:src/test/resources/certs/ca.pem")
.to("direct:tls-enable")
```

gRPC service producer with custom JSON Web Token implementation authentication

```
from("direct:grpc-jwt")
.to("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
method=pingSyncSync&synchronous=true&authenticationType=JWT&jwtSecret=supersecuredsecret"
);
```

127.8. CONFIGURATION

It's it is recommended to use Maven Protocol Buffers Plugin which calls Protocol Buffer Compiler (protoc) tool to generate Java source files from .proto (protocol buffer definition) files for the custom project. This plugin will generate procedures request and response classes, their builders and gRPC procedures stubs classes as well.

Following steps are required:

Insert operating system and CPU architecture detection extension inside `<build>` tag of the project pom.xml or set `os.detected.classifier` parameter manually

```
<extensions>
  <extension>
    <groupId>kr.motd.maven</groupId>
    <artifactId>os-maven-plugin</artifactId>
    <version>1.4.1.Final</version>
  </extension>
</extensions>
```

Insert gRPC and protobuf Java code generator plugin `<plugins>` tag of the project pom.xml

```
<plugin>
  <groupId>org.xolstice.maven.plugins</groupId>
  <artifactId>protobuf-maven-plugin</artifactId>
  <version>0.5.0</version>
  <configuration>
    <protocArtifact>com.google.protobuf:protoc:${protobuf-
version}:exe:${os.detected.classifier}</protocArtifact>
    <pluginId>grpc-java</pluginId>
    <pluginArtifact>io.grpc:protoc-gen-grpc-java:${grpc-
version}:exe:${os.detected.classifier}</pluginArtifact>
  </configuration>
  <executions>
    <execution>
      <goals>
        <goal>compile</goal>
        <goal>compile-custom</goal>
        <goal>test-compile</goal>
        <goal>test-compile-custom</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```

CHAPTER 128. GUAVA EVENTBUS COMPONENT

Available as of Camel version 2.10

The [Google Guava EventBus](#) allows publish-subscribe-style communication between components without requiring the components to explicitly register with one another (and thus be aware of each other). The **guava-eventbus** component provides integration bridge between Camel and [Google Guava EventBus](#) infrastructure. With the latter component, messages exchanged with the Guava **EventBus** can be transparently forwarded to the Camel routes. EventBus component allows also to route body of Camel exchanges to the Guava **EventBus**.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-guava-eventbus</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

128.1. URI FORMAT

```
guava-eventbus:busName[?options]
```

Where **busName** represents the name of the **com.google.common.eventbus.EventBus** instance located in the Camel registry.

128.2. OPTIONS

The Guava EventBus component supports 3 options, which are listed below.

Name	Description	Default	Type
eventBus (common)	To use the given Guava EventBus instance		EventBus
listenerInterface (common)	The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option.		Class
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Guava EventBus endpoint is configured using URI syntax:

guava-eventbus:eventBusRef

with the following path and query parameters:

128.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
eventBusRef	To lookup the Guava EventBus from the registry with the given name		String

128.2.2. Query Parameters (6 parameters):

Name	Description	Default	Type
eventClass (common)	If used on the consumer side of the route, will filter events received from the EventBus to the instances of the class and superclasses of eventClass. Null value of this option is equal to setting it to the java.lang.Object i.e. the consumer will capture all messages incoming to the event bus. This option cannot be used together with listenerInterface option.		Class
listenerInterface (common)	The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option.		Class
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

128.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
camel.component.guava-eventbus.enabled	Enable guava-eventbus component	true	Boolean
camel.component.guava-eventbus.eventbus	To use the given Guava EventBus instance. The option is a <code>com.google.common.eventbus.EventBus</code> type.		String
camel.component.guava-eventbus.listener-interface	The interface with method(s) marked with the <code>Subscribe</code> annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling <code>DeadEvent</code> properly. This option cannot be used together with <code>eventClass</code> option.		Class
camel.component.guava-eventbus.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

128.4. USAGE

Using **guava-eventbus** component on the consumer side of the route will capture messages sent to the Guava **EventBus** and forward them to the Camel route. Guava EventBus consumer processes incoming messages [asynchronously](#).

```
SimpleRegistry registry = new SimpleRegistry();
EventBus eventBus = new EventBus();
```

```
registry.put("busName", eventBus);
CamelContext camel = new DefaultCamelContext(registry);

from("guava-eventbus:busName").to("seda:queue");

eventBus.post("Send me to the SEDA queue.");
```

Using **guava-eventbus** component on the producer side of the route will forward body of the Camel exchanges to the Guava **EventBus** instance.

```
SimpleRegistry registry = new SimpleRegistry();
EventBus eventBus = new EventBus();
registry.put("busName", eventBus);
CamelContext camel = new DefaultCamelContext(registry);

from("direct:start").to("guava-eventbus:busName");

ProducerTemplate producerTemplate = camel.createProducerTemplate();
producer.sendBody("direct:start", "Send me to the Guava EventBus.");

eventBus.register(new Object(){
    @Subscribe
    public void messageHandler(String message) {
        System.out.println("Message received from the Camel: " + message);
    }
});
```

128.5. DEADEVENT CONSIDERATIONS

Keep in mind that due to the limitations caused by the design of the Guava EventBus, you cannot specify event class to be received by the listener without creating class annotated with **@Subscribe** method. This limitation implies that endpoint with **eventClass** option specified actually listens to all possible events (**java.lang.Object**) and filter appropriate messages programmatically at runtime. The snippet below demonstrates an appropriate excerpt from the Camel code base.

```
@Subscribe
public void eventReceived(Object event) {
    if (eventClass == null || eventClass.isAssignableFrom(event.getClass())) {
        doEventReceived(event);
    }
    ...
}
```

This drawback of this approach is that **EventBus** instance used by Camel will never generate **com.google.common.eventbus.DeadEvent** notifications. If you want Camel to listen only to the precisely specified event (and therefore enable **DeadEvent** support), use **listenerInterface** endpoint option. Camel will create dynamic proxy over the interface you specify with the latter option and listen only to messages specified by the interface handler methods. The example of the listener interface with single method handling only **SpecificEvent** instances is demonstrated below.

```
package com.example;

public interface CustomListener {

    @Subscribe
```

```
void eventReceived(SpecificEvent event);  
}
```

The listener presented above could be used in the endpoint definition as follows.

```
from("guava-eventbus:busName?listenerInterface=com.example.CustomListener").to("seda:queue");
```

128.6. CONSUMING MULTIPLE TYPE OF EVENTS

In order to define multiple type of events to be consumed by Guava EventBus consumer use **listenerInterface** endpoint option, as listener interface could provide multiple methods marked with the **@Subscribe** annotation.

```
package com.example;  
  
public interface MultipleEventsListener {  
  
    @Subscribe  
    void someEventReceived(SomeEvent event);  
  
    @Subscribe  
    void anotherEventReceived(AnotherEvent event);  
  
}
```

The listener presented above could be used in the endpoint definition as follows.

```
from("guava-eventbus:busName?  
listenerInterface=com.example.MultipleEventsListener").to("seda:queue");
```

CHAPTER 129. HAWTDB (DEPRECATED)

Available as of Camel 2.3

[HawtDB](#) is a very lightweight and embedable key value database. It allows together with Camel to provide persistent support for various Camel features such as Aggregator.

Current features it provides:

- `HawtDBAggregationRepository`

Deprecated

The [HawtDB](#) project is being deprecated and replaced by [leveldb](#) as the lightweight and embedable key value database. To make using leveldb easy there is a [leveldbjni](#) project for that. The Apache ActiveMQ project is planning on using leveldb as their primary file based message store in the future, to replace kahadb.

There is a camel-leveldb component we recommend to use instead of this.

Issue with HawtDB 1.4 or older

There is a bug in HawtDB 1.4 or older which means the filestore will not free unused space. That means the file keeps growing. This has been fixed in HawtDB 1.5 which is shipped with Camel 2.5 onwards.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hawtdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

Current features it provides:

- `HawtDBAggregationRepository`

129.1. USING HAWTDBAGGREGATIONREPOSITORY

HawtDBAggregationRepository is an **AggregationRepository** which on the fly persists the aggregated messages. This ensures that you will not loose messages, as the default aggregator will use an in memory only **AggregationRepository**.

It has the following options:

Option	Type	Description
repositoryName	String	A mandatory repository name. Allows you to use a shared HawtDBFile for multiple repositories.

Option	Type	Description
persistentFileName	String	Filename for the persistent storage. If no file exists on startup a new file is created.
bufferSize	int	The size of the memory segment buffer which is mapped to the file store. By default its 8mb. The value is in bytes.
sync	boolean	Whether or not the HawtDBFile should sync on write or not. Default is true . By sync on write ensures that its always waiting for all writes to be spooled to disk and thus will not loose updates. If you disable this option, then HawtDB will auto sync when it has batched up a number of writes.
pageSize	short	The size of memory pages. By default its 512 bytes. The value is in bytes.
hawtDBFile	HawtDBFile	Use an existing configured org.apache.camel.component.hawtdb.HawtDBFile instance.
returnOldExchange	boolean	Whether the get operation should return the old existing Exchange if any existed. By default this option is false to optimize as we do not need the old exchange when aggregating.
useRecovery	boolean	Whether or not recovery is enabled. This option is by default true . When enabled the Camel Aggregator automatic recover failed aggregated exchange and have them resubmitted.
recoveryInterval	long	If recovery is enabled then a background task is run every x'th time to scan for failed exchanges to recover and resubmit. By default this interval is 5000 millis.
maximumRedeliveries	int	Allows you to limit the maximum number of redelivery attempts for a recovered exchange. If enabled then the Exchange will be moved to the dead letter channel if all redelivery attempts failed. By default this option is disabled. If this option is used then the deadLetterUri option must also be provided.
deadLetterUri	String	An endpoint uri for a Dead Letter Channel where exhausted recovered Exchanges will be moved. If this option is used then the maximumRedeliveries option must also be provided.
optimisticLocking	false	Camel 2.12: To turn on optimistic locking, which often would be needed in clustered environments where multiple Camel applications shared the same HawtDB based aggregation repository.

The **repositoryName** option must be provided. Then either the **persistentFileName** or the **hawtDBFile** must be provided.

129.1.1. What is preserved when persisting

HawtDBAggregationRepository will only preserve any **Serializable** compatible data types. If a data type is not such a type its dropped and a **WARN** is logged. And it only persists the **Message** body and the **Message** headers. The **Exchange** properties are **not** persisted.

129.1.2. Recovery

The **HawtDBAggregationRepository** will by default recover any failed Exchange. It does this by having a background tasks that scans for failed Exchanges in the persistent store. You can use the **checkInterval** option to set how often this task runs. The recovery works as transactional which ensures that Camel will try to recover and redeliver the failed Exchange. Any Exchange which was found to be recovered will be restored from the persistent store and resubmitted and send out again.

The following headers is set when an Exchange is being recovered/redelivered:

Header	Type	Description
Exchange.REDELIVERED	Boolean	Is set to true to indicate the Exchange is being redelivered.
Exchange.REDELIVERY_COUNTER	Integer	The redelivery attempt, starting from 1.

Only when an Exchange has been successfully processed it will be marked as complete which happens when the **confirm** method is invoked on the **AggregationRepository**. This means if the same Exchange fails again it will be kept retried until it success.

You can use option **maximumRedeliveries** to limit the maximum number of redelivery attempts for a given recovered Exchange. You must also set the **deadLetterUri** option so Camel knows where to send the Exchange when the **maximumRedeliveries** was hit.

You can see some examples in the unit tests of camel-hawtodb, for example [this test](#).

129.1.2.1. Using HawtDBAggregationRepository in Java DSL

In this example we want to persist aggregated messages in the **target/data/hawtodb.dat** file.

129.1.2.2. Using HawtDBAggregationRepository in Spring XML

The same example but using Spring XML instead:

129.1.3. Dependencies

To use HawtDB in your camel routes you need to add the a dependency on **camel-hawtodb**.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-hawtdb</artifactId>  
  <version>2.3.0</version>  
</dependency>
```

CHAPTER 130. HAZELCAST COMPONENT

Available as of Camel version 2.7

The **hazelcast**- component allows you to work with the [Hazelcast](#) distributed data grid / cache. Hazelcast is a in memory data grid, entirely written in Java (single jar). It offers a great palette of different data stores like map, multi map (same key, n values), queue, list and atomic number. The main reason to use Hazelcast is its simple cluster support. If you have enabled multicast on your network you can run a cluster with hundred nodes with no extra configuration. Hazelcast can simply configured to add additional features like n copies between nodes (default is 1), cache persistence, network configuration (if needed), near cache, eviction and so on. For more information consult the Hazelcast documentation on <http://www.hazelcast.com/docs.jsp>.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hazelcast</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

130.1. HAZELCAST COMPONENTS

See followings for each component usage: * [map](#) * [multimap](#) * [queue](#) * [topic](#) * [list](#) * [seda](#) * [set](#) * [atomic number](#) * [cluster support \(instance\)](#) * [replicatedmap](#) * [ringbuffer](#)

130.2. USING HAZELCAST REFERENCE

130.2.1. By its name

```
<bean id="hazelcastLifecycle" class="com.hazelcast.core.LifecycleService"
  factory-bean="hazelcastInstance" factory-method="getLifecycleService"
  destroy-method="shutdown" />

<bean id="config" class="com.hazelcast.config.Config">
  <constructor-arg type="java.lang.String" value="HZ.INSTANCE" />
</bean>

<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast" factory-
method="newHazelcastInstance">
  <constructor-arg type="com.hazelcast.config.Config" ref="config"/>
</bean>

<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route id="testHazelcastInstanceBeanRefPut">
    <from uri="direct:testHazelcastInstanceBeanRefPut"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>put</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstanceName=HZ.INSTANCE"/>
  </route>

  <route id="testHazelcastInstanceBeanRefGet">
```

```

<from uri="direct:testHazelcastInstanceBeanRefGet" />
<setHeader headerName="CamelHazelcastOperationType">
  <constant>get</constant>
</setHeader>
<to uri="hazelcast-map:testmap?hazelcastInstanceName=HZ.INSTANCE"/>
<to uri="seda:out" />
</route>
</camelContext>

```

130.2.2. By instance

```

<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast"
  factory-method="newHazelcastInstance" />
<bean id="hazelcastLifecycle" class="com.hazelcast.core.LifecycleService"
  factory-bean="hazelcastInstance" factory-method="getLifecycleService"
  destroy-method="shutdown" />

<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route id="testHazelcastInstanceBeanRefPut">
    <from uri="direct:testHazelcastInstanceBeanRefPut"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>put</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
  </route>

  <route id="testHazelcastInstanceBeanRefGet">
    <from uri="direct:testHazelcastInstanceBeanRefGet" />
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>get</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
    <to uri="seda:out" />
  </route>
</camelContext>

```

130.3. PUBLISHING HAZELCAST INSTANCE AS AN OSGI SERVICE

If operating in an OSGI container and you would want to use one instance of hazelcast across all bundles in the same container. You can publish the instance as an OSGI service and bundles using the cache all need is to reference the service in the hazelcast endpoint.

130.3.1. Bundle A create an instance and publishes it as an OSGI service

```

<bean id="config" class="com.hazelcast.config.FileSystemXmlConfig">
  <argument type="java.lang.String" value="{hazelcast.config}"/>
</bean>

<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast" factory-
method="newHazelcastInstance">
  <argument type="com.hazelcast.config.Config" ref="config"/>
</bean>

```

```

<!-- publishing the hazelcastInstance as a service -->
<service ref="hazelcastInstance" interface="com.hazelcast.core.HazelcastInstance" />

```

130.3.2. Bundle B uses the instance

```

<!-- referencing the hazelcastInstance as a service -->
<reference ref="hazelcastInstance" interface="com.hazelcast.core.HazelcastInstance" />

<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <route id="testHazelcastInstanceBeanRefPut">
    <from uri="direct:testHazelcastInstanceBeanRefPut"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>put</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
  </route>

  <route id="testHazelcastInstanceBeanRefGet">
    <from uri="direct:testHazelcastInstanceBeanRefGet" />
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>get</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
    <to uri="seda:out" />
  </route>
</camelContext>

```

CHAPTER 131. HAZELCAST ATOMIC NUMBER COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) atomic number component is one of Camel Hazelcast Components which allows you to access Hazelcast atomic number. An atomic number is an object that simply provides a grid wide number (long).

There is no consumer for this endpoint!

131.1. OPTIONS

The Hazelcast Atomic Number component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Atomic Number endpoint is configured using URI syntax:

```
hazelcast-atomicvalue:cacheName
```

with the following path and query parameters:

131.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

131.1.2. Query Parameters (10 parameters):

Name	Description	Default	Type
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
defaultOperation (producer)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation
hazelcastInstance (producer)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (producer)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

131.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.hazelcast-atomicvalue.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-atomicvalue.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-atomicvalue.enabled</code>	Enable hazelcast-atomicvalue component	true	Boolean
<code>camel.component.hazelcast-atomicvalue.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-atomicvalue.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-atomicvalue.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

131.3. ATOMIC NUMBER PRODUCER - TO("HAZELCAST-ATOMICVALUE:FOO")

The operations for this producer are: * setvalue (set the number with a given value) * get * increase (+1) * decrease (-1) * destroy

Header Variables for the request message:

Name	Type	Description
Camel HazelcastOperationType	String	valid values are: setvalue, get, increase, decrease, destroy

131.3.1. Sample for set:

Java DSL:

```
from("direct:set")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.SET_VALUE))
.toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```
<route>
  <from uri="direct:set" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>setvalue</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

Provide the value to set inside the message body (here the value is 10):

```
template.sendBody("direct:set", 10);
```

131.3.2. Sample for get:

Java DSL:

```
from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
.toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```
<route>
  <from uri="direct:get" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

You can get the number with **long body = template.requestBody("direct:get", null, Long.class);**

131.3.3. Sample for increment:

Java DSL:

```
from("direct:increment")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.INCREMENT))
.toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```
<route>
  <from uri="direct:increment" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>increment</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

The actual value (after increment) will be provided inside the message body.

131.3.4. Sample for decrement:

Java DSL:

```
from("direct:decrement")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DECREMENT))
.toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```
<route>
  <from uri="direct:decrement" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>decrement</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

The actual value (after decrement) will be provided inside the message body.

131.3.5. Sample for destroy

Java DSL:

```
from("direct:destroy")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DESTROY))
.toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```
<route>
```

```
<from uri="direct:destroy" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>destroy</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

CHAPTER 132. HAZELCAST INSTANCE COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) instance component is one of Camel Hazelcast Components which allows you to consume join/leave events of the cache instance in the cluster. Hazelcast makes sense in one single "server node", but it's extremely powerful in a clustered environment.

This endpoint provides no producer!

132.1. OPTIONS

The Hazelcast Instance component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Instance endpoint is configured using URI syntax:

```
hazelcast-instance:cacheName
```

with the following path and query parameters:

132.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

132.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
defaultOperation (consumer)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation
hazelcastInstance (consumer)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (consumer)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

Name	Description	Default	Type
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

132.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 26 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-atomicvalue.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-atomicvalue.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-instance.enabled	Enable hazelcast-instance component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-instance.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-instance.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-instance.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.hazelcast-list.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-list.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-map.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-map.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-multimap.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-multimap.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-queue.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-queue.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-replicatedmap.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-replicatedmap.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-ringbuffer.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-ringbuffer.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-seda.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-seda.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-set.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-set.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-topic.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-topic.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-topic.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-topic.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean

132.3. INSTANCE CONSUMER - FROM("HAZELCAST-INSTANCE:FOO")

The instance consumer fires if a new cache instance will join or leave the cluster.

Here's a sample:

```
fromF("hazelcast-%sfoo", HazelcastConstants.INSTANCE_PREFIX)
.log("instance...")
.choice()
  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
    .log("...added")
    .to("mock:added")
  .otherwise()
    .log("...removed")
    .to("mock:removed");
```

Each event provides the following information inside the message header:

Header Variables inside the response message:

Name	Type	Description
Camel HazelcastListenerTime	Long	time of the event in millis
Camel HazelcastListenerType	String	the map consumer sets here "instancelistener"
Camel HazelcastListenerAction	String	type of event - here added or removed .
Camel HazelcastInstanceHost	String	host name of the instance
Camel HazelcastInstancePort	Integer	port number of the instance

CHAPTER 133. HAZELCAST LIST COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) List component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed list.

133.1. OPTIONS

The Hazelcast List component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast List endpoint is configured using URI syntax:

```
hazelcast-list:cacheName
```

with the following path and query parameters:

133.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

133.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

133.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-list.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-list.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-list.enabled	Enable hazelcast-list component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-list.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-list.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-list.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

133.3. LIST PRODUCER – TO("HAZELCAST-LIST:FOO")

The list producer provides 7 operations: * add * addAll * set * get * removevalue * removeAll * clear

133.3.1. Sample for add:

```
from("direct:add")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
.toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

133.3.2. Sample for get:

```
from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
.toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX)
.to("seda:out");
```

133.3.3. Sample for setvalue:

```
from("direct:set")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.SET_VALUE))
.toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

133.3.4. Sample for removevalue:

```
from("direct:removevalue")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
.toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

Note that `CamelHazelcastObjectIndex` header is used for indexing purpose.

133.4. LIST CONSUMER – FROM(“HAZELCAST-LIST:FOO”)

The list consumer provides 2 operations: * add * remove

```
fromF("hazelcast-%smm", HazelcastConstants.LIST_PREFIX)
    .log("object...")
    .choice()

.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
    .log("...added")
    .to("mock:added")

.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
    .log("...removed")
    .to("mock:removed")
    .otherwise()
    .log("fail!");
```

CHAPTER 134. HAZELCAST MAP COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) Map component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed map.

134.1. OPTIONS

The Hazelcast Map component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Map endpoint is configured using URI syntax:

```
hazelcast-map:cacheName
```

with the following path and query parameters:

134.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

134.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

134.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-map.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-map.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-map.enabled	Enable hazelcast-map component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-map.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-map.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-map.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

134.3. MAP CACHE PRODUCER - TO("HAZELCAST-MAP:FOO")

If you want to store a value in a map you can use the map cache producer.

The map cache producer provides follow operations specified by `CamelHazelcastOperationType` header:

- put
- putIfAbsent
- get
- getAll
- keySet
- containsKey
- containsValue
- delete
- update
- query
- clear
- evict
- evictAll

All operations are provide the inside the "hazelcast.operation.type" header variable. In Java DSL you can use the constants from **org.apache.camel.component.hazelcast.HazelcastOperation**.

Header Variables for the request message:

Name	Type	Description
Camel HazelcastOperationType	String	as already described.
Camel HazelcastObjectid	String	the object id to store / find your object inside the cache (not needed for the query operation)

put and **putIfAbsent** operations provide an eviction mechanism:

Name	Type	Description
Camel HazelcastObjectTtlValue	Integer	value of TTL.
Camel HazelcastObjectTtlUnit	java.util.concurrent.TimeUnit	value of time unit (DAYS / HOURS / MINUTES /

You can call the samples with:

```
template.sendBodyAndHeader("direct:[put|get|update|delete|query|evict]", "my-foo",
HazelcastConstants.OBJECT_ID, "4711");
```

134.3.1. Sample for put:

Java DSL:

```
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);
```

Spring DSL:

```
<route>
```

```

<from uri="direct:put" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>put</constant>
  </setHeader>
  <to uri="hazelcast-map:foo" />
</route>

```

Sample for **put** with eviction:

Java DSL:

```

from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.setHeader(HazelcastConstants.TTL_VALUE, constant(Long.valueOf(1)))
.setHeader(HazelcastConstants.TTL_UNIT, constant(TimeUnit.MINUTES))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);

```

Spring DSL:

```

<route>
  <from uri="direct:put" />
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
    <setHeader headerName="hazelcast.operation.type">
      <constant>put</constant>
    </setHeader>
    <setHeader headerName="HazelcastConstants.TTL_VALUE">
      <simple resultType="java.lang.Long">1</simple>
    </setHeader>
    <setHeader headerName="HazelcastConstants.TTL_UNIT">
      <simple resultType="java.util.concurrent.TimeUnit">TimeUnit.MINUTES</simple>
    </setHeader>
    <to uri="hazelcast-map:foo" />
</route>

```

134.3.2. Sample for get:

Java DSL:

```

from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
.to("seda:out");

```

Spring DSL:

```

<route>
  <from uri="direct:get" />
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
    <setHeader headerName="hazelcast.operation.type">
      <constant>get</constant>
    </setHeader>

```

```

<to uri="hazelcast-map:foo" />
<to uri="seda:out" />
</route>

```

134.3.3. Sample for update:

Java DSL:

```

from("direct:update")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.UPDATE))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);

```

Spring DSL:

```

<route>
  <from uri="direct:update" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>update</constant>
  </setHeader>
  <to uri="hazelcast-map:foo" />
</route>

```

134.3.4. Sample for delete:

Java DSL:

```

from("direct:delete")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);

```

Spring DSL:

```

<route>
  <from uri="direct:delete" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>delete</constant>
  </setHeader>
  <to uri="hazelcast-map:foo" />
</route>

```

134.3.5. Sample for query

Java DSL:

```

from("direct:query")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.QUERY))
.toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
.to("seda:out");

```

Spring DSL:

```

<route>
  <from uri="direct:query" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>query</constant>
  </setHeader>
  <to uri="hazelcast-map:foo" />
  <to uri="seda:out" />
</route>

```

For the query operation Hazelcast offers a SQL like syntax to query your distributed map.

```

String q1 = "bar > 1000";
template.sendBodyAndHeader("direct:query", null, HazelcastConstants.QUERY, q1);

```

134.4. MAP CACHE CONSUMER - FROM("HAZELCAST-MAP:FOO")

Hazelcast provides event listeners on their data grid. If you want to be notified if a cache will be manipulated, you can use the map consumer. There're 4 events: **put**, **update**, **delete** and **evict**. The event type will be stored in the "**hazelcast.listener.action**" header variable. The map consumer provides some additional information inside these variables:

Header Variables inside the response message:

Name	Type	Description
Camel HazelcastListenerTime	Long	time of the event in millis
Camel HazelcastListenerType	String	the map consumer sets here "cachelister"
Camel HazelcastListenerAction	String	type of event - here added , updated , evicted and removed .
Camel HazelcastObjectid	String	the oid of the object

Name	Type	Description
Camel HazelcastCacheName	String	the name of the cache - e.g. "foo"
Camel HazelcastCacheType	String	the type of the cache - here map

The object value will be stored within **put** and **update** actions inside the message body.

Here's a sample:

```

fromF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
.log("object...")
.choice()
  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
    .log("...added")
    .to("mock:added")

  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))

    .log("...envicted")
    .to("mock:envicted")

  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.UPDATED))
    .log("...updated")
    .to("mock:updated")

  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))

    .log("...removed")
    .to("mock:removed")
  .otherwise()
    .log("fail!");

```

CHAPTER 135. HAZELCAST MULTIMAP COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) Multimap component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed multimap.

135.1. OPTIONS

The Hazelcast Multimap component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Multimap endpoint is configured using URI syntax:

```
hazelcast-multimap:cacheName
```

with the following path and query parameters:

135.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

135.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

135.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-multimap.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-multimap.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-multimap.enabled	Enable hazelcast-multimap component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-multimap.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-multimap.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-multimap.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

135.3. MULTIMAP CACHE PRODUCER - TO("HAZELCAST-MULTIMAP:FOO")

A multimap is a cache where you can store n values to one key. The multimap producer provides 4 operations (put, get, removevalue, delete).

Header Variables for the request message:

Name	Type	Description
Camel HazelcastOperationType	String	valid values are: put, get, removevalue, delete From Camel 2.16: clear.
Camel HazelcastObjectid	String	the object id to store / find your object inside the cache

135.3.1. Sample for put:

Java DSL:

```
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.to(String.format("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX));
```

Spring DSL:

```
<route>
  <from uri="direct:put" />
  <log message="put.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>put</constant>
  </setHeader>
  <to uri="hazelcast-multimap:foo" />
</route>
```

135.3.2. Sample for removevalue:

Java DSL:

```
from("direct:removevalue")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
.toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX);
```

Spring DSL:

```
<route>
  <from uri="direct:removevalue" />
  <log message="removevalue.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>removevalue</constant>
  </setHeader>
  <to uri="hazelcast-multimap:foo" />
</route>
```

To remove a value you have to provide the value you want to remove inside the message body. If you have a multimap object `\{key: "4711" values: { "my-foo", "my-bar"}\}` you have to put "my-foo" inside the message body to remove the "my-foo" value.

135.3.3. Sample for get:

Java DSL:

```
from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
.toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
.to("seda:out");
```

Spring DSL:

```
<route>
  <from uri="direct:get" />
  <log message="get.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
```

```

</setHeader>
<to uri="hazelcast-multimap:foo" />
<to uri="seda:out" />
</route>

```

135.3.4. Sample for delete:

Java DSL:

```

from("direct:delete")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
.toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX);

```

Spring DSL:

```

<route>
  <from uri="direct:delete" />
  <log message="delete.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>delete</constant>
  </setHeader>
  <to uri="hazelcast-multimap:foo" />
</route>

```

you can call them in your test class with:

```

template.sendBodyAndHeader("direct:[put|get|removevalue|delete]", "my-foo",
HazelcastConstants.OBJECT_ID, "4711");

```

135.4. MULTIMAP CACHE CONSUMER - FROM("HAZELCAST-MULTIMAP:FOO")

For the multimap cache this component provides the same listeners / variables as for the map cache consumer (except the update and eviction listener). The only difference is the **multimap** prefix inside the URI. Here is a sample:

```

fromF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
.log("object...")
.choice()
  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
    .log("...added")
    .to("mock:added")

  // .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))
  //   .log("...envicted")
  //   .to("mock:envicted")

  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
    .log("...removed")

```

```

        .to("mock:removed")
        .otherwise()
        .log("fail!");

```

Header Variables inside the response message:

Name	Type	Description
Camel HazelcastListenerTime	Long	time of the event in millis
Camel HazelcastListenerType	String	the map consumer sets here "cachelister"
Camel HazelcastListenerAction	String	type of event - here added and removed (and soon evicted)
Camel HazelcastObjectid	String	the oid of the object
Camel HazelcastCacheName	String	the name of the cache - e.g. "foo"
Camel HazelcastCacheType	String	the type of the cache - here multimap

CHAPTER 136. HAZELCAST QUEUE COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) Queue component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed queue.

136.1. OPTIONS

The Hazelcast Queue component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Queue endpoint is configured using URI syntax:

```
hazelcast-queue:cacheName
```

with the following path and query parameters:

136.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

136.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

136.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-queue.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-queue.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-queue.enabled	Enable hazelcast-queue component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-queue.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-queue.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-queue.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

136.3. QUEUE PRODUCER – TO(“HAZELCAST-QUEUE:FOO”)

The queue producer provides 10 operations: * add * put * poll * peek * offer * remove value * remaining capacity * remove all * remove if * drain to * take * retain all

136.3.1. Sample for add:

```
from("direct:add")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
.toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.2. Sample for put:

```
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.3. Sample for poll:

```
from("direct:poll")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.POLL))
.toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.4. Sample for peek:

```
from("direct:peek")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PEEK))
.toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.5. Sample for offer:

```
from("direct:offer")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.OFFER))
.toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.6. Sample for removevalue:

```
from("direct:removevalue")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
.toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);
```

136.3.7. Sample for remaining capacity:

```
from("direct:remaining-capacity").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.REMAINING_CAPACITY)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.3.8. Sample for remove all:

```
from("direct:removeAll").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.REMOVE_ALL)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.3.9. Sample for remove if:

```
from("direct:removelf").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.REMOVE_IF)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.3.10. Sample for drain to:

```
from("direct:drainTo").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.DRAIN_TO)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.3.11. Sample for take:

```
from("direct:take").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.TAKE)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.3.12. Sample for retain all:

```
from("direct:retainAll").setHeader(HazelcastConstants.OPERATION,
constant(HazelcastOperation.RETAIN_ALL)).to(
String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));
```

136.4. QUEUE CONSUMER – FROM("HAZELCAST-QUEUE:FOO")

The queue consumer provides two different modes:

- Poll
- Listen

Sample for **Poll** mode

```
fromF("hazelcast-%sfoo?queueConsumerMode=Poll",
HazelcastConstants.QUEUE_PREFIX)).to("mock:result");
```

In this way the consumer will poll the queue and return the head of the queue or null after a timeout.

In Listen mode instead the consumer will listen for events on queue.

The queue consumer in Listen mode provides 2 operations: * add * remove

Sample for **Listen** mode

```
fromF("hazelcast-%smm", HazelcastConstants.QUEUE_PREFIX)
.log("object...")
.choice()
.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
.log("...added")
.to("mock:added")

.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))

.log("...removed")
.to("mock:removed")
.otherwise()
.log("fail!");
```

CHAPTER 137. HAZELCAST REPLICATED MAP COMPONENT

Available as of Camel version 2.16

The [Hazelcast](#) instance component is one of Camel Hazelcast Components which allows you to consume join/leave events of the cache instance in the cluster. A replicated map is a weakly consistent, distributed key-value data structure with no data partition.

137.1. OPTIONS

The Hazelcast Replicated Map component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Replicated Map endpoint is configured using URI syntax:

```
hazelcast-replicatedmap:cacheName
```

with the following path and query parameters:

137.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

137.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstance Name (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumer Mode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

137.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-replicatedmap.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-replicatedmap.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-replicatedmap.enabled	Enable hazelcast-replicatedmap component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-replicatedmap.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-replicatedmap.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-replicatedmap.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

137.3. REPLICATEDMAP CACHE PRODUCER

The replicatedmap producer provides 4 operations: * put * get * delete * clear

Header Variables for the request message:

Name	Type	Description
Camel HazelcastOperationType	String	valid values are: put, get, removevalue, delete
Camel HazelcastObjectid	String	the object id to store / find your object inside the cache

137.3.1. Sample for put:

Java DSL:

```
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.to(String.format("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX));
```

Spring DSL:

```

<route>
  <from uri="direct:put" />
  <log message="put.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>put</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo" />
</route>

```

137.3.2. Sample for get:

Java DSL:

```

from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
.toF("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX)
.to("seda:out");

```

Spring DSL:

```

<route>
  <from uri="direct:get" />
  <log message="get.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo" />
  <to uri="seda:out" />
</route>

```

137.3.3. Sample for delete:

Java DSL:

```

from("direct:delete")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
.toF("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX);

```

Spring DSL:

```

<route>
  <from uri="direct:delete" />
  <log message="delete.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>delete</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo" />
</route>

```

you can call them in your test class with:

```
template.sendBodyAndHeader("direct:[put|get|delete|clear]", "my-foo",
HazelcastConstants.OBJECT_ID, "4711");
```

137.4. REPLICATEDMAP CACHE CONSUMER

For the multimap cache this component provides the same listeners / variables as for the map cache consumer (except the update and eviction listener). The only difference is the **multimap** prefix inside the URI. Here is a sample:

```
fromF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
.log("object...")
.choice()
  .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
    .log("...added")
    .to("mock:added")

//.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))

// .log("...envicted")
// .to("mock:envicted")

.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
  .log("...removed")
  .to("mock:removed")
.otherwise()
  .log("fail!");
```

Header Variables inside the response message:

Name	Type	Description
Camel HazelcastListenerTime	Long	time of the event in millis
Camel HazelcastListenerType	String	the map consumer sets here "cachelister"
Camel HazelcastListenerAction	String	type of event - here added and removed (and soon envicted)

Name	Type	Description
Camel HazelcastObjectid	String	the oid of the object
Camel HazelcastCacheName	String	the name of the cache - e.g. "foo"
Camel HazelcastCacheType	String	the type of the cache - here replicatedmap

CHAPTER 138. HAZELCAST RINGBUFFER COMPONENT

Available as of Camel version 2.16

Available from Camel 2.16

The [Hazelcast](#) ringbuffer component is one of Camel Hazelcast Components which allows you to access Hazelcast ringbuffer. Ringbuffer is a distributed data structure where the data is stored in a ring-like structure. You can think of it as a circular array with a certain capacity.

138.1. OPTIONS

The Hazelcast Ringbuffer component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Ringbuffer endpoint is configured using URI syntax:

```
hazelcast-ringbuffer:cacheName
```

with the following path and query parameters:

138.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

138.1.2. Query Parameters (10 parameters):

Name	Description	Default	Type
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
defaultOperation (producer)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation
hazelcastInstance (producer)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (producer)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

138.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.hazelcast-ringbuffer.customizer.hazelcast-instance.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.hazelcast-ringbuffer.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-ringbuffer.enabled</code>	Enable hazelcast-ringbuffer component	true	Boolean
<code>camel.component.hazelcast-ringbuffer.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-ringbuffer.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-ringbuffer.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

138.3. RINGBUFFER CACHE PRODUCER

The ringbuffer producer provides 5 operations: * add * readonceHead * readonceTail * remainingCapacity * capacity

Header Variables for the request message:

Name	Type	Description
Camel HazelcastOperationType	String	valid values are: put, get, removevalue, delete
Camel HazelcastObjectid	String	the object id to store / find your object inside the cache

138.3.1. Sample for put:

Java DSL:

```
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
.to(String.format("hazelcast-%sbar", HazelcastConstants.RINGBUFFER_PREFIX));
```

Spring DSL:

```
<route>
  <from uri="direct:put" />
  <log message="put.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>add</constant>
  </setHeader>
  <to uri="hazelcast-ringbuffer:foo" />
</route>
```

138.3.2. Sample for readonce from head:

Java DSL:

```
from("direct:get")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.READ_ONCE_HEAD))
.toF("hazelcast-%sbar", HazelcastConstants.RINGBUFFER_PREFIX)
.to("seda:out");
```

CHAPTER 139. HAZELCAST SEDA COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) SEDA component is one of Camel Hazelcast Components which allows you to access Hazelcast BlockingQueue. SEDA component differs from the rest components provided. It implements a work-queue in order to support asynchronous SEDA architectures, similar to the core "SEDA" component.

139.1. OPTIONS

The Hazelcast SEDA component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast SEDA endpoint is configured using URI syntax:

```
hazelcast-seda:cacheName
```

with the following path and query parameters:

139.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

139.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

Name	Description	Default	Type
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

139.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-seda.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-seda.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-seda.enabled	Enable hazelcast-seda component	true	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-seda.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-seda.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-seda.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

139.3. SEDA PRODUCER – TO(“HAZELCAST-SEDA:FOO”)

The SEDA producer provides no operations. You only send data to the specified queue.

Java DSL :

```
from("direct:foo")
.to("hazelcast-seda:foo");
```

Spring DSL :

```
<route>
  <from uri="direct:start" />
  <to uri="hazelcast-seda:foo" />
</route>
```

139.4. SEDA CONSUMER – FROM(“HAZELCAST-SEDA:FOO”)

The SEDA consumer provides no operations. You only retrieve data from the specified queue.

Java DSL :

```
from("hazelcast-seda:foo")
.to("mock:result");
```

Spring DSL:

```
<route>
```

```
<from uri="hazelcast-seda:foo" />  
<to uri="mock:result" />  
</route>
```

CHAPTER 140. HAZELCAST SET COMPONENT

Available as of Camel version 2.7

The [Hazelcast](#) Set component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed set.

140.1. OPTIONS

The Hazelcast Set component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Set endpoint is configured using URI syntax:

```
hazelcast-set:cacheName
```

with the following path and query parameters:

140.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

140.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

140.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-set.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-set.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
camel.component.hazelcast-set.enabled	Enable hazelcast-set component	true	Boolean

Name	Description	Default	Type
camel.component.hazelcast-set.hazelcast-instance	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
camel.component.hazelcast-set.hazelcast-mode	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
camel.component.hazelcast-set.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 141. HAZELCAST TOPIC COMPONENT

Available as of Camel version 2.15

The [Hazelcast](#) Topic component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed topic.

141.1. OPTIONS

The Hazelcast Topic component supports 3 options, which are listed below.

Name	Description	Default	Type
hazelcastInstance (advanced)	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		HazelcastInstance
hazelcastMode (advanced)	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Hazelcast Topic endpoint is configured using URI syntax:

```
hazelcast-topic:cacheName
```

with the following path and query parameters:

141.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

141.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
defaultOperation (common)	To specify a default operation to use, if no operation header has been provided.		HazelcastOperation

Name	Description	Default	Type
hazelcastInstance (common)	The hazelcast instance reference which can be used for hazelcast endpoint.		HazelcastInstance
hazelcastInstanceName (common)	The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.		String
reliable (common)	Define if the endpoint will use a reliable Topic struct or not.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pollingTimeout (consumer)	Define the polling timeout of the Queue consumer in Poll mode	10000	long
poolSize (consumer)	Define the Pool size for Queue Consumer Executor	1	int
queueConsumerMode (consumer)	Define the Queue Consumer mode: Listen or Poll	Listen	HazelcastQueueConsumer Mode
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
concurrentConsumers (seda)	To use concurrent consumers polling from the SEDA queue.	1	int

Name	Description	Default	Type
onErrorDelay (seda)	Milliseconds before consumer continues polling after an error has occurred.	1000	int
pollTimeout (seda)	The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.	1000	int
transacted (seda)	If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.	false	boolean
transferExchange (seda)	If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.	false	boolean

141.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 8 options, which are listed below.

Name	Description	Default	Type
camel.component.hazelcast-topic.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-topic.customizer.hazelcast-instance.enabled	Enable or disable the cache-manager customizer.	true	Boolean
camel.component.hazelcast-topic.customizer.hazelcast-instance.override	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean

Name	Description	Default	Type
<code>camel.component.hazelcast-topic.customizer.hazelcast-instance.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.hazelcast-topic.enabled</code>	Enable hazelcast-topic component	true	Boolean
<code>camel.component.hazelcast-topic.hazelcast-instance</code>	The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. The option is a <code>com.hazelcast.core.HazelcastInstance</code> type.		String
<code>camel.component.hazelcast-topic.hazelcast-mode</code>	The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.	node	String
<code>camel.component.hazelcast-topic.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

141.3. TOPIC PRODUCER – TO("HAZELCAST-TOPIC:FOO")

The topic producer provides only one operation (publish).

141.3.1. Sample for publish:

```
from("direct:add")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUBLISH))
  .toF("hazelcast-%sbar", HazelcastConstants.PUBLISH_OPERATION);
```

141.4. TOPIC CONSUMER – FROM("HAZELCAST-TOPIC:FOO")

The topic consumer provides only one operation (received). This component is supposed to support multiple consumption as it's expected when it comes to topics so you are free to have as much consumers as you need on the same hazelcast topic.

```
fromF("hazelcast-%sfoo", HazelcastConstants.TOPIC_PREFIX)
  .choice()
```

```
.when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.RECEIVED))  
    .log("...message received")  
    .otherwise()  
    .log("...this should never have happened")
```

CHAPTER 142. HBASE COMPONENT

Available as of Camel version 2.10

This component provides an idempotent repository, producers and consumers for [Apache HBase](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hbase</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

142.1. APACHE HBASE OVERVIEW

HBase is an open-source, distributed, versioned, column-oriented store modeled after Google's Bigtable: A Distributed Storage System for Structured Data. You can use HBase when you need random, realtime read/write access to your Big Data. More information at [Apache HBase](#).

142.2. CAMEL AND HBASE

When using a datastore inside a camel route, there is always the challenge of specifying how the camel message will be stored to the datastore. In document based stores things are more easy as the message body can be directly mapped to a document. In relational databases an ORM solution can be used to map properties to columns etc. In column based stores things are more challenging as there is no standard way to perform that kind of mapping.

HBase adds two additional challenges:

- HBase groups columns into families, so just mapping a property to a column using a name convention is just not enough.
- HBase doesn't have the notion of type, which means that it stores everything as `byte[]` and doesn't know if the `byte[]` represents a String, a Number, a serialized Java object or just binary data.

To overcome these challenges, camel-hbase makes use of the message headers to specify the mapping of the message to HBase columns. It also provides the ability to use some camel-hbase provided classes that model HBase data and can be easily converted to and from xml/json etc. Finally it provides the ability to the user to implement and use his own mapping strategy.

Regardless of the mapping strategy camel-hbase will convert a message into an `org.apache.camel.component.hbase.model.HBaseData` object and use that object for its internal operations.

142.3. CONFIGURING THE COMPONENT

The HBase component can be provided a custom `HBaseConfiguration` object as a property or it can create an HBase configuration object on its own based on the HBase related resources that are found on classpath.

```
<bean id="hbase" class="org.apache.camel.component.hbase.HBaseComponent">
  <property name="configuration" ref="config"/>
</bean>
```

If no configuration object is provided to the component, the component will create one. The created configuration will search the class path for an `hbase-site.xml` file, from which it will draw the configuration. You can find more information about how to configure HBase clients at: [HBase client configuration and dependencies](#)

142.4. HBASE PRODUCER

As mentioned above camel provides producers endpoints for HBase. This allows you to store, delete, retrieve or query data from HBase using your camel routes.

```
hbase://table[?options]
```

where **table** is the table name.

The supported operations are:

- Put
- Get
- Delete
- Scan

142.4.1. Supported URI options

The HBase component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (advanced)	To use the shared configuration		Configuration
poolMaxSize (common)	Maximum number of references to keep for each table in the HTable pool. The default value is 10.	10	int
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The HBase endpoint is configured using URI syntax:

```
hbase:tableName
```

with the following path and query parameters:

142.4.2. Path Parameters (1 parameters):

Name	Description	Default	Type
tableName	Required The name of the table		String

142.4.3. Query Parameters (16 parameters):

Name	Description	Default	Type
cellMappingStrategyFactory (common)	To use a custom CellMappingStrategyFactory that is responsible for mapping cells.		CellMappingStrategyFactory
filters (common)	A list of filters to use.		List
mappingStrategyClassName (common)	The class name of a custom mapping strategy implementation.		String
mappingStrategyName (common)	The strategy to use for mapping Camel messages to HBase columns. Supported values: header, or body.		String
rowMapping (common)	To map the key/values from the Map to a HBaseRow. The following keys is supported: rowId - The id of the row. This has limited use as the row usually changes per Exchange. rowType - The type to covert row id to. Supported operations: CamelHBaseScan. family - The column family. Supports a number suffix for referring to more than one columns. qualifier - The column qualifier. Supports a number suffix for referring to more than one columns. value - The value. Supports a number suffix for referring to more than one columns valueType - The value type. Supports a number suffix for referring to more than one columns. Supported operations: CamelHBaseGet, and CamelHBaseScan.		Map
rowModel (common)	An instance of org.apache.camel.component.hbase.model.HBaseRow which describes how each row should be modeled		HBaseRow
userGroupInformation (common)	Defines privileges to communicate with HBase such as using kerberos.		UserGroupInformation

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
maxMessagesPerPoll (consumer)	Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited.		int
operation (consumer)	The HBase operation to perform		String
remove (consumer)	If the option is true, Camel HBase Consumer will remove the rows which it processes.	true	boolean
removeHandler (consumer)	To use a custom HBaseRemoveHandler that is executed when a row is to be removed.		HBaseRemoveHandler
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
maxResults (producer)	The maximum number of rows to scan.	100	int
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

142.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.hbase.configuration</code>	To use the shared configuration. The option is a <code>org.apache.hadoop.conf.Configuration</code> type.		String
<code>camel.component.hbase.enabled</code>	Enable hbase component	true	Boolean
<code>camel.component.hbase.pool-max-size</code>	Maximum number of references to keep for each table in the HTable pool. The default value is 10.	10	Integer
<code>camel.component.hbase.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

142.5.1. Put Operations.

HBase is a column based store, which allows you to store data into a specific column of a specific row. Columns are grouped into families, so in order to specify a column you need to specify the column family and the qualifier of that column. To store data into a specific column you need to specify both the column and the row.

The simplest scenario for storing data into HBase from a camel route, would be to store part of the message body to specified HBase column.

```

<route>
  <from uri="direct:in"/>
  <!-- Set the HBase Row -->
  <setHeader headerName="CamelHBaseRowId">
    <el>${in.body.id}</el>
  </setHeader>
  <!-- Set the HBase Value -->
  <setHeader headerName="CamelHBaseValue">
    <el>${in.body.value}</el>
  </setHeader>
  <to uri="hbase:mytable?
operation=CamelHBasePut&amp;family=myfamily&amp;qualifier=myqualifier"/>
</route>

```

The route above assumes that the message body contains an object that has an id and value property and will store the content of value in the HBase column `myfamily:myqualifier` in the row specified by id. If we needed to specify more than one column/value pairs we could just specify additional column mappings. Notice that you must use numbers from the 2nd header onwards, eg `RowId2`, `RowId3`, `RowId4`, etc. Only the 1st header does not have the number 1.

```

<route>
  <from uri="direct:in"/>

```

```

<!-- Set the HBase Row 1st column -->
<setHeader headerName="CamelHBaseRowId">
  <el>${in.body.id}</el>
</setHeader>
<!-- Set the HBase Row 2nd column -->
<setHeader headerName="CamelHBaseRowId2">
  <el>${in.body.id}</el>
</setHeader>
<!-- Set the HBase Value for 1st column -->
<setHeader headerName="CamelHBaseValue">
  <el>${in.body.value}</el>
</setHeader>
<!-- Set the HBase Value for 2nd column -->
<setHeader headerName="CamelHBaseValue2">
  <el>${in.body.othervalue}</el>
</setHeader>
<to uri="hbase:mytable?
operation=CamelHBasePut&amp;family=myfamily&amp;qualifier=myqualifier&amp;family2=myfamily&a
p;qualifier2=myqualifier2"/>
</route>

```

It is important to remember that you can use uri options, message headers or a combination of both. It is recommended to specify constants as part of the uri and dynamic values as headers. If something is defined both as header and as part of the uri, the header will be used.

142.5.2. Get Operations.

A Get Operation is an operation that is used to retrieve one or more values from a specified HBase row. To specify what are the values that you want to retrieve you can just specify them as part of the uri or as message headers.

```

<route>
  <from uri="direct:in"/>
  <!-- Set the HBase Row of the Get -->
  <setHeader headerName="CamelHBaseRowId">
    <el>${in.body.id}</el>
  </setHeader>
  <to uri="hbase:mytable?
operation=CamelHBaseGet&amp;family=myfamily&amp;qualifier=myqualifier&amp;valueType=java.lang
Long"/>
  <to uri="log:out"/>
</route>

```

In the example above the result of the get operation will be stored as a header with name CamelHBaseValue.

142.5.3. Delete Operations.

You can also use camel-hbase to perform HBase delete operation. The delete operation will remove an entire row. All that needs to be specified is one or more rows as part of the message headers.

```

<route>
  <from uri="direct:in"/>
  <!-- Set the HBase Row of the Get -->
  <setHeader headerName="CamelHBaseRowId">

```

```

    <el>${in.body.id}</el>
  </setHeader>
  <to uri="hbase:mytable?operation=CamelHBaseDelete"/>
</route>

```

142.5.4. Scan Operations.

A scan operation is the equivalent of a query in HBase. You can use the scan operation to retrieve multiple rows. To specify what columns should be part of the result and also specify how the values will be converted to objects you can use either uri options or headers.

```

<route>
  <from uri="direct:in"/>
  <to uri="hbase:mytable?
operation=CamelHBaseScan&family=myfamily&qualifier=myqualifier&valueType=java.la
ng.Long&rowType=java.lang.String"/>
  <to uri="log:out"/>
</route>

```

In this case its probable that you also also need to specify a list of filters for limiting the results. You can specify a list of filters as part of the uri and camel will return only the rows that satisfy **ALL** the filters. To have a filter that will be aware of the information that is part of the message, camel defines the `ModelAwareFilter`. This will allow your filter to take into consideration the model that is defined by the message and the mapping strategy.

When using a `ModelAwareFilter` camel-hbase will apply the selected mapping strategy to the in message, will create an object that models the mapping and will pass that object to the Filter.

For example to perform scan using as criteria the message headers, you can make use of the `ModelAwareColumnMatchingFilter` as shown below.

```

<route>
  <from uri="direct:scan"/>
  <!-- Set the Criteria -->
  <setHeader headerName="CamelHBaseFamily">
    <constant>name</constant>
  </setHeader>
  <setHeader headerName="CamelHBaseQualifier">
    <constant>first</constant>
  </setHeader>
  <setHeader headerName="CamelHBaseValue">
    <el>in.body.firstName</el>
  </setHeader>
  <setHeader headerName="CamelHBaseFamily2">
    <constant>name</constant>
  </setHeader>
  <setHeader headerName="CamelHBaseQualifier2">
    <constant>last</constant>
  </setHeader>
  <setHeader headerName="CamelHBaseValue2">
    <el>in.body.lastName</el>
  </setHeader>
  <!-- Set additional fields that you want to be return by skipping value -->
  <setHeader headerName="CamelHBaseFamily3">
    <constant>address</constant>
  </setHeader>

```

```

<setHeader headerName="CamelHBaseQualifier3">
  <constant>country</constant>
</setHeader>
<to uri="hbase:mytable?operation=CamelHBaseScan&filters=#myFilterList"/>
</route>

<bean id="myFilters" class="java.util.ArrayList">
  <constructor-arg>
    <list>
      <bean
class="org.apache.camel.component.hbase.filters.ModelAwareColumnMatchingFilter"/>
    </list>
  </constructor-arg>
</bean>

```

The route above assumes that a pojo is with properties firstName and lastName is passed as the message body, it takes those properties and adds them as part of the message headers. The default mapping strategy will create a model object that will map the headers to HBase columns and will pass that model the ModelAwareColumnMatchingFilter. The filter will filter out any rows, that do not contain columns that match the model. It is like query by example.

142.6. HBASE CONSUMER

The Camel HBase Consumer, will perform repeated scan on the specified HBase table and will return the scan results as part of the message. You can either specify header mapping (default) or body mapping. The later will just add the org.apache.camel.component.hbase.model.HBaseData as part of the message body.

```
hbase://table[?options]
```

You can specify the columns that you want to be return and their types as part of the uri options:

```
hbase:mutable?
family=name&qualifer=first&valueType=java.lang.String&family=address&qualifer=number&valueType2:
ava.lang.Integer&rowType=java.lang.Long
```

The example above will create a model object that is consisted of the specified fields and the scan results will populate the model object with values. Finally the mapping strategy will be used to map this model to the camel message.

142.7. HBASE IDEMPOTENT REPOSITORY

The camel-hbase component also provides an idempotent repository which can be used when you want to make sure that each message is processed only once. The HBase idempotent repository is configured with a table, a column family and a column qualifier and will create to that table a row per message.

```

HBaseConfiguration configuration = HBaseConfiguration.create();
HBaseIdempotentRepository repository = new HBaseIdempotentRepository(configuration,
tableName, family, qualifier);

from("direct:in")
  .idempotentConsumer(header("messageId"), repository)
  .to("log:out");

```

142.8. HBASE MAPPING

It was mentioned above that you the default mapping strategies are **header** and **body** mapping. Below you can find some detailed examples of how each mapping strategy works.

142.8.1. HBase Header mapping Examples

The header mapping is the default mapping. To put the value "myvalue" into HBase row "myrow" and column "myfamily:mycolumn" the message should contain the following headers:

Header	Value
Camel HBase RowId	myrow
Camel HBase Family	myfamily
Camel HBase Qualifi er	myqualifier
Camel HBase Value	myvalue

To put more values for different columns and / or different rows you can specify additional headers suffixed with the index of the headers, e.g:

Header	Value
Camel HBase RowId	myrow
Camel HBase Family	myfamily
Camel HBase Qualifi er	myqualifier

Header	Value
Camel HBase Value	myvalue
Camel HBase RowId2	myrow2
Camel HBase Family2	myfamily
Camel HBase Qualifier2	myqualifier
Camel HBase Value2	myvalue2

In the case of retrieval operations such as get or scan you can also specify for each column the type that you want the data to be converted to. For example:

Header	Value
Camel HBase Family	myfamily
Camel HBase Qualifier	myqualifier
Camel HBase ValueType	Long

Please note that in order to avoid boilerplate headers that are considered constant for all messages, you can also specify them as part of the endpoint uri, as you will see below.

142.8.2. Body mapping Examples

In order to use the body mapping strategy you will have to specify the option `mappingStrategy` as part of the uri, for example:

-

```
hbase:mytable?mappingStrategyName=body
```

To use the body mapping strategy the body needs to contain an instance of `org.apache.camel.component.hbase.model.HBaseData`. You can construct t

```
HBaseData data = new HBaseData();
HBaseRow row = new HBaseRow();
row.setId("myRowId");
HBaseCell cell = new HBaseCell();
cell.setFamily("myfamily");
cell.setQualifier("myqualifier");
cell.setValue("myValue");
row.getCells().add(cell);
data.addRows().add(row);
```

The object above can be used for example in a put operation and will result in creating or updating the row with id `myRowId` and add the value `myvalue` to the column `myfamily:myqualifier`. The body mapping strategy might not seem very appealing at first. The advantage it has over the header mapping strategy is that the `HBaseData` object can be easily converted to or from xml/json.

142.9. SEE ALSO

- [Polling Consumer](#)
- [Apache HBase](#)

CHAPTER 143. HDFS COMPONENT (DEPRECATED)

Available as of Camel version 2.8

The `hdfs` component enables you to read and write messages from/to an HDFS file system. HDFS is the distributed file system at the heart of [Hadoop](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hdfs</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

143.1. URI FORMAT

```
hdfs://hostname[:port][/path][?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`. The path is treated in the following way:

1. as a consumer, if it's a file, it just reads the file, otherwise if it represents a directory it scans all the file under the path satisfying the configured pattern. All the files under that directory must be of the same type.
2. as a producer, if at least one split strategy is defined, the path is considered a directory and under that directory the producer creates a different file per split named using the configured `UuidGenerator`.

Note

When consuming from `hdfs` then in normal mode, a file is split into chunks, producing a message per chunk. You can configure the size of the chunk using the `chunkSize` option. If you want to read from `hdfs` and write to a regular file using the `file` component, then you can use the `fileMode=Append` to append each of the chunks together.

143.2. OPTIONS

The HDFS component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>jaasConfiguration</code> (common)	To use the given configuration for security with JAAS.		Configuration

Name	Description	Default	Type
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The HDFS endpoint is configured using URI syntax:

```
hdfs:hostName:port/path
```

with the following path and query parameters:

143.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
hostName	Required HDFS host to use		String
port	HDFS port to use	8020	int
path	Required The directory path to use		String

143.2.2. Query Parameters (38 parameters):

Name	Description	Default	Type
connectOnStartup (common)	Whether to connect to the HDFS file system on starting the producer/consumer. If false then the connection is created on-demand. Notice that HDFS may take up till 15 minutes to establish a connection, as it has hardcoded 45 x 20 sec redelivery. By setting this option to false allows your application to startup, and not block for up till 15 minutes.	true	boolean
filesystemType (common)	Set to LOCAL to not use HDFS but local java.io.File instead.	HDFS	HdfsFileSystemType
fileType (common)	The file type to use. For more details see Hadoop HDFS documentation about the various files types.	NORMAL_FILE	HdfsFileType
keyType (common)	The type for the key in case of sequence or map files.	NULL	WritableType

Name	Description	Default	Type
owner (common)	The file owner must match this owner for the consumer to pickup the file. Otherwise the file is skipped.		String
valueType (common)	The type for the key in case of sequence or map files	BYTES	WritableType
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
delay (consumer)	The interval (milliseconds) between the directory scans.	1000	long
initialDelay (consumer)	For the consumer, how much to wait (milliseconds) before to start scanning the directory.		long
pattern (consumer)	The pattern used for scanning the directory	*	String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
append (producer)	Append to existing file. Notice that not all HDFS file systems support the append option.	false	boolean

Name	Description	Default	Type
overwrite (producer)	Whether to overwrite existing files with the same name	true	boolean
blockSize (advanced)	The size of the HDFS blocks	67108864	long
bufferSize (advanced)	The buffer size used by HDFS	4096	int
checkIdleInterval (advanced)	How often (time in millis) in to run the idle checker background task. This option is only in use if the splitter strategy is IDLE.	500	int
chunkSize (advanced)	When reading a normal file, this is split into chunks producing a message per chunk.	4096	int
compressionCodec (advanced)	The compression codec to use	DEFAULT	HdfsCompressionCodec
compressionType (advanced)	The compression type to use (is default not in use)	NONE	CompressionType
openedSuffix (advanced)	When a file is opened for reading/writing the file is renamed with this suffix to avoid to read it during the writing phase.	opened	String
readSuffix (advanced)	Once the file has been read is renamed with this suffix to avoid to read it again.	read	String
replication (advanced)	The HDFS replication factor	3	short

Name	Description	Default	Type
splitStrategy (advanced)	In the current version of Hadoop opening a file in append mode is disabled since it's not very reliable. So, for the moment, it's only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way: If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator. Every time a splitting condition is met, a new file is created. The splitStrategy option is defined as a string with the following syntax: splitStrategy=ST:value,ST:value,... where ST can be: BYTES a new file is created, and the old is closed when the number of written bytes is more than value MESSAGES a new file is created, and the old is closed when the number of written messages is more than value IDLE a new file is created, and the old is closed when no writing happened in the last value milliseconds		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel

Name	Description	Default	Type
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumerScheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLISECONDS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

143.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.hdfs.enabled	Enable hdfs component	true	Boolean
camel.component.hdfs.j-a-a-s-configuration	To use the given configuration for security with JAAS. The option is a javax.security.auth.login.Configuration type.		String
camel.component.hdfs.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

143.3.1. KeyType and ValueType

- NULL it means that the key or the value is absent
- BYTE for writing a byte, the java Byte class is mapped into a BYTE

- BYTES for writing a sequence of bytes. It maps the java ByteBuffer class
- INT for writing java integer
- FLOAT for writing java float
- LONG for writing java long
- DOUBLE for writing java double
- TEXT for writing java strings

BYTES is also used with everything else, for example, in Camel a file is sent around as an InputStream, in this case is written in a sequence file or a map file as a sequence of bytes.

143.4. SPLITTING STRATEGY

In the current version of Hadoop opening a file in append mode is disabled since it's not very reliable. So, for the moment, it's only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way:

- If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator
- Every time a splitting condition is met, a new file is created.
The splitStrategy option is defined as a string with the following syntax:
splitStrategy=<ST>:<value>,<ST>:<value>,*

where <ST> can be:

- BYTES a new file is created, and the old is closed when the number of written bytes is more than <value>
- MESSAGES a new file is created, and the old is closed when the number of written messages is more than <value>
- IDLE a new file is created, and the old is closed when no writing happened in the last <value> milliseconds

Note

note that this strategy currently requires either setting an IDLE value or setting the HdfsConstants.HDFS_CLOSE header to false to use the BYTES/MESSAGES configuration...otherwise, the file will be closed with each message

for example:

```
hdfs://localhost/tmp/simple-file?splitStrategy=IDLE:1000,BYTES:5
```

it means: a new file is created either when it has been idle for more than 1 second or if more than 5 bytes have been written. So, running **hadoop fs -ls /tmp/simple-file** you'll see that multiple files have been created.

143.5. MESSAGE HEADERS

The following headers are supported by this component:

143.5.1. Producer only

Header	Description
Camel FileName	Camel 2.13: Specifies the name of the file to write (relative to the endpoint path). The name can be a String or an Expression object. Only relevant when not using a split strategy.

143.6. CONTROLLING TO CLOSE FILE STREAM

Available as of Camel 2.10.4

When using the [HDFS](#) producer **without** a split strategy, then the file output stream is by default closed after the write. However you may want to keep the stream open, and only explicitly close the stream later. For that you can use the header **HdfsConstants.HDFS_CLOSE** (value = "**CamelHdfsClose**") to control this. Setting this value to a boolean allows you to explicit control whether the stream should be closed or not.

Notice this does not apply if you use a split strategy, as there are various strategies that can control when the stream is closed.

143.7. USING THIS COMPONENT IN OSGI

This component is fully functional in an OSGi environment, however, it requires some actions from the user. Hadoop uses the thread context class loader in order to load resources. Usually, the thread context classloader will be the bundle class loader of the bundle that contains the routes. So, the default configuration files need to be visible from the bundle class loader. A typical way to deal with it is to keep a copy of core-default.xml in your bundle root. That file can be found in the hadoop-common.jar.

CHAPTER 144. HDFS2 COMPONENT

Available as of Camel version 2.14

The `hdfs2` component enables you to read and write messages from/to an HDFS file system using Hadoop 2.x. HDFS is the distributed file system at the heart of [Hadoop](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hdfs2</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

144.1. URI FORMAT

```
hdfs2://hostname[:port][[/path]][?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`. The path is treated in the following way:

1. as a consumer, if it's a file, it just reads the file, otherwise if it represents a directory it scans all the file under the path satisfying the configured pattern. All the files under that directory must be of the same type.
2. as a producer, if at least one split strategy is defined, the path is considered a directory and under that directory the producer creates a different file per split named using the configured `UuidGenerator`.

When consuming from `hdfs2` then in normal mode, a file is split into chunks, producing a message per chunk. You can configure the size of the chunk using the `chunkSize` option. If you want to read from `hdfs` and write to a regular file using the `file` component, then you can use the `fileMode=Append` to append each of the chunks together.

144.2. OPTIONS

The HDFS2 component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>jaasConfiguration</code> (common)	To use the given configuration for security with JAAS.		Configuration
<code>resolvePropertyPlaceholders</code> (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The HDFS2 endpoint is configured using URI syntax:

hdfs2:hostName:port/path

with the following path and query parameters:

144.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
hostName	Required HDFS host to use		String
port	HDFS port to use	8020	int
path	Required The directory path to use		String

144.2.2. Query Parameters (38 parameters):

Name	Description	Default	Type
connectOnStartup (common)	Whether to connect to the HDFS file system on starting the producer/consumer. If false then the connection is created on-demand. Notice that HDFS may take up till 15 minutes to establish a connection, as it has hardcoded 45 x 20 sec redelivery. By setting this option to false allows your application to startup, and not block for up till 15 minutes.	true	boolean
fileSystemType (common)	Set to LOCAL to not use HDFS but local java.io.File instead.	HDFS	HdfsFileSystemType
fileType (common)	The file type to use. For more details see Hadoop HDFS documentation about the various files types.	NORMAL_FILE	HdfsFileType
keyType (common)	The type for the key in case of sequence or map files.	NULL	WritableType
owner (common)	The file owner must match this owner for the consumer to pickup the file. Otherwise the file is skipped.		String
valueType (common)	The type for the key in case of sequence or map files	BYTES	WritableType

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
pattern (consumer)	The pattern used for scanning the directory	*	String
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
pollStrategy (consumer)	A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		<code>PollingConsumerPollStrategy</code>
append (producer)	Append to existing file. Notice that not all HDFS file systems support the append option.	false	boolean
overwrite (producer)	Whether to overwrite existing files with the same name	true	boolean
blockSize (advanced)	The size of the HDFS blocks	67108864	long
bufferSize (advanced)	The buffer size used by HDFS	4096	int
checkIdleInterval (advanced)	How often (time in millis) in to run the idle checker background task. This option is only in use if the splitter strategy is IDLE.	500	int

Name	Description	Default	Type
chunkSize (advanced)	When reading a normal file, this is split into chunks producing a message per chunk.	4096	int
compressionCode c (advanced)	The compression codec to use	DEFAULT	HdfsCompression Codec
compressionType (advanced)	The compression type to use (is default not in use)	NONE	CompressionType
openedSuffix (advanced)	When a file is opened for reading/writing the file is renamed with this suffix to avoid to read it during the writing phase.	opened	String
readSuffix (advanced)	Once the file has been read is renamed with this suffix to avoid to read it again.	read	String
replication (advanced)	The HDFS replication factor	3	short
splitStrategy (advanced)	In the current version of Hadoop opening a file in append mode is disabled since it's not very reliable. So, for the moment, it's only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way: If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator. Every time a splitting condition is met, a new file is created. The splitStrategy option is defined as a string with the following syntax: splitStrategy=ST:value,ST:value,... where ST can be: BYTES a new file is created, and the old is closed when the number of written bytes is more than value MESSAGES a new file is created, and the old is closed when the number of written messages is more than value IDLE a new file is created, and the old is closed when no writing happened in the last value milliseconds		String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
backoffErrorThre shold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultipler should kick-in.		int
backoffIdleThres hold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultipler should kick-in.		int

Name	Description	Default	Type
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LogLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean
timeUnit (scheduler)	Time unit for <code>initialDelay</code> and <code>delay</code> options.	MILLISECONDS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details.	true	boolean

144.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.hdfs2.enabled</code>	Enable hdfs2 component	true	Boolean
<code>camel.component.hdfs2.j-a-a-s-configuration</code>	To use the given configuration for security with JAAS. The option is a <code>javax.security.auth.login.Configuration</code> type.		String
<code>camel.component.hdfs2.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

144.3.1. KeyType and ValueType

- NULL it means that the key or the value is absent
- BYTE for writing a byte, the java Byte class is mapped into a BYTE
- BYTES for writing a sequence of bytes. It maps the java ByteBuffer class
- INT for writing java integer
- FLOAT for writing java float
- LONG for writing java long
- DOUBLE for writing java double
- TEXT for writing java strings

BYTES is also used with everything else, for example, in Camel a file is sent around as an `InputStream`, in this case is written in a sequence file or a map file as a sequence of bytes.

144.4. SPLITTING STRATEGY

In the current version of Hadoop opening a file in append mode is disabled since it's not very reliable. So, for the moment, it's only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way:

- If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured `UuidGenerator`
- Every time a splitting condition is met, a new file is created.
The `splitStrategy` option is defined as a string with the following syntax: `splitStrategy=<ST>:<value>,<ST>:<value>,*`

where `<ST>` can be:

- BYTES a new file is created, and the old is closed when the number of written bytes is more than <value>
- MESSAGES a new file is created, and the old is closed when the number of written messages is more than <value>
- IDLE a new file is created, and the old is closed when no writing happened in the last <value> milliseconds

note that this strategy currently requires either setting an IDLE value or setting the `HdfsConstants.HDFS_CLOSE` header to false to use the BYTES/MESSAGES configuration...otherwise, the file will be closed with each message

for example:

```
hdfs2://localhost/tmp/simple-file?splitStrategy=IDLE:1000,BYTES:5
```

it means: a new file is created either when it has been idle for more than 1 second or if more than 5 bytes have been written. So, running `hadoop fs -ls /tmp/simple-file` you'll see that multiple files have been created.

144.5. MESSAGE HEADERS

The following headers are supported by this component:

144.5.1. Producer only

Header	Description
Camel FileName	Camel 2.13: Specifies the name of the file to write (relative to the endpoint path). The name can be a String or an Expression object. Only relevant when not using a split strategy.

144.6. CONTROLLING TO CLOSE FILE STREAM

When using the [HDFS2](#) producer **without** a split strategy, then the file output stream is by default closed after the write. However you may want to keep the stream open, and only explicitly close the stream later. For that you can use the header `HdfsConstants.HDFS_CLOSE` (value = "**CamelHdfsClose**") to control this. Setting this value to a boolean allows you to explicit control whether the stream should be closed or not.

Notice this does not apply if you use a split strategy, as there are various strategies that can control when the stream is closed.

144.7. USING THIS COMPONENT IN OSGI

There are some quirks when running this component in an OSGi environment related to the mechanism Hadoop 2.x uses to discover different `org.apache.hadoop.fs.FileSystem` implementations. Hadoop 2.x uses `java.util.ServiceLoader` which looks for `/META-INF/services/org.apache.hadoop.fs.FileSystem` files defining available filesystem types and implementations. These resources are not available when running inside OSGi.

As with **camel-hdfs** component, the default configuration files need to be visible from the bundle class loader. A typical way to deal with it is to keep a copy of **core-default.xml** (and e.g., **hdfs-default.xml**) in your bundle root.

144.7.1. Using this component with manually defined routes

There are two options:

1. Package **/META-INF/services/org.apache.hadoop.fs.FileSystem** resource with bundle that defines the routes. This resource should list all the required Hadoop 2.x filesystem implementations.
2. Provide boilerplate initialization code which populates internal, static cache inside **org.apache.hadoop.fs.FileSystem** class:

```
org.apache.hadoop.conf.Configuration conf = new org.apache.hadoop.conf.Configuration();
conf.setClass("fs.file.impl", org.apache.hadoop.fs.LocalFileSystem.class, FileSystem.class);
conf.setClass("fs.hdfs.impl", org.apache.hadoop.hdfs.DistributedFileSystem.class, FileSystem.class);
...
FileSystem.get("file://", conf);
FileSystem.get("hdfs://localhost:9000/", conf);
...
```

144.7.2. Using this component with Blueprint container

Two options:

1. Package **/META-INF/services/org.apache.hadoop.fs.FileSystem** resource with bundle that contains blueprint definition.
2. Add the following to the blueprint definition file:

```
<bean id="hdfsOsgiHelper" class="org.apache.camel.component.hdfs2.HdfsOsgiHelper">
  <argument>
    <map>
      <entry key="file://" value="org.apache.hadoop.fs.LocalFileSystem" />
      <entry key="hdfs://localhost:9000/" value="org.apache.hadoop.hdfs.DistributedFileSystem" />
      ...
    </map>
  </argument>
</bean>

<bean id="hdfs2" class="org.apache.camel.component.hdfs2.HdfsComponent" depends-
on="hdfsOsgiHelper" />
```

This way Hadoop 2.x will have correct mapping of URI schemes to filesystem implementations.

CHAPTER 145. HEADERSMAP

Available as of Camel 2.20

The camel-headersmap is a faster implementation of a case-insensitive map which can be plugged in and used by Camel at runtime to have slight faster performance in the Camel Message headers.

145.1. AUTO DETECTION FROM CLASSPATH

To use this implementation all you need to do is to add the **camel-headersmap** dependency to the classpath, and Camel should auto-detect this on startup and log as follows:

```
Detected and using custom HeadersMapFactory:  
org.apache.camel.component.headersmap.FastHeadersMapFactory@71e9ebae
```

For spring-boot there is a **camel-headersmap-starter** dependency you should use.

145.2. MANUAL ENABLING

If you use OSGi or the implementation is not added to the classpath, you need to enable this explicit such:

```
CamelContext camel = ...  
  
camel.setHeadersMapFactory(new FastHeadersMapFactory());
```

Or in XML DSL (spring or blueprint XML file) you can declare the factory as a **<bean>**:

```
<bean id="fastMapFactory"  
class="org.apache.camel.component.headersmap.FastHeadersMapFactory"/>
```

and then Camel should detect the bean and use the factory.

CHAPTER 146. HESSIAN DATAFORMAT (DEPRECATED)

Available as of Camel version 2.17

Hessian is Data Format for marshalling and unmarshalling messages using Caucho's Hessian format.

If you want to use Hessian Data Format from Maven, add the following dependency to your **pom.xml**:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hessian</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

146.1. OPTIONS

The Hessian dataformat supports 4 options, which are listed below.

Name	Default	Java Type	Description
whitelistEnabled	true	Boolean	Define if Whitelist feature is enabled or not
allowedUnmarshalledObjects		String	Define the allowed objects to be unmarshalled
deniedUnmarshalledObjects		String	Define the denied objects to be unmarshalled
contentTypeHeader	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

146.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.dataformat.hessian.allowed-unmarshalled-objects	Define the allowed objects to be unmarshalled		String

Name	Description	Default	Type
<code>camel.dataformat.hessian.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.hessian.denied-unmarshall-objects</code>	Define the denied objects to be unmarshalled		String
<code>camel.dataformat.hessian.enabled</code>	Enable hessian dataformat	true	Boolean
<code>camel.dataformat.hessian.whitelist-enabled</code>	Define if Whitelist feature is enabled or not	true	Boolean

ND

146.3. USING THE HESSIAN DATA FORMAT IN JAVA DSL

```
from("direct:in")
    .marshal().hessian();
```

146.4. USING THE HESSIAN DATA FORMAT IN SPRING DSL

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal ref="hessian"/>
  </route>
</camelContext>
```

CHAPTER 147. HIPCHAT COMPONENT

Available as of Camel version 2.15

The Hipchat component supports producing and consuming messages from/to [Hipchat](#) service.

Prerequisites

You must have a valid Hipchat user account and get a [personal access token](#) that you can use to produce/consume messages.

147.1. URI FORMAT

```
hipchat://[host][:port]?options
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

147.2. URI OPTIONS

The Hipchat component has no options.

The Hipchat endpoint is configured using URI syntax:

```
hipchat:protocol:host:port
```

with the following path and query parameters:

147.2.1. Path Parameters (3 parameters):

Name	Description	Default	Type
protocol	Required The protocol for the hipchat server, such as http.		String
host	Required The host for the hipchat server, such as api.hipchat.com		String
port	The port for the hipchat server. Is by default 80.	80	Integer

147.2.2. Query Parameters (22 parameters):

Name	Description	Default	Type
authToken (common)	OAuth 2 auth token		String

Name	Description	Default	Type
consumeUsers (common)	Username(s) when consuming messages from the hiptchat server. Multiple user names can be separated by comma.		String
httpClient (common)	The CloseableHttpClient reference from registry to be used during API HTTP requests.	CloseableHttpClient default from HttpClient library	CloseableHttpClient
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
sendEmptyMessageWhenIdle (consumer)	If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
pollStrategy (consumer)	A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.		PollingConsumerPollStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

Name	Description	Default	Type
backoffErrorThreshold (scheduler)	The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.		int
backoffIdleThreshold (scheduler)	The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.		int
backoffMultiplier (scheduler)	To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.		int
delay (scheduler)	Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	500	long
greedy (scheduler)	If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.	false	boolean
initialDelay (scheduler)	Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).	1000	long
runLoggingLevel (scheduler)	The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.	TRACE	LoggingLevel
scheduledExecutorService (scheduler)	Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.		ScheduledExecutorService
scheduler (scheduler)	To use a cron scheduler from either camel-spring or camel-quartz2 component	none	ScheduledPollConsumer Scheduler
schedulerProperties (scheduler)	To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.		Map
startScheduler (scheduler)	Whether the scheduler should be auto started.	true	boolean

Name	Description	Default	Type
timeUnit (scheduler)	Time unit for initialDelay and delay options.	MILLIS ECON DS	TimeUnit
useFixedDelay (scheduler)	Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.	true	boolean

147.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.hipchat.enabled	Enable hipchat component	true	Boolean
camel.component.hipchat.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

147.4. SCHEDULED POLL CONSUMER

This component implements the ScheduledPollConsumer. Only the last message from the provided 'consumeUsers' are retrieved and sent as Exchange body. If you do not want the same message to be retrieved again when there are no new messages on next poll then you can add the idempotent consumer as shown below. All the options on the ScheduledPollConsumer can also be used for more control on the consumer.

```

@Override
public void configure() throws Exception {
    String hipchatEndpointUri = "hipchat://?authToken=XXXX&consumeUsers=@Joe,@John";
    from(hipchatEndpointUri)
    .idempotentConsumer(
        simple("${in.header.HipchatMessageDate} ${in.header.HipchatFromUser}"),
        MemoryIdempotentRepository.memoryIdempotentRepository(200)
    )
    .to("mock:result");
}

```

147.4.1. Message headers set by the Hipchat consumer

Header	Constant	Type	Description
HipchatFromUser	HipchatConstants.FROM_USER	String	The body has the message that was sent from this user to the owner of authToken
HipchatMessageDate	HipchatConstants.MESSAGE_DATE	String	The date message was sent. The format is ISO-8601 as present in the Hipchat response .

147.5. HIPCHAT PRODUCER

Producer can send messages to both Room's and User's simultaneously. The body of the exchange is sent as message. Sample usage is shown below. Appropriate headers needs to be set.

```
@Override
public void configure() throws Exception {
    String hipchatEndpointUri = "hipchat://?authToken=XXXX";
    from("direct:start")
        .to(hipchatEndpointUri)
        .to("mock:result");
}
```

147.5.1. Message headers evaluated by the Hipchat producer

Header	Constant	Type	Description
HipchatToUser	HipchatConstants.TO_USER	String	The Hipchat user to which the message needs to be sent.
HipchatToRoom	HipchatConstants.TO_ROOM	String	The Hipchat room to which the message needs to be sent.

Header	Constant	Type	Description
HipchatMessageFormat	HipchatConstants.MESSAGE_FORMAT	String	Valid formats are 'text' or 'html'. Default: 'text'
HipchatMessageBackgroundColor	HipchatConstants.MESSAGE_BACKGROUND_COLOR	String	Valid color values are 'yellow', 'green', 'red', 'purple', 'gray', 'random'. Default: 'yellow' (Room Only)
HipchatTriggerNotification	HipchatConstants.TRIGGER_NOTIFY	String	Valid values are 'true' or 'false'. Whether this message should trigger a user notification (change the tab color, play a sound, notify mobile phones, etc). Default: 'false' (Room Only)

147.5.2. Message headers set by the Hipchat producer

Header	Constant	Type	Description
HipchatToUserResponseStatus	HipchatConstants.TO_USER_RESPONSE_STATUS	<i>StatusLine</i>	HipchatFromUserResponseStatus The status of the API response received when message sent to the user.

147.5.3. Configuring Http Client

The HipChat component allow your own **HttpClient** configuration. This can be done by defining a reference for **CloseableHttpClient** in the [registry](#) (e.g. Spring Context) and then, set the parameter

during the Endpoint definition, for example: **hipchat:http://api.hipchat.com?httpClient=#myHttpClient**.

```
CloseableHttpClient httpClient = HttpClients.custom()
    .setConnectionManager(connManager)
    .setDefaultCookieStore(cookieStore)
    .setDefaultCredentialsProvider(credentialsProvider)
    .setProxy(new HttpHost("myproxy", 8080))
    .setDefaultRequestConfig(defaultRequestConfig)
    .build();
```

To see more information about Http Client configuration, please check the [official documentation](#).

147.5.4. Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hipchat</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.15.0 or higher)

CHAPTER 148. HL7 DATAFORMAT

Available as of Camel version 2.0

The **HL7** component is used for working with the HL7 MLLP protocol and [HL7 v2 messages](#) using the [HAPI library](#).

This component supports the following:

- HL7 MLLP codec for [Mina](#)
- HL7 MLLP codec for [Netty4](#) from **Camel 2.15** onwards
- Type Converter from/to HAPI and String
- HL7 DataFormat using the HAPI library
- Even more ease-of-use as it's integrated well with the [camel-mina2](#) component.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hl7</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

148.1. HL7 MLLP PROTOCOL

HL7 is often used with the HL7 MLLP protocol, which is a text based TCP socket based protocol. This component ships with a Mina and Netty4 Codec that conforms to the MLLP protocol so you can easily expose an HL7 listener accepting HL7 requests over the TCP transport layer. To expose a HL7 listener service, the [camel-mina2](#) or [camel-netty4](#) component is used with the **HL7MLLPCodec** (mina2) or **HL7MLLPNettyDecoder/HL7MLLPNettyEncoder** (Netty4).

HL7 MLLP codec can be configured as follows:

Name	Default Value	Description
startByte	0x0b	The start byte spanning the HL7 payload.
endByte1	0x1c	The first end byte spanning the HL7 payload.
endByte2	0x0d	The 2nd end byte spanning the HL7 payload.
charset	JVM Default	The encoding (a charset name) to use for the codec. If not provided, Camel will use the JVM default Charset .

Name	Default Value	Description
produceString	true	(as of Camel 2.14.1) If true, the codec creates a string using the defined charset. If false, the codec sends a plain byte array into the route, so that the HL7 Data Format can determine the actual charset from the HL7 message content.
convertLFtoCR	false	Will convert <code>\n</code> to <code>\r</code> (0x0d , 13 decimal) as HL7 stipulates <code>\r</code> as segment terminators. The HAPI library requires the use of <code>\r</code> .

148.1.1. Exposing an HL7 listener using Mina

In the Spring XML file, we configure a mina2 endpoint to listen for HL7 requests using TCP on port **8888**:

```
<endpoint id="hl7MinaListener" uri="mina2:tcp://localhost:8888?sync=true&codec=#hl7codec"/>
```

sync=true indicates that this listener is synchronous and therefore will return a HL7 response to the caller. The HL7 codec is setup with **codec=#hl7codec**. Note that **hl7codec** is just a Spring bean ID, so it could be named **mygreatcodecforhl7** or whatever. The codec is also set up in the Spring XML file:

```
<bean id="hl7codec" class="org.apache.camel.component.hl7.HL7MLLPCodec">
  <property name="charset" value="iso-8859-1"/>
</bean>
```

The endpoint **hl7MinaListener** can then be used in a route as a consumer, as this Java DSL example illustrates:

```
from("hl7MinaListener")
  .bean("patientLookupService");
```

This is a very simple route that will listen for HL7 and route it to a service named **patientLookupService**. This is also Spring bean ID, configured in the Spring XML as:

```
<bean id="patientLookupService"
  class="com.mycompany.healthcare.service.PatientLookupService"/>
```

The business logic can be implemented in POJO classes that do not depend on Camel, as shown here:

```
import ca.uhn.hl7v2.HL7Exception;
import ca.uhn.hl7v2.model.Message;
import ca.uhn.hl7v2.model.v24.segment.QRD;

public class PatientLookupService {
  public Message lookupPatient(Message input) throws HL7Exception {
    QRD qrd = (QRD)input.get("QRD");
    String patientId = qrd.getWhoSubjectFilter(0).getIDNumber().getValue();

    // find patient data based on the patient id and create a HL7 model object with the response
```

```

    Message response = ... create and set response data
    return response
}

```

148.1.2. Exposing an HL7 listener using Netty (available from Camel 2.15 onwards)

In the Spring XML file, we configure a netty4 endpoint to listen for HL7 requests using TCP on port **8888**:

```

<endpoint id="hl7NettyListener" uri="netty4:tcp://localhost:8888?
sync=true&encoder=#hl7encoder&decoder=#hl7decoder"/>

```

sync=true indicates that this listener is synchronous and therefore will return a HL7 response to the caller. The HL7 codec is setup with **encoder=#hl7encoder*and*decoder=#hl7decoder**. Note that **hl7encoder** and **hl7decoder** are just bean IDs, so they could be named differently. The beans can be set in the Spring XML file:

```

<bean id="hl7decoder" class="org.apache.camel.component.hl7.HL7MLLPNettyDecoderFactory"/>
<bean id="hl7encoder" class="org.apache.camel.component.hl7.HL7MLLPNettyEncoderFactory"/>

```

The endpoint **hl7NettyListener** can then be used in a route as a consumer, as this Java DSL example illustrates:

```

from("hl7NettyListener")
    .bean("patientLookupService");

```

148.2. HL7 MODEL USING JAVA.LANG.STRING OR BYTE[]

The HL7 MLLP codec uses plain String as its data format. Camel uses its Type Converter to convert to/from strings to the HAPI HL7 model objects, but you can use the plain String objects if you prefer, for instance if you wish to parse the data yourself.

As of Camel 2.14.1 you can also let both the Mina and Netty codecs use a plain **byte[]** as its data format by setting the **produceString** property to false. The Type Converter is also capable of converting the **byte[]** to/from HAPI HL7 model objects.

148.3. HL7V2 MODEL USING HAPI

The HL7v2 model uses Java objects from the HAPI library. Using this library, you can encode and decode from the EDI format (ER7) that is mostly used with HL7v2.

The sample below is a request to lookup a patient with the patient ID **0101701234**.

```

MSH|^~\&|MYSENDER|MYRECEIVER|MYAPPLICATION||200612211200||QRY^A19|1234|P|2.4
QRD|200612211200|R||GetPatient|||1^RD|0101701234|DEM||

```

Using the HL7 model you can work with a **ca.uhn.hl7v2.model.Message** object, e.g. to retrieve a patient ID:

```

Message msg = exchange.getIn().getBody(Message.class);
QRD qrd = (QRD)msg.get("QRD");
String patientId = qrd.getWhoSubjectFilter(0).getIDNumber().getValue(); // 0101701234

```

This is powerful when combined with the HL7 listener, because you don't have to work with **byte[]**, **String** or any other simple object formats. You can just use the HAPI HL7v2 model objects. If you know the message type in advance, you can be more type-safe:

```
QRY_A19 msg = exchange.getIn().getBody(QRY_A19.class);
String patientId = msg.getQRD().getWhoSubjectFilter(0).getIDNumber().getValue();
```

148.4. HL7 DATAFORMAT

The [HL7](#) component ships with a HL7 data format that can be used to marshal or unmarshal HL7 model objects.

The HL7 dataformat supports 2 options, which are listed below.

Name	Default	Java Type	Description
validate	true	Boolean	Whether to validate the HL7 message is by default true.
contentTypeHeader	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.

148.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.dataformat.hl7.content-type-header	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.	false	Boolean
camel.dataformat.hl7.enabled	Enable hl7 dataformat	true	Boolean
camel.dataformat.hl7.validate	Whether to validate the HL7 message is by default true.	true	Boolean
camel.language.terser.enabled	Enable terser language	true	Boolean

Name	Description	Default	Type
<code>camel.language.texter.trim</code>	Whether to trim the value to remove leading and trailing whitespaces and line breaks	true	Boolean

ND

- **marshal** = from Message to byte stream (can be used when responding using the HL7 MLLP codec)
- **unmarshal** = from byte stream to Message (can be used when receiving streamed data from the HL7 MLLP)

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```
DataFormat hl7 = new HL7DataFormat();

from("direct:hl7in")
  .marshal(hl7)
  .to("jms:queue:hl7out");
```

In the sample above, the HL7 is marshalled from a HAPI Message object to a byte stream and put on a JMS queue.

The next example is the opposite:

```
DataFormat hl7 = new HL7DataFormat();

from("jms:queue:hl7out")
  .unmarshal(hl7)
  .to("patientLookupService");
```

Here we unmarshal the byte stream into a HAPI Message object that is passed to our patient lookup service.

148.5.1. Serializable messages

As of HAPI 2.0 (used by **Camel 2.11**), the HL7v2 model classes are fully serializable. So you can put HL7v2 messages directly into a JMS queue (i.e. without calling **marshal()**) and read them again directly from the queue (i.e. without calling **unmarshal()**).

148.5.2. Segment separators

As of **Camel 2.11**, **unmarshal** does not automatically fix segment separators anymore by converting `\n` to `\r`. If you need this conversion, **org.apache.camel.component.hl7.HL7#convertLFToCR** provides a handy **Expression** for this purpose.

148.5.3. Charset

As of **Camel 2.14.1**, both **marshal** and **unmarshal** evaluate the charset provided in the field **MSH-18**. If this field is empty, by default the charset contained in the corresponding Camel charset property/header is assumed. You can even change this default behavior by overriding the **guessCharsetName** method when inheriting from the **HL7DataFormat** class.

There is a shorthand syntax in Camel for well-known data formats that are commonly used. Then you don't need to create an instance of the **HL7DataFormat** object:

```
from("direct:hl7in")
  .marshal().hl7()
  .to("jms:queue:hl7out");

from("jms:queue:hl7out")
  .unmarshal().hl7()
  .to("patientLookupService");
```

148.6. MESSAGE HEADERS

The **unmarshal** operation adds these fields from the MSH segment as headers on the Camel message:

Key	MSH field	Example
Camel HL7Sending Application	MSH-3	MYSERVER
Camel HL7Sending Facility	MSH-4	MYSERVERAPP
Camel HL7Receiving Application	MSH-5	MYCLIENT
Camel HL7Receiving Facility	MSH-6	MYCLIENTAPP

Key	MSH field	Example
Camel HL7Timestamp	MSH-7	20071231235900
Camel HL7Security	MSH-8	null
Camel HL7MessageType	MSH-9-1	ADT
Camel HL7TriggerEvent	MSH-9-2	A01
Camel HL7MessageControl	MSH-10	1234
Camel HL7ProcessingId	MSH-11	P
Camel HL7VersionId	MSH-12	2.4
Camel HL7Context	``	(Camel 2.14) contains the HapiContext that was used to parse the message
Camel HL7CharacterSet	MSH-18	(Camel 2.14.1) UNICODE UTF-8

All headers except **CamelHL7Context** are **String** types. If a header value is missing, its value is **null**.

148.7. OPTIONS

The HL7 Data Format supports the following options:

Option	Default	Description
validate	true	Whether the HAPI Parser should validate the message using the default validation rules. It is recommended to use the parser or hapiContext option and initialize it with the desired HAPI ValidationContext
parser	ca.uhn.hl7v2.parser.GenericParser	Custom parser to be used. Must be of type ca.uhn.hl7v2.parser.Parser . Note that GenericParser also allows to parse XML-encoded HL7v2 messages
hapiContext	ca.uhn.hl7v2.DefaultHapiContext	Camel 2.14: Custom HAPI context that can define a custom parser, custom ValidationContext etc. This gives you full control over the HL7 parsing and rendering process.

148.8. DEPENDENCIES

To use HL7 in your Camel routes you'll need to add a dependency on **camel-hl7** listed above, which implements this data format.

The HAPI library is split into a **base library** and several structure libraries, one for each HL7v2 message version:

- [v2.1 structures library](#)
- [v2.2 structures library](#)
- [v2.3 structures library](#)
- [v2.3.1 structures library](#)
- [v2.4 structures library](#)
- [v2.5 structures library](#)
- [v2.5.1 structures library](#)
- [v2.6 structures library](#)

By default **camel-hl7** only references the HAPI **base library**. Applications are responsible for including structure libraries themselves. For example, if an application works with HL7v2 message versions 2.4 and 2.5 then the following dependencies must be added:

```
<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-structures-v24</artifactId>
  <version>2.2</version>
```

```

    <!-- use the same version as your hapi-base version -->
</dependency>
<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-structures-v25</artifactId>
  <version>2.2</version>
  <!-- use the same version as your hapi-base version -->
</dependency>

```

Alternatively, an OSGi bundle containing the base library, all structures libraries and required dependencies (on the bundle classpath) can be downloaded from the [central Maven repository](#).

```

<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-osgi-base</artifactId>
  <version>2.2</version>
</dependency>

```

148.9. TERSER LANGUAGE

HAPI provides a [Terser](#) class that provides access to fields using a commonly used terse location specification syntax. The Terser language allows to use this syntax to extract values from messages and to use them as expressions and predicates for filtering, content-based routing etc.

Sample:

```

import static org.apache.camel.component.hl7.HL7.terser;

// extract patient ID from field QRD-8 in the QRY_A19 message above and put into message
header
from("direct:test1")
  .setHeader("PATIENT_ID",terser("QRD-8(0)-1"))
  .to("mock:test1");

// continue processing if extracted field equals a message header
from("direct:test2")
  .filter(terser("QRD-8(0)-1").isEqualTo(header("PATIENT_ID")))
  .to("mock:test2");

```

148.10. HL7 VALIDATION PREDICATE

Often it is preferable to first parse a HL7v2 message and in a separate step validate it against a HAPI [ValidationContext](#).

Sample:

```

import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import ca.uhn.hl7v2.validation.impl.DefaultValidation;

// Use standard or define your own validation rules
ValidationContext defaultContext = new DefaultValidation();

// Throws PredicateValidationException if message does not validate

```

```

from("direct:test1")
  .validate(messageConformsTo(defaultContext))
  .to("mock:test1");

```

148.11. HL7 VALIDATION PREDICATE USING THE HAPICONTEXT (CAMEL 2.14)

The HAPI Context is always configured with a [ValidationContext](#) (or a [ValidationRuleBuilder](#)), so you can access the validation rules indirectly. Furthermore, when unmarshalling the HL7DataFormat forwards the configured HAPI context in the **CamelHL7Context** header, and the validation rules of this context can be easily reused:

```

import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import static org.apache.camel.component.hl7.HL7.messageConforms

HapiContext hapiContext = new DefaultHapiContext();
hapiContext.getParserConfiguration().setValidating(false); // don't validate during parsing

// customize HapiContext some more ... e.g. enforce that PID-8 in ADT_A01 messages of version
// 2.4 is not empty
ValidationRuleBuilder builder = new ValidationRuleBuilder() {
    @Override
    protected void configure() {
        forVersion(Version.V24)
            .message("ADT", "A01")
            .terser("PID-8", not(empty()));
    }
};
hapiContext.setValidationRuleBuilder(builder);

HL7DataFormat hl7 = new HL7DataFormat();
hl7.setHapiContext(hapiContext);

from("direct:test1")
  .unmarshal(hl7) // uses the GenericParser returned from the HapiContext
  .validate(messageConforms()) // uses the validation rules returned from the HapiContext
  // equivalent with .validate(messageConformsTo(hapiContext))
  // route continues from here

```

148.12. HL7 ACKNOWLEDGEMENT EXPRESSION

A common task in HL7v2 processing is to generate an acknowledgement message as response to an incoming HL7v2 message, e.g. based on a validation result. The **ack** expression lets us accomplish this very elegantly:

```

import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import static org.apache.camel.component.hl7.HL7.ack;
import ca.uhn.hl7v2.validation.impl.DefaultValidation;

// Use standard or define your own validation rules
ValidationContext defaultContext = new DefaultValidation();

from("direct:test1")

```

```
.onException(Exception.class)
  .handled(true)
  .transform(ack()) // auto-generates negative ack because of exception in Exchange
  .end()
.validate(messageConformsTo(defaultContext))
// do something meaningful here

// acknowledgement
.transform(ack())
```

CHAPTER 149. HTTP COMPONENT (DEPRECATED)

Available as of Camel version 1.0

The **http:** component provides HTTP based endpoints for consuming external HTTP resources (as a client to call external servers using HTTP).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-http</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

149.1. URI FORMAT

```
http:hostname[:port][/resourceUri][?param1=value1][&param2=value2]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

camel-http vs camel-jetty

You can only produce to endpoints generated by the HTTP component. Therefore it should never be used as input into your camel Routes. To bind/expose an HTTP endpoint via a HTTP server as input to a camel route, you can use the [Jetty Component](#) or the [Servlet Component](#)

149.2. EXAMPLES

Call the url with the body using POST and return response as out message. If body is null call URL using GET and return response as out message

Java DSL

Spring DSL

```
from("direct:start")
  .to("http://myhost/mypath");
```

```
<from uri="direct:start"/>
<to uri="http://oldhost"/>
```

You can override the HTTP endpoint URI by adding a header. Camel will call the [http://newhost](#). This is very handy for e.g. REST urls.

Java DSL

```
from("direct:start")
  .setHeader(Exchange.HTTP_URI, simple("http://myserver/orders/${header.orderId}"))
  .to("http://dummyhost");
```

URI parameters can either be set directly on the endpoint URI or as a header

Java DSL

```
from("direct:start")
  .to("http://oldhost?order=123&detail=short");
from("direct:start")
  .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
  .to("http://oldhost");
```

Set the HTTP request method to POST

Java DSL

Spring DSL

```
from("direct:start")
  .setHeader(Exchange.HTTP_METHOD, constant("POST"))
  .to("http://www.google.com");
```

```
<from uri="direct:start"/>
<setHeader headerName="CamelHttpMethod">
  <constant>POST</constant>
</setHeader>
<to uri="http://www.google.com"/>
<to uri="mock:results"/>
```

149.3. HTTP OPTIONS

The HTTP component supports 8 options, which are listed below.

Name	Description	Default	Type
httpClientConfigurer (advanced)	To use the custom HttpClientConfigurer to perform configuration of the HttpClient that will be used.		HttpClientConfigurer
httpClientConnectionManager (advanced)	To use a custom HttpClientConnectionManager to manage connections		HttpClientConnectionManager
httpClientBinding (producer)	To use a custom HttpClientBinding to control the mapping between Camel message and HttpClient.		HttpClientBinding
httpClientConfiguration (producer)	To use the shared HttpClientConfiguration as base configuration.		HttpClientConfiguration
allowJavaSerializedObject (producer)	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean

Name	Description	Default	Type
useGlobalSslContext Parameters (security)	Enable usage of global SSL context parameters.	false	boolean
headerFilterStrategy (filter)	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message.		HeaderFilterStrategy
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The HTTP endpoint is configured using URI syntax:

```
http:httpUri
```

with the following path and query parameters:

149.3.1. Path Parameters (1 parameters):

Name	Description	Default	Type
httpUri	Required The url of the HTTP endpoint to call.		URI

149.3.2. Query Parameters (38 parameters):

Name	Description	Default	Type
------	-------------	---------	------

Name	Description	Default	Type
disableStreamCache (common)	Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.	false	boolean
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
httpBinding (common)	To use a custom HttpBinding to control the mapping between Camel message and HttpClient.		HttpBinding
bridgeEndpoint (producer)	If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint's URI for request. You may also set the option <code>throwExceptionOnFailure</code> to be false to let the HttpProducer send all the fault response back.	false	boolean
chunked (producer)	If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response	true	boolean
connectionClose (producer)	Specifies whether a Connection Close header must be added to HTTP Request. By default <code>connectionClose</code> is false.	false	boolean
copyHeaders (producer)	If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).	true	boolean

Name	Description	Default	Type
httpMethod (producer)	Configure the HTTP method to use. The <code>HttpMethod</code> header cannot override this option if set.		<code>HttpMethods</code>
ignoreResponseBody (producer)	If this option is true, The http producer won't read response body and cache the input stream	false	boolean
preserveHostHeader (producer)	If the option is true, <code>HttpProducer</code> will set the <code>Host</code> header to the value contained in the current exchange <code>Host</code> header, useful in reverse proxy applications where you want the <code>Host</code> header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the <code>Host</code> header to generate accurate URL's for a proxied service	false	boolean
throwExceptionOnFailure (producer)	Option to disable throwing the <code>HttpOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean
transferException (producer)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a <code>application/x-java-serialized-object</code> content type. On the producer side the exception will be deserialized and thrown as is, instead of the <code>HttpOperationFailedException</code> . The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		<code>CookieHandler</code>
okStatusCodeRange (producer)	The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.	200-299	String
urlRewrite (producer)	Deprecated Refers to a custom <code>org.apache.camel.component.http.UrlRewrite</code> which allows you to rewrite urls when you bridge/proxy endpoints. See more details at http://camel.apache.org/urlrewrite.html		<code>UrlRewrite</code>

Name	Description	Default	Type
httpClientConfigurer (advanced)	Register a custom configuration strategy for new HttpClient instances created by producers or consumers such as to configure authentication mechanisms etc		HttpClientConfigurer
httpClientOptions (advanced)	To configure the HttpClient using the key/values from the Map.		Map
httpClientConnectionManager (advanced)	To use a custom HttpClientConnectionManager to manage connections		HttpClientConnectionManager
httpClientConnectionManagerOptions (advanced)	To configure the HttpClientConnectionManager using the key/values from the Map.		Map
mapHttpMessageBody (advanced)	If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.	true	boolean
mapHttpMessageFormUrlEncodedBody (advanced)	If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.	true	boolean
mapHttpMessageHeaders (advanced)	If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
proxyAuthDomain (proxy)	Proxy authentication domain to use with NTLM		String
proxyAuthHost (proxy)	Proxy authentication host		String
proxyAuthMethod (proxy)	Proxy authentication method to use		String
proxyAuthPassword (proxy)	Proxy authentication password		String

Name	Description	Default	Type
proxyAuthPort (proxy)	Proxy authentication port		int
proxyAuthScheme (proxy)	Proxy authentication scheme to use		String
proxyAuthUsername (proxy)	Proxy authentication username		String
proxyHost (proxy)	Proxy hostname to use		String
proxyPort (proxy)	Proxy port to use		int
authDomain (security)	Authentication domain to use with NTLM		String
authHost (security)	Authentication host to use with NTLM		String
authMethod (security)	Authentication methods allowed to use as a comma separated list of values Basic, Digest or NTLM.		String
authMethodPriority (security)	Which authentication method to prioritize to use, either as Basic, Digest or NTLM.		String
authPassword (security)	Authentication password		String
authUsername (security)	Authentication username		String

149.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

Name	Description	Default	Type
camel.component.http.allow-java-serialized-object	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean

Name	Description	Default	Type
<code>camel.component.http.enabled</code>	Enable http component	true	Boolean
<code>camel.component.http.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
<code>camel.component.http.http-binding</code>	To use a custom <code>HttpBinding</code> to control the mapping between Camel message and <code>HttpClient</code> . The option is a <code>org.apache.camel.http.common.HttpBinding</code> type.		String
<code>camel.component.http.http-client-configurer</code>	To use the custom <code>HttpClientConfigurer</code> to perform configuration of the <code>HttpClient</code> that will be used. The option is a <code>org.apache.camel.component.http.HttpClientConfigurer</code> type.		String
<code>camel.component.http.http-configuration</code>	To use the shared <code>HttpConfiguration</code> as base configuration. The option is a <code>org.apache.camel.http.common.HttpConfiguration</code> type.		String
<code>camel.component.http.http-connection-manager</code>	To use a custom <code>HttpConnectionManager</code> to manage connections. The option is a <code>org.apache.commons.httpclient.HttpConnectionManager</code> type.		String
<code>camel.component.http.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.http.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

149.5. MESSAGE HEADERS

Name	Type	Description
Exchange.HTTP_URI	String	URI to call. Will override existing URI set directly on the endpoint. This uri is the uri of the http server to call. Its not the same as the Camel endpoint uri, where you can configure endpoint options such as security etc. This header does not support that, its only the uri of the http server.
Exchange.HTTP_METHOD	String	HTTP Method / Verb to use (GET/POST/PUT/DELETE/HEAD/OPTIONS/TRACE)
Exchange.HTTP_PATH	String	Request URI's path, the header will be used to build the request URI with the HTTP_URI. Camel 2.3.0: If the path is start with "/", http producer will try to find the relative path based on the Exchange.HTTP_BASE_URI header or the exchange.getFromEndpoint().getEndpointUri();
Exchange.HTTP_QUERY	String	URI parameters. Will override existing URI parameters set directly on the endpoint.
Exchange.HTTP_RESPONSE_CODE	int	The HTTP response code from the external server. Is 200 for OK.
Exchange.HTTP_CHARACTER_ENCODING	String	Character encoding.
Exchange.CONTENT_TYPE	String	The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html .

Name	Type	Description
Exchange.CONTENT_ENCODING	String	The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as gzip .
Exchange.HTTP_SERVLET_REQUEST	HttpServletRequest	The HttpServletRequest object.
Exchange.HTTP_SERVLET_RESPONSE	HttpServletResponse	The HttpServletResponse object.
Exchange.HTTP_PROTOCOL_VERSION	String	Camel 2.5: You can set the http protocol version with this header, eg. "HTTP/1.0". If you didn't specify the header, <code>HttpProducer</code> will use the default value "HTTP/1.1"

The header name above are constants. For the spring DSL you have to use the value of the constant instead of the name.

149.6. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

149.7. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a **HttpOperationFailedException** with the information.

- Response code is 400+, Camel regards it as an external server failure and will throw a **HttpOperationFailedException** with the information.

throwExceptionOnFailure

The option, **throwExceptionOnFailure**, can be set to **false** to prevent the **HttpOperationFailedException** from being thrown for failed response codes. This allows you to get any response from the remote server.

There is a sample below demonstrating this.

149.8. HTTPOPERATIONFAILEDEXCEPTION

This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a **java.lang.String**, if server provided a body as response

149.9. WHICH HTTP METHOD WILL BE USED

The following algorithm is used to determine what HTTP method should be used:

1. Use method provided as endpoint configuration (**httpMethod**).
2. Use method provided in header (**Exchange.HTTP_METHOD**).
3. **GET** if query string is provided in header.
4. **GET** if endpoint is configured with a query string.
5. **POST** if there is data to send (body is not **null**).
6. **GET** otherwise.

149.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE

You can get access to these two using the Camel type converter system using

```
HttpServletRequest request = exchange.getIn().getBody(HttpServletRequest.class);
HttpServletRequest response = exchange.getIn().getBody(HttpServletRequestResponse.class);
```

149.11. USING CLIENT TIMEOUT - SO_TIMEOUT

See the unit test in [this link](#)

149.12. MORE EXAMPLES

149.12.1. Configuring a Proxy

Java DSL

```
from("direct:start")
  .to("http://oldhost?proxyHost=www.myproxy.com&proxyPort=80");
```

There is also support for proxy authentication via the **proxyUsername** and **proxyPassword** options.

149.12.2. Using proxy settings outside of URI

Java DSL

Spring DSL

```
context.getProperties().put("http.proxyHost", "172.168.18.9");
context.getProperties().put("http.proxyPort", "8080");
```

```
<camelContext>
  <properties>
    <property key="http.proxyHost" value="172.168.18.9"/>
    <property key="http.proxyPort" value="8080"/>
  </properties>
</camelContext>
```

Options on Endpoint will override options on the context.

149.13. CONFIGURING CHARSET

If you are using **POST** to send data you can configure the **charset**

```
setProperty(Exchange.CHARSET_NAME, "iso-8859-1");
```

149.14. SAMPLE WITH SCHEDULED POLL

The sample polls the Google homepage every 10 seconds and write the page to the file **message.html**:

```
from("timer://foo?fixedRate=true&delay=0&period=10000")
  .to("http://www.google.com")
  .setHeader(FileComponent.HEADER_FILE_NAME, "message.html").to("file:target/google");
```

149.15. GETTING THE RESPONSE CODE

You can get the HTTP response code from the HTTP component by getting the value from the Out message header with **Exchange.HTTP_RESPONSE_CODE**.

```
Exchange exchange = template.send("http://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq"));
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);
```

149.16. USING THROWEXCEPTIONONFAILURE=FALSE TO GET ANY RESPONSE BACK

In the route below we want to route a message that we enrich with data returned from a remote HTTP call. As we want any response from the remote server, we set the **throwExceptionOnFailure** option to **false** so we get any response in the **AggregationStrategy**. As the code is based on a unit test that simulates a HTTP status code 404, there is some assertion code etc.

149.17. DISABLING COOKIES

To disable cookies you can set the HTTP Client to ignore cookies by adding this URI option: **httpClient.cookiePolicy=ignoreCookies**

149.18. ADVANCED USAGE

If you need more control over the HTTP producer you should use the **HttpComponent** where you can set various classes to give you custom behavior.

149.18.1. Setting MaxConnectionsPerHost

The **HTTP** Component has a **org.apache.commons.httpclient.HttpConnectionManager** where you can configure various global configuration for the given component.

By global, we mean that any endpoint the component creates has the same shared **HttpConnectionManager**. So, if we want to set a different value for the max connection per host, we need to define it on the HTTP component and **not** on the endpoint URI that we usually use. So here comes:

First, we define the **http** component in Spring XML. Yes, we use the same scheme name, **http**, because otherwise Camel will auto-discover and create the component with default settings. What we need is to overrule this so we can set our options. In the sample below we set the max connection to 5 instead of the default of 2.

And then we can just use it as we normally do in our routes:

149.18.2. Using preemptive authentication

An end user reported that he had problem with authenticating with HTTPS. The problem was eventually resolved when he discovered the HTTPS server did not return a HTTP code 401 Authorization Required. The solution was to set the following URI option: **httpClient.authenticationPreemptive=true**

149.18.3. Accepting self signed certificates from remote server

See this [link](#) from a mailing list discussion with some code to outline how to do this with the Apache Commons HTTP API.

149.18.4. Setting up SSL for HTTP Client

Using the JSSE Configuration Utility

As of Camel 2.8, the HTTP4 component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the HTTP4 component.

The version of the Apache HTTP client used in this component resolves SSL/TLS information from a global "protocol" registry. This component provides an implementation, **org.apache.camel.component.http.SSLContextParametersSecureProtocolSocketFactory**, of the

HTTP client's protocol socket factory in order to support the use of the Camel JSSE Configuration utility. The following example demonstrates how to configure the protocol registry and use the registered protocol information in a route.

```

KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

ProtocolSocketFactory factory =
    new SSLContextParametersSecureProtocolSocketFactory(scp);

Protocol.registerProtocol("https",
    new Protocol(
        "https",
        factory,
        443));

from("direct:start")
    .to("https://mail.google.com/mail/").to("mock:results");

```

Configuring Apache HTTP Client Directly

Basically camel-http component is built on the top of Apache HTTP client, and you can implement a custom **org.apache.camel.component.http.HttpClientConfigurer** to do some configuration on the http client if you need full control of it.

However if you *just* want to specify the keystore and truststore you can do this with Apache HTTP **HttpClientConfigurer**, for example:

```

Protocol authhttps = new Protocol("https", new AuthSSLProtocolSocketFactory(
    new URL("file:my.keystore"), "mypassword",
    new URL("file:my.truststore"), "mypassword"), 443);

Protocol.registerProtocol("https", authhttps);

```

And then you need to create a class that implements **HttpClientConfigurer**, and registers https protocol providing a keystore or truststore per example above. Then, from your camel route builder class you can hook it up like so:

```

HttpComponent httpComponent = getContext().getComponent("http", HttpComponent.class);
httpComponent.setHttpClientConfigurer(new MyHttpClientConfigurer());

```

If you are doing this using the Spring DSL, you can specify your **HttpClientConfigurer** using the URI. For example:

```

<bean id="myHttpClientConfigurer"
    class="my.https.HttpClientConfigurer">
</bean>

```

```
<to uri="https://myhostname.com:443/myURL?httpClientConfigurerRef=myHttpClientConfigurer"/>
```

As long as you implement the `HttpClientConfigurer` and configure your keystore and truststore as described above, it will work fine.

149.19. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [Jetty](#)

CHAPTER 150. HTTP4 COMPONENT

Available as of Camel version 2.3

The **http4:** component provides HTTP based endpoints for calling external HTTP resources (as a client to call external servers using HTTP).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-http4</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

camel-http4 vs camel-http

Camel-http4 uses [Apache HttpClient 4.x](#) while camel-http uses [Apache HttpClient 3.x](#).

150.1. URI FORMAT

For HTTP

```
http4:hostname[:port][/resourceUri][?options]
```

For HTTPS

```
https4:hostname[:port][/resourceUri][?options]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

You can append query options to the URI in the following format, **?option=value&option=value&...**

camel-http4 vs camel-jetty

You can only produce to endpoints generated by the HTTP4 component. Therefore it should never be used as input into your Camel Routes. To bind/expose an HTTP endpoint via a HTTP server as input to a Camel route, use the [Jetty Component](#) instead.

150.2. HTTP4 COMPONENT OPTIONS

The HTTP4 component supports 18 options, which are listed below.

Name	Description	Default	Type
httpClientConfigurer (advanced)	To use the custom HttpClientConfigurer to perform configuration of the HttpClient that will be used.		HttpClientConfigurer

Name	Description	Default	Type
clientConnectionManager (advanced)	To use a custom and shared <code>HttpClientConnectionManager</code> to manage connections. If this has been configured then this is always used for all endpoints created by this component.		<code>HttpClientConnectionManager</code>
httpContext (advanced)	To use a custom <code>org.apache.http.protocol.HttpContext</code> when executing requests.		<code>HttpContext</code>
sslContextParameters (security)	To configure security using <code>SSLContextParameters</code> . Important: Only one instance of <code>org.apache.camel.util.jsse.SSLContextParameters</code> is supported per <code>HttpComponent</code> . If you need to use 2 or more different instances, you need to define a new <code>HttpComponent</code> per instance you need.		<code>SSLContextParameters</code>
useGlobalSslContextParameters (security)	Enable usage of global SSL context parameters.	false	boolean
x509HostnameVerifier (security)	To use a custom <code>X509HostnameVerifier</code> such as <code>DefaultHostnameVerifier</code> or <code>org.apache.http.conn.ssl.NoopHostnameVerifier</code> .		<code>HostnameVerifier</code>
maxTotalConnections (advanced)	The maximum number of connections.	200	int
connectionsPerRoute (advanced)	The maximum number of connections per route.	20	int
connectionTimeToLive (advanced)	The time for connection to live, the time unit is millisecond, the default value is always keep alive.		long
cookieStore (producer)	To use a custom <code>org.apache.http.client.CookieStore</code> . By default the <code>org.apache.http.impl.client.BasicCookieStore</code> is used which is an in-memory only cookie store. Notice if <code>bridgeEndpoint=true</code> then the cookie store is forced to be a noop cookie store as cookie shouldn't be stored as we are just bridging (eg acting as a proxy).		<code>CookieStore</code>
connectionRequestTimeout (timeout)	The timeout in milliseconds used when requesting a connection from the connection manager. A timeout value of zero is interpreted as an infinite timeout. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	int

Name	Description	Default	Type
connectTimeout (timeout)	Determines the timeout in milliseconds until a connection is established. A timeout value of zero is interpreted as an infinite timeout. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	int
socketTimeout (timeout)	Defines the socket timeout (SO_TIMEOUT) in milliseconds, which is the timeout for waiting for data or, put differently, a maximum period inactivity between two consecutive data packets). A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	int
httpBinding (advanced)	To use a custom HttpBinding to control the mapping between Camel message and HttpClient.		HttpBinding
httpConfiguration (advanced)	To use the shared HttpConfiguration as base configuration.		HttpConfiguration
allowJavaSerialized Object (advanced)	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
headerFilterStrategy (filter)	To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The HTTP4 endpoint is configured using URI syntax:

```
http4:httpUri
```

with the following path and query parameters:

150.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
httpUri	Required The url of the HTTP endpoint to call.		URI

150.2.2. Query Parameters (49 parameters):

Name	Description	Default	Type
disableStreamCache (common)	Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.	false	boolean
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy
httpBinding (common)	To use a custom HttpBinding to control the mapping between Camel message and HttpClient.		HttpBinding
authenticationPreemptive (producer)	If this option is true, camel-http4 sends preemptive basic authentication to the server.	false	boolean
bridgeEndpoint (producer)	If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint's URI for request. You may also set the option <code>throwExceptionOnFailure</code> to be false to let the HttpProducer send all the fault response back.	false	boolean
chunked (producer)	If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response	true	boolean

Name	Description	Default	Type
clearExpiredCookies (producer)	Whether to clear expired cookies before sending the HTTP request. This ensures the cookies store does not keep growing by adding new cookies which is newer removed when they are expired.	true	boolean
connectionClose (producer)	Specifies whether a Connection Close header must be added to HTTP Request. By default connectionClose is false.	false	boolean
cookieStore (producer)	To use a custom CookieStore. By default the BasicCookieStore is used which is an in-memory only cookie store. Notice if bridgeEndpoint=true then the cookie store is forced to be a noop cookie store as cookie shouldn't be stored as we are just bridging (eg acting as a proxy). If a cookieHandler is set then the cookie store is also forced to be a noop cookie store as cookie handling is then performed by the cookieHandler.		CookieStore
copyHeaders (producer)	If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).	true	boolean
deleteWithBody (producer)	Whether the HTTP DELETE should include the message body or not. By default HTTP DELETE do not include any HTTP message. However in some rare cases users may need to be able to include the message body.	false	boolean
httpMethod (producer)	Configure the HTTP method to use. The HttpMethod header cannot override this option if set.		HttpMethods
ignoreResponseBody (producer)	If this option is true, The http producer won't read response body and cache the input stream	false	boolean
preserveHostHeader (producer)	If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL's for a proxied service	false	boolean

Name	Description	Default	Type
throwExceptionOnFailure (producer)	Option to disable throwing the <code>HttpOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean
transferException (producer)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a <code>application/x-java-serialized-object</code> content type. On the producer side the exception will be deserialized and thrown as is, instead of the <code>HttpOperationFailedException</code> . The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
okStatusCodeRange (producer)	The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.	200-299	String
urlRewrite (producer)	Deprecated Refers to a custom <code>org.apache.camel.component.http.UrlRewrite</code> which allows you to rewrite urls when you bridge/proxy endpoints. See more details at http://camel.apache.org/urlrewrite.html		UrlRewrite
clientBuilder (advanced)	Provide access to the http client request parameters used on new <code>RequestConfig</code> instances used by producers or consumers of this endpoint.		HttpClientBuilder
clientConnectionManager (advanced)	To use a custom <code>HttpClientConnectionManager</code> to manage connections		HttpClientConnectionManager
connectionsPerRoute (advanced)	The maximum number of connections per route.	20	int
httpClient (advanced)	Sets a custom <code>HttpClient</code> to be used by the producer		HttpClient

Name	Description	Default	Type
httpClientConfigurer (advanced)	Register a custom configuration strategy for new HttpClient instances created by producers or consumers such as to configure authentication mechanisms etc		HttpClientConfigurer
httpClientOptions (advanced)	To configure the HttpClient using the key/values from the Map.		Map
httpClientContext (advanced)	To use a custom HttpClient instance		HttpClientContext
mapHttpMessageBody (advanced)	If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.	true	boolean
mapHttpMessageFormUrlEncodedBody (advanced)	If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.	true	boolean
mapHttpMessageHeaders (advanced)	If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.	true	boolean
maxTotalConnections (advanced)	The maximum number of connections.	200	int
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
useSystemProperties (advanced)	To use System Properties as fallback for configuration	false	boolean
proxyAuthDomain (proxy)	Proxy authentication domain to use with NTLM		String
proxyAuthHost (proxy)	Proxy authentication host		String
proxyAuthMethod (proxy)	Proxy authentication method to use		String

Name	Description	Default	Type
proxyAuthPassword (proxy)	Proxy authentication password		String
proxyAuthPort (proxy)	Proxy authentication port		int
proxyAuthScheme (proxy)	Proxy authentication scheme to use		String
proxyAuthUsername (proxy)	Proxy authentication username		String
proxyHost (proxy)	Proxy hostname to use		String
proxyPort (proxy)	Proxy port to use		int
authDomain (security)	Authentication domain to use with NTLM		String
authHost (security)	Authentication host to use with NTLM		String
authMethod (security)	Authentication methods allowed to use as a comma separated list of values Basic, Digest or NTLM.		String
authMethodPriority (security)	Which authentication method to prioritize to use, either as Basic, Digest or NTLM.		String
authPassword (security)	Authentication password		String
authUsername (security)	Authentication username		String
sslContextParameters (security)	To configure security using SSLContextParameters. Important: Only one instance of org.apache.camel.util.jsse.SSLContextParameters is supported per HttpComponent. If you need to use 2 or more different instances, you need to define a new HttpComponent per instance you need.		SSLContextParameters
x509HostnameVerifier (security)	To use a custom X509HostnameVerifier such as DefaultHostnameVerifier or org.apache.http.conn.ssl.NoopHostnameVerifier.		HostnameVerifier

150.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 19 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.http4.allow-java-serialized-object</code>	Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean
<code>camel.component.http4.client-connection-manager</code>	To use a custom and shared <code>HttpClientConnectionManager</code> to manage connections. If this has been configured then this is always used for all endpoints created by this component. The option is a <code>org.apache.http.conn.HttpClientConnectionManager</code> type.		String
<code>camel.component.http4.connect-timeout</code>	Determines the timeout in milliseconds until a connection is established. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	Integer
<code>camel.component.http4.connection-request-timeout</code>	The timeout in milliseconds used when requesting a connection from the connection manager. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	Integer
<code>camel.component.http4.connection-time-to-live</code>	The time for connection to live, the time unit is millisecond, the default value is always keep alive.		Long
<code>camel.component.http4.connections-per-route</code>	The maximum number of connections per route.	20	Integer
<code>camel.component.http4.cookie-store</code>	To use a custom <code>org.apache.http.client.CookieStore</code> . By default the <code>org.apache.http.impl.client.BasicCookieStore</code> is used which is an in-memory only cookie store. Notice if <code>bridgeEndpoint=true</code> then the cookie store is forced to be a noop cookie store as cookie shouldn't be stored as we are just bridging (eg acting as a proxy). The option is a <code>org.apache.http.client.CookieStore</code> type.		String

Name	Description	Default	Type
<code>camel.component.http4.enabled</code>	Enable http4 component	true	Boolean
<code>camel.component.http4.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String
<code>camel.component.http4.http-binding</code>	To use a custom <code>HttpBinding</code> to control the mapping between Camel message and <code>HttpClient</code> . The option is a <code>org.apache.camel.http.common.HttpBinding</code> type.		String
<code>camel.component.http4.http-client-configurer</code>	To use the custom <code>HttpClientConfigurer</code> to perform configuration of the <code>HttpClient</code> that will be used. The option is a <code>org.apache.camel.component.http4.HttpClientConfigurer</code> type.		String
<code>camel.component.http4.http-configuration</code>	To use the shared <code>HttpConfiguration</code> as base configuration. The option is a <code>org.apache.camel.http.common.HttpConfiguration</code> type.		String
<code>camel.component.http4.http-context</code>	To use a custom <code>org.apache.http.protocol.HttpContext</code> when executing requests. The option is a <code>org.apache.http.protocol.HttpContext</code> type.		String
<code>camel.component.http4.max-total-connections</code>	The maximum number of connections.	200	Integer
<code>camel.component.http4.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.http4.socket-timeout</code>	Defines the socket timeout (<code>SO_TIMEOUT</code>) in milliseconds, which is the timeout for waiting for data or, put differently, a maximum period inactivity between two consecutive data packets). A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1	-1	Integer

Name	Description	Default	Type
<code>camel.component.http4.ssl-context-parameters</code>	To configure security using <code>SSLContextParameters</code> . Important: Only one instance of <code>org.apache.camel.util.jsse.SSLContextParameters</code> is supported per <code>HttpComponent</code> . If you need to use 2 or more different instances, you need to define a new <code>HttpComponent</code> per instance you need. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type.		String
<code>camel.component.http4.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean
<code>camel.component.http4.x509-hostname-verifyer</code>	To use a custom <code>X509HostnameVerifier</code> such as <code>DefaultHostnameVerifier</code> or <code>org.apache.http.conn.ssl.NoopHostnameVerifier</code> . The option is a <code>javax.net.ssl.HostnameVerifier</code> type.		String

150.4. MESSAGE HEADERS

Name	Type	Description
<code>Exchange.HTTP_URI</code>	String	URI to call. Will override existing URI set directly on the endpoint. This uri is the uri of the http server to call. Its not the same as the Camel endpoint uri, where you can configure endpoint options such as security etc. This header does not support that, its only the uri of the http server.
<code>Exchange.HTTP_PATH</code>	String	Request URI's path, the header will be used to build the request URI with the <code>HTTP_URI</code> .
<code>Exchange.HTTP_QUERY</code>	String	URI parameters. Will override existing URI parameters set directly on the endpoint.
<code>Exchange.HTTP_RESPONSE_CODE</code>	int	The HTTP response code from the external server. Is 200 for OK.

Name	Type	Description
Exchange.HTTP_RESPONSE_TEXT	String	The HTTP response text from the external server.
Exchange.HTTP_CHARACTER_ENCODING	String	Character encoding.
Exchange.CONTENT_TYPE	String	The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html .
Exchange.CONTENT_ENCODING	String	The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as gzip .

150.5. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

150.6. USING SYSTEM PROPERTIES

When setting `useSystemProperties` to true, the HTTP Client will look for the following System Properties and it will use it:

- `ssl.TrustManagerFactory.algorithm`
- [javax.net.ssl.trustStoreType](#)
- [javax.net.ssl.trustStore](#)
- [javax.net.ssl.trustStoreProvider](#)

- [javax.net.ssl.trustStorePassword](#)
- `java.home`
- `ssl.KeyManagerFactory.algorithm`
- [javax.net.ssl.keyStoreType](#)
- [javax.net.ssl.keyStore](#)
- [javax.net.ssl.keyStoreProvider](#)
- [javax.net.ssl.keyStorePassword](#)
- `http.proxyHost`
- `http.proxyPort`
- `http.nonProxyHosts`
- `http.keepAlive`
- `http.maxConnections`

150.7. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a **HttpOperationFailedException** with the information.
- Response code is 400+, Camel regards it as an external server failure and will throw a **HttpOperationFailedException** with the information.

throwExceptionOnFailure The option, **throwExceptionOnFailure**, can be set to **false** to prevent the **HttpOperationFailedException** from being thrown for failed response codes. This allows you to get any response from the remote server.

There is a sample below demonstrating this.

150.8. HTTPOPERATIONFAILEDEXCEPTION

This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a **java.lang.String**, if server provided a body as response

150.9. WHICH HTTP METHOD WILL BE USED

The following algorithm is used to determine what HTTP method should be used:

1. Use method provided as endpoint configuration (**httpMethod**).
2. Use method provided in header (**Exchange.HTTP_METHOD**).
3. **GET** if query string is provided in header.
4. **GET** if endpoint is configured with a query string.
5. **POST** if there is data to send (body is not **null**).
6. **GET** otherwise.

150.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE

You can get access to these two using the Camel type converter system using

NOTE You can get the request and response not just from the processor after the camel-jetty or camel-cxf endpoint.

```
HttpServletRequest request = exchange.getIn().getBody(HttpServletRequest.class);
HttpServletRequest response = exchange.getIn().getBody(HttpServletRequestResponse.class);
```

150.11. CONFIGURING URI TO CALL

You can set the HTTP producer's URI directly from the endpoint URI. In the route below, Camel will call out to the external server, **oldhost**, using HTTP.

```
from("direct:start")
    .to("http4://oldhost");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="http4://oldhost"/>
  </route>
</camelContext>
```

You can override the HTTP endpoint URI by adding a header with the key, **Exchange.HTTP_URI**, on the message.

```
from("direct:start")
    .setHeader(Exchange.HTTP_URI, constant("http://newhost"))
    .to("http4://oldhost");
```

In the sample above Camel will call the <http://newhost> despite the endpoint is configured with `http4://oldhost`.

If the `http4` endpoint is working in bridge mode, it will ignore the message header of **Exchange.HTTP_URI**.

150.12. CONFIGURING URI PARAMETERS

The **http** producer supports URI parameters to be sent to the HTTP server. The URI parameters can either be set directly on the endpoint URI or as a header with the key **Exchange.HTTP_QUERY** on the message.

```
from("direct:start")
  .to("http4://oldhost?order=123&detail=short");
```

Or options provided in a header:

```
from("direct:start")
  .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
  .to("http4://oldhost");
```

150.13. HOW TO SET THE HTTP METHOD (GET/PATCH/POST/PUT/DELETE/HEAD/OPTIONS/TRACE) TO THE HTTP PRODUCER

Using the http PATCH method

The http PATCH method is supported starting with Camel 2.11.3 / 2.12.1.

The HTTP4 component provides a way to set the HTTP request method by setting the message header. Here is an example:

```
from("direct:start")
  .setHeader(Exchange.HTTP_METHOD,
    constant(org.apache.camel.component.http4.HttpMethods.POST))
  .to("http4://www.google.com")
  .to("mock:results");
```

The method can be written a bit shorter using the string constants:

```
.setHeader("CamelHttpMethod", constant("POST"))
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <setHeader headerName="CamelHttpMethod">
      <constant>POST</constant>
    </setHeader>
    <to uri="http4://www.google.com"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

150.14. USING CLIENT TIMEOUT - SO_TIMEOUT

See the [HttpSOTimeoutTest](#) unit test.

Since Camel 2.13.0: See the updated [HttpSOTimeoutTest](#) unit test.

150.15. CONFIGURING A PROXY

The HTTP4 component provides a way to configure a proxy.

```
from("direct:start")
  .to("http4://oldhost?proxyAuthHost=www.myproxy.com&proxyAuthPort=80");
```

There is also support for proxy authentication via the **proxyAuthUsername** and **proxyAuthPassword** options.

150.15.1. Using proxy settings outside of URI

To avoid System properties conflicts, you can set proxy configuration only from the CamelContext or URI.

Java DSL :

```
context.getProperties().put("http.proxyHost", "172.168.18.9");
context.getProperties().put("http.proxyPort" "8080");
```

Spring XML

```
<camelContext>
  <properties>
    <property key="http.proxyHost" value="172.168.18.9"/>
    <property key="http.proxyPort" value="8080"/>
  </properties>
</camelContext>
```

Camel will first set the settings from Java System or CamelContext Properties and then the endpoint proxy options if provided.

So you can override the system properties with the endpoint options.

Notice in **Camel 2.8** there is also a **http.proxyScheme** property you can set to explicit configure the scheme to use.

150.16. CONFIGURING CHARSET

If you are using **POST** to send data you can configure the **charset** using the **Exchange** property:

```
exchange.setProperty(Exchange.CHARSET_NAME, "ISO-8859-1");
```

150.16.1. Sample with scheduled poll

This sample polls the Google homepage every 10 seconds and write the page to the file **message.html**:

```
from("timer://foo?fixedRate=true&delay=0&period=10000")
  .to("http4://www.google.com")
  .setHeader(FileComponent.HEADER_FILE_NAME, "message.html")
  .to("file:target/google");
```

150.16.2. URI Parameters from the endpoint URI

In this sample we have the complete URI endpoint that is just what you would have typed in a web browser. Multiple URI parameters can of course be set using the **&** character as separator, just as you would in the web browser. Camel does no tricks here.

```
// we query for Camel at the Google page
template.sendBody("http4://www.google.com/search?q=Camel", null);
```

150.16.3. URI Parameters from the Message

```
Map headers = new HashMap();
headers.put(Exchange.HTTP_QUERY, "q=Camel&lr=lang_en");
// we query for Camel and English language at Google
template.sendBody("http4://www.google.com/search", null, headers);
```

In the header value above notice that it should **not** be prefixed with **?** and you can separate parameters as usual with the **&** char.

150.16.4. Getting the Response Code

You can get the HTTP response code from the HTTP4 component by getting the value from the Out message header with **Exchange.HTTP_RESPONSE_CODE**.

```
Exchange exchange = template.send("http4://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq"));
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);
```

150.17. DISABLING COOKIES

To disable cookies you can set the HTTP Client to ignore cookies by adding this URI option: **httpClient.cookiePolicy=ignoreCookies**

150.18. ADVANCED USAGE

If you need more control over the HTTP producer you should use the **HttpComponent** where you can set various classes to give you custom behavior.

150.18.1. Setting up SSL for HTTP Client

Using the JSSE Configuration Utility

As of Camel 2.8, the HTTP4 component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the HTTP4 component.

Programmatic configuration of the component

```
KeyStoreParameters ksp = new KeyStoreParameters();
```

```

ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

HttpComponent httpComponent = getContext().getComponent("https4", HttpComponent.class);
httpComponent.setSslContextParameters(scp);

```

Spring DSL based configuration of endpoint

```

...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:keyManagers
    keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  </camel:sslContextParameters>...
...
<to uri="https4://127.0.0.1/mail/?sslContextParameters=#sslContextParameters"/>...

```

Configuring Apache HTTP Client Directly

Basically camel-http4 component is built on the top of [Apache HttpClient](#). Please refer to [SSL/TLS customization](#) for details or have a look into the

org.apache.camel.component.http4.HttpsServerTestSupport unit test base class.

You can also implement a custom **org.apache.camel.component.http4.HttpClientConfigurer** to do some configuration on the http client if you need full control of it.

However if you *just* want to specify the keystore and truststore you can do this with Apache HTTP **HttpClientConfigurer**, for example:

```

KeyStore keystore = ...;
KeyStore truststore = ...;

SchemeRegistry registry = new SchemeRegistry();
registry.register(new Scheme("https", 443, new SSLSocketFactory(keystore, "mypassword",
truststore)));

```

And then you need to create a class that implements **HttpClientConfigurer**, and registers https protocol providing a keystore or truststore per example above. Then, from your camel route builder class you can hook it up like so:

```

HttpComponent httpComponent = getContext().getComponent("http4", HttpComponent.class);
httpComponent.setHttpClientConfigurer(new MyHttpClientConfigurer());

```

If you are doing this using the Spring DSL, you can specify your **HttpClientConfigurer** using the URI. For example:

```
<bean id="myHttpClientConfigurer"
class="my.https.HttpClientConfigurer">
</bean>
```

```
<to uri="https4://myhostname.com:443/myURL?httpClientConfigurer=myHttpClientConfigurer"/>
```

As long as you implement the `HttpClientConfigurer` and configure your keystore and truststore as described above, it will work fine.

Using HTTPS to authenticate gotchas

An end user reported that he had problem with authenticating with HTTPS. The problem was eventually resolved by providing a custom configured **`org.apache.http.protocol.HttpContext`**:

- 1. Create a (Spring) factory for `HttpContext`s:

```
public class HttpContextFactory {

private String httpHost = "localhost";
private String httpPort = 9001;

private BasicHttpContext httpContext = new BasicHttpContext();
private BasicAuthCache authCache = new BasicAuthCache();
private BasicScheme basicAuth = new BasicScheme();

public HttpContext getObject() {
authCache.put(new HttpHost(httpHost, httpPort), basicAuth);

httpContext.setAttribute(ClientContext.AUTH_CACHE, authCache);

return httpContext;
}

// getter and setter
}
```

- 2. Declare an `HttpContext` in the Spring application context file:

```
<bean id="myHttpContext" factory-bean="httpContextFactory" factory-method="getObject"/>
```

- 3. Reference the context in the http4 URL:

```
<to uri="https4://myhostname.com:443/myURL?httpContext=myHttpContext"/>
```

Using different `SSLContextParameters`

The `HTTP4` component only support one instance of **`org.apache.camel.util.jsse.SSLContextParameters`** per component. If you need to use 2 or more different instances, then you need to setup multiple `HTTP4` components as shown below. Where we have 2 components, each using their own instance of **`sslContextParameters`** property.

```
<bean id="http4-foo" class="org.apache.camel.component.http4.HttpComponent">
<property name="sslContextParameters" ref="sslContextParams1"/>
<property name="x509HostnameVerifier" ref="hostnameVerifier"/>
```

```
</bean>
```

```
<bean id="http4-bar" class="org.apache.camel.component.http4.HttpComponent">  
  <property name="sslContextParameters" ref="sslContextParams2"/>  
  <property name="x509HostnameVerifier" ref="hostnameVerifier"/>  
</bean>
```

CHAPTER 151. HYSTRIX COMPONENT

Available as of Camel version 2.18

The hystrix component integrates Netflix Hystrix circuit breaker in Camel routes.

For more details see the Hystrix EIP documentation.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hystrix</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

151.1. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.hystrix.mapping.enabled</code>	Enables the automatic mapping of the hystrix metric servlet into the Spring web context.	true	Boolean
<code>camel.component.hystrix.mapping.path</code>	Endpoint for hystrix metrics servlet.	/hystrix-stream	String
<code>camel.component.hystrix.mapping.servlet-name</code>	Name of the Hystrix metrics servlet.	HystrixEventStreamServlet	String

CHAPTER 152. ICAL DATAFORMAT

Available as of Camel version 2.12

The **ICal** dataformat is used for working with [iCalendar](#) messages.

A typical iCalendar message looks like:

```
BEGIN:VCALENDAR
VERSION:2.0
PRODID:-//Events Calendar//iCal4j 1.0//EN
CALSCALE:GREGORIAN
BEGIN:VEVENT
DTSTAMP:20130324T180000Z
DTSTART:20130401T170000
DTEND:20130401T210000
SUMMARY:Progress Meeting
TZID:America/New_York
UID:00000000
ATTENDEE;ROLE=REQ-PARTICIPANT;CN=Developer 1:mailto:dev1@mycompany.com
ATTENDEE;ROLE=OPT-PARTICIPANT;CN=Developer 2:mailto:dev2@mycompany.com
END:VEVENT
END:VCALENDAR
```

152.1. OPTIONS

The iCal dataformat supports 2 options, which are listed below.

Name	Default	Java Type	Description
<code>validating</code>	<code>false</code>	Boolean	Whether to validate.
<code>contentTypeHeader</code>	<code>false</code>	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

152.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
		<code>t</code>	

Name	Description	Default	Type
<code>camel.dataformat.ical.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.	false	Boolean
<code>camel.dataformat.ical.enabled</code>	Enable ical dataformat	true	Boolean
<code>camel.dataformat.ical.validating</code>	Whether to validate.	false	Boolean

ND

152.3. BASIC USAGE

To unmarshal and marshal the message shown above, your route will look like the following:

```
from("direct:ical-unmarshal")
  .unmarshal("ical")
  .to("mock:unmarshaled")
  .marshal("ical")
  .to("mock:marshaled");
```

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ical</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

152.4. SEE ALSO

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 153. IEC 60870 CLIENT COMPONENT

Available as of Camel version 2.20

The **IEC 60870-5-104 Client** component provides access to IEC 60870 servers using the [Eclipse NeoSCADA™](#) implementation.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-iec60870</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The IEC 60870 Client component supports 2 options, which are listed below.

Name	Description	Default	Type
defaultConnectionOptions (common)	Default connection options		ClientOptions
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

153.1. URI FORMAT

The URI syntax of the endpoint is:

```
iec60870-client:host:port/00-01-02-03-04
```

The information object address is encoded in the path in the syntax shows above. Please note that always the full, 5 octet address format is being used. Unused octets have to be filled with zero.

153.2. URI OPTIONS

The IEC 60870 Client endpoint is configured using URI syntax:

```
iec60870-client:uriPath
```

with the following path and query parameters:

153.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
uriPath	Required The object information address		ObjectAddress

153.2.2. Query Parameters (19 parameters):

Name	Description	Default	Type
dataModuleOptions (common)	Data module options		DataModuleOptions
protocolOptions (common)	Protocol options		ProtocolOptions
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
acknowledgeWindow (connection)	Parameter W - Acknowledgment window.	10	short
adsuAddressType (connection)	The common ASDU address size. May be either SIZE_1 or SIZE_2.		ASDUAddressType
causeOfTransmissionType (connection)	The cause of transmission type. May be either SIZE_1 or SIZE_2.		CauseOfTransmissionType

Name	Description	Default	Type
informationObjectAddressType (connection)	The information address size. May be either SIZE_1, SIZE_2 or SIZE_3.		InformationObjectAddressType
maxUnacknowledged (connection)	Parameter K - Maximum number of unacknowledged messages.	15	short
timeout1 (connection)	Timeout T1 in milliseconds.	15000	int
timeout2 (connection)	Timeout T2 in milliseconds.	10000	int
timeout3 (connection)	Timeout T3 in milliseconds.	20000	int
causeSourceAddress (data)	Whether to include the source address	true	boolean
ignoreBackgroundScan (data)	Whether background scan transmissions should be ignored.	true	boolean
ignoreDaylightSavingTime (data)	Whether to ignore or respect DST	false	boolean
timeZone (data)	The timezone to use. May be any Java time zone string	UTC	TimeZone
connectionId (id)	An identifier grouping connection instances		String

153.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.iec60870-client.default-connection-options.ignore-background-scan	Whether background scan transmissions should be ignored.	true	Boolean

Name	Description	Default	Type
<code>camel.component.iec60870-client.enabled</code>	Whether to enable auto configuration of the <code>iec60870-client</code> component. This is enabled by default.		Boolean
<code>camel.component.iec60870-client.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

A connection instance is identified by the host and port part of the URI, plus all parameters in the "id" group. If a new connection id is encountered the connection options will be evaluated and the connection instance is created with those options.

NOTE

If two URIs specify the same connection (host, port, ...) but different connection options, then it is undefined which of those connection options will be used.

The final connection options will be evaluated in the following order:

- If present, the `connectionOptions` parameter will be used
- Otherwise the `defaultConnectionOptions` instance is copied and customized in the following steps
- Apply `protocolOptions` if present
- Apply `dataModuleOptions` if present
- Apply all explicit connection parameters (e.g. `timeZone`)

CHAPTER 154. IEC 60870 SERVER COMPONENT

Available as of Camel version 2.20

The **IEC 60870-5-104 Server** component provides access to IEC 60870 servers using the [Eclipse NeoSCADA™](#) implementation.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-iec60870</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The IEC 60870 Server component supports 2 options, which are listed below.

Name	Description	Default	Type
defaultConnectionOptions (common)	Default connection options		ServerOptions
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

154.1. URI FORMAT

The URI syntax of the endpoint is:

```
iec60870-server:host:port/00-01-02-03-04
```

The information object address is encoded in the path in the syntax shows above. Please note that always the full, 5 octet address format is being used. Unused octets have to be filled with zero.

154.2. URI OPTIONS

The IEC 60870 Server endpoint is configured using URI syntax:

```
iec60870-server:uriPath
```

with the following path and query parameters:

154.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
uriPath	Required The object information address		ObjectAddress

154.2.2. Query Parameters (20 parameters):

Name	Description	Default	Type
dataModuleOptions (common)	Data module options		DataModuleOptions
filterNonExecute (common)	Filter out all requests which don't have the execute bit set	true	boolean
protocolOptions (common)	Protocol options		ProtocolOptions
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
acknowledgeWindow (connection)	Parameter W - Acknowledgment window.	10	short
adsuAddressType (connection)	The common ASDU address size. May be either <code>SIZE_1</code> or <code>SIZE_2</code> .		ASDUAddressType

Name	Description	Default	Type
causeOfTransmissionType (connection)	The cause of transmission type. May be either SIZE_1 or SIZE_2.		CauseOfTransmissionType
informationObjectAddressType (connection)	The information address size. May be either SIZE_1, SIZE_2 or SIZE_3.		InformationObjectAddressType
maxUnacknowledged (connection)	Parameter K - Maximum number of unacknowledged messages.	15	short
timeout1 (connection)	Timeout T1 in milliseconds.	15000	int
timeout2 (connection)	Timeout T2 in milliseconds.	10000	int
timeout3 (connection)	Timeout T3 in milliseconds.	20000	int
causeSourceAddress (data)	Whether to include the source address	true	boolean
ignoreBackgroundScan (data)	Whether background scan transmissions should be ignored.	true	boolean
ignoreDaylightSavingTime (data)	Whether to ignore or respect DST	false	boolean
timeZone (data)	The timezone to use. May be any Java time zone string	UTC	TimeZone
connectionId (id)	An identifier grouping connection instances		String

154.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 7 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.iec60870-server.default-connection-options.background-scan-period</code>	The period in "ms" between background transmission cycles. <p>If this is set to zero or less, background transmissions will be disabled.</p>		Integer
<code>camel.component.iec60870-server.default-connection-options.booleans-with-timestamp</code>	Send booleans with timestamps		Boolean
<code>camel.component.iec60870-server.default-connection-options.buffering-period</code>	A time period in "ms" the protocol layer will buffer change events in order to send out aggregated change messages		Integer
<code>camel.component.iec60870-server.default-connection-options.floats-with-timestamp</code>	Send floats with timestamps		Boolean
<code>camel.component.iec60870-server.default-connection-options.spontaneous-duplicates</code>	Number of spontaneous events to keep in the buffer. <p>When there are more than this number of spontaneous in events in the buffer, then events will be dropped in order to maintain the buffer size.</p>		Integer
<code>camel.component.iec60870-server.enabled</code>	Whether to enable auto configuration of the iec60870-server component. This is enabled by default.		Boolean
<code>camel.component.iec60870-server.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 155. IGNITE CACHE COMPONENT

Available as of Camel version 2.17

The Ignite Cache endpoint is one of camel-ignite endpoints which allows you to interact with an [Ignite Cache](#). This offers both a Producer (to invoke cache operations on an Ignite cache) and a Consumer (to consume changes from a continuous query).

The cache value is always the body of the message, whereas the cache key is always stored in the **IgniteConstants.IGNITE_CACHE_KEY** message header.

Even if you configure a fixed operation in the endpoint URI, you can vary it per-exchange by setting the **IgniteConstants.IGNITE_CACHE_OPERATION** message header.

155.1. OPTIONS

The Ignite Cache component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (common)	Sets the Ignite instance.		Ignite
configurationResource (common)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (common)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Cache endpoint is configured using URI syntax:

```
ignite-cache:cacheName
```

with the following path and query parameters:

155.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The cache name.		String

155.1.2. Query Parameters (16 parameters):

Name	Description	Default	Type
propagateIncomingBodyIfNoReturnValue (common)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
treatCollectionsAsCache Objects (common)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
autoUnsubscribe (consumer)	Whether auto unsubscribe is enabled in the Continuous Query Consumer.	true	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
fireExistingQuery Results (consumer)	Whether to process existing results that match the query. Used on initialization of the Continuous Query Consumer.	false	boolean
oneExchangePer Update (consumer)	Whether to pack each update in an individual Exchange, even if multiple updates are received in one batch. Only used by the Continuous Query Consumer.	true	boolean
pageSize (consumer)	The page size. Only used by the Continuous Query Consumer.	1	int
query (consumer)	The Query to execute, only needed for operations that require it, and for the Continuous Query Consumer.		Query
remoteFilter (consumer)	The remote filter, only used by the Continuous Query Consumer.		CacheEntryEvent SerializableFilter
timeInterval (consumer)	The time interval for the Continuous Query Consumer.	0	long

Name	Description	Default	Type
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
cachePeekMode (producer)	The CachePeekMode, only needed for operations that require it (IgniteCacheOperation#SIZE).	ALL	CachePeekMode
failIfInexistentCache (producer)	Whether to fail the initialization if the cache doesn't exist.	false	boolean
operation (producer)	The cache operation to invoke. Possible values: GET, PUT, REMOVE, SIZE, REBALANCE, QUERY, CLEAR.		IgniteCacheOperation
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

155.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.component.ignite-cache.configuration-resource	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a <code>java.lang.Object</code> type.		String
camel.component.ignite-cache.enabled	Enable ignite-cache component	true	Boolean
camel.component.ignite-cache.ignite	Sets the Ignite instance. The option is a <code>org.apache.ignite.Ignite</code> type.		String
camel.component.ignite-cache.ignite-configuration	Allows the user to set a programmatic IgniteConfiguration. The option is a <code>org.apache.ignite.configuration.IgniteConfiguration</code> type.		String

Name	Description	Default	Type
<code>camel.component.ignite-cache.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

155.2.1. Headers used

This endpoint uses the following headers:

Header name	Constant	Expected type	Description
CamelligniteCacheKey	IgniteConstants.IGNITE_CACHE_KEY	String	The cache key for the entry value in the message body.
CamelligniteCacheQuery	IgniteConstants.IGNITE_CACHE_QUERY	Query	The query to run (producer) when invoking the QUERY operation.
CamelligniteCacheOperation	IgniteConstants.IGNITE_CACHE_OPERATION	IgniteCacheOperation enum	Allows you to dynamically change the cache operation to execute (producer).
CamelligniteCachePeekMode	IgniteConstants.IGNITE_CACHE_PEEK_MODE	CachePeekMode enum	Allows you to dynamically change the cache peek mode when running the SIZE operation.
CamelligniteCacheEventType	IgniteConstants.IGNITE_CACHE_EVENT_TYPE	int (EventType constants)	This header carries the received event type when using the continuous query consumer.
CamelligniteCacheName	IgniteConstants.IGNITE_CACHE_NAME	String	This header carries the cache name for which a continuous query event was received (consumer). It does not allow you to dynamically change the cache against which a producer operation is performed. Use EIPs for that (e.g. recipient list, dynamic router).

Header name	Constant	Expected type	Description
Camellignite CacheOldV alue	IgniteConst ants.IGNITE _CACHE_O LD_VALUE	Object	This header carries the old cache value when passed in the incoming cache event (consumer).

CHAPTER 156. IGNITE COMPUTE COMPONENT

Available as of Camel version 2.17

The Ignite Compute endpoint is one of camel-ignite endpoints which allows you to run [compute operations](#) on the cluster by passing in an IgniteCallable, an IgniteRunnable, an IgniteClosure, or collections of them, along with their parameters if necessary.

This endpoint only supports producers.

The host part of the endpoint URI is a symbolic endpoint ID, it is not used for any purposes.

The endpoint tries to run the object passed in the body of the IN message as the compute job. It expects different payload types depending on the execution type.

156.1. OPTIONS

The Ignite Compute component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (producer)	Sets the Ignite instance.		Ignite
configurationResource (producer)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (producer)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Compute endpoint is configured using URI syntax:

```
ignite-compute:endpointId
```

with the following path and query parameters:

156.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
endpointId	Required The endpoint ID (not used).		String

156.1.2. Query Parameters (8 parameters):

Name	Description	Default	Type
clusterGroupExpression (producer)	An expression that returns the Cluster Group for the IgniteCompute instance.		ClusterGroupExpression
computeName (producer)	The name of the compute job, which will be set via IgniteCompute#withName(String).		String
executionType (producer)	Required The compute operation to perform. Possible values: CALL, BROADCAST, APPLY, EXECUTE, RUN, AFFINITY_CALL, AFFINITY_RUN. The component expects different payload types depending on the operation.		IgniteComputeExecutionType
propagateIncomingBodyIfNoReturnValue (producer)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
taskName (producer)	The task name, only applicable if using the IgniteComputeExecutionType#EXECUTE execution type.		String
timeoutMillis (producer)	The timeout interval for triggered jobs, in milliseconds, which will be set via IgniteCompute#withTimeout(long).		Long
treatCollectionsAsCache Objects (producer)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

156.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.component.ignite-compute.configuration-resource	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a java.lang.Object type.		String

Name	Description	Default	Type
<code>camel.component.ignite-compute.enabled</code>	Enable ignite-compute component	true	Boolean
<code>camel.component.ignite-compute.ignite</code>	Sets the Ignite instance. The option is a <code>org.apache.ignite.Ignite</code> type.		String
<code>camel.component.ignite-compute.ignite-configuration</code>	Allows the user to set a programmatic IgniteConfiguration. The option is a <code>org.apache.ignite.configuration.IgniteConfiguration</code> type.		String
<code>camel.component.ignite-compute.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

156.2.1. Expected payload types

Each operation expects the indicated types:

Operation	Expected payloads
CALL	Collection of IgniteCallable, or a single IgniteCallable.
BROADCAST	IgniteCallable, IgniteRunnable, IgniteClosure.
APPLY	IgniteClosure.
EXECUTE	ComputeTask, Class<? extends ComputeTask> or an object representing parameters if the <code>taskName</code> option is not null.
RUN	A Collection of IgniteRunnables, or a single IgniteRunnable.
AFFINITY_CALL	IgniteCallable.
AFFINITY_RUN	IgniteRunnable.

156.2.2. Headers used

This endpoint uses the following headers:

Header name	Constant	Expected type	Description
CamelligniteComputeExecutionType	IgniteConstants.IGNITE_COMPUTE_EXECUTION_TYPE	IgniteComputeExecutionType enum	Allows you to dynamically change the compute operation to perform.
CamelligniteComputeParameters	IgniteConstants.IGNITE_COMPUTE_PARAMS	Any object or Collection of objects.	Parameters for APPLY, BROADCAST and EXECUTE operations.
CamelligniteComputeReducer	IgniteConstants.IGNITE_COMPUTE_REDUCER	IgniteReducer	Reducer for the APPLY and CALL operations.
CamelligniteComputeAffinityCacheName	IgniteConstants.IGNITE_COMPUTE_AFFINITY_CACHE_NAME	String	Affinity cache name for the AFFINITY_CALL and AFFINITY_RUN operations.
CamelligniteComputeAffinityKey	IgniteConstants.IGNITE_COMPUTE_AFFINITY_KEY	Object	Affinity key for the AFFINITY_CALL and AFFINITY_RUN operations.

CHAPTER 157. IGNITE EVENTS COMPONENT

Available as of Camel version 2.17

The Ignite Events endpoint is one of camel-ignite endpoints which allows you to [receive events](#) from the Ignite cluster by creating a local event listener.

This endpoint only supports consumers. The Exchanges created by this consumer put the received Event object into the body of the IN message.

157.1. OPTIONS

The Ignite Events component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (consumer)	Sets the Ignite instance.		Ignite
configurationResource (consumer)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (consumer)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Events endpoint is configured using URI syntax:

```
ignite-events:endpointId
```

with the following path and query parameters:

157.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
endpointId	The endpoint ID (not used).		String

157.1.2. Query Parameters (8 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
clusterGroupExpression (consumer)	The cluster group expression.		ClusterGroupExpression
events (consumer)	The event IDs to subscribe to as a Set directly where the IDs are the different constants in <code>org.apache.ignite.events.EventType</code> .	EventType.EVTS_ALL	SetOrString
propagateIncomingBodyIfNoReturnValue (consumer)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
treatCollectionsAsCache Objects (consumer)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

157.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.ignite-events.configuration-resource</code>	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a java.lang.Object type.		String
<code>camel.component.ignite-events.enabled</code>	Enable ignite-events component	true	Boolean
<code>camel.component.ignite-events.ignite</code>	Sets the Ignite instance. The option is a org.apache.ignite.Ignite type.		String
<code>camel.component.ignite-events.ignite-configuration</code>	Allows the user to set a programmatic IgniteConfiguration. The option is a org.apache.ignite.configuration.IgniteConfiguration type.		String
<code>camel.component.ignite-events.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 158. IGNITE ID GENERATOR COMPONENT

Available as of Camel version 2.17

The Ignite ID Generator endpoint is one of camel-ignite endpoints which allows you to interact with [Ignite Atomic Sequences and ID Generators](#).

This endpoint only supports producers.

158.1. OPTIONS

The Ignite ID Generator component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (producer)	Sets the Ignite instance.		Ignite
configurationResource (producer)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (producer)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite ID Generator endpoint is configured using URI syntax:

```
ignite-idgen:name
```

with the following path and query parameters:

158.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required The sequence name.		String

158.1.2. Query Parameters (6 parameters):

Name	Description	Default	Type
batchSize (producer)	The batch size.		Integer
initialValue (producer)	The initial value.	0	Long
operation (producer)	The operation to invoke on the Ignite ID Generator. Superseded by the IgniteConstants.IGNITE_IDGEN_OPERATION header in the IN message. Possible values: ADD_AND_GET, GET, GET_AND_ADD, GET_AND_INCREMENT, INCREMENT_AND_GET.		IgniteIdGenOperation
propagateIncomingBodyIfNoReturnValue (producer)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
treatCollectionsAsCache Objects (producer)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

158.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.component.ignite-idgen.configuration-resource	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a java.lang.Object type.		String
camel.component.ignite-idgen.enabled	Enable ignite-idgen component	true	Boolean
camel.component.ignite-idgen.ignite	Sets the Ignite instance. The option is a org.apache.ignite.Ignite type.		String

Name	Description	Default	Type
camel.component.ignite-idgen.ignite-configuration	Allows the user to set a programmatic IgniteConfiguration. The option is a org.apache.ignite.configuration.IgniteConfiguration type.		String
camel.component.ignite-idgen.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

CHAPTER 159. IGNITE MESSAGING COMPONENT

Available as of Camel version 2.17

The Ignite Messaging endpoint is one of camel-ignite endpoints which allows you to send and consume messages from an [ignite topic](#).

This endpoint supports producers (to send messages) and consumers (to receive messages).

159.1. OPTIONS

The Ignite Messaging component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (common)	Sets the Ignite instance.		Ignite
configurationResource (common)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (common)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Messaging endpoint is configured using URI syntax:

```
ignite-messaging:topic
```

with the following path and query parameters:

159.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
topic	Required The topic name.		String

159.1.2. Query Parameters (9 parameters):

Name	Description	Default	Type
propagateIncomingBodyIfNoReturnValue (common)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
treatCollectionsAsCache Objects (common)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
clusterGroupExpression (producer)	The cluster group expression.		ClusterGroupExpression
sendMode (producer)	The send mode to use. Possible values: UNORDERED, ORDERED.	UNORDERED	IgniteMessagingSend Mode
timeout (producer)	The timeout for the send operation when using ordered messages.		Long
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

159.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.ignite-messaging.configuration-resource</code>	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a <code>java.lang.Object</code> type.		String
<code>camel.component.ignite-messaging.enabled</code>	Enable ignite-messaging component	true	Boolean
<code>camel.component.ignite-messaging.ignite</code>	Sets the Ignite instance. The option is a <code>org.apache.ignite.Ignite</code> type.		String
<code>camel.component.ignite-messaging.ignite-configuration</code>	Allows the user to set a programmatic IgniteConfiguration. The option is a <code>org.apache.ignite.configuration.IgniteConfiguration</code> type.		String
<code>camel.component.ignite-messaging.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

159.2.1. Headers used

This endpoint uses the following headers:

Header name	Constant	Expected type	Description
Camellignite MessagingTopic	<code>IgniteConstants.IGNITE_MESSAGING_TOPIC</code>	String	Allows you to dynamically change the topic to send messages to (producer). It also carries the topic on which a message was received (consumer).
Camellignite MessagingUUID	<code>IgniteConstants.IGNITE_MESSAGING_UUID</code>	UUID	This header is filled in with the UUID of the subscription when a message arrives (consumer).

CHAPTER 160. IGNITE QUEUES COMPONENT

Available as of Camel version 2.17

The Ignite Queue endpoint is one of camel-ignite endpoints which allows you to interact with [Ignite Queue data structures](#).

This endpoint only supports producers.

160.1. OPTIONS

The Ignite Queues component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (producer)	Sets the Ignite instance.		Ignite
configurationResource (producer)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (producer)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Queues endpoint is configured using URI syntax:

```
ignite-queue:name
```

with the following path and query parameters:

160.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required The queue name.		String

160.1.2. Query Parameters (7 parameters):

Name	Description	Default	Type
capacity (producer)	The queue capacity. Default: non-bounded.		int
configuration (producer)	The collection configuration. Default: empty configuration. You can also conveniently set inner properties by using configuration.xyz=123 options.		CollectionConfiguration
operation (producer)	The operation to invoke on the Ignite Queue. Superseded by the IgniteConstants.IGNITE_QUEUE_OPERATION header in the IN message. Possible values: CONTAINS, ADD, SIZE, REMOVE, ITERATOR, CLEAR, RETAIN_ALL, ARRAY, DRAIN, ELEMENT, PEEK, OFFER, POLL, TAKE, PUT.		IgniteQueueOperation
propagateIncomingBodyIfNoReturnValue (producer)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
timeoutMillis (producer)	The queue timeout in milliseconds. Default: no timeout.		Long
treatCollectionsAsCache Objects (producer)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

160.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.component.ignite-queue.configuration-resource	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a java.lang.Object type.		String

Name	Description	Default	Type
<code>camel.component.ignite-queue.enabled</code>	Enable ignite-queue component	true	Boolean
<code>camel.component.ignite-queue.ignite</code>	Sets the Ignite instance. The option is a <code>org.apache.ignite.Ignite</code> type.		String
<code>camel.component.ignite-queue.ignite-configuration</code>	Allows the user to set a programmatic IgniteConfiguration. The option is a <code>org.apache.ignite.configuration.IgniteConfiguration</code> type.		String
<code>camel.component.ignite-queue.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

160.2.1. Headers used

This endpoint uses the following headers:

Header name	Constant	Expected type	Description
<code>CamellgniteQueueOperation</code>	<code>IgniteConstants.IGNITE_QUEUE_OPERATION</code>	<code>IgniteQueueOperation</code> enum	Allows you to dynamically change the queue operation.
<code>CamellgniteQueueMaxElements</code>	<code>IgniteConstants.IGNITE_QUEUE_MAX_ELEMENTS</code>	Integer or int	When invoking the DRAIN operation, the amount of items to drain.
<code>CamellgniteQueueTransferredCount</code>	<code>IgniteConstants.IGNITE_QUEUE_TRANSFERRED_COUNT</code>	Integer or int	The amount of items transferred as the result of the DRAIN operation.

Header name	Constant	Expected type	Description
CamelIgniteQueueTimeoutMillis	IgniteConstants.IGNITE_QUEUE_TIMEOUT_MILLIS	Long or long	Dynamically sets the timeout in milliseconds to use when invoking the OFFER or POLL operations.

CHAPTER 161. IGNITE SETS COMPONENT

Available as of Camel version 2.17

The Ignite Sets endpoint is one of camel-ignite endpoints which allows you to interact with [Ignite Set data structures](#).

This endpoint only supports producers.

161.1. OPTIONS

The Ignite Sets component supports 4 options, which are listed below.

Name	Description	Default	Type
ignite (producer)	Sets the Ignite instance.		Ignite
configurationResource (producer)	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.		Object
igniteConfiguration (producer)	Allows the user to set a programmatic IgniteConfiguration.		IgniteConfiguration
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Ignite Sets endpoint is configured using URI syntax:

```
ignite-set:name
```

with the following path and query parameters:

161.1.1. Path Parameters (1 parameters):

Name	Description	Default	Type
name	Required The set name.		String

161.1.2. Query Parameters (5 parameters):

Name	Description	Default	Type
configuration (producer)	The collection configuration. Default: empty configuration. You can also conveniently set inner properties by using configuration.xyz=123 options.		CollectionConfiguration
operation (producer)	The operation to invoke on the Ignite Set. Superseded by the IgniteConstants.IGNITE_SETS_OPERATION header in the IN message. Possible values: CONTAINS, ADD, SIZE, REMOVE, ITERATOR, CLEAR, RETAIN_ALL, ARRAY. The set operation to perform.		IgniteSetOperation
propagateIncomingBodyIfNoReturnValue (producer)	Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.	true	boolean
treatCollectionsAsCache Objects (producer)	Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.	false	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

161.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

Name	Description	Default	Type
camel.component.ignite-set.configuration-resource	Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream. The option is a java.lang.Object type.		String
camel.component.ignite-set.enabled	Enable ignite-set component	true	Boolean
camel.component.ignite-set.ignite	Sets the Ignite instance. The option is a org.apache.ignite.ignite type.		String

Name	Description	Default	Type
<code>camel.component.ignite-set.ignite-configuration</code>	Allows the user to set a programmatic IgniteConfiguration. The option is a <code>org.apache.ignite.configuration.IgniteConfiguration</code> type.		String
<code>camel.component.ignite-set.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

161.2.1. Headers used

This endpoint uses the following headers:

Header name	Constant	Expected type	Description
Camellgnite SetsOperation	<code>IgniteConstants.IGNITE_SETS_OPERATION</code>	<code>IgniteSetOperation</code> enum	Allows you to dynamically change the set operation.

CHAPTER 162. INFINISPAN COMPONENT

Available as of Camel version 2.13

This component allows you to interact with [Infinispan](#) distributed data grid / cache. Infinispan is an extremely scalable, highly available key/value data store and data grid platform written in Java.

From **Camel 2.17** onwards Infinispan requires Java 8.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-infinispan</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

162.1. URI FORMAT

```
infinispan://cacheName?[options]
```

162.2. URI OPTIONS

The producer allows sending messages to a local infinispan cache configured in the registry, or to a remote cache using the HotRod protocol. The consumer allows listening for events from local infinispan cache accessible from the registry.

The Infinispan component supports 3 options, which are listed below.

Name	Description	Default	Type
configuration (common)	The default configuration shared among endpoints.		InfinispanConfiguration
cacheContainer (common)	The default cache container.		BasicCacheContainer
resolvePropertyPlaceholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Infinispan endpoint is configured using URI syntax:

```
infinispan:cacheName
```

with the following path and query parameters:

162.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The cache to use		String

162.2.2. Query Parameters (18 parameters):

Name	Description	Default	Type
hosts (common)	Specifies the host of the cache on Infinispan instance		String
queryBuilder (common)	Specifies the query builder.		InfinispanQueryBuilder
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
clusteredListener (consumer)	If true, the listener will be installed for the entire cluster	false	boolean
command (consumer)	Deprecated The operation to perform.	PUT	String
customListener (consumer)	Returns the custom listener in use, if provided		InfinispanCustomListener

Name	Description	Default	Type
eventTypes (consumer)	Specifies the set of event types to register by the consumer. Multiple event can be separated by comma. The possible event types are: CACHE_ENTRY_ACTIVATED, CACHE_ENTRY_PASSIVATED, CACHE_ENTRY_VISITED, CACHE_ENTRY_LOADED, CACHE_ENTRY_EVICTED, CACHE_ENTRY_CREATED, CACHE_ENTRY_REMOVED, CACHE_ENTRY_MODIFIED, TRANSACTION_COMPLETED, TRANSACTION_REGISTERED, CACHE_ENTRY_INVALIDATED, DATA_REHASHED, TOPOLOGY_CHANGED, PARTITION_STATUS_CHANGED		String
sync (consumer)	If true, the consumer will receive notifications synchronously	true	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
operation (producer)	The operation to perform.	PUT	InfinispanOperation
cacheContainer (advanced)	Specifies the cache Container to connect		BasicCacheContainer
cacheContainerConfiguration (advanced)	The CacheContainer configuration. Uses if the cacheContainer is not defined. Must be the following types: org.infinispan.client.hotrod.configuration.Configuration - for remote cache interaction configuration; org.infinispan.configuration.cache.Configuration - for embedded cache interaction configuration;		Object
configurationProperties (advanced)	Implementation specific properties for the CacheManager		Map

Name	Description	Default	Type
configurationUri (advanced)	An implementation specific URI for the CacheManager		String
flags (advanced)	A comma separated list of Flag to be applied by default on each cache invocation, not applicable to remote caches.		String
resultHeader (advanced)	Store the operation result in a header instead of the message body. By default, resultHeader == null and the query result is stored in the message body, any existing content in the message body is discarded. If resultHeader is set, the value is used as the name of the header to store the query result and the original message body is preserved. This value can be overridden by an in message header named: CamelInfinispanOperationResultHeader		Object
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

162.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 21 options, which are listed below.

Name	Description	Default	Type
camel.component.infinispan.cache-container	The default cache container. The option is a org.infinispan.commons.api.BasicCacheContainer type.		String
camel.component.infinispan.configuration.cache-container	Specifies the cache Container to connect		BasicCacheContainer
camel.component.infinispan.configuration.cache-container-configuration	The CacheContainer configuration. Uses if the cacheContainer is not defined. Must be the following types: org.infinispan.client.hotrod.configuration.Configuration - for remote cache interaction configuration; org.infinispan.configuration.cache.Configuration - for embedded cache interaction configuration;		Object

Name	Description	Default	Type
<code>camel.component.infinispan.configuration.clustered-listener</code>	If true, the listener will be installed for the entire cluster	false	Boolean
<code>camel.component.infinispan.configuration.configuration-properties</code>	Implementation specific properties for the CacheManager		Map
<code>camel.component.infinispan.configuration.configuration-uri</code>	An implementation specific URI for the CacheManager		String
<code>camel.component.infinispan.configuration.custom-listener</code>	Returns the custom listener in use, if provided		InfinispanCustom Listener
<code>camel.component.infinispan.configuration.event-types</code>	Specifies the set of event types to register by the consumer. Multiple event can be separated by comma. The possible event types are: CACHE_ENTRY_ACTIVATED, CACHE_ENTRY_PASSIVATED, CACHE_ENTRY_VISITED, CACHE_ENTRY_LOADED, CACHE_ENTRY_EVICTED, CACHE_ENTRY_CREATED, CACHE_ENTRY_REMOVED, CACHE_ENTRY_MODIFIED, TRANSACTION_COMPLETED, TRANSACTION_REGISTERED, CACHE_ENTRY_INVALIDATED, DATA_REHASHED, TOPOLOGY_CHANGED, PARTITION_STATUS_CHANGED		Set
<code>camel.component.infinispan.configuration.flags</code>	A comma separated list of Flag to be applied by default on each cache invocation, not applicable to remote caches.		Flag[]
<code>camel.component.infinispan.configuration.hosts</code>	Specifies the host of the cache on Infinispan instance		String
<code>camel.component.infinispan.configuration.operation</code>	The operation to perform.		InfinispanOperation

Name	Description	Default	Type
<code>camel.component.infinispan.configuration.query-builder</code>	Specifies the query builder.		InfinispanQueryBuilder
<code>camel.component.infinispan.configuration.result-header</code>	Store the operation result in a header instead of the message body. By default, <code>resultHeader == null</code> and the query result is stored in the message body, any existing content in the message body is discarded. If <code>resultHeader</code> is set, the value is used as the name of the header to store the query result and the original message body is preserved. This value can be overridden by an in message header named: <code>CamelInfinispanOperationResultHeader</code>		Object
<code>camel.component.infinispan.configuration.sync</code>	If true, the consumer will receive notifications synchronously	true	Boolean
<code>camel.component.infinispan.customizer.embedded-cache-manager.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.infinispan.customizer.embedded-cache-manager.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.infinispan.customizer.remote-cache-manager.enabled</code>	Enable or disable the cache-manager customizer.	true	Boolean
<code>camel.component.infinispan.customizer.remote-cache-manager.override</code>	Configure if the cache manager eventually set on the component should be overridden by the customizer.	false	Boolean
<code>camel.component.infinispan.enabled</code>	Enable infinispan component	true	Boolean

Name	Description	Default	Type
<code>camel.component.infinispan.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.infinispan.configuration.command</code>	The operation to perform.	PUT	String

162.4. MESSAGE HEADERS

Name	Default Value	Type	Context	Description
<code>CamellnfinispanCacheName</code>	null	String	Shared	The cache participating in the operation or event.
<code>CamellnfinispanOperation</code>	PUT	InfinispanOperation	Producer	The operation to perform.
<code>CamellnfinispanMap</code>	null	Map	Producer	A Map to use in case of <code>CamellInfinispanOperationPutAll</code> operation
<code>CamellnfinispanKey</code>	null	Object	Shared	The key to perform the operation to or the key generating the event.
<code>CamellnfinispanValue</code>	null	Object	Producer	The value to use for the operation.
<code>CamellnfinispanEventType</code>	null	String	Consumer	The type of the received event. Possible values defined here <code>org.infinispan.notifications.cachelistener.event.Event.Type</code>
<code>CamellnfinispanIsPre</code>	null	Boolean	Consumer	Infinispan fires two events for each operation: one before and one after the operation.

Name	Default Value	Type	Context	Description
CamelInfinispanLifespanTime	null	long	Producer	The Lifespan time of a value inside the cache. Negative values are interpreted as infinity.
CamelInfinispanTimeUnit	null	String	Producer	The Time Unit of an entry Lifespan Time.
CamelInfinispanMaxIdleTime	null	long	Producer	The maximum amount of time an entry is allowed to be idle for before it is considered as expired.
CamelInfinispanMaxIdleTimeUnit	null	String	Producer	The Time Unit of an entry Max Idle Time.
CamelInfinispanQueryBuilder	null	InfinispanQueryBuilder	Producer	From Camel 2.17: The QueryBuilder to use for QUERY command, if not present the command defaults to InfinispanConfiguration's one
CamelInfinispanIgnoreReturnValues	null	Boolean	Producer	From Camel 2.17: If this header is set, the return value for cache operation returning something is ignored by the client application
CamelInfinispanOperationResultHeader	null	String	Producer	From Camel 2.20: Store the operation result in a header instead of the message body

162.5. EXAMPLES

- Retrieve a specific key from the default cache using a custom cache container:

```

from("direct:start")
  .setHeader(InfinispanConstants.OPERATION).constant(InfinispanOperation.GET)
  .setHeader(InfinispanConstants.KEY).constant("123")
  .to("infinispan?cacheContainer=#cacheContainer");

```

- Retrieve a specific key from a named cache:

```

from("direct:start")
  .setHeader(InfinispanConstants.OPERATION).constant(InfinispanOperation.PUT)
  .setHeader(InfinispanConstants.KEY).constant("123")
  .to("infinispan:myCacheName");

```

- Put a value with lifespan

```

from("direct:start")
  .setHeader(InfinispanConstants.OPERATION).constant(InfinispanOperation.GET)
  .setHeader(InfinispanConstants.KEY).constant("123")
  .setHeader(InfinispanConstants.LIFESPAN_TIME).constant(100L)

  .setHeader(InfinispanConstants.LIFESPAN_TIME_UNIT).constant(TimeUnit.MILLISECONDS.toString())
  .to("infinispan:myCacheName");

```

- Retrieve a specific key from the remote cache using a cache container configuration with additional parameters (host, port and protocol version):

```

org.infinispan.client.hotrod.configuration.Configuration cacheContainerConfiguration = new
org.infinispan.client.hotrod.configuration.ConfigurationBuilder()
  .addServer()
    .host("localhost")
    .port(9999)
    .version(org.infinispan.client.hotrod.ProtocolVersion.PROTOCOL_VERSION_25)
  .build();
...

from("direct:start")
  .setHeader(InfinispanConstants.OPERATION).constant(InfinispanOperation.GET)
  .setHeader(InfinispanConstants.KEY).constant("123")
  .to("infinispan?cacheContainerConfiguration=#cacheContainerConfiguration");

```

162.6. USING THE INFINISPAN BASED IDEMPOTENT REPOSITORY

In this section we will use the Infinispan based idempotent repository.

First, we need to create a cacheManager and then configure our

```
org.apache.camel.component.infinispan.processor.idempotent.InfinispanIdempotentRepository:
```

```

<!-- set up the cache manager -->
<bean id="cacheManager"
  class="org.infinispan.manager.DefaultCacheManager"
  init-method="start"
  destroy-method="stop"/>

```

```
<!-- set up the repository -->
<bean id="infinispanRepo"

class="org.apache.camel.component.infinispan.processor.idempotent.InfinispanIdempotentRepository"

    factory-method="infinispanIdempotentRepository">
    <argument ref="cacheManager"/>
    <argument value="idempotent"/>
</bean>
```

Then we can create our Infinispan idempotent repository in the spring XML file as well:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route id="JpaMessageIdRepositoryTest">
    <from uri="direct:start" />
    <idempotentConsumer messageIdRepositoryRef="infinispanStore">
      <header>messageId</header>
      <to uri="mock:result" />
    </idempotentConsumer>
  </route>
</camelContext>
```

162.7. USING THE INFINISPAN BASED ROUTE POLICY

162.8. SEE ALSO

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 163. INFLUXDB COMPONENT

Available as of Camel version 2.18

This component allows you to interact with InfluxDB <https://influxdata.com/time-series-platform/influxdb/> a time series database. The native body type for this component is Point (the native influxdb class), but it can also accept Map<String, Object> as message body and it will get converted to Point.class, please note that the map must contain an element with InfluxDbConstants.MEASUREMENT_NAME as key.

Additionally of course you may register your own Converters to your data type to Point, or use the (un)marshalling tools provided by camel.

From **Camel 2.18** onwards Influxdb requires Java 8.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-influxdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

163.1. URI FORMAT

```
influxdb://beanName?[options]
```

163.2. URI OPTIONS

The producer allows sending messages to a influxdb configured in the registry, using the native java driver.

The InfluxDB component has no options.

The InfluxDB endpoint is configured using URI syntax:

```
influxdb:connectionBean
```

with the following path and query parameters:

163.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
connectionBean	Required Connection to the influx database, of class InfluxDB.class	t	String

163.2.2. Query Parameters (6 parameters):

Name	Description	Default	Type
batch (producer)	Define if this operation is a batch operation or not	false	boolean
databaseName (producer)	The name of the database where the time series will be stored		String
operation (producer)	Define if this operation is an insert or a query	insert	String
query (producer)	Define the query in case of operation query		String
retentionPolicy (producer)	The string that defines the retention policy to the data created by the endpoint	default	String
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

163.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.influxdb.enabled	Enable influxdb component	true	Boolean
camel.component.influxdb.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

163.4. MESSAGE HEADERS

Name	Default Value	Type	Context	Description

163.5. EXAMPLE

Below is an example route that stores a point into the db (taking the db name from the URI) specific key:

```
from("direct:start")
    .setHeader(InfluxDbConstants.DBNAME_HEADER, constant("myTimeSeriesDB"))
    .to("influxdb://connectionBean);
```

```
from("direct:start")
    .to("influxdb://connectionBean?databaseName=myTimeSeriesDB");
```

For more information, see these resources...

163.6. SEE ALSO

- [Getting Started](#)

CHAPTER 164. IPFS COMPONENT

Available as of Camel version 2.23

The **ipfs:** component provides access to the Interplanetary File System ([IPFS](#)).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ipfs</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

164.1. URI FORMAT

```
ipfs://cmd?options
```

164.2. OPTIONS

The IPFS component has no options.

The IPFS endpoint is configured using URI syntax:

```
ipfs:host:port/cmd
```

with the following path and query parameters:

164.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
ipfsCmd	The ipfs command		String

164.2.2. Query Parameters (2 parameters):

Name	Description	Default	Type
outdir (producer)	The ipfs output directory		Path
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

164.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.ipfs.enabled</code>	Whether to enable auto configuration of the ipfs component. This is enabled by default.		Boolean
<code>camel.component.ipfs.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

164.4. KARAF SUPPORT

Actually this component is not supported in Karaf

164.5. MESSAGE HEADERS

<TODO><title>Samples</title>

In this sample we add a file to IPFS, get a file from IPFS and finally access the content of an IPFS file.

```
from("direct:start").to("ipfs:add")
from("direct:start").to("ipfs:get?outdir=target")
from("direct:start").to("ipfs:cat");
```

</TODO>

CHAPTER 165. IRC COMPONENT

Available as of Camel version 1.1

The `irc` component implements an [IRC](#) (Internet Relay Chat) transport.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-irc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

165.1. URI FORMAT

```
irc:nick@host[:port]/#room[?options]
irc:nick@host[:port]?channels=#channel1,#channel2,#channel3[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

165.2. OPTIONS

The IRC component supports 2 options, which are listed below.

Name	Description	Default	Type
useGlobalSslContext Parameters (security)	Enable usage of global SSL context parameters.	false	boolean
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The IRC endpoint is configured using URI syntax:

```
irc:hostname:port
```

with the following path and query parameters:

165.2.1. Path Parameters (2 parameters):

Name	Description	Default	Type
hostname	Required Hostname for the IRC chat server		String
port	Port number for the IRC chat server. If no port is configured then a default port of either 6667, 6668 or 6669 is used.		int

165.2.2. Query Parameters (25 parameters):

Name	Description	Default	Type
autoRejoin (common)	Whether to auto re-join when being kicked	true	boolean
commandTimeout (common)	Delay in milliseconds before sending commands after the connection is established.	5000	long
namesOnJoin (common)	Sends NAMES command to channel after joining it. onReply has to be true in order to process the result which will have the header value irc.num = '353'.	false	boolean
nickname (common)	The nickname used in chat.		String
persistent (common)	Deprecated Use persistent messages.	true	boolean
realname (common)	The IRC user's actual name.		String
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		ExceptionHandler

Name	Description	Default	Type
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		ExchangePattern
colors (advanced)	Whether or not the server supports color codes.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
onJoin (filter)	Handle user join events.	true	boolean
onKick (filter)	Handle kick events.	true	boolean
onMode (filter)	Handle mode change events.	true	boolean
onNick (filter)	Handle nickname change events.	true	boolean
onPart (filter)	Handle user part events.	true	boolean
onPrivmsg (filter)	Handle private message events.	true	boolean
onQuit (filter)	Handle user quit events.	true	boolean
onReply (filter)	Whether or not to handle general responses to commands or informational messages.	false	boolean
onTopic (filter)	Handle topic change events.	true	boolean
nickPassword (security)	Your IRC server nickname password.		String
password (security)	The IRC server password.		String
sslContextParameters (security)	Used for configuring security using SSL. Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. This reference overrides any configured <code>SSLContextParameters</code> at the component level. Note that this setting overrides the <code>trustManager</code> option.		SSLContextParameters
trustManager (security)	The trust manager used to verify the SSL server's certificate.		SSLTrustManager

Name	Description	Default	Type
<code>username</code> (security)	The IRC server user name.		String

165.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.irc.enabled</code>	Enable irc component	true	Boolean
<code>camel.component.irc.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.irc.use-global-ssl-context-parameters</code>	Enable usage of global SSL context parameters.	false	Boolean

165.4. SSL SUPPORT

165.4.1. Using the JSSE Configuration Utility

As of Camel 2.9, the IRC component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the IRC component.

Programmatic configuration of the endpoint

```

KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/truststore.jks");
ksp.setPassword("keystorePassword");

TrustManagersParameters tmp = new TrustManagersParameters();
tmp.setKeyStore(ksp);

SSLContextParameters scp = new SSLContextParameters();
scp.setTrustManagers(tmp);

Registry registry = ...
registry.bind("sslContextParameters", scp);

```

```

...
from(...)
  .to("ircs://camel-prd-user@server:6669/#camel-test?nickname=camel-
prd&password=password&sslContextParameters=#sslContextParameters");

```

Spring DSL based configuration of endpoint

```

...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:trustManagers>
  <camel:keyStore
    resource="/users/home/server/truststore.jks"
    password="keystorePassword"/>
  </camel:keyManagers>
</camel:sslContextParameters>...
...
<to uri="ircs://camel-prd-user@server:6669/#camel-test?nickname=camel-
prd&password=password&sslContextParameters=#sslContextParameters"/>...

```

165.4.2. Using the legacy basic configuration options

You can also connect to an SSL enabled IRC server, as follows:

```
ircs:host[:port]/#room?username=user&password=pass
```

By default, the IRC transport uses [SSLDefaultTrustManager](#). If you need to provide your own custom trust manager, use the **trustManager** parameter as follows:

```
ircs:host[:port]/#room?
username=user&password=pass&trustManager=#referenceToMyTrustManagerBean
```

165.5. USING KEYS

Available as of Camel 2.2

Some irc rooms requires you to provide a key to be able to join that channel. The key is just a secret word.

For example we join 3 channels where as only channel 1 and 3 uses a key.

```
irc:nick@irc.server.org?channels=#chan1,#chan2,#chan3&keys=chan1Key,,chan3key
```

165.6. GETTING A LIST OF USERS OF THE CHANNEL

Using the **namesOnJoin** option one can invoke the IRC- **NAMES** command after the component has joined a channel. The server will reply with **irc.num = 353**. So in order to process the result the property **onReply** has to be **true**. Furthermore one has to filter the **onReply** exchanges in order to get the names.

For example we want to get all exchanges that contain the usernames of the channel:

```
from("ircs:nick@myserver:1234/#mychannelname?namesOnJoin=true&onReply=true")
    .choice()
    .when(header("irc.messageType").isEqualToIgnoreCase("REPLY"))
    .filter(header("irc.num").isEqualTo("353"))
    .to("mock:result").stop();
```

165.7. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 166. JACKSONXML DATAFORMAT

Available as of Camel version 2.16

Jackson XML is a Data Format which uses the [Jackson library](#) with the [XMLMapper extension](#) to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

INFO:If you are familiar with Jackson, this XML data format behaves in the same way as its JSON counterpart, and thus can be used with classes annotated for JSON serialization/deserialization.

This extension also mimics [JAXB's "Code first" approach](#).

This data format relies on [Woodstox](#) (especially for features like pretty printing), a fast and efficient XML processor.

```
from("activemq:My.Queue").
  unmarshal().jacksonxml().
  to("mqseries:Another.Queue");
```

166.1. JACKSONXML OPTIONS

The JacksonXML dataformat supports 15 options, which are listed below.

Name	Default	Java Type	Description
xmlMapper		String	Lookup and use the existing XmlMapper with the given id.
prettyPrint	false	Boolean	To enable pretty printing output nicely formatted. Is by default false.
unmarshalTypeName		String	Class name of the java type to use when unmarshalling
jsonView		Class	When marshalling a POJO to JSON you might want to exclude certain fields from the JSON output. With Jackson you can use JSON views to accomplish this. This option is to refer to the class which has JsonView annotations
include		String	If you want to marshal a pojo to JSON, and the pojo has some fields with null values. And you want to skip these null values, you can set this option to NON_NULL
allowJmsType	false	Boolean	Used for JMS users to allow the JMSType header from the JMS spec to specify a FQN classname to use to unmarshal to.
collectionTypeName		String	Refers to a custom collection type to lookup in the registry to use. This option should rarely be used, but allows to use different collection types than java.util.Collection based as default.

Name	Default	Java Type	Description
<code>useList</code>	false	Boolean	To unarmshal to a List of Map or a List of Pojo.
<code>enableJaxbAnnotationModule</code>	false	Boolean	Whether to enable the JAXB annotations module when using jackson. When enabled then JAXB annotations can be used by Jackson.
<code>moduleClassNames</code>		String	To use custom Jackson modules com.fasterxml.jackson.databind.Module specified as a String with FQN class names. Multiple classes can be separated by comma.
<code>moduleRefs</code>		String	To use custom Jackson modules referred from the Camel registry. Multiple modules can be separated by comma.
<code>enableFeatures</code>		String	Set of features to enable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature Multiple features can be separated by comma
<code>disableFeatures</code>		String	Set of features to disable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature Multiple features can be separated by comma
<code>allowUnmarshalType</code>	false	Boolean	If enabled then Jackson is allowed to attempt to use the CamelJacksonUnmarshalType header during the unmarshalling. This should only be enabled when desired to be used.
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.

166.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

Name	Description	Default	Type
<code>camel.dataformat.jacksonxml.allow-jms-type</code>	Used for JMS users to allow the JMSType header from the JMS spec to specify a FQN classname to use to unmarshal to.	false	Boolean
<code>camel.dataformat.jacksonxml.allow-unmarshall-type</code>	If enabled then Jackson is allowed to attempt to use the CamelJacksonUnmarshalType header during the unmarshalling. This should only be enabled when desired to be used.	false	Boolean
<code>camel.dataformat.jacksonxml.collection-type-name</code>	Refers to a custom collection type to lookup in the registry to use. This option should rarely be used, but allows to use different collection types than java.util.Collection based as default.		String
<code>camel.dataformat.jacksonxml.content-type-header</code>	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
<code>camel.dataformat.jacksonxml.disable-features</code>	Set of features to disable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature Multiple features can be separated by comma		String
<code>camel.dataformat.jacksonxml.enable-features</code>	Set of features to enable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature Multiple features can be separated by comma		String
<code>camel.dataformat.jacksonxml.enable-jaxb-annotation-module</code>	Whether to enable the JAXB annotations module when using jackson. When enabled then JAXB annotations can be used by Jackson.	false	Boolean
<code>camel.dataformat.jacksonxml.enabled</code>	Enable jacksonxml dataformat	true	Boolean

Name	Description	Default	Type
<code>camel.dataformat.jacksonxml.include</code>	If you want to marshal a pojo to JSON, and the pojo has some fields with null values. And you want to skip these null values, you can set this option to <code>NON_NULL</code>		String
<code>camel.dataformat.jacksonxml.json-view</code>	When marshalling a POJO to JSON you might want to exclude certain fields from the JSON output. With Jackson you can use JSON views to accomplish this. This option is to refer to the class which has <code>JsonView</code> annotations		Class
<code>camel.dataformat.jacksonxml.module-class-names</code>	To use custom Jackson modules <code>com.fasterxml.jackson.databind.Module</code> specified as a String with FQN class names. Multiple classes can be separated by comma.		String
<code>camel.dataformat.jacksonxml.module-refs</code>	To use custom Jackson modules referred from the Camel registry. Multiple modules can be separated by comma.		String
<code>camel.dataformat.jacksonxml.pretty-print</code>	To enable pretty printing output nicely formatted. Is by default false.	false	Boolean
<code>camel.dataformat.jacksonxml.unmarshal-type-name</code>	Class name of the java type to use when unmarshalling		String
<code>camel.dataformat.jacksonxml.use-list</code>	To unmarshal to a List of Map or a List of Pojo.	false	Boolean
<code>camel.dataformat.jacksonxml.xml-mapper</code>	Lookup and use the existing XmlMapper with the given id.		String

ND

166.2.1. Using Jackson XML in Spring DSL

When using Data Format in Spring DSL you need to declare the data formats first. This is done in the `DataFormats` XML tag.

```
<dataFormats>
  <!-- here we define a Xml data format with the id jack and that it should use the TestPojo as
  the class type when
```

```

    doing unmarshal. The unmarshalTypeName is optional, if not provided Camel will use a
    Map as the type -->
    <jacksonxml id="jack"
unmarshalTypeName="org.apache.camel.component.jacksonxml.TestPojo"/>
    </dataFormats>

```

And then you can refer to this id in the route:

```

<route>
  <from uri="direct:back"/>
  <unmarshal ref="jack"/>
  <to uri="mock:reverse"/>
</route>

```

166.3. EXCLUDING POJO FIELDS FROM MARSHALLING

When marshalling a POJO to XML you might want to exclude certain fields from the XML output. With Jackson you can use [JSON views](#) to accomplish this. First create one or more marker classes.

Use the marker classes with the `@JsonView` annotation to include/exclude certain fields. The annotation also works on getters.

Finally use the Camel **JacksonXMLDataFormat** to marshal the above POJO to XML.

Note that the weight field is missing in the resulting XML:

```
<pojo age="30" weight="70"/>
```

166.4. INCLUDE/EXCLUDE FIELDS USING THE JSONVIEW ATTRIBUTE WITH `JACKSONXML` DATAFORMAT

As an example of using this attribute you can instead of:

```

JacksonXMLDataFormat ageViewFormat = new JacksonXMLDataFormat(TestPojoView.class,
Views.Age.class);
from("direct:inPojoAgeView").
  marshal(ageViewFormat);

```

Directly specify your [JSON view](#) inside the Java DSL as:

```

from("direct:inPojoAgeView").
  marshal().jacksonxml(TestPojoView.class, Views.Age.class);

```

And the same in XML DSL:

```

<from uri="direct:inPojoAgeView"/>
  <marshal>
    <jacksonxml unmarshalTypeName="org.apache.camel.component.jacksonxml.TestPojoView"
jsonView="org.apache.camel.component.jacksonxml.Views$Age"/>
  </marshal>

```

166.5. SETTING SERIALIZATION INCLUDE OPTION

If you want to marshal a pojo to XML, and the pojo has some fields with null values. And you want to skip these null values, then you need to set either an annotation on the pojo,

```
@JsonInclude(Include.NON_NULL)
public class MyPojo {
    ...
}
```

But this requires you to include that annotation in your pojo source code. You can also configure the Camel JacksonXMLDataFormat to set the include option, as shown below:

```
JacksonXMLDataFormat format = new JacksonXMLDataFormat();
format.setInclude("NON_NULL");
```

Or from XML DSL you configure this as

```
<dataFormats>
  <jacksonxml id="jacksonxml" include="NON_NULL"/>
</dataFormats>
```

166.6. UNMARSHALLING FROM XML TO POJO WITH DYNAMIC CLASS NAME

If you use jackson to unmarshal XML to POJO, then you can now specify a header in the message that indicate which class name to unmarshal to.

The header has key **CamelJacksonUnmarshalType** if that header is present in the message, then Jackson will use that as FQN for the POJO class to unmarshal the XML payload as.

For JMS end users there is the JMSType header from the JMS spec that indicates that also. To enable support for JMSType you would need to turn that on, on the jackson data format as shown:

```
JacksonDataFormat format = new JacksonDataFormat();
format.setAllowJmsType(true);
```

Or from XML DSL you configure this as

```
<dataFormats>
  <jacksonxml id="jacksonxml" allowJmsType="true"/>
</dataFormats>
```

166.7. UNMARSHALLING FROM XML TO LIST<MAP> OR LIST<POJO>

If you are using Jackson to unmarshal XML to a list of map/pojo, you can now specify this by setting **useList="true"** or use

the **org.apache.camel.component.jacksonxml.ListJacksonXMLDataFormat**. For example with Java you can do as shown below:

```
JacksonXMLDataFormat format = new ListJacksonXMLDataFormat();
// or
JacksonXMLDataFormat format = new JacksonXMLDataFormat();
```

```
format.useList();
// and you can specify the pojo class type also
format.setUnmarshalType(MyPojo.class);
```

And if you use XML DSL then you configure to use list using **useList** attribute as shown below:

```
<dataFormats>
  <jacksonxml id="jack" useList="true"/>
</dataFormats>
```

And you can specify the pojo type also

```
<dataFormats>
  <jacksonxml id="jack" useList="true" unmarshalTypeName="com.foo.MyPojo"/>
</dataFormats>
```

166.8. USING CUSTOM JACKSON MODULES

You can use custom Jackson modules by specifying the class names of those using the `moduleClassNames` option as shown below.

```
<dataFormats>
  <jacksonxml id="jack" useList="true" unmarshalTypeName="com.foo.MyPojo"
  moduleClassNames="com.foo.MyModule,com.foo.MyOtherModule"/>
</dataFormats>
```

When using `moduleClassNames` then the custom jackson modules are not configured, by created using default constructor and used as-is. If a custom module needs any custom configuration, then an instance of the module can be created and configured, and then use `modulesRefs` to refer to the module as shown below:

```
<bean id="myJacksonModule" class="com.foo.MyModule">
  ... // configure the module as you want
</bean>

<dataFormats>
  <jacksonxml id="jacksonxml" useList="true" unmarshalTypeName="com.foo.MyPojo"
  moduleRefs="myJacksonModule"/>
</dataFormats>
```

Multiple modules can be specified separated by comma, such as `moduleRefs="myJacksonModule,myOtherModule"`

166.9. ENABLING OR DISABLE FEATURES USING JACKSON

Jackson has a number of features you can enable or disable, which its `ObjectMapper` uses. For example to disable failing on unknown properties when marshalling, you can configure this using the `disableFeatures`:

```
<dataFormats>
  <jacksonxml id="jacksonxml" unmarshalTypeName="com.foo.MyPojo"
  disableFeatures="FAIL_ON_UNKNOWN_PROPERTIES"/>
</dataFormats>
```

You can disable multiple features by separating the values using comma. The values for the features must be the name of the enums from Jackson from the following enum classes

- `com.fasterxml.jackson.databind.SerializationFeature`
- `com.fasterxml.jackson.databind.DeserializationFeature`
- `com.fasterxml.jackson.databind.MapperFeature`

To enable a feature use the `enableFeatures` options instead.

From Java code you can use the type safe methods from `camel-jackson` module:

```
JacksonDataFormat df = new JacksonDataFormat(MyPojo.class);
df.disableFeature(DeserializationFeature.FAIL_ON_UNKNOWN_PROPERTIES);
df.disableFeature(DeserializationFeature.FAIL_ON_NULL_FOR_PRIMITIVES);
```

166.10. CONVERTING MAPS TO POJO USING JACKSON

Jackson **ObjectMapper** can be used to convert maps to POJO objects. Jackson component comes with the data converter that can be used to convert `java.util.Map` instance to non-String, non-primitive and non-Number objects.

```
Map<String, Object> invoiceData = new HashMap<String, Object>();
invoiceData.put("netValue", 500);
producerTemplate.sendBody("direct:mapToInvoice", invoiceData);
...
// Later in the processor
Invoice invoice = exchange.getIn().getBody(Invoice.class);
```

If there is a single **ObjectMapper** instance available in the Camel registry, it will be used by the converter to perform the conversion. Otherwise the default mapper will be used.

166.11. FORMATTED XML MARSHALLING (PRETTY-PRINTING)

Using the **prettyPrint** option one can output a well formatted XML while marshalling:

```
<dataFormats>
  <jacksonxml id="jack" prettyPrint="true"/>
</dataFormats>
```

And in Java DSL:

```
from("direct:inPretty").marshal().jacksonxml(true);
```

Please note that there are 5 different overloaded **jacksonxml()** DSL methods which support the **prettyPrint** option in combination with other settings for **unmarshalType**, **jsonView** etc.

166.12. DEPENDENCIES

To use Jackson XML in your camel routes you need to add the dependency on `camel-jacksonxml` which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-jacksonxml</artifactId>  
  <version>x.x.x</version>  
  <!-- use the same version as your Camel core version -->  
</dependency>
```

CHAPTER 167. JASYPT COMPONENT

Available as of Camel 2.5

Jasypt is a simplified encryption library which makes encryption and decryption easy. Camel integrates with Jasypt to allow sensitive information in [Properties](#) files to be encrypted. By dropping **camel-jasypt** on the classpath those encrypted values will automatically be decrypted on-the-fly by Camel. This ensures that human eyes can't easily spot sensitive information such as usernames and passwords.

If you are using Maven, you need to add the following dependency to your **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jasypt</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

If you are using an Apache Karaf container, you need to add the following dependency to your **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.karaf.jaas</groupId>
  <artifactId>org.apache.karaf.jaas.jasypt</artifactId>
  <version>x.x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

167.1. TOOLING

The Jasypt component provides a little command line tooling to encrypt or decrypt values.

The console output the syntax and which options it provides:

Apache Camel Jasypt takes the following options

- h or -help = Displays the help screen
- c or -command <command> = Command either encrypt or decrypt
- p or -password <password> = Password to use
- i or -input <input> = Text to encrypt or decrypt
- a or -algorithm <algorithm> = Optional algorithm to use

For example to encrypt the value **tiger** you run with the following parameters. In the apache camel kit, you cd into the lib folder and run the following java cmd, where <CAMEL_HOME> is where you have downloaded and extract the Camel distribution.

```
$ cd <CAMEL_HOME>/lib
$ java -jar camel-jasypt-2.5.0.jar -c encrypt -p secret -i tiger
```

Which outputs the following result

```
Encrypted text: qaEEacuW7BUti8LcMgyjKw==
```

This means the encrypted representation **qaEEacuW7BUti8LcMgyjKw==** can be decrypted back to **tiger** if you know the master password which was **secret**.

If you run the tool again then the encrypted value will return a different result. But decrypting the value will always return the correct original value.

So you can test it by running the tooling using the following parameters:

```
$ cd <CAMEL_HOME>/lib
$ java -jar camel-jasypt-2.5.0.jar -c decrypt -p secret -i qaEEacuW7BUti8LcMgyjKw==
```

Which outputs the following result:

```
Decrypted text: tiger
```

The idea is then to use those encrypted values in your [Properties](#) files. Notice how the password value is encrypted and the value has the tokens surrounding **ENC(value here)**

TIP

When running jasypt tooling, if you come across **java.lang.NoClassDefFoundError: org/jasypt/encryption/pbe/StandardPBEStrngEncryptor** this means you have to include jasypt7.8.jar in your classpath. Example of adding jar to classpath may be copying jasypt7.8.jar to `$JAVA_HOME\jre\lib\ext` if you are going to run as **java -jar ...**. The latter may be adding jasypt7.8.jar to classpath using **-cp**, in that case you should provide main class to execute as eg: **java -cp jasypt-1.9.2.jar:camel-jasypt-2.18.2.jar org.apache.camel.component.jasypt.Main -c encrypt -p secret -i tiger**

167.2. URI OPTIONS

The options below are exclusive for the Jasypt component.

Name	Default Value	Type	Description
password	null	String	Specifies the master password to use for decrypting. This option is mandatory. See below for more details.
algorithm	null	String	Name of an optional algorithm to use.

167.3. PROTECTING THE MASTER PASSWORD

The master password used by Jasypt must be provided, so that it's capable of decrypting the values. However having this master password out in the open may not be an ideal solution. Therefore you could for example provide it as a JVM system property or as a OS environment setting. If you decide to do so then the **password** option supports prefixes which dictates this. **sysenv:** means to lookup the OS system environment with the given key. **sys:** means to lookup a JVM system property.

For example you could provided the password before you start the application

```
$ export CAMEL_ENCRYPTION_PASSWORD=secret
```

Then start the application, such as running the start script.

When the application is up and running you can unset the environment

```
$ unset CAMEL_ENCRYPTION_PASSWORD
```

The **password** option is then a matter of defining as follows:
password=sysenv:CAMEL_ENCRYPTION_PASSWORD.

167.4. EXAMPLE WITH JAVA DSL

In Java DSL you need to configure Jasypt as a **JasyptPropertiesParser** instance and set it on the [Properties](#) component as show below:

The properties file **myproperties.properties** then contain the encrypted value, such as shown below. Notice how the password value is encrypted and the value has the tokens surrounding **ENC(value here)**

167.5. EXAMPLE WITH SPRING XML

In Spring XML you need to configure the **JasyptPropertiesParser** which is shown below. Then the Camel [Properties](#) component is told to use **jasypt** as the properties parser, which means Jasypt has its chance to decrypt values looked up in the properties.

```
<!-- define the jasypt properties parser with the given password to be used -->
<bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
  <property name="password" value="secret"/>
</bean>

<!-- define the camel properties component -->
<bean id="properties" class="org.apache.camel.component.properties.PropertiesComponent">
  <!-- the properties file is in the classpath -->
  <property name="location"
value="classpath:org/apache/camel/component/jasypt/myproperties.properties"/>
  <!-- and let it leverage the jasypt parser -->
  <property name="propertiesParser" ref="jasypt"/>
</bean>
```

The [Properties](#) component can also be inlined inside the **<camelContext>** tag which is shown below. Notice how we use the **propertiesParserRef** attribute to refer to Jasypt.

```
<!-- define the jasypt properties parser with the given password to be used -->
<bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
  <!-- password is mandatory, you can prefix it with sysenv: or sys: to indicate it should use
an OS environment or JVM system property value, so you dont have the master password
defined here -->
  <property name="password" value="secret"/>
</bean>

<camelContext xmlns="http://camel.apache.org/schema/spring">
  <!-- define the camel properties placeholder, and let it leverage jasypt -->
  <propertyPlaceholder id="properties"
    location="classpath:org/apache/camel/component/jasypt/myproperties.properties"
    propertiesParserRef="jasypt"/>
  <route>
```

```

    <from uri="direct:start"/>
    <to uri="{{cool.result}}"/>
  </route>
</camelContext>

```

167.6. EXAMPLE WITH BLUEPRINT XML

In Blueprint XML you need to configure the **JasyptPropertiesParser** which is shown below. Then the Camel **Properties** component is told to use **jasypt** as the properties parser, which means Jasypt has its chance to decrypt values looked up in the properties.

```

<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xsi:schemaLocation="
    http://www.osgi.org/xmlns/blueprint/v1.0.0
    http://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

  <cm:property-placeholder id="myblue" persistent-id="mypersistent">
    <!-- list some properties for this test -->
    <cm:default-properties>
      <cm:property name="cool.result" value="mock:{{cool.password}}"/>
      <cm:property name="cool.password" value="ENC(bsW9uV37gQ0QHFu7KO03Ww==)"/>
    </cm:default-properties>
  </cm:property-placeholder>

  <!-- define the jasypt properties parser with the given password to be used -->
  <bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
    <property name="password" value="secret"/>
  </bean>

  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <!-- define the camel properties placeholder, and let it leverage jasypt -->
    <propertyPlaceholder id="properties"
      location="blueprint:myblue"
      propertiesParserRef="jasypt"/>

    <route>
      <from uri="direct:start"/>
      <to uri="{{cool.result}}"/>
    </route>
  </camelContext>

</blueprint>

```

The **Properties** component can also be inlined inside the **<camelContext>** tag which is shown below. Notice how we use the **propertiesParserRef** attribute to refer to Jasypt.

```

<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xsi:schemaLocation="
    http://www.osgi.org/xmlns/blueprint/v1.0.0
    http://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

  <!-- define the jasypt properties parser with the given password to be used -->

```

```
<bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
  <property name="password" value="secret"/>
</bean>

<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <!-- define the camel properties placeholder, and let it leverage jasypt -->
  <propertyPlaceholder id="properties"
    location="classpath:org/apache/camel/component/jasypt/myproperties.properties"
    propertiesParserRef="jasypt"/>

  <route>
    <from uri="direct:start"/>
    <to uri="{{cool.result}}"/>
  </route>
</camelContext>

</blueprint>
```

- [Security](#)
- [Properties](#)
- [Encrypted passwords in ActiveMQ](#) - ActiveMQ has a similar feature as this **camel-jasypt** component

CHAPTER 168. JAXB DATAFORMAT

Available as of Camel version 1.0

JAXB is a Data Format which uses the JAXB2 XML marshalling standard which is included in Java 6 to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

168.1. OPTIONS

The JAXB dataformat supports 18 options, which are listed below.

Name	Default	Java Type	Description
contextPath		String	Package name where your JAXB classes are located.
schema		String	To validate against an existing schema. You can use the prefix classpath:, file: or http: to specify how the resource should be resolved. You can separate multiple schema files by using the ',' character.
schemaSeverityLevel	0	Integer	Sets the schema severity level to use when validating against a schema. This level determines the minimum severity error that triggers JAXB to stop continue parsing. The default value of 0 (warning) means that any error (warning, error or fatal error) will trigger JAXB to stop. There are the following three levels: 0=warning, 1=error, 2=fatal error.
prettyPrint	false	Boolean	To enable pretty printing output nicely formatted. Is by default false.
objectFactory	false	Boolean	Whether to allow using ObjectFactory classes to create the POJO classes during marshalling. This only applies to POJO classes that has not been annotated with JAXB and providing jaxb.index descriptor files.
ignoreJAXBElement	false	Boolean	Whether to ignore JAXBElement elements - only needed to be set to false in very special use-cases.
mustBeJAXBElement	false	Boolean	Whether marshalling must be java objects with JAXB annotations. And if not then it fails. This option can be set to false to relax that, such as when the data is already in XML format.
filterNonXmlChars	false	Boolean	To ignore non xml characters and replace them with an empty space.
encoding		String	To overrule and use a specific encoding

Name	Default	Java Type	Description
<code>fragment</code>	false	Boolean	To turn on marshalling XML fragment trees. By default JAXB looks for <code>XmlRootElement</code> annotation on given class to operate on whole XML tree. This is useful but not always - sometimes generated code does not have <code>XmlRootElement</code> annotation, sometimes you need unmarshall only part of tree. In that case you can use partial unmarshalling. To enable this behaviours you need set property <code>partClass</code> . Camel will pass this class to JAXB's unmarshaller.
<code>partClass</code>		String	Name of class used for fragment parsing. See more details at the <code>fragment</code> option.
<code>partNamespace</code>		String	XML namespace to use for fragment parsing. See more details at the <code>fragment</code> option.
<code>namespacePrefix Ref</code>		String	When marshalling using JAXB or SOAP then the JAXB implementation will automatic assign namespace prefixes, such as <code>ns2</code> , <code>ns3</code> , <code>ns4</code> etc. To control this mapping, Camel allows you to refer to a map which contains the desired mapping.
<code>xmlStreamWriter Wrapper</code>		String	To use a custom xml stream writer.
<code>schemaLocation</code>		String	To define the location of the schema
<code>noNamespaceSchemaLocation</code>		String	To define the location of the namespaceless schema
<code>jaxbProviderProperties</code>		String	Refers to a custom <code>java.util.Map</code> to lookup in the registry containing custom JAXB provider properties to be used with the JAXB marshaller.
<code>contentTypeHeader</code>	false	Boolean	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc.

168.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 19 options, which are listed below.

Name	Description	Default	Type
camel.dataformat.jaxb.content-type-header	Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.	false	Boolean
camel.dataformat.jaxb.context-path	Package name where your JAXB classes are located.		String
camel.dataformat.jaxb.enabled	Enable jaxb dataformat	true	Boolean
camel.dataformat.jaxb.encoding	To overrule and use a specific encoding		String
camel.dataformat.jaxb.filter-non-xml-chars	To ignore non xml characheters and replace them with an empty space.	false	Boolean
camel.dataformat.jaxb.fragment	To turn on marshalling XML fragment trees. By default JAXB looks for XmlRootElement annotation on given class to operate on whole XML tree. This is useful but not always - sometimes generated code does not have XmlRootElement annotation, sometimes you need unmarshall only part of tree. In that case you can use partial unmarshalling. To enable this behaviours you need set property partClass. Camel will pass this class to JAXB's unmarshaller.	false	Boolean
camel.dataformat.jaxb.ignore-j-a-x-b-element	Whether to ignore JAXBElement elements - only needed to be set to false in very special use-cases.	false	Boolean
camel.dataformat.jaxb.jaxb-provider-properties	Refers to a custom java.util.Map to lookup in the registry containing custom JAXB provider properties to be used with the JAXB marshaller.		String
camel.dataformat.jaxb.must-be-j-a-x-b-element	Whether marhsalling must be java objects with JAXB annotations. And if not then it fails. This option can be set to false to relax that, such as when the data is already in XML format.	false	Boolean

Name	Description	Default	Type
<code>camel.dataformat.jaxb.namespace-prefix-ref</code>	When marshalling using JAXB or SOAP then the JAXB implementation will automatic assign namespace prefixes, such as ns2, ns3, ns4 etc. To control this mapping, Camel allows you to refer to a map which contains the desired mapping.		String
<code>camel.dataformat.jaxb.no-namespace-schema-location</code>	To define the location of the namespaceless schema		String
<code>camel.dataformat.jaxb.object-factory</code>	Whether to allow using ObjectFactory classes to create the POJO classes during marshalling. This only applies to POJO classes that has not been annotated with JAXB and providing jaxb.index descriptor files.	false	Boolean
<code>camel.dataformat.jaxb.part-class</code>	Name of class used for fragment parsing. See more details at the fragment option.		String
<code>camel.dataformat.jaxb.part-namespace</code>	XML namespace to use for fragment parsing. See more details at the fragment option.		String
<code>camel.dataformat.jaxb.pretty-print</code>	To enable pretty printing output nicely formatted. Is by default false.	false	Boolean
<code>camel.dataformat.jaxb.schema</code>	To validate against an existing schema. Your can use the prefix classpath:, file: or http: to specify how the resource should by resolved. You can separate multiple schema files by using the ',' character.		String
<code>camel.dataformat.jaxb.schema-location</code>	To define the location of the schema		String
<code>camel.dataformat.jaxb.schema-severity-level</code>	Sets the schema severity level to use when validating against a schema. This level determines the minimum severity error that triggers JAXB to stop continue parsing. The default value of 0 (warning) means that any error (warning, error or fatal error) will trigger JAXB to stop. There are the following three levels: 0=warning, 1=error, 2=fatal error.	0	Integer
<code>camel.dataformat.jaxb.xml-stream-writer-wrapper</code>	To use a custom xml stream writer.		String

ND

168.3. USING THE JAVA DSL

For example the following uses a named DataFormat of *jaxb* which is configured with a number of Java package names to initialize the [JAXBContext](#).

```
DataFormat jaxb = new JaxbDataFormat("com.acme.model");
from("activemq:My.Queue").
  unmarshal(jaxb).
  to("mqseries:Another.Queue");
```

You can if you prefer use a named reference to a data format which can then be defined in your Registry such as via your Spring XML file. e.g.

```
from("activemq:My.Queue").
  unmarshal("myJaxbDataType").
  to("mqseries:Another.Queue");
```

168.4. USING SPRING XML

The following example shows how to use JAXB to unmarshal using Spring configuring the jaxb data type

This example shows how to configure the data type just once and reuse it on multiple routes.

Multiple context paths

It is possible to use this data format with more than one context path. You can specify context path using `:` as separator, for example `com.mycompany:com.mycompany2`. Note that this is handled by JAXB implementation and might change if you use different vendor than RI.

168.5. PARTIAL MARSHALLING/UNMARSHALLING

This feature is new to Camel 2.2.0.

JAXB 2 supports marshalling and unmarshalling XML tree fragments. By default JAXB looks for `@XmlElement` annotation on given class to operate on whole XML tree. This is useful but not always - sometimes generated code does not have `@XmlElement` annotation, sometimes you need unmarshal only part of tree.

In that case you can use partial unmarshalling. To enable this behaviours you need set property `partClass`. Camel will pass this class to JAXB's unmarshaller. If `JaxbConstants.JAXB_PART_CLASS` is set as one of headers, (even if `partClass` property is set on DataFormat), the property on DataFormat is surpassed and the one set in the headers is used.

For marshalling you have to add `partNamespace` attribute with QName of destination namespace. Example of Spring DSL you can find above. If `JaxbConstants.JAXB_PART_NAMESPACE` is set as one of headers, (even if `partNamespace` property is set on DataFormat), the property on DataFormat is surpassed and the one set in the headers is used. While setting `partNamespace` through `JaxbConstants.JAXB_PART_NAMESPACE`, please note that you need to specify its value `{[namespaceUri]}[localPart]`

```
...
.setHeader(JaxbConstants.JAXB_PART_NAMESPACE, simple("
```

```
{http://www.camel.apache.org/jaxb/example/address/1}address"));
```

```
...
```

168.6. FRAGMENT

This feature is new to Camel 2.8.0.

JaxbDataFormat has new property fragment which can set the the **Marshaller.JAXB_FRAGMENT** encoding property on the JAXB Marshaller. If you don't want the JAXB Marshaller to generate the XML declaration, you can set this option to be true. The default value of this property is false.

168.7. IGNORING THE NONXML CHARACTER

This feature is new to Camel 2.2.0.

JaxbDataFormat supports to ignore the [NonXML Character](#), you just need to set the filterNonXmlChars property to be true, JaxbDataFormat will replace the NonXML character with " " when it is marshaling or unmarshaling the message. You can also do it by setting the Exchange property **Exchange.FILTER_NON_XML_CHARS**.

	JDK 1.5	JDK 1.6+
Filtering in use	StAX API and implementation	No
Filtering not in use	StAX API only	No

This feature has been tested with Woodstox 3.2.9 and Sun JDK 1.6 StAX implementation.

New for Camel 2.12.1

JaxbDataFormat now allows you to customize the XMLStreamWriter used to marshal the stream to XML. Using this configuration, you can add your own stream writer to completely remove, escape, or replace non-xml characters.

```
JaxbDataFormat customWriterFormat = new JaxbDataFormat("org.apache.camel.foo.bar");
customWriterFormat.setXmlStreamWriterWrapper(new TestXmlStreamWriter());
```

The following example shows using the Spring DSL and also enabling Camel's NonXML filtering:

```
<bean id="testXmlStreamWriterWrapper" class="org.apache.camel.jaxb.TestXmlStreamWriter"/>
<jaxb filterNonXmlChars="true" contextPath="org.apache.camel.foo.bar"
xmlStreamWriterWrapper="#testXmlStreamWriterWrapper" />
```

168.8. WORKING WITH THE OBJECTFACTORY

If you use XJC to create the java class from the schema, you will get an ObjectFactory for you JAXB context. Since the ObjectFactory uses [JAXBElement](#) to hold the reference of the schema and element instance value, jaxbDataformat will ignore the JAXBElement by default and you will get the element instance value instead of the JAXBElement object form the unmarshaled message body. If you want to get the JAXBElement object form the unmarshaled message body, you need to set the JaxbDataFormat object's ignoreJAXBElement property to be false.

168.9. SETTING ENCODING

You can set the **encoding** option to use when marshalling. Its the **Marshaller.JAXB_ENCODING** encoding property on the JAXB Marshaller.

You can setup which encoding to use when you declare the JAXB data format. You can also provide the encoding in the Exchange property **Exchange.CHARSET_NAME**. This property will overrule the encoding set on the JAXB data format.

In this Spring DSL we have defined to use **iso-8859-1** as the encoding:

168.10. CONTROLLING NAMESPACE PREFIX MAPPING

Available as of Camel 2.11

When marshalling using [JAXB](#) or [SOAP](#) then the JAXB implementation will automatic assign namespace prefixes, such as ns2, ns3, ns4 etc. To control this mapping, Camel allows you to refer to a map which contains the desired mapping.

Notice this requires having JAXB-RI 2.1 or better (from SUN) on the classpath, as the mapping functionality is dependent on the implementation of JAXB, whether its supported.

For example in Spring XML we can define a Map with the mapping. In the mapping file below, we map SOAP to use soap as prefix. While our custom namespace "http://www.mycompany.com/foo/2" is not using any prefix.

```
<util:map id="myMap">
  <entry key="http://www.w3.org/2003/05/soap-envelope" value="soap"/>
  <!-- we dont want any prefix for our namespace -->
  <entry key="http://www.mycompany.com/foo/2" value=""/>
</util:map>
```

To use this in [JAXB](#) or [SOAP](#) you refer to this map, using the **namespacePrefixRef** attribute as shown below. Then Camel will lookup in the Registry a **java.util.Map** with the id "myMap", which was what we defined above.

```
<marshal>
  <soapjaxb version="1.2" contextPath="com.mycompany.foo" namespacePrefixRef="myMap"/>
</marshal>
```

168.11. SCHEMA VALIDATION

Available as of Camel 2.11

The JAXB Data Format supports validation by marshalling and unmarshalling from/to XML. Your can use the prefix **classpath:**, **file:** or **http:** to specify how the resource should by resolved. You can separate multiple schema files by using the ',' character.

Known issue

Camel 2.11.0 and 2.11.1 has a known issue by validation multiple `Exchange`s in parallel. See [CAMEL-6630](#). This is fixed with Camel 2.11.2/2.12.0.

Using the Java DSL, you can configure it in the following way:

```
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setContextPath(Person.class.getPackage().getName());
jaxbDataFormat.setSchema("classpath:person.xsd,classpath:address.xsd");
```

You can do the same using the XML DSL:

```
<marshal>
  <jaxb id="jaxb" schema="classpath:person.xsd,classpath:address.xsd"/>
</marshal>
```

Camel will create and pool the underlying **SchemaFactory** instances on the fly, because the **SchemaFactory** shipped with the JDK is not thread safe.

However, if you have a **SchemaFactory** implementation which is thread safe, you can configure the JAXB data format to use this one:

```
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setSchemaFactory(threadSafeSchemaFactory);
```

168.12. SCHEMA LOCATION

Available as of Camel 2.14

The JAXB Data Format supports to specify the SchemaLocation when marshaling the XML.

Using the Java DSL, you can configure it in the following way:

```
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setContextPath(Person.class.getPackage().getName());
jaxbDataFormat.setSchemaLocation("schema/person.xsd");
```

You can do the same using the XML DSL:

```
<marshal>
  <jaxb id="jaxb" schemaLocation="schema/person.xsd"/>
</marshal>
```

168.13. MARSHAL DATA THAT IS ALREADY XML

Available as of Camel 2.14.1

The JAXB marshaller requires that the message body is JAXB compatible, eg its a JAXBElement, eg a java instance that has JAXB annotations, or extend JAXBElement. There can be situations where the message body is already in XML, eg from a String type. There is a new option **mustBeJAXBElement** you can set to false, to relax this check, so the JAXB marshaller only attempts to marshal JAXBElements (javax.xml.bind.JAXBIntrospector#isElement returns true). And in those situations the marshaller fallbacks to marshal the message body as-is.

168.14. DEPENDENCIES

To use JAXB in your camel routes you need to add the a dependency on **camel-jaxb** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-jaxb</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 169. JCACHE COMPONENT

Available as of Camel version 2.17

The jcache component enables you to perform caching operations using JSR107/JCache as cache implementation.

169.1. URI FORMAT

```
jcache:cacheName[?options]
```

169.2. URI OPTIONS

The JCache endpoint is configured using URI syntax:

```
jcache:cacheName
```

with the following path and query parameters:

169.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
cacheName	Required The name of the cache		String

169.2.2. Query Parameters (22 parameters):

Name	Description	Default	Type
cacheConfiguration (common)	A Configuration for the Cache		Configuration
cacheConfigurationProperties (common)	The Properties for the javax.cache.spi.CachingProvider to create the CacheManager		Properties
cachingProvider (common)	The fully qualified class name of the javax.cache.spi.CachingProvider		String
configurationUri (common)	An implementation specific URI for the CacheManager		String
managementEnabled (common)	Whether management gathering is enabled	false	boolean

Name	Description	Default	Type
readThrough (common)	If read-through caching should be used	false	boolean
statisticsEnabled (common)	Whether statistics gathering is enabled	false	boolean
storeByValue (common)	If cache should use store-by-value or store-by-reference semantics	true	boolean
writeThrough (common)	If write-through caching should be used	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
filteredEvents (consumer)	Events a consumer should filter. If using <code>filteredEvents</code> option, then <code>eventFilters</code> one will be ignored		List
oldValueRequired (consumer)	if the old value is required for events	false	boolean
synchronous (consumer)	if the event listener should block the thread causing the event	false	boolean
eventFilters (consumer)	The <code>CacheEntryEventFilter</code> . If using <code>eventFilters</code> option, then <code>filteredEvents</code> one will be ignored		List
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
action (producer)	To configure using a cache operation by default. If an operation in the message header, then the operation from the header takes precedence.		String

Name	Description	Default	Type
cacheLoaderFactory (advanced)	The CacheLoader factory		Factory
cacheWriterFactory (advanced)	The CacheWriter factory		Factory
createCacheIfNotExists (advanced)	Configure if a cache need to be created if it does exist or can't be pre-configured.	true	boolean
expiryPolicyFactory (advanced)	The ExpiryPolicy factory		Factory
lookupProviders (advanced)	Configure if a camel-cache should try to find implementations of jcache api in runtimes like OSGi.	false	boolean

169.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

Name	Description	Default	Type
camel.component.jcache.cache-configuration	A Configuration for the Cache. The option is a <code>javax.cache.configuration.Configuration</code> type.		String
camel.component.jcache.cache-configuration-properties	The Properties for the <code>javax.cache.spi.CachingProvider</code> to create the <code>CacheManager</code> . The option is a <code>java.util.Properties</code> type.		String
camel.component.jcache.caching-provider	The fully qualified class name of the <code>javax.cache.spi.CachingProvider</code>		String
camel.component.jcache.configuration-uri	An implementation specific URI for the <code>CacheManager</code>		String
camel.component.jcache.enabled	Enable jcache component	true	Boolean
camel.component.jcache.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

The JCache component supports 5 options, which are listed below.

Name	Description	Default	Type
cachingProvider (common)	The fully qualified class name of the <code>javax.cache.spi.CachingProvider</code>		String
cacheConfiguration (common)	A Configuration for the Cache		Configuration
cacheConfiguration Properties (common)	The Properties for the <code>javax.cache.spi.CachingProvider</code> to create the <code>CacheManager</code>		Properties
configurationUri (common)	An implementation specific URI for the <code>CacheManager</code>		String
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

CHAPTER 170. JCLOUDS COMPONENT

Available as of Camel version 2.9

This component allows interaction with cloud provider key-value engines (blobstores) and compute services. The component uses `jclouds` which is a library that provides abstractions for blobstores and compute services.

ComputeService simplifies the task of managing machines in the cloud. For example, you can use `ComputeService` to start 5 machines and install your software on them.

BlobStore simplifies dealing with key-value providers such as Amazon S3. For example, `BlobStore` can give you a simple Map view of a container.

The camel `jclouds` component allows you to use both abstractions, as it specifies two types of endpoint the `JcloudsBlobStoreEndpoint` and the `JcloudsComputeEndpoint`. You can have both producers and consumers on a blobstore endpoint but you can only have producers on compute endpoints.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jclouds</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

170.1. CONFIGURING THE COMPONENT

The camel `jclouds` component will make use of multiple `jclouds` blobstores and compute services as long as they are passed to the component during initialization. The component accepts a list blobstores and compute services. Here is how it can be configured.

```
<bean id="jclouds" class="org.apache.camel.component.jclouds.JcloudsComponent">
  <property name="computeServices">
    <list>
      <ref bean="computeService"/>
    </list>
  </property>
  <property name="blobStores">
    <list>
      <ref bean="blobStore"/>
    </list>
  </property>
</bean>

<!-- Creating a blobstore from spring / blueprint xml -->
<bean id="blobStoreContextFactory" class="org.jclouds.blobstore.BlobStoreContextFactory"/>

<bean id="blobStoreContext" factory-bean="blobStoreContextFactory" factory-
method="createContext">
  <constructor-arg name="provider" value="PROVIDER_NAME"/>
  <constructor-arg name="identity" value="IDENTITY"/>
  <constructor-arg name="credential" value="CREDENTIAL"/>
</bean>
```

```

<bean id="blobStore" factory-bean="blobStoreContext" factory-method="getBlobStore"/>

<!-- Creating a compute service from spring / blueprint xml -->
<bean id="computeServiceContextFactory"
class="org.jclouds.compute.ComputeServiceContextFactory"/>

<bean id="computeServiceContext" factory-bean="computeServiceContextFactory" factory-
method="createContext">
  <constructor-arg name="provider" value="PROVIDER_NAME"/>
  <constructor-arg name="identity" value="IDENTITY"/>
  <constructor-arg name="credential" value="CREDENTIAL"/>
</bean>

<bean id="computeService" factory-bean="computeServiceContext" factory-
method="getComputeService"/>

```

As you can see the component is capable of handling multiple blobstores and compute services. The actual implementation that will be used by each endpoint is specified by passing the provider inside the URI.

170.2. JCLOUDS OPTIONS

```

jclouds:blobstore:[provider id][?options]
jclouds:compute:[provider id][?options]

```

The **provider id** is the name of the cloud provider that provides the target service (e.g. *aws-s3* or *aws_ec2*).

You can append query options to the URI in the following format, **?option=value&option=value&...**

170.3. BLOBSTORE URI OPTIONS

The JClouds component supports 3 options, which are listed below.

Name	Description	Default	Type
blobStores (common)	To use the given BlobStore which must be configured when using blobstore.		List
computeServices (common)	To use the given ComputeService which must be configured when use compute.		List
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The JClouds endpoint is configured using URI syntax:

```

jclouds:command:providerId

```

with the following path and query parameters:

170.3.1. Path Parameters (2 parameters):

Name	Description	Default	Type
command	Required What command to execute such as blobstore or compute.		JcloudsCommand
providerId	Required The name of the cloud provider that provides the target service (e.g. aws-s3 or aws_ec2).		String

170.3.2. Query Parameters (15 parameters):

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
blobName (blobstore)	The name of the blob.		String
container (blobstore)	The name of the blob container.		String
directory (blobstore)	An optional directory name to use		String

Name	Description	Default	Type
group (compute)	The group that will be assigned to the newly created node. Values depend on the actual cloud provider.		String
hardwareId (compute)	The hardware that will be used for creating a node. Values depend on the actual cloud provider.		String
imageId (compute)	The imageId that will be used for creating a node. Values depend on the actual cloud provider.		String
locationId (compute)	The location that will be used for creating a node. Values depend on the actual cloud provider.		String
nodeId (compute)	The id of the node that will run the script or destroyed.		String
nodeState (compute)	To filter by node status to only select running nodes etc.		String
operation (compute)	Specifies the type of operation that will be performed to the blobstore.		String
user (compute)	The user on the target node that will run the script.		String

You can have as many of these options as you like.

```
jclouds:blobstore:aws-s3?
operation=CamelJcloudsGet&container=mycontainer&blobName=someblob
```

For producer endpoint you can override all of the above URI options by passing the appropriate headers to the message.

170.3.3. Message Headers for blobstore

Header	Description
CamelJcloudsOperation	The operation to be performed on the blob. The valid options are * PUT * GET
CamelJcloudsContainer	The name of the blob container.

Header	Description
Camel JcloudsBlobName	The name of the blob.

170.4. BLOBSTORE USAGE SAMPLES

170.4.1. Example 1: Putting to the blob

This example will show you how you can store any message inside a blob using the jclouds component.

```
from("direct:start")
  .to("jclouds:blobstore:aws-s3" +
    "?operation=PUT" +
    "&container=mycontainer" +
    "&blobName=myblob");
```

In the above example you can override any of the URI parameters with headers on the message. Here is how the above example would look like using xml to define our route.

```
<route>
  <from uri="direct:start"/>
  <to uri="jclouds:blobstore:aws-s3?operation=PUT&container=mycontainer&blobName=myblob"/>
</route>
```

170.4.2. Example 2: Getting/Reading from a blob

This example will show you how you can read the content of a blob using the jclouds component.

```
from("direct:start")
  .to("jclouds:blobstore:aws-s3" +
    "?operation=GET" +
    "&container=mycontainer" +
    "&blobName=myblob");
```

In the above example you can override any of the URI parameters with headers on the message. Here is how the above example would look like using xml to define our route.

```
<route>
  <from uri="direct:start"/>
  <to uri="jclouds:blobstore:aws-s3?operation=GET&container=mycontainer&blobName=myblob"/>
</route>
```

170.4.3. Example 3: Consuming a blob

This example will consume all blob that are under the specified container. The generated exchange will contain the payload of the blob as body.

```
from("jclouds:blobstore:aws-s3" +
    "?container=mycontainer")
    .to("direct:next");
```

You can achieve the same goal by using xml, as you can see below.

```
<route>
  <from uri="jclouds:blobstore:aws-s3?
operation=GET&container=mycontainer&blobName=myblob"/>
  <to uri="direct:next"/>
</route>
```

```
jclouds:compute:aws-ec2?
operation=CamelJcloudsCreateNode&imageId=AMI_XXXXX&locationId=eu-west-1&group=mygroup
```

170.5. COMPUTE USAGE SAMPLES

Below are some examples that demonstrate the use of jclouds compute producer in java dsl and spring/blueprint xml.

170.5.1. Example 1: Listing the available images.

```
from("jclouds:compute:aws-ec2" +
    "&operation=CamelJCloudsListImages")
    .to("direct:next");
```

This will create a message that will contain the list of images inside its body. You can also do the same using xml.

```
<route>
  <from uri="jclouds:compute:aws-ec2?operation=CamelJCloudsListImages"/>
  <to uri="direct:next"/>
</route>
```

170.5.2. Example 2: Create a new node.

```
from("direct:start").
to("jclouds:compute:aws-ec2" +
    "?operation=CamelJcloudsCreateNode" +
    "&imageId=AMI_XXXXX" +
    "&locationId=XXXXX" +
    "&group=myGroup");
```

This will create a new node on the cloud provider. The out message in this case will be a set of metadata that contains information about the newly created node (e.g. the ip, hostname etc). Here is the same using spring xml.

```
<route>
  <from uri="direct:start"/>
```

```
<to uri="jclouds:compute:aws-ec2?
operation=CamelJcloudsCreateNode&imageId=AMI_XXXXX&locationId=XXXXX&group=myGroup"/>
</route>
```

170.5.3. Example 3: Run a shell script on running node.

```
from("direct:start").
to("jclouds:compute:aws-ec2" +
"?operation=CamelJcloudsRunScript" +
"?nodeId=10" +
"&user=ubuntu");
```

The sample above will retrieve the body of the in message, which is expected to contain the shell script to be executed. Once the script is retrieved, it will be sent to the node for execution under the specified user (*in order case ubuntu*). The target node is specified using its nodeId. The nodeId can be retrieved either upon the creation of the node, it will be part of the resulting metadata or by a executing a LIST_NODES operation.

Note This will require that the compute service that will be passed to the component, to be initialized with the appropriate jclouds ssh capable module (e.g. *jsch* or *sshj*).

Here is the same using spring xml.

```
<route>
<from uri="direct:start"/>
<to uri="jclouds:compute:aws-ec2?operation=CamelJcloudsListNodes&?
nodeId=10&user=ubuntu"/>
</route>
```

CHAPTER 171. JCR COMPONENT

Available as of Camel version 1.3

The **jcr** component allows you to add/read nodes to/from a JCR compliant content repository (for example, [Apache Jackrabbit](#)) with its producer, or register an EventListener with the consumer.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jcr</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

171.1. URI FORMAT

```
jcr://user:password@repository/path/to/node
```

Consumer added

From **Camel 2.10** onwards you can use consumer as an EventListener in JCR or a producer to read a node by identifier.

171.2. USAGE

The **repository** element of the URI is used to look up the JCR **Repository** object in the Camel context registry.

171.2.1. JCR Options

The JCR component has no options.

The JCR endpoint is configured using URI syntax:

```
jcr:host/base
```

with the following path and query parameters:

171.2.2. Path Parameters (2 parameters):

Name	Description	Default	Type
host	Required Name of the javax.jcr.Repository to lookup from the Camel registry to be used.		String
base	Get the base node when accessing the repository		String

171.2.3. Query Parameters (14 parameters):

Name	Description	Default	Type
deep (common)	When isDeep is true, events whose associated parent node is at absPath or within its subgraph are received.	false	boolean
eventTypes (common)	eventTypes (a combination of one or more event types encoded as a bit mask value such as javax.jcr.observation.Event.NODE_ADDED, javax.jcr.observation.Event.NODE_REMOVED, etc.).		int
nodeTypeNames (common)	When a comma separated nodeTypeName list string is set, only events whose associated parent node has one of the node types (or a subtype of one of the node types) in this list will be received.		String
noLocal (common)	If noLocal is true, then events generated by the session through which the listener was registered are ignored. Otherwise, they are not ignored.	false	boolean
password (common)	Password for login		String
sessionLiveCheck Interval (common)	Interval in milliseconds to wait before each session live checking The default value is 60000 ms.	60000	long
sessionLiveCheck IntervalOn Start (common)	Interval in milliseconds to wait before the first session live checking. The default value is 3000 ms.	3000	long
username (common)	Username for login		String
uuids (common)	When a comma separated uuid list string is set, only events whose associated parent node has one of the identifiers in the comma separated uuid list will be received.		String
workspaceName (common)	The workspace to access. If it's not specified then the default one will be used		String

Name	Description	Default	Type
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

171.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

Name	Description	Default	Type
camel.component.jcr.enabled	Enable jcr component	true	Boolean
camel.component.jcr.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

Please note that the JCR Producer used message properties instead of message headers in Camel versions earlier than 2.12.3. See <https://issues.apache.org/jira/browse/CAMEL-7067> for more details.

171.4. EXAMPLE

The snippet below creates a node named **node** under the **/home/test** node in the content repository. One additional property is added to the node as well: **my.contents.property** which will contain the body of the message being sent.

```
from("direct:a").setHeader(JcrConstants.JCR_NODE_NAME, constant("node"))
    .setHeader("my.contents.property", body())
    .to("jcr://user:pass@repository/home/test");
```

The following code will register an `EventListener` under the path `import-application/inbox` for `Event.NODE_ADDED` and `Event.NODE_REMOVED` events (event types 1 and 2, both masked as 3) and listening deep for all the children.

```
<route>
  <from uri="jcr://user:pass@repository/import-application/inbox?eventTypes=3&deep=true" />
  <to uri="direct:execute-import-application" />
</route>
```

171.5. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 172. JDBC COMPONENT

Available as of Camel version 1.2

The `jdbc` component enables you to access databases through JDBC, where SQL queries (SELECT) and operations (INSERT, UPDATE, etc) are sent in the message body. This component uses the standard JDBC API, unlike the [SQL Component](#) component, which uses `spring-jdbc`.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jdbc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

This component can only be used to define producer endpoints, which means that you cannot use the JDBC component in a `from()` statement.

Transactions

When using the `camel-jdbc` option you must have implemented and configured a transaction manager and set the `resetAutoCommit` property in your Camel route definition to `false`:

Transactional route definition with camel-jdbc

```
from("direct:tx")
  .transacted()
  .to("jdbc:test_db?resetAutoCommit=false")
```

NOTE

The `transacted=true` property is not required when used with the `camel-jdbc` component. If you require additional functionality, please consider using the `camel-sql` component.

172.1. URI FORMAT

```
jdbc:dataSourceName[?options]
```

This component only supports producer endpoints.

You can append query options to the URI in the following format, `?option=value&option=value&...`

172.2. OPTIONS

The JDBC component supports 2 options, which are listed below.

Name	Description	Default	Type
dataSource (producer)	To use the DataSource instance instead of looking up the data source by name from the registry.		DataSource
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The JDBC endpoint is configured using URI syntax:

```
jdbc:dataSourceName
```

with the following path and query parameters:

172.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
dataSourceName	Required Name of DataSource to lookup in the Registry. If the name is dataSource or default, then Camel will attempt to lookup a default DataSource from the registry, meaning if there is a only one instance of DataSource found, then this DataSource will be used.		String

172.2.2. Query Parameters (13 parameters):

Name	Description	Default	Type
allowNamedParameters (producer)	Whether to allow using named parameters in the queries.	true	boolean
outputClass (producer)	Specify the full package and class name to use as conversion when outputType=SelectOne or SelectList.		String
outputType (producer)	Determines the output the producer should use.	Select List	JdbcOutputType
parameters (producer)	Optional parameters to the java.sql.Statement. For example to set maxRows, fetchSize etc.		Map

Name	Description	Default	Type
readSize (producer)	The default maximum number of rows that can be read by a polling query. The default value is 0.		int
resetAutoCommit (producer)	Camel will set the autoCommit on the JDBC connection to be false, commit the change after executed the statement and reset the autoCommit flag of the connection at the end, if the resetAutoCommit is true. If the JDBC connection doesn't support to reset the autoCommit flag, you can set the resetAutoCommit flag to be false, and Camel will not try to reset the autoCommit flag. When used with XA transactions you most likely need to set it to false so that the transaction manager is in charge of committing this tx.	true	boolean
transacted (producer)	Whether transactions are in use.	false	boolean
useGetBytesForBlob (producer)	To read BLOB columns as bytes instead of string data. This may be needed for certain databases such as Oracle where you must read BLOB columns as bytes.	false	boolean
useHeadersAsParameters (producer)	Set this option to true to use the prepareStatementStrategy with named parameters. This allows to define queries with named placeholders, and use headers with the dynamic values for the query placeholders.	false	boolean
useJDBC4ColumnNameAndLabelSemantics (producer)	Sets whether to use JDBC 4 or JDBC 3.0 or older semantic when retrieving column name. JDBC 4.0 uses columnName to get the column name where as JDBC 3.0 uses both columnName or columnLabel. Unfortunately JDBC drivers behave differently so you can use this option to work out issues around your JDBC driver if you get problem using this component This option is default true.	true	boolean
beanRowMapper (advanced)	To use a custom org.apache.camel.component.jdbc.BeanRowMapper when using outputClass. The default implementation will lower case the row names and skip underscores, and dashes. For example CUST_ID is mapped as custId.		BeanRowMapper

Name	Description	Default	Type
prepareStatementStrategy (advanced)	Allows to plugin to use a custom <code>org.apache.camel.component.jdbc.JdbcPreparedStatementStrategy</code> to control preparation of the query and prepared statement.		JdbcPreparedStatementStrategy
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean

172.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

Name	Description	Default	Type
camel.component.jdbc.data-source	To use the <code>DataSource</code> instance instead of looking up the data source by name from the registry. The option is a <code>javax.sql.DataSource</code> type.		String
camel.component.jdbc.enabled	Enable jdbc component	true	Boolean
camel.component.jdbc.resolve-property-placeholders	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean

172.4. RESULT

By default the result is returned in the OUT body as an `ArrayList<HashMap<String, Object>>`. The **List** object contains the list of rows and the **Map** objects contain each row with the **String** key as the column name. You can use the option **outputType** to control the result.

Note: This component fetches **ResultSetMetaData** to be able to return the column name as the key in the **Map**.

172.4.1. Message Headers

Header	Description
CamelJdbcRowCount	If the query is a SELECT , query the row count is returned in this OUT header.

Header	Description
CamelJdbcUpdateCount	If the query is an UPDATE , query the update count is returned in this OUT header.
CamelGeneratedKeysRows	Camel 2.10: Rows that contains the generated keys.
CamelGeneratedKeysRowCount	Camel 2.10: The number of rows in the header that contains generated keys.
CamelJdbcColumnNames	Camel 2.11.1: The column names from the ResultSet as a java.util.Set type.
CamelJdbcParameters	Camel 2.12: A java.util.Map which has the headers to be used if useHeadersAsParameters has been enabled.

172.5. GENERATED KEYS

Available as of Camel 2.10

If you insert data using SQL INSERT, then the RDBMS may support auto generated keys. You can instruct the [JDBC](#) producer to return the generated keys in headers.

To do that set the header **CamelRetrieveGeneratedKeys=true**. Then the generated keys will be provided as headers with the keys listed in the table above.

You can see more details in this [unit test](#).

Using generated keys does not work with together with named parameters.

172.6. USING NAMED PARAMETERS

Available as of Camel 2.12

In the given route below, we want to get all the projects from the projects table. Notice the SQL query has 2 named parameters, `:?lic` and `:?min`.

Camel will then lookup these parameters from the message headers. Notice in the example above we

set two headers with constant value for the named parameters:

```
from("direct:projects")
  .setHeader("lic", constant("ASF"))
  .setHeader("min", constant(123))
  .setBody("select * from projects where license = :?lic and id > :?min order by id")
  .to("jdbc:myDataSource?useHeadersAsParameters=true")
```

You can also store the header values in a **java.util.Map** and store the map on the headers with the key **CamelJdbcParameters**.

172.7. SAMPLES

In the following example, we fetch the rows from the customer table.

First we register our datasource in the Camel registry as **testdb**:

Then we configure a route that routes to the JDBC component, so the SQL will be executed. Note how we refer to the **testdb** datasource that was bound in the previous step:

Or you can create a **DataSource** in Spring like this:

We create an endpoint, add the SQL query to the body of the IN message, and then send the exchange. The result of the query is returned in the OUT body:

If you want to work on the rows one by one instead of the entire ResultSet at once you need to use the Splitter EIP such as:

```
from("direct:hello")
  // here we split the data from the testdb into new messages one by one
  // so the mock endpoint will receive a message per row in the table
  // the StreamList option allows to stream the result of the query without creating a List of rows
  // and notice we also enable streaming mode on the splitter
  .to("jdbc:testdb?outputType=StreamList")
  .split(body()).streaming()
  .to("mock:result");
```

172.8. SAMPLE - POLLING THE DATABASE EVERY MINUTE

If we want to poll a database using the JDBC component, we need to combine it with a polling scheduler such as the [Timer](#) or [Quartz](#) etc. In the following example, we retrieve data from the database every 60 seconds:

```
from("timer://foo?period=60000")
  .setBody(constant("select * from customer"))
  .to("jdbc:testdb")
  .to("activemq:queue:customers");
```

172.9. SAMPLE - MOVE DATA BETWEEN DATA SOURCES

A common use case is to query for data, process it and move it to another data source (ETL operations). In the following example, we retrieve new customer records from the source table every hour, filter/transform them and move them to a destination table:

```
from("timer://MoveNewCustomersEveryHour?period=3600000")
  .setBody(constant("select * from customer where create_time > (sysdate-1/24)"))
  .to("jdbc:testdb")
  .split(body())
  .process(new MyCustomerProcessor()) //filter/transform results as needed
  .setBody(simple("insert into processed_customer values('${body[ID]}','${body[NAME]}')"))
  .to("jdbc:testdb");
```

CHAPTER 173. JETTY 9 COMPONENT

Available as of Camel version 1.2

WARNING

The producer is deprecated - do not use. We only recommend using jetty as consumer (eg from jetty)

The **jetty** component provides HTTP-based endpoints for consuming and producing HTTP requests. That is, the Jetty component behaves as a simple Web server. Jetty can also be used as a http client which mean you can also use it with Camel as a producer.

Stream

The **assert** call appears in this example, because the code is part of an unit test. Jetty is stream based, which means the input it receives is submitted to Camel as a stream. That means you will only be able to read the content of the stream **once**.

If you find a situation where the message body appears to be empty or you need to access the Exchange.HTTP_RESPONSE_CODE data multiple times (e.g.: doing multicasting, or redelivery error handling), you should use Stream caching or convert the message body to a **String** which is safe to be re-read multiple times.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jetty</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

173.1. URI FORMAT

```
jetty:http://hostname[:port][/resourceUri][?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

173.2. OPTIONS

The Jetty 9 component supports 33 options, which are listed below.

Name	Description	Default	Type
		t	

Name	Description	Default	Type
sslKeyPassword (security)	The key password, which is used to access the certificate's key entry in the keystore (this is the same password that is supplied to the keystore command's -keypass option).		String
sslPassword (security)	The ssl password, which is required to access the keystore file (this is the same password that is supplied to the keystore command's -storepass option).		String
keystore (security)	Specifies the location of the Java keystore file, which contains the Jetty server's own X.509 certificate in a key entry.		String
errorHandler (advanced)	This option is used to set the ErrorHandler that Jetty server uses.		ErrorHandler
sslSocketConnectors (security)	A map which contains per port number specific SSL connectors.		Map
socketConnectors (security)	A map which contains per port number specific HTTP connectors. Uses the same principle as sslSocketConnectors.		Map
httpClientMinThreads (producer)	To set a value for minimum number of threads in HttpClient thread pool. Notice that both a min and max size must be configured.		Integer
httpClientMaxThreads (producer)	To set a value for maximum number of threads in HttpClient thread pool. Notice that both a min and max size must be configured.		Integer
minThreads (consumer)	To set a value for minimum number of threads in server thread pool. Notice that both a min and max size must be configured.		Integer
maxThreads (consumer)	To set a value for maximum number of threads in server thread pool. Notice that both a min and max size must be configured.		Integer
threadPool (consumer)	To use a custom thread pool for the server. This option should only be used in special circumstances.		ThreadPool
enableJmx (common)	If this option is true, Jetty JMX support will be enabled for this endpoint.	false	boolean

Name	Description	Default	Type
jettyHttpBinding (advanced)	To use a custom <code>org.apache.camel.component.jetty.JettyHttpBinding</code> , which are used to customize how a response should be written for the producer.		JettyHttpBinding
httpBinding (advanced)	Not to be used - use <code>JettyHttpBinding</code> instead.		HttpBinding
httpConfiguration (advanced)	Jetty component does not use <code>HttpConfiguration</code> .		HttpConfiguration
mbContainer (advanced)	To use a existing configured <code>org.eclipse.jetty.jmx.MBeanContainer</code> if JMX is enabled that Jetty uses for registering mbeans.		MBeanContainer
sslSocketConnectorProperties (security)	A map which contains general SSL connector properties.		Map
socketConnectorProperties (security)	A map which contains general HTTP connector properties. Uses the same principle as <code>sslSocketConnectorProperties</code> .		Map
continuationTimeout (consumer)	Allows to set a timeout in millis when using Jetty as consumer (server). By default Jetty uses 30000. You can use a value of = 0 to never expire. If a timeout occurs then the request will be expired and Jetty will return back a http error 503 to the client. This option is only in use when using Jetty with the Asynchronous Routing Engine.	30000	Long
useContinuation (consumer)	Whether or not to use Jetty continuations for the Jetty Server.	true	boolean
sslContextParameters (security)	To configure security using <code>SSLContextParameters</code>		SSLContextParameters
useGlobalSslContextParameters (security)	Enable usage of global SSL context parameters	false	boolean
responseBufferSize (common)	Allows to configure a custom value of the response buffer size on the Jetty connectors.		Integer
requestBufferSize (common)	Allows to configure a custom value of the request buffer size on the Jetty connectors.		Integer

Name	Description	Default	Type
requestHeaderSize (common)	Allows to configure a custom value of the request header size on the Jetty connectors.		Integer
responseHeaderSize (common)	Allows to configure a custom value of the response header size on the Jetty connectors.		Integer
proxyHost (proxy)	To use a http proxy to configure the hostname.		String
proxyPort (proxy)	To use a http proxy to configure the port number.		Integer
useXForwardedFor Header (common)	To use the X-Forwarded-For header in <code>HttpServletRequest.getRemoteAddr</code> .	false	boolean
sendServerVersion (consumer)	If the option is true, jetty server will send the date header to the client which sends the request. NOTE please make sure there is no any other camel-jetty endpoint is share the same port, otherwise this option may not work as expected.	true	boolean
allowJavaSerialized Object (advanced)	Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
headerFilterStrategy (filter)	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message.		HeaderFilterStrategy
resolveProperty Placeholders (advanced)	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	boolean

The Jetty 9 endpoint is configured using URI syntax:

```
jetty:httpUri
```

with the following path and query parameters:

173.2.1. Path Parameters (1 parameters):

Name	Description	Default	Type
httpUri	Required The url of the HTTP endpoint to call.		URI

173.2.2. Query Parameters (54 parameters):

Name	Description	Default	Type
chunked (common)	If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response	true	boolean
disableStreamCache (common)	Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.	false	boolean
enableMultipartFilter (common)	Whether Jetty org.eclipse.jetty.servlets.MultiPartFilter is enabled or not. You should set this value to false when bridging endpoints, to ensure multipart requests is proxied/bridged as well.	false	boolean
headerFilterStrategy (common)	To use a custom HeaderFilterStrategy to filter header to and from Camel message.		HeaderFilterStrategy

Name	Description	Default	Type
transferException (common)	If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the <code>HttpOperationFailedException</code> . The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	boolean
httpBinding (common)	To use a custom <code>HttpBinding</code> to control the mapping between Camel message and <code>HttpClient</code> .		<code>HttpBinding</code>
async (consumer)	Configure the consumer to work in async mode	false	boolean
bridgeErrorHandler (consumer)	Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored.	false	boolean
continuationTimeout (consumer)	Allows to set a timeout in millis when using Jetty as consumer (server). By default Jetty uses 30000. You can use a value of = 0 to never expire. If a timeout occurs then the request will be expired and Jetty will return back a http error 503 to the client. This option is only in use when using Jetty with the Asynchronous Routing Engine.	30000	Long
enableCORS (consumer)	If the option is true, Jetty server will setup the <code>CrossOriginFilter</code> which supports the CORS out of box.	false	boolean
enableJmx (consumer)	If this option is true, Jetty JMX support will be enabled for this endpoint. See Jetty JMX support for more details.	false	boolean
httpMethodRestrict (consumer)	Used to only allow consuming if the <code>HttpMethod</code> matches, such as GET/POST/PUT etc. Multiple methods can be specified separated by comma.		String

Name	Description	Default	Type
matchOnUriPrefix (consumer)	Whether or not the consumer should try to find a target consumer by matching the URI prefix if no exact match is found.	false	boolean
responseBufferSize (consumer)	To use a custom buffer size on the <code>javax.servlet.ServletResponse</code> .		Integer
sendDateHeader (consumer)	If the option is true, jetty server will send the date header to the client which sends the request. NOTE please make sure there is no any other camel-jetty endpoint is share the same port, otherwise this option may not work as expected.	false	boolean
sendServerVersion (consumer)	If the option is true, jetty will send the server header with the jetty version information to the client which sends the request. NOTE please make sure there is no any other camel-jetty endpoint is share the same port, otherwise this option may not work as expected.	true	boolean
sessionSupport (consumer)	Specifies whether to enable the session manager on the server side of Jetty.	false	boolean
useContinuation (consumer)	Whether or not to use Jetty continuations for the Jetty Server.		Boolean
eagerCheckContentAvailable (consumer)	Whether to eager check whether the HTTP requests has content if the content-length header is 0 or not present. This can be turned on in case HTTP clients do not send streamed data.	false	boolean
exceptionHandler (consumer)	To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.		<code>ExceptionHandler</code>
exchangePattern (consumer)	Sets the exchange pattern when the consumer creates an exchange.		<code>ExchangePattern</code>
filterInitParameters (consumer)	Configuration of the filter init parameters. These parameters will be applied to the filter list before starting the jetty server.		Map
filtersRef (consumer)	Allows using a custom filters which is putted into a list and can be find in the Registry. Multiple values can be separated by comma.		String

Name	Description	Default	Type
handlers (consumer)	Specifies a comma-delimited set of Handler instances to lookup in your Registry. These handlers are added to the Jetty servlet context (for example, to add security). Important: You can not use different handlers with different Jetty endpoints using the same port number. The handlers is associated to the port number. If you need different handlers, then use different port numbers.		String
httpBindingRef (consumer)	Deprecated Option to disable throwing the <code>HttpOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.		String
multipartFilter (consumer)	Allows using a custom multipart filter. Note: setting <code>multipartFilterRef</code> forces the value of <code>enableMultipartFilter</code> to true.		Filter
multipartFilterRef (consumer)	Deprecated Allows using a custom multipart filter. Note: setting <code>multipartFilterRef</code> forces the value of <code>enableMultipartFilter</code> to true.		String
optionsEnabled (consumer)	Specifies whether to enable HTTP OPTIONS for this Servlet consumer. By default OPTIONS is turned off.	false	boolean
traceEnabled (consumer)	Specifies whether to enable HTTP TRACE for this Servlet consumer. By default TRACE is turned off.	false	boolean
bridgeEndpoint (producer)	If the option is true, <code>HttpProducer</code> will ignore the <code>Exchange.HTTP_URI</code> header, and use the endpoint's URI for request. You may also set the option <code>throwExceptionOnFailure</code> to be false to let the <code>HttpProducer</code> send all the fault response back.	false	boolean
connectionClose (producer)	Specifies whether a Connection Close header must be added to HTTP Request. By default <code>connectionClose</code> is false.	false	boolean
cookieHandler (producer)	Configure a cookie handler to maintain a HTTP session		CookieHandler
copyHeaders (producer)	If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).	true	boolean

Name	Description	Default	Type
httpClientMaxThreads (producer)	To set a value for maximum number of threads in HttpClient thread pool. This setting override any setting configured on component level. Notice that both a min and max size must be configured. If not set it default to max 254 threads used in Jettys thread pool.	254	Integer
httpClientMinThreads (producer)	To set a value for minimum number of threads in HttpClient thread pool. This setting override any setting configured on component level. Notice that both a min and max size must be configured. If not set it default to min 8 threads used in Jettys thread pool.	8	Integer
httpMethod (producer)	Configure the HTTP method to use. The HttpMethod header cannot override this option if set.		HttpMethods
ignoreResponseBody (producer)	If this option is true, The http producer won't read response body and cache the input stream	false	boolean
preserveHostHeader (producer)	If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL's for a proxied service	false	boolean
throwExceptionOnFailure (producer)	Option to disable throwing the HttpOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.	true	boolean
httpClient (producer)	Sets a shared HttpClient to use for all producers created by this endpoint. By default each producer will use a new http client, and not share. Important: Make sure to handle the lifecycle of the shared client, such as stopping the client, when it is no longer in use. Camel will call the start method on the client to ensure its started when this endpoint creates a producer. This options should only be used in special circumstances.		HttpClient

Name	Description	Default	Type
httpClientParameters (producer)	Configuration of Jetty's HttpClient. For example, setting <code>httpClient.idleTimeout=30000</code> sets the idle timeout to 30 seconds. And <code>httpClient.timeout=30000</code> sets the request timeout to 30 seconds, in case you want to timeout sooner if you have long running request/response calls.		Map
jettyBinding (producer)	To use a custom JettyHttpBinding which be used to customize how a response should be written for the producer.		JettyHttpBinding
jettyBindingRef (producer)	Deprecated To use a custom JettyHttpBinding which be used to customize how a response should be written for the producer.		String
okStatusCodeRange (producer)	The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.	200-299	String
urlRewrite (producer)	Deprecated Refers to a custom <code>org.apache.camel.component.http.UrlRewrite</code> which allows you to rewrite urls when you bridge/proxy endpoints. See more details at http://camel.apache.org/urlrewrite.html		UrlRewrite
mapHttpMessageBody (advanced)	If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.	true	boolean
mapHttpMessageFormUrlEncodedBody (advanced)	If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.	true	boolean
mapHttpMessageHeaders (advanced)	If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.	true	boolean
synchronous (advanced)	Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).	false	boolean
proxyAuthScheme (proxy)	Proxy authentication scheme to use		String

Name	Description	Default	Type
<code>proxyHost</code> (proxy)	Proxy hostname to use		String
<code>proxyPort</code> (proxy)	Proxy port to use		int
<code>authHost</code> (security)	Authentication host to use with NTML		String
<code>sslContextParameters</code> (security)	To configure security using <code>SSLContextParameters</code>		<code>SSLContextParameters</code>

173.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 34 options, which are listed below.

Name	Description	Default	Type
<code>camel.component.jetty.allow-java-serialized-object</code>	Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.	false	Boolean
<code>camel.component.jetty.continuation-timeout</code>	Allows to set a timeout in millis when using Jetty as consumer (server). By default Jetty uses 30000. You can use a value of = 0 to never expire. If a timeout occurs then the request will be expired and Jetty will return back a http error 503 to the client. This option is only in use when using Jetty with the Asynchronous Routing Engine.	30000	Long
<code>camel.component.jetty.enable-jmx</code>	If this option is true, Jetty JMX support will be enabled for this endpoint.	false	Boolean
<code>camel.component.jetty.enabled</code>	Enable jetty component	true	Boolean
<code>camel.component.jetty.error-handler</code>	This option is used to set the <code>ErrorHandler</code> that Jetty server uses. The option is a <code>org.eclipse.jetty.server.handler.ErrorHandler</code> type.		String
<code>camel.component.jetty.header-filter-strategy</code>	To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type.		String

Name	Description	Default	Type
<code>camel.component.jetty.http-binding</code>	Not to be used - use <code>JettyHttpBinding</code> instead. The option is a <code>org.apache.camel.http.common.HttpBinding</code> type.		String
<code>camel.component.jetty.http-client-max-threads</code>	To set a value for maximum number of threads in <code>HttpClient</code> thread pool. Notice that both a min and max size must be configured.		Integer
<code>camel.component.jetty.http-client-min-threads</code>	To set a value for minimum number of threads in <code>HttpClient</code> thread pool. Notice that both a min and max size must be configured.		Integer
<code>camel.component.jetty.http-configuration</code>	Jetty component does not use <code>HttpConfiguration</code> . The option is a <code>org.apache.camel.http.common.HttpConfiguration</code> type.		String
<code>camel.component.jetty.jetty-http-binding</code>	To use a custom <code>org.apache.camel.component.jetty.JettyHttpBinding</code> , which are used to customize how a response should be written for the producer. The option is a <code>org.apache.camel.component.jetty.JettyHttpBinding</code> type.		String
<code>camel.component.jetty.keystore</code>	Specifies the location of the Java keystore file, which contains the Jetty server's own X.509 certificate in a key entry.		String
<code>camel.component.jetty.max-threads</code>	To set a value for maximum number of threads in server thread pool. Notice that both a min and max size must be configured.		Integer
<code>camel.component.jetty.mbean-container</code>	To use an existing configured <code>org.eclipse.jetty.jmx.MBeanContainer</code> if JMX is enabled that Jetty uses for registering mbeans. The option is a <code>org.eclipse.jetty.jmx.MBeanContainer</code> type.		String
<code>camel.component.jetty.min-threads</code>	To set a value for minimum number of threads in server thread pool. Notice that both a min and max size must be configured.		Integer
<code>camel.component.jetty.proxy-host</code>	To use an http proxy to configure the hostname.		String
<code>camel.component.jetty.proxy-port</code>	To use an http proxy to configure the port number.		Integer

Name	Description	Default	Type
<code>camel.component.jetty.request-buffer-size</code>	Allows to configure a custom value of the request buffer size on the Jetty connectors.		Integer
<code>camel.component.jetty.request-header-size</code>	Allows to configure a custom value of the request header size on the Jetty connectors.		Integer
<code>camel.component.jetty.resolve-property-placeholders</code>	Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.	true	Boolean
<code>camel.component.jetty.response-buffer-size</code>	Allows to configure a custom value of the response buffer size on the Jetty connectors.		Integer
<code>camel.component.jetty.response-header-size</code>	Allows to configure a custom value of the response header size on the Jetty connectors.		Integer
