#### **Abstract**

This document explains how to allocate storage to core services and hosted applications in Red Hat OpenShift Data Foundation.

# **Table of Contents**

MAKING OPEN SOURCE MORE INCLUSIVE	. 4
PROVIDING FEEDBACK ON RED HAT DOCUMENTATION	. 5
CHAPTER 1. OVERVIEW	. 6
CHAPTER 2. STORAGE CLASSES	. 7
2.1. CREATING STORAGE CLASSES AND POOLS	7
2.2. STORAGE CLASS FOR PERSISTENT VOLUME ENCRYPTION	8
2.2.1. Access configuration for Key Management System (KMS)	8
2.2.1.1. Configuring access to KMS using vaulttokens	9
2.2.1.2. Configuring access to KMS using Thales CipherTrust Manager	9
2.2.1.3. Configuring access to KMS using vaulttenantsa	10
2.2.2. Creating a storage class for persistent volume encryption	13
2.2.2.1. Overriding Vault connection details using tenant ConfigMap	16
CHAPTER 3. BLOCK POOLS	18
3.1. CREATING A BLOCK POOL	18
3.2. UPDATING AN EXISTING POOL	18
3.3. DELETING A POOL	19
CHAPTER 4. CONFIGURE STORAGE FOR OPENSHIFT CONTAINER PLATFORM SERVICES	20
4.1. CONFIGURING IMAGE REGISTRY TO USE OPENSHIFT DATA FOUNDATION	20
4.2. USING MULTICLOUD OBJECT GATEWAY AS OPENSHIFT IMAGE REGISTRY BACKEND STORAGE	22
4.3. CONFIGURING MONITORING TO USE OPENSHIFT DATA FOUNDATION	25
4.4. OVERPROVISION LEVEL POLICY CONTROL [TECHNOLOGY PREVIEW]	28
4.5. CLUSTER LOGGING FOR OPENSHIFT DATA FOUNDATION	29
4.5.1. Configuring persistent storage	30
4.5.2. Configuring cluster logging to use OpenShift data Foundation	30
CHAPTER 5. BACKING OPENSHIFT CONTAINER PLATFORM APPLICATIONS WITH OPENSHIFT DATA FOUNDATION	34
CHAPTER 6. ADDING FILE AND OBJECT STORAGE TO AN EXISTING EXTERNAL OPENSHIFT DATA	
FOUNDATION CLUSTER	36
CHAPTER 7. HOW TO USE DEDICATED WORKER NODES FOR RED HAT OPENSHIFT DATA FOUNDATION	١
	40
7.1. ANATOMY OF AN INFRASTRUCTURE NODE	40
7.2. MACHINE SETS FOR CREATING INFRASTRUCTURE NODES	40
7.3. MANUAL CREATION OF INFRASTRUCTURE NODES	41
7.4. TAINT A NODE FROM THE USER INTERFACE	42
CHAPTER 8. MANAGING PERSISTENT VOLUME CLAIMS	43
8.1. CONFIGURING APPLICATION PODS TO USE OPENSHIFT DATA FOUNDATION	43
8.2. VIEWING PERSISTENT VOLUME CLAIM REQUEST STATUS	44
8.3. REVIEWING PERSISTENT VOLUME CLAIM REQUEST EVENTS	45
8.4. EXPANDING PERSISTENT VOLUME CLAIMS	45
8.5. DYNAMIC PROVISIONING	47
8.5.1. About dynamic provisioning	47
8.5.2. Dynamic provisioning in OpenShift Data Foundation	47
8.5.3. Available dynamic provisioning plug-ins	48
CHAPTER 9. RECLAIMING SPACE ON TARGET VOLUMES	50
9.1. ENABLING RECLAIM SPACE OPERATION USING ANNOTATING PERSISTENTVOLUMECLAIMS	50

9.2. ENABLING RECLAIM SPACE OPERATION USING RECLAIMSPACEJOB 9.3. ENABLING RECLAIM SPACE OPERATION USING RECLAIMSPACECRONJOB	52 53
CHAPTER 10. VOLUME SNAPSHOTS	55
10.1. CREATING VOLUME SNAPSHOTS	55
10.2. RESTORING VOLUME SNAPSHOTS	56
10.3. DELETING VOLUME SNAPSHOTS	58
CHAPTER 11. VOLUME CLONING	60
11.1. CREATING A CLONE	60
CHAPTER 12. MANAGING CONTAINER STORAGE INTERFACE (CSI) COMPONENT PLACEMENTS	61
CHAPTER 13. CREATING EXPORTS USING NFS [TECHNOLOGY PREVIEW]	63
13.1. ENABLING THE NFS FEATURE	63
13.2. CREATING NFS EXPORTS	64
13.3. CONSUMING NFS EXPORTS IN-CLUSTER	65
13.4. CONSUMING NES EXPORTS EXTERNALLY FROM THE OPENSHIET CLUSTER	66

# MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright's message.

# PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

We appreciate your input on our documentation. Do let us know how we can make it better.

To give feedback, create a Bugzilla ticket:

- 1. Go to the Bugzilla website.
- 2. In the **Component** section, choose **documentation**.
- 3. Fill in the **Description** field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
- 4. Click Submit Bug.

# **CHAPTER 1. OVERVIEW**

Read this document to understand how to create, configure, and allocate storage to core services or hosted applications in Red Hat OpenShift Data Foundation.

- Chapter 2, Storage classes shows you how to create custom storage classes.
- Chapter 3, *Block pools* provides you with information on how to create, update and delete block pools.
- Chapter 4, Configure storage for OpenShift Container Platform services shows you how to use OpenShift Data Foundation for core OpenShift Container Platform services.
- Chapter 5, Backing OpenShift Container Platform applications with OpenShift Data Foundation provides information about how to configure OpenShift Container Platform applications to use OpenShift Data Foundation.
- Adding file and object storage to an existing external OpenShift Data Foundation cluster
- Chapter 7, How to use dedicated worker nodes for Red Hat OpenShift Data Foundation provides information about how to use dedicated worker nodes for Red Hat OpenShift Data Foundation.
- Chapter 8, Managing Persistent Volume Claims provides information about managing Persistent Volume Claim requests, and automating the fulfillment of those requests.
- Chapter 9, Reclaiming space on target volumes shows you how to reclaim the actual available storage space.
- Chapter 10, Volume Snapshots shows you how to create, restore, and delete volume snapshots.
- Chapter 11, Volume cloning shows you how to create volume clones.
- Chapter 12, Managing container storage interface (CSI) component placements provides information about setting tolerations to bring up container storage interface component on the nodes.

# **CHAPTER 2. STORAGE CLASSES**

The OpenShift Data Foundation operator installs a default storage class depending on the platform in use. This default storage class is owned and controlled by the operator and it cannot be deleted or modified. However, you can create custom storage classes to use other storage resources or to offer a different behavior to applications.

#### NOTE

Custom storage classes are not supported for *external mode* OpenShift Data Foundation clusters.

# 2.1. CREATING STORAGE CLASSES AND POOLS

You can create a storage class using an existing pool or you can create a new pool for the storage class while creating it.

#### **Prerequisites**

• Ensure that you are logged into the OpenShift Container Platform web console and OpenShift Data Foundation cluster is in **Ready** state.

#### **Procedure**

- Click Storage → StorageClasses.
- 2. Click Create Storage Class
- 3. Enter the storage class Name and Description.
- 4. **Reclaim Policy** is set to **Delete** as the default option. Use this setting. If you change the reclaim policy to **Retain** in the storage class, the persistent volume (PV) remains in **Released** state even after deleting the persistent volume claim (PVC).
- 5. **Volume binding mode** is set to **WaitForConsumer** as the default option. If you choose the **Immediate** option, then the PV gets created immediately when creating the PVC.
- 6. Select **RBD** or **CephFS Provisioner** as the plugin for provisioning the persistent volumes.
- 7. Select an existing **Storage Pool** from the list or create a new pool.

#### **NOTE**

The 2-way replication data protection policy is only supported for the non-default RBD pool. 2-way replication can be used by creating an additional pool. To know about Data Availability and Integrity considerations for replica 2 pools, see Knowledgebase Customer Solution Article .

#### Create new pool

- a. Click Create New Pool
- b. Enter Pool name.

- c. Choose 2-way-Replication or 3-way-Replication as the Data Protection Policy.
- d. Select **Enable compression** if you need to compress the data.

  Enabling compression can impact application performance and might prove ineffective when data to be written is already compressed or encrypted. Data written before enabling compression will not be compressed.
- e. Click Create to create the new storage pool.
- f. Click **Finish** after the pool is created.
- 8. Optional: Select **Enable Encryption** checkbox.
- 9. Click **Create** to create the storage class.

# 2.2. STORAGE CLASS FOR PERSISTENT VOLUME ENCRYPTION

Persistent volume (PV) encryption guarantees isolation and confidentiality between tenants (applications). Before you can use PV encryption, you must create a storage class for PV encryption. Persistent volume encryption is only available for RBD PVs.

OpenShift Data Foundation supports storing encryption passphrases in HashiCorp Vault and Thales CipherTrust Manager. You can create an encryption enabled storage class using an external key management system (KMS) for persistent volume encryption. You need to configure access to the KMS before creating the storage class.

#### **NOTE**

For PV encryption, you must have a valid Red Hat OpenShift Data Foundation Advanced subscription. For more information, see the knowledgebase article on OpenShift Data Foundation subscriptions.

# 2.2.1. Access configuration for Key Management System (KMS)

Based on your use case, you need to configure access to KMS using one of the following ways:

- Using **vaulttokens**: allows users to authenticate using a token
- Using **Thales CipherTrust Manager**: uses Key Management Interoperability Protocol (KMIP)
- Using vaulttenantsa (Technology Preview): allows users to use serviceaccounts to authenticate with Vault

#### **IMPORTANT**

Accessing the KMS using **vaulttenantsa** is a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information, see Technology Preview Features Support Scope.

### 2.2.1.1. Configuring access to KMS using vaulttokens

#### **Prerequisites**

- The OpenShift Data Foundation cluster is in **Ready** state.
- On the external key management system (KMS),
  - Ensure that a policy with a token exists and the key value backend path in **Vault** is enabled.
  - Ensure that you are using signed certificates on your **Vault** servers.

#### **Procedure**

Create a secret in the tenant's namespace.

- 1. In the OpenShift Container Platform web console, navigate to Workloads → Secrets
- 2. Click Create → Key/value secret
- 3. Enter Secret Name as ceph-csi-kms-token.
- 4. Enter **Key** as **token**.
- 5. Enter **Value**.

It is the token from Vault. You can either click **Browse** to select and upload the file containing the token or enter the token directly in the text box.

6. Click Create.

#### **NOTE**

The token can be deleted only after all the encrypted PVCs using the **ceph-csi-kms-token** have been deleted.

## 2.2.1.2. Configuring access to KMS using Thales CipherTrust Manager

#### **Prerequisites**

- Create a KMIP client if one does not exist. From the user interface, select KMIP → Client Profile → Add Profile.
  - a. Add the CipherTrust username to the Common Name field during profile creation.
- Create a token be navigating to KMIP → Registration Token → New Registration Token.
   Copy the token for the next step.
- 3. To register the client, navigate to KMIP → Registered Clients → Add Client. Specify the Name. Paste the Registration Token from the previous step, then click Save.
- 4. Download the Private Key and Client Certificate by clicking **Save Private Key** and **Save Certificate** respectively.
- 5. To create a new KMIP interface, navigate to **Admin Settings** → **Interfaces** → **Add Interface**.
  - a. Select KMIP Key Management Interoperability Protocol and click Next.

- b. Select a free Port.
- c. Select Network Interface as all.
- d. Select Interface Mode as TLS, verify client cert, user name taken from client cert, auth request is optional.
- e. (Optional) You can enable hard delete to delete both meta-data and material when the key is deleted. It is disabled by default.
- f. Select the CA to be used, and click Save.
- 6. To get the server CA certificate, click on the Action menu ( i) on the right of the newly created interface, and click **Download Certificate**.

#### **Procedure**

- 1. To create a key to act as the Key Encryption Key (KEK) for storageclass encryption, follow the steps below:
  - a. Navigate to **Keys** → **Add Key**.
  - b. Enter Key Name.
  - c. Set the Algorithm and Size to AES and 256 respectively.
  - d. Enable Create a key in Pre-Active state and set the date and time for activation.
  - e. Ensure that Encrypt and Decrypt are enabled under Key Usage.
  - f. Copy the ID of the newly created Key to be used as the Unique Identifier during deployment.

#### 2.2.1.3. Configuring access to KMS using vaulttenantsa

#### **Prerequisites**

- The OpenShift Data Foundation cluster is in **Ready** state.
- On the external key management system (KMS),
  - Ensure that a policy exists and the key value backend path in Vault is enabled.
  - Ensure that you are using signed certificates on your Vault servers.
- Create the following serviceaccount in the tenant namespace as shown below:

\$ cat <<EOF | oc create -f apiVersion: v1 kind: ServiceAccount metadata: name: ceph-csi-vault-sa

**EOF** 

#### **Procedure**

You need to configure the Kubernetes authentication method before OpenShift Data Foundation can authenticate with and start using **Vault**. The following instructions create and configure **serviceAccount**, **ClusterRole**, and **ClusterRoleBinding** required to allow OpenShift Data Foundation to authenticate with **Vault**.

1. Apply the following YAML to your Openshift cluster:

```
apiVersion: v1
kind: ServiceAccount
metadata:
 name: rbd-csi-vault-token-review
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: rbd-csi-vault-token-review
rules:
 - apiGroups: ["authentication.k8s.io"]
  resources: ["tokenreviews"]
  verbs: ["create", "get", "list"]
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: rbd-csi-vault-token-review
subjects:
- kind: ServiceAccount
  name: rbd-csi-vault-token-review
  namespace: openshift-storage
roleRef:
 kind: ClusterRole
 name: rbd-csi-vault-token-review
 apiGroup: rbac.authorization.k8s.io
```

2. Create a secret for serviceaccount token and CA certificate.

```
$ cat <<EOF | oc create -f -
apiVersion: v1
kind: Secret
metadata:
name: rbd-csi-vault-token-review-token
namespace: openshift-storage
annotations:
kubernetes.io/service-account.name: "rbd-csi-vault-token-review"
type: kubernetes.io/service-account-token
data: {}
EOF
```

3. Get the token and the CA certificate from the secret.

```
$ SA_JWT_TOKEN=$(oc -n openshift-storage get secret rbd-csi-vault-token-review-token -o jsonpath="{.data['token']}" | base64 --decode; echo)

$ SA_CA_CRT=$(oc -n openshift-storage get secret rbd-csi-vault-token-review-token -o jsonpath="{.data['ca\.crt']}" | base64 --decode; echo)
```

4. Retrieve the OpenShift cluster endpoint.

```
$ OCP_HOST=$(oc config view --minify --flatten -o jsonpath="{.clusters[0].cluster.server}")
```

5. Use the information collected in the previous steps to set up the kubernetes authentication method in Vault as shown:

```
$ vault auth enable kubernetes
$ vault write auth/kubernetes/config \
    token_reviewer_jwt="$SA_JWT_TOKEN" \
    kubernetes_host="$OCP_HOST" \
    kubernetes_ca_cert="$SA_CA_CRT"
```

6. Create a role in Vault for the tenant namespace:

```
$ vault write "auth/kubernetes/role/csi-kubernetes" bound_service_account_names="ceph-
csi-vault-sa" bound_service_account_namespaces=<tenant_namespace> policies=
<policy_name_in_vault>
```

**csi-kubernetes** is the default role name that OpenShift Data Foundation looks for in Vault. The default service account name in the tenant namespace in the OpenShift Data Foundation cluster is **ceph-csi-vault-sa**. These default values can be overridden by creating a ConfigMap in the tenant namespace.

For more information about overriding the default names, see Overriding Vault connection details using tenant ConfigMap.

#### Sample YAML

 To create a storageclass that uses the vaulttenantsa method for PV encrytpion, you must either edit the existing ConfigMap or create a ConfigMap named csi-kms-connection-details that will hold all the information needed to establish the connection with Vault.
 The sample yaml given below can be used to update or create the csi-kms-connection-detail ConfigMap:

```
apiVersion: v1
data:
 vault-tenant-sa: |-
   "encryptionKMSType": "vaulttenantsa",
   "vaultAddress": "<https://hostname_or_ip_of_vault_server:port>",
   "vaultTLSServerName": "<vault TLS server name>",
   "vaultAuthPath": "/v1/auth/kubernetes/login",
   "vaultAuthNamespace": "<vault auth namespace name>"
   "vaultNamespace": "<vault namespace name>",
   "vaultBackendPath": "<vault backend path name>",
   "vaultCAFromSecret": "<secret containing CA cert>",
   "vaultClientCertFromSecret": "<secret containing client cert>",
   "vaultClientCertKeyFromSecret": "<secret containing client private key>",
   "tenantSAName": "<service account name in the tenant namespace>"
  }
metadata:
 name: csi-kms-connection-details
```

encryptio nKMSTyp e	Set to <b>vaulttenantsa</b> to use service accounts for authentication with vault.
vaultAddr ess	The hostname or IP address of the vault server with the port number.
vaultTLSS erverNam e	(Optional) The vault TLS server name
vaultAuth Path	(Optional) The path where kubernetes auth method is enabled in Vault. The default path is <b>kubernetes</b> . If the auth method is enabled in a different path other than <b>kubernetes</b> , this variable needs to be set as "/v1/auth/ <path>/login".</path>
vaultAuth Namespa ce	(Optional) The Vault namespace where kubernetes auth method is enabled.
vaultNam espace	(Optional) The Vault namespace where the backend path being used to store the keys exists
vaultBack endPath	The backend path in Vault where the encryption keys will be stored
vaultCAFr omSecret	The secret in the OpenShift Data Foundation cluster containing the CA certificate from Vault
vaultClien tCertFrom Secret	The secret in the OpenShift Data Foundation cluster containing the client certificate from Vault
vaultClien tCertKeyF romSecret	The secret in the OpenShift Data Foundation cluster containing the client private key from Vault
tenantSA Name	(Optional) The service account name in the tenant namespace. The default value is <b>ceph-csi-vault-sa</b> . If a different name is to be used, this variable has to be set accordingly.

# 2.2.2. Creating a storage class for persistent volume encryption

# **Prerequisites**

Based on your use case, you must ensure to configure access to KMS for one of the following:

- Using **vaulttokens**: Ensure to configure access as described in Configuring access to KMS using **vaulttokens**
- Using **vaulttenantsa** (Technology Preview): Ensure to configure access as described in Configuring access to KMS using **vaulttenantsa**

 Using Thales CipherTrust Manager (using KMIP): Ensure to configure access as described in Configuring access to KMS using Thales CipherTrust Manager

#### **Procedure**

- 1. In the OpenShift Web Console, navigate to **Storage** → **StorageClasses**.
- 2. Click Create Storage Class
- 3. Enter the storage class Name and Description.
- 4. Select either **Delete** or **Retain** for the **Reclaim Policy**. By default, **Delete** is selected.
- 5. Select either Immediate or WaitForFirstConsumer as the Volume binding mode WaitForConsumer is set as the default option.
- 6. Select **RBD Provisioner openshift-storage.rbd.csi.ceph.com** which is the plugin used for provisioning the persistent volumes.
- 7. Select **Storage Pool** where the volume data is stored from the list or create a new pool.
- 8. Select the **Enable encryption** checkbox. There are two options available to set the KMS connection details:
  - Select existing KMS connection: Select an existing KMS connection from the drop-down list. The list is populated from the the connection details available in the csi-kms-connection-details ConfigMap.
    - a. Select the **Provider** from the drop down.
    - b. Select the **Key service** for the given provider from the list.
  - Create new KMS connection This is applicable for vaulttokens and Thales CipherTrust Manager (using KMIP) only.
    - a. Select the Key Management Service Provider.
    - b. If Vault is selected as the Key Management Service Provider, follow these steps:
      - i. Enter a unique **Connection Name**, host **Address** of the Vault server ('https://<hostname or ip>'), Port number and **Token**.
      - ii. Expand **Advanced Settings** to enter additional settings and certificate details based on your **Vault** configuration:
        - A. Enter the Key Value secret path in **Backend Path** that is dedicated and unique to OpenShift Data Foundation.
        - B. Optional: Enter TLS Server Name and Vault Enterprise Namespace.
        - C. Upload the respective PEM encoded certificate file to provide the CA Certificate, Client Certificate and Client Private Key.
        - D. Click Save.
    - c. If **Thales CipherTrust Manager (using KMIP)** is selected as the **Key Management Service Provider**, follow these steps:

- i. Enter a unique Connection Name.
- ii. In the **Address** and **Port** sections, enter the IP of Thales CipherTrust Manager and the port where the KMIP interface is enabled. For example, **Address**: 123.34.3.2, **Port**: 5696.
- iii. Upload the Client Certificate, CA certificate, and Client Private Key.
- iv. Enter the **Unique Identifier** for the key to be used for encryption and decryption, generated above.
- v. The **TLS Server** field is optional and used when there is no DNS entry for the KMIP endpoint. For example, **kmip\_all\_<port>.ciphertrustmanager.local**.
- d. Click Save.
- e. Click Create.
- 9. Edit the ConfigMap to add the **vaultBackend** parameter if the HashiCorp Vault setup does not allow automatic detection of the Key/Value (KV) secret engine API version used by the backend path.

#### NOTE

**vaultBackend** is an optional parameters that is added to the configmap to specify the version of the KV secret engine API associated with the backend path. Ensure that the value matches the KV secret engine API version that is set for the backend path, otherwise it might result in a failure during persistent volume claim (PVC) creation.

- a. Identify the encryptionKMSID being used by the newly created storage class.
  - i. On the OpenShift Web Console, navigate to **Storage** → **Storage Classes**.
  - ii. Click the **Storage class** name → **YAML** tab.
  - iii. Capture the **encryptionKMSID** being used by the storage class. Example:

encryptionKMSID: 1-vault

- b. On the OpenShift Web Console, navigate to **Workloads** → **ConfigMaps**.
- c. To view the KMS connection details, click **csi-kms-connection-details**.
- d. Edit the ConfigMap.
  - i. Click Action menu ( i ) → Edit ConfigMap.
  - ii. Add the **vaultBackend** parameter depending on the backend that is configured for the previously identified **encryptionKMSID**.

You can assign **kv** for KV secret engine API, version 1 and **kv-v2** for KV secret engine API, version 2.

Example:

```
kind: ConfigMap
apiVersion: v1
metadata:
name: csi-kms-connection-details
[...]
data:
1-vault: |-
{
    "encryptionKMSType": "vaulttokens",
    "kmsServiceName": "1-vault",
    [...]
    "vaultBackend": "kv-v2"
}
2-vault: |-
{
    "encryptionKMSType": "vaulttenantsa",
    [...]
    "vaultBackend": "kv"
}
```

iii. Click Save

#### **Next steps**

• The storage class can be used to create encrypted persistent volumes. For more information, see managing persistent volume claims.

#### **IMPORTANT**

Red Hat works with the technology partners to provide this documentation as a service to the customers. However, Red Hat does not provide support for the HashiCorp product. For technical assistance with this product, contact HashiCorp.

#### 2.2.2.1. Overriding Vault connection details using tenant ConfigMap

The Vault connections details can be reconfigured per tenant by creating a ConfigMap in the Openshift namespace with configuration options that differ from the values set in the **csi-kms-connection-details** ConfigMap in the **openshift-storage** namespace. The ConfigMap needs to be located in the tenant namespace. The values in the ConfigMap in the tenant namespace will override the values set in the **csi-kms-connection-details** ConfigMap for the encrypted Persistent Volumes created in that namespace.

#### **Procedure**

- 1. Ensure that you are in the tenant namespace.
- 2. Click on Workloads → ConfigMaps.
- 3. Click on Create ConfigMap.
- 4. The following is a sample yaml. The values to be overidden for the given tenant namespace can be specified under the **data** section as shown below:

---

apiVersion: v1 kind: ConfigMap

metadata:

name: ceph-csi-kms-config

data:

vaultAddress: "<vault\_address:port>"
vaultBackendPath: "<backend\_path>"

vaultTLSServerName: "<vault\_tls\_server\_name>"

vaultNamespace: "<vault\_namespace>"

5. After the yaml is edited, click on **Create**.

## **CHAPTER 3. BLOCK POOLS**

The OpenShift Data Foundation operator installs a default set of storage pools depending on the platform in use. These default storage pools are owned and controlled by the operator and it cannot be deleted or modified. With OpenShift Container Platform, you can create multiple custom storage pools which map to storage classes that provide the following features:

- Enable applications with their own high availability to use persistent volumes with two replicas, potentially improving application performance.
- Save space for persistent volume claims using storage classes with compression enabled.

#### NOTE

Multiple block pools are not supported for external mode OpenShift Data Foundation clusters.

## 3.1. CREATING A BLOCK POOL

#### **Prerequisites**

• You must be logged into the OpenShift Container Platform web console as an administrator.

#### **Procedure**

- 1. Click Storage → Data Foundation
- 2. In the **Storage systems** tab, select the storage system and then click the **BlockPools** tab.
- 3. Click Create Block Pool
- 4. Enter Pool name.

#### NOTE

Using 2-way replication data protection policy is not supported for the default pool. However, you can use 2-way replication if you are creating an additional pool.

- 5. Select **Data protection policy** as either **2-way Replication** or **3-way Replication**.
- 6. Select Volume Type.
- 7. Optional: Select **Enable compression** checkbox if you need to compress the data. Enabling compression can impact application performance and might prove ineffective when data to be written is already compressed or encrypted. Data written before enabling compression will not be compressed.
- 8. Click Create.

#### 3.2. UPDATING AN EXISTING POOL

#### **Prerequisites**

• You must be logged into the OpenShift Container Platform web console as an administrator.

#### **Procedure**

- 1. Click Storage → Data Foundation
- 2. In the Storage systems tab, select the storage system and then click BlockPools.
- 3. Click the Action Menu ( ; ) at the end the pool you want to update.
- 4. Click Edit Block Pool.
- 5. Modify the form details as follows:

#### **NOTE**

Using 2-way replication data protection policy is not supported for the default pool. However, you can use 2-way replication if you are creating an additional pool.

- a. Change the **Data protection policy** to either 2-way Replication or 3-way Replication.
- Enable or disable the compression option.
   Enabling compression can impact application performance and might prove ineffective when data to be written is already compressed or encrypted. Data written before enabling compression will not be compressed.
- 6. Click Save.

### 3.3. DELETING A POOL

Use this procedure to delete a pool in OpenShift Data Foundation.

#### **Prerequisites**

• You must be logged into the OpenShift Container Platform web console as an administrator.

#### Procedure

- 1. . Click Storage → Data Foundation
- 2. In the **Storage systems** tab, select the storage system and then click the **BlockPools** tab.
- 3. Click the Action Menu ( : ) at the end the pool you want to delete.
- 4. Click Delete Block Pool
- 5. Click **Delete** to confirm the removal of the Pool.

#### **NOTE**

A pool cannot be deleted when it is bound to a PVC. You must detach all the resources before performing this activity.

# CHAPTER 4. CONFIGURE STORAGE FOR OPENSHIFT CONTAINER PLATFORM SERVICES

You can use OpenShift Data Foundation to provide storage for OpenShift Container Platform services such as image registry, monitoring, and logging.

The process for configuring storage for these services depends on the infrastructure used in your OpenShift Data Foundation deployment.

#### **WARNING**

Always ensure that you have plenty of storage capacity for these services. If the storage for these critical services runs out of space, the cluster becomes inoperable and very difficult to recover.

Red Hat recommends configuring shorter curation and retention intervals for these services. See Configuring the Curator schedule and the Modifying retention time for Prometheus metrics data of *Monitoring* guide in the OpenShift Container Platform documentation for details.

If you do run out of storage space for these services, contact Red Hat Customer Support.

# 4.1. CONFIGURING IMAGE REGISTRY TO USE OPENSHIFT DATA FOUNDATION

OpenShift Container Platform provides a built in Container Image Registry which runs as a standard workload on the cluster. A registry is typically used as a publication target for images built on the cluster as well as a source of images for workloads running on the cluster.

Follow the instructions in this section to configure OpenShift Data Foundation as storage for the Container Image Registry. On AWS, it is not required to change the storage for the registry. However, it is recommended to change the storage to OpenShift Data Foundation Persistent Volume for vSphere and Bare metal platforms.

#### **WARNING**

This process does not migrate data from an existing image registry to the new image registry. If you already have container images in your existing registry, back up your registry before you complete this process, and re-register your images when this process is complete.

#### **Prerequisites**

• You have administrative access to OpenShift Web Console.

- OpenShift Data Foundation Operator is installed and running in the openshift-storage
  namespace. In OpenShift Web Console, click Operators → Installed Operators to view installed
  operators.
- Image Registry Operator is installed and running in the openshift-image-registry namespace. In OpenShift Web Console, click Administration → Cluster Settings → Cluster Operators to view cluster operators.
- A storage class with provisioner openshift-storage.cephfs.csi.ceph.com is available. In OpenShift Web Console, click Storage → StorageClasses to view available storage classes.

#### Procedure

- 1. Create a Persistent Volume Claim for the Image Registry to use.
  - a. In the OpenShift Web Console, click Storage → Persistent Volume Claims
  - b. Set the Project to openshift-image-registry.
  - c. Click Create Persistent Volume Claim
    - i. From the list of available storage classes retrieved above, specify the **Storage Class** with the provisioner **openshift-storage.cephfs.csi.ceph.com**.
    - ii. Specify the Persistent Volume Claim Name, for example, ocs4registry.
    - iii. Specify an Access Mode of Shared Access (RWX).
    - iv. Specify a Size of at least 100 GB.
    - v. Click **Create**.

      Wait until the status of the new Persistent Volume Claim is listed as **Bound**.
- 2. Configure the cluster's Image Registry to use the new Persistent Volume Claim.
  - a. Click Administration → Custom Resource Definitions
  - b. Click the **Config** custom resource definition associated with the **imageregistry.operator.openshift.io** group.
  - c. Click the **Instances** tab.
  - d. Beside the cluster instance, click the **Action Menu ( : )** → **Edit Config**.
  - e. Add the new Persistent Volume Claim as persistent storage for the Image Registry.
    - i. Add the following under **spec:**, replacing the existing **storage:** section if necessary.

```
storage:
pvc:
claim: <new-pvc-name>
```

For example:

```
storage:
pvc:
claim: ocs4registry
```

- ii. Click Save.
- 3. Verify that the new configuration is being used.
  - a. Click Workloads → Pods.
  - b. Set the Project to openshift-image-registry.
  - c. Verify that the new **image-registry-**\* pod appears with a status of **Running**, and that the previous **image-registry-**\* pod terminates.
  - d. Click the new **image-registry-\*** pod to view pod details.
  - e. Scroll down to **Volumes** and verify that the **registry-storage** volume has a **Type** that matches your new Persistent Volume Claim, for example, **ocs4registry**.

# 4.2. USING MULTICLOUD OBJECT GATEWAY AS OPENSHIFT IMAGE REGISTRY BACKEND STORAGE

You can use Multicloud Object Gateway (MCG) as OpenShift Container Platform (OCP) Image Registry backend storage in an on-prem OCP deployment starting from OCP 4.11.

To configure MCG as a backend storage for the OCP image registry, follow the steps mentioned in the procedure.

#### **Prerequisites**

- Administrative access to OCP Web Console.
- A running OpenShift Data Foundation cluster with MCG.

#### Procedure

- 1. Create **ObjectBucketClaim** by following the steps in Creating Object Bucket Claim.
- 2. Create an image-registry-private-configuration-user secret.
  - a. Go to the OpenShift web-console.
  - b. Click ObjectBucketClaim -→ ObjectBucketClaim Data.
  - c. In the ObjectBucketClaim data, look for MCG access key and MCG secret key in the openshift-image-registry namespace.
  - d. Create the secret using the following command:

\$ oc create secret generic image-registry-private-configuration-user --from-literal=REGISTRY\_STORAGE\_S3\_ACCESSKEY=<MCG Accesskey> --from-literal=REGISTRY\_STORAGE\_S3\_SECRETKEY=<MCG Secretkey> --namespace openshift-image-registry

3. Change the status of **managementState** of Image Registry Operator to **Managed**.

\$ oc patch configs.imageregistry.operator.openshift.io/cluster --type merge -p '{"spec": {"managementState": "Managed"}}'

- 4. Edit the **spec.storage** section of Image Registry Operator configuration file:
  - a. Get the **unique-bucket-name** and **regionEndpoint** under the **Object Bucket Claim Data** section from the Web Console **OR** you can also get the information on regionEndpoint and unique-bucket-name from the command:

\$ oc describe noobaa

- b. Add regionEndpoint as http://<Endpoint-name>:<port> if the
  - storageclass is **ceph-rgw** storageclass and the
  - endpoint points to the internal SVC from the openshift-storage namespace.
- c. An **image-registry** pod spawns after you make the changes to the Operator registry configuration file.

```
$ oc edit configs.imageregistry.operator.openshift.io -n openshift-image-registry
apiVersion: imageregistry.operator.openshift.io/v1
kind: Config
metadata:
[..]
name: cluster
spec:
[..]
storage:
s3:

bucket: <Unique-bucket-name>

region: us-east-1 (Use this region as default)

regionEndpoint: https://<Endpoint-name>:<port>
virtualHostedStyle: false
```

5. Reset the image registry settings to default.

\$ oc get pods -n openshift-image-registry

#### Verification steps

 Run the following command to check if you have configured the MCG as OpenShift Image Registry backend storage successfully.

\$ oc get pods -n openshift-image-registry

#### **Example output**

\$ oc get pods -n openshift-image-registry

NAME READY STATUS RESTARTS AGE

cluster-image-registry-operator-56d78bc5fb-bxcgv 2/2 Running 0 44d

image-pruner-1605830400-29r7k		0/1 Completed 0			10h

# 4.3. CONFIGURING MONITORING TO USE OPENSHIFT DATA FOUNDATION

OpenShift Data Foundation provides a monitoring stack that comprises of Prometheus and Alert Manager.

Follow the instructions in this section to configure OpenShift Data Foundation as storage for the monitoring stack.

#### **IMPORTANT**

Monitoring will not function if it runs out of storage space. Always ensure that you have plenty of storage capacity for monitoring.

Red Hat recommends configuring a short retention interval for this service. See the Modifying retention time for Prometheus metrics data of Monitoring guide in the OpenShift Container Platform documentation for details.

#### **Prerequisites**

- You have administrative access to OpenShift Web Console.
- OpenShift Data Foundation Operator is installed and running in the openshift-storage
  namespace. In the OpenShift Web Console, click Operators → Installed Operators to view
  installed operators.
- Monitoring Operator is installed and running in the openshift-monitoring namespace. In the OpenShift Web Console, click Administration → Cluster Settings → Cluster Operators to view cluster operators.
- A storage class with provisioner openshift-storage.rbd.csi.ceph.com is available. In the OpenShift Web Console, click Storage → StorageClasses to view available storage classes.

#### **Procedure**

- 1. In the OpenShift Web Console, go to Workloads → Config Maps.
- 2. Set the Project dropdown to openshift-monitoring.
- 3. Click Create Config Map.
- 4. Define a new **cluster-monitoring-config** Config Map using the following example.

Replace the content in angle brackets (<, >) with your own values, for example, **retention: 24h** or **storage: 40Gi**.

Replace the **storageClassName** with the **storageclass** that uses the provisioner **openshift-storage.rbd.csi.ceph.com**. In the example given below the name of the **storageclass** is **ocs-storagecluster-ceph-rbd**.

### Example cluster-monitoring-config Config Map

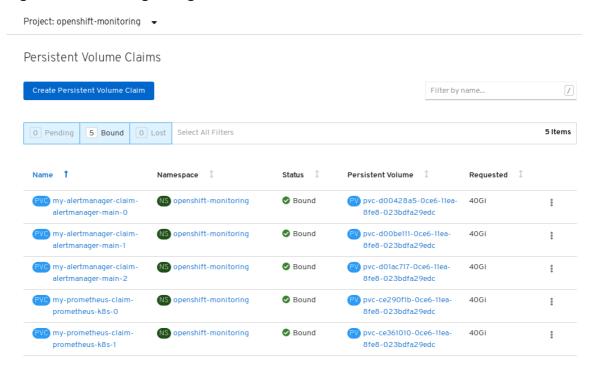

```
apiVersion: v1
kind: ConfigMap
metadata:
 name: cluster-monitoring-config
 namespace: openshift-monitoring
 config.yaml: |
   prometheusK8s:
    retention: <time to retain monitoring files, e.g. 24h>
    volumeClaimTemplate:
      metadata:
       name: ocs-prometheus-claim
      spec:
       storageClassName: ocs-storagecluster-ceph-rbd
       resources:
        requests:
         storage: <size of claim, e.g. 40Gi>
   alertmanagerMain:
    volumeClaimTemplate:
      metadata:
       name: ocs-alertmanager-claim
       storageClassName: ocs-storagecluster-ceph-rbd
       resources:
        requests:
         storage: <size of claim, e.g. 40Gi>
```

5. Click **Create** to save and create the Config Map.

#### Verification steps

- 1. Verify that the Persistent Volume Claims are bound to the pods.
  - a. Go to Storage → Persistent Volume Claims
  - b. Set the Project dropdown to openshift-monitoring.
  - c. Verify that 5 Persistent Volume Claims are visible with a state of **Bound**, attached to three **alertmanager-main-\*** pods, and two **prometheus-k8s-\*** pods.

Figure 4.1. Monitoring storage created and bound

- 2. Verify that the new **alertmanager-main-\*** pods appear with a state of **Running**.
  - a. Go to Workloads → Pods.
  - b. Click the new **alertmanager-main-\*** pods to view the pod details.
  - c. Scroll down to **Volumes** and verify that the volume has a **Type**, **ocs-alertmanager-claim** that matches one of your new Persistent Volume Claims, for example, **ocs-alertmanager-claim-alertmanager-main-0**.

Figure 4.2. Persistent Volume Claims attached to alertmanager-main-\* pod

- 3. Verify that the new **prometheus-k8s-\*** pods appear with a state of **Running**.
  - a. Click the new **prometheus-k8s-\*** pods to view the pod details.
  - b. Scroll down to **Volumes** and verify that the volume has a **Type**, **ocs-prometheus-claim** that matches one of your new Persistent Volume Claims, for example, **ocs-prometheus-claim-prometheus-k8s-0**.

Figure 4.3. Persistent Volume Claims attached toprometheus-k8s-\* pod

# 4.4. OVERPROVISION LEVEL POLICY CONTROL [TECHNOLOGY PREVIEW]

Overprovision control is a mechanism that enables you to define a quota on the amount of Persistent Volume Claims (PVCs) consumed from a storage cluster, based on the specific application namespace.

When you enable the overprovision control mechanism, it prevents you from overprovisioning the PVCs consumed from the storage cluster. OpenShift provides flexibility for defining constraints that limit the aggregated resource consumption at cluster scope with the help of **ClusterResourceQuota**. For more information see, OpenShift ClusterResourceQuota.

With overprovision control, a **ClusteResourceQuota** is initiated, and you can set the storage capacity limit for each storage class. The alarm triggers when 80% of the capacity limit is consumed.

#### **NOTE**

Overprovision level policy control is a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process. For more information, refer to Technology Preview Features Support Scope.

For more information about OpenShift Data Foundation deployment, refer to Product Documentation and select the deployment procedure according to the platform.

#### **Prerequisites**

• Ensure that the OpenShift Data Foundation cluster is created.

#### Procedure

- 1. Deploy **storagecluster** either from the command line interface or the user interface.
- 2. Label the application namespace.

apiVersion: v1 kind: Namespace metadata:

name: <desired\_name>

labels:

storagequota: <desired\_label>

#### <desired name>

Specify a name for the application namespace, for example, **quota-rbd**.

### <desired\_label>

Specify a label for the storage quota, for example, **storagequota1**.

3. Edit the **storagecluster** to set the quota limit on the storage class.

\$ oc edit storagecluster -n openshift-storage <ocs\_storagecluster\_name>

<ocs\_storagecluster\_name>

Specify the name of the storage cluster.

4. Add an entry for Overprovision Control with the desired hard limit into the **StorageCluster.Spec**:

```
apiVersion: ocs.openshift.io/v1
kind: StorageCluster
spec:
[...]
overprovisionControl:
- capacity: <desired_quota_limit>
    storageClassName: <storage_class_name>
    quotaName: <desired_quota_name>
    selector:
    labels:
        matchLabels:
        storagequota: <desired_label>
[...]
```

#### <desired\_quota\_limit>

Specify a desired quota limit for the storage class, for example, 27Ti.

#### <storage\_class\_name>

Specify the name of the storage class for which you want to set the quota limit, for example, ocs-storagecluster-ceph-rbd.

<desired quota name>

Specify a name for the storage quota, for example, quota1.

<desired\_label>

Specify a label for the storage quota, for example, **storagequota1**.

- 5. Save the modified **storagecluster**.
- 6. Verify that the **clusterresourcequota** is defined.

#### NOTE

Expect the **clusterresourcequota** with the **quotaName** that you defined in the previous step, for example, **quota1**.

\$ oc get clusterresourcequota -A

\$ oc describe clusterresourcequota -A

#### 4.5. CLUSTER LOGGING FOR OPENSHIFT DATA FOUNDATION

You can deploy cluster logging to aggregate logs for a range of OpenShift Container Platform services. For information about how to deploy cluster logging, see Deploying cluster logging.

Upon initial OpenShift Container Platform deployment, OpenShift Data Foundation is not configured by default and the OpenShift Container Platform cluster will solely rely on default storage available from the nodes. You can edit the default configuration of OpenShift logging (ElasticSearch) to be backed by OpenShift Data Foundation to have OpenShift Data Foundation backed logging (Elasticsearch).

#### **IMPORTANT**

Always ensure that you have plenty of storage capacity for these services. If you run out of storage space for these critical services, the logging application becomes inoperable and very difficult to recover.

Red Hat recommends configuring shorter curation and retention intervals for these services. See Cluster logging curator in the OpenShift Container Platform documentation for details.

If you run out of storage space for these services, contact Red Hat Customer Support.

# 4.5.1. Configuring persistent storage

You can configure a persistent storage class and size for the Elasticsearch cluster using the storage class name and size parameters. The Cluster Logging Operator creates a Persistent Volume Claim for each data node in the Elasticsearch cluster based on these parameters. For example:

```
spec:
  logStore:
  type: "elasticsearch"
  elasticsearch:
    nodeCount: 3
    storage:
    storageClassName: "ocs-storagecluster-ceph-rbd"
    size: "200G"
```

This example specifies that each data node in the cluster will be bound to a Persistent Volume Claim that requests **200GiB** of **ocs-storagecluster-ceph-rbd** storage. Each primary shard will be backed by a single replica. A copy of the shard is replicated across all the nodes and are always available and the copy can be recovered if at least two nodes exist due to the single redundancy policy. For information about Elasticsearch replication policies, see Configuring replication policy for the log store .

#### **NOTE**

Omission of the storage block will result in a deployment backed by default storage. For example:

```
spec:
  logStore:
  type: "elasticsearch"
  elasticsearch:
   nodeCount: 3
  storage: {}
```

For more information, see Configuring persistent storage for the log store and Configuring the log store for emptyDir storage.

### 4.5.2. Configuring cluster logging to use OpenShift data Foundation

Follow the instructions in this section to configure OpenShift Data Foundation as storage for the OpenShift cluster logging.

#### **NOTE**

You can obtain all the logs when you configure logging for the first time in OpenShift Data Foundation. However, after you uninstall and reinstall logging, the old logs are removed and only the new logs are processed.

### **Prerequisites**

- You have administrative access to OpenShift Web Console.
- OpenShift Data Foundation Operator is installed and running in the openshift-storage namespace.
- Cluster logging Operator is installed and running in the **openshift-logging** namespace.

#### **Procedure**

- Click Administration → Custom Resource Definitions from the left pane of the OpenShift Web Console.
- 2. On the Custom Resource Definitions page, click ClusterLogging.
- 3. On the Custom Resource Definition Overview page, select **View Instances** from the Actions menu or click the **Instances** Tab.
- 4. On the Cluster Logging page, click **Create Cluster Logging**. You might have to refresh the page to load the data.
- 5. In the YAML, replace the storageClassName with the storageclass that uses the provisioner openshift-storage.rbd.csi.ceph.com. In the example given below the name of the storageclass is ocs-storagecluster-ceph-rbd:

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
 name: "instance"
 namespace: "openshift-logging"
spec:
 managementState: "Managed"
 logStore:
  type: "elasticsearch"
  elasticsearch:
   nodeCount: 3
   storage:
    storageClassName: ocs-storagecluster-ceph-rbd
    size: 200G # Change as per your requirement
   redundancyPolicy: "SingleRedundancy"
 visualization:
  type: "kibana"
  kibana:
   replicas: 1
 curation:
  type: "curator"
  curator:
   schedule: "30 3 * * * "
 collection:
```

logs: type: "fluentd" fluentd: {}

If you have tainted the OpenShift Data Foundation nodes, you must add toleration to enable scheduling of the daemonset pods for logging.

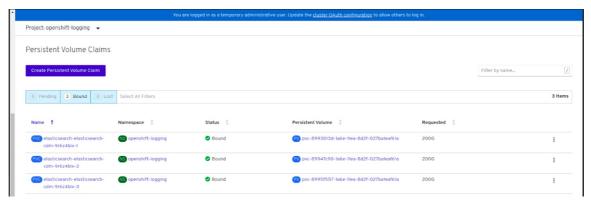

spec:
[...]
collection:
logs:
fluentd:
tolerations:
- effect: NoSchedule
key: node.ocs.openshift.io/storage
value: 'true'
type: fluentd

6. Click Save.

#### Verification steps

- 1. Verify that the Persistent Volume Claims are bound to the **elasticsearch** pods.
  - a. Go to Storage → Persistent Volume Claims
  - b. Set the **Project** dropdown to **openshift-logging**.
  - c. Verify that Persistent Volume Claims are visible with a state of **Bound**, attached to **elasticsearch-\*** pods.

Figure 4.4. Cluster logging created and bound

- 2. Verify that the new cluster logging is being used.
  - a. Click Workload → Pods.
  - b. Set the Project to openshift-logging.
  - c. Verify that the new **elasticsearch-\*** pods appear with a state of **Running**.
  - d. Click the new **elasticsearch-\*** pod to view pod details.

- e. Scroll down to **Volumes** and verify that the elasticsearch volume has a **Type** that matches your new Persistent Volume Claim, for example, **elasticsearch-elasticsearch-cdm-9r624biv-3**.
- f. Click the Persistent Volume Claim name and verify the storage class name in the PersistentVolumeClaim Overview page.

#### **NOTE**

Make sure to use a shorter curator time to avoid PV full scenario on PVs attached to Elasticsearch pods.

You can configure Curator to delete Elasticsearch data based on retention settings. It is recommended that you set the following default index data retention of 5 days as a default.

```
config.yaml: |
openshift-storage:
delete:
days: 5
```

For more details, see Configuring log retention time.

#### NOTE

To uninstall the cluster logging backed by Persistent Volume Claim, use the procedure removing the cluster logging operator from OpenShift Data Foundation in the uninstall chapter of the respective deployment guide.

# CHAPTER 5. BACKING OPENSHIFT CONTAINER PLATFORM APPLICATIONS WITH OPENSHIFT DATA FOUNDATION

You cannot directly install OpenShift Data Foundation during the OpenShift Container Platform installation. However, you can install OpenShift Data Foundation on an existing OpenShift Container Platform by using the Operator Hub and then configure the OpenShift Container Platform applications to be backed by OpenShift Data Foundation.

# **Prerequisites**

- OpenShift Container Platform is installed and you have administrative access to OpenShift Web Console.
- OpenShift Data Foundation is installed and running in the **openshift-storage** namespace.

#### **Procedure**

- 1. In the OpenShift Web Console, perform one of the following:
  - Click Workloads → Deployments.
     In the Deployments page, you can do one of the following:
    - Select any existing deployment and click **Add Storage** option from the **Action** menu (:).
    - Create a new deployment and then add storage.
      - i. Click Create Deployment to create a new deployment.
      - ii. Edit the YAML based on your requirement to create a deployment.
      - iii. Click Create.
      - iv. Select **Add Storage** from the **Actions** drop-down menu on the top right of the page.
  - Click Workloads → Deployment Configs
     In the Deployment Configs page, you can do one of the following:
    - Select any existing deployment and click Add Storage option from the Action menu
       (:).
    - Create a new deployment and then add storage.
      - i. Click Create Deployment Config to create a new deployment.
      - ii. Edit the **YAML** based on your requirement to create a deployment.
      - iii. Click Create.
      - iv. Select **Add Storage** from the **Actions** drop-down menu on the top right of the page.
- 2. In the Add Storage page, you can choose one of the following options:
  - Click the **Use existing claim** option and select a suitable PVC from the drop-down list.

- Click the **Create new claim** option.
  - a. Select the appropriate **CephFS** or **RBD** storage class from the **Storage Class** dropdown list.
  - b. Provide a name for the Persistent Volume Claim.
  - c. Select ReadWriteOnce (RWO) or ReadWriteMany (RWX) access mode.

#### **NOTE**

ReadOnlyMany (ROX) is deactivated as it is not supported.

d. Select the size of the desired storage capacity.

#### **NOTE**

You can expand the block PVs but cannot reduce the storage capacity after the creation of Persistent Volume Claim.

- 3. Specify the mount path and subpath (if required) for the mount path volume inside the container.
- 4. Click Save.

## Verification steps

- 1. Depending on your configuration, perform one of the following:
  - Click Workloads → Deployments.
  - Click Workloads → Deployment Configs
- 2. Set the Project as required.
- 3. Click the deployment for which you added storage to display the deployment details.
- 4. Scroll down to **Volumes** and verify that your deployment has a **Type** that matches the Persistent Volume Claim that you assigned.
- 5. Click the Persistent Volume Claim name and verify the storage class name in the Persistent Volume Claim Overview page.

# CHAPTER 6. ADDING FILE AND OBJECT STORAGE TO AN EXISTING EXTERNAL OPENSHIFT DATA FOUNDATION CLUSTER

When OpenShift Data Foundation is configured in external mode, there are several ways to provide storage for persistent volume claims and object bucket claims.

- Persistent volume claims for block storage are provided directly from the external Red Hat Ceph Storage cluster.
- Persistent volume claims for file storage can be provided by adding a Metadata Server (MDS) to the external Red Hat Ceph Storage cluster.
- Object bucket claims for object storage can be provided either by using the Multicloud Object Gateway or by adding the Ceph Object Gateway to the external Red Hat Ceph Storage cluster.

Use the following process to add file storage (using Metadata Servers) or object storage (using Ceph Object Gateway) or both to an external OpenShift Data Foundation cluster that was initially deployed to provide only block storage.

# **Prerequisites**

- You have OpenShift Data Foundation 4.12 installed and running on the OpenShift Container Platform version 4.12 or above. Also, the OpenShift Data Foundation Cluster in external mode is in the **Ready** state.
- Your external Red Hat Ceph Storage cluster is configured with one or both of the following:
  - a Ceph Object Gateway (RGW) endpoint that can be accessed by the OpenShift Container Platform cluster for object storage
  - a Metadata Server (MDS) pool for file storage
- Ensure that you know the parameters used with the **ceph-external-cluster-details-exporter.py** script during external OpenShift Data Foundation cluster deployment.

#### **Procedure**

1. Download the OpenShift Data Foundation version of the **ceph-external-cluster-details-exporter.py** python script using the following command:

oc get csv \$(oc get csv -n openshift-storage | grep ocs-operator | awk '{print \$1}') -n openshift-storage -o

jsonpath='{.metadata.annotations.external\.features\.ocs\.openshift\.io/export-script}' | base64 --decode > ceph-external-cluster-details-exporter.py

2. Update permission caps on the external Red Hat Ceph Storage cluster by running **ceph-external-cluster-details-exporter.py** on any client node in the external Red Hat Ceph Storage cluster. You may need to ask your Red Hat Ceph Storage administrator to do this.

# python3 ceph-external-cluster-details-exporter.py --upgrade \

- --run-as-user=ocs-client-name \
- --rgw-pool-prefix rgw-pool-prefix

#### --run-as-user

The client name used during OpenShift Data Foundation cluster deployment. Use the default client name **client.healthchecker** if a different client name was not set.

# --rgw-pool-prefix

The prefix used for the Ceph Object Gateway pool. This can be omitted if the default prefix is used.

- 3. Generate and save configuration details from the external Red Hat Ceph Storage cluster.
  - a. Generate configuration details by running **ceph-external-cluster-details-exporter.py** on any client node in the external Red Hat Ceph Storage cluster.

# python3 ceph-external-cluster-details-exporter.py --rbd-data-pool-name *rbd-block-pool-name* --monitoring-endpoint *ceph-mgr-prometheus-exporter-endpoint* --monitoring-endpoint-port *ceph-mgr-prometheus-exporter-port* --run-as-user *ocs-client-name* --rgw-endpoint *rgw-endpoint* --rgw-pool-prefix *rgw-pool-prefix* 

# --monitoring-endpoint

Is optional. It accepts comma separated list of IP addresses of active and standby mgrs reachable from the OpenShift Container Platform cluster. If not provided, the value is automatically populated.

#### --monitoring-endpoint-port

Is optional. It is the port associated with the ceph-mgr Prometheus exporter specified by **--monitoring-endpoint**. If not provided, the value is automatically populated.

#### --run-as-user

The client name used during OpenShift Data Foundation cluster deployment. Use the default client name client.healthchecker if a different client name was not set.

#### --rgw-endpoint

Provide this parameter to provision object storage through Ceph Object Gateway for OpenShift Data Foundation. (optional parameter)

#### --rgw-pool-prefix

The prefix used for the Ceph Object Gateway pool. This can be omitted if the default prefix is used.

User permissions are updated as shown:

caps: [mgr] allow command config

caps: [mon] allow r, allow command quorum\_status, allow command version caps: [osd] allow rwx pool=default.rgw.meta, allow r pool=.rgw.root, allow rw

pool=default.rgw.control, allow rx pool=default.rgw.log, allow x

pool-default.igw.control, allow ix pool-default.igw

pool=default.rgw.buckets.index

## NOTE

Ensure that all the parameters (including the optional arguments) except the Ceph Object Gateway details (if provided), are the same as what was used during the deployment of OpenShift Data Foundation in external mode.

b. Save the output of the script in an external-cluster-config.json file.
 The following example output shows the generated configuration changes in bold text.

[{"name": "rook-ceph-mon-endpoints", "kind": "ConfigMap", "data": {"data": "xxx.xxx.xxx.xxx", "maxMonId": "0", "mapping": "{}"}}, {"name": "rook-ceph-mon", "kind": "Secret", "data": {"admin-secret": "admin-secret", "fsid": "<fs-id>", "mon-secret": "mon-secret"}}, {"name": "rook-ceph-operator-creds", "kind": "Secret", "data": {"userID": " <user-id>", "userKey": "<user-key>"}}, {"name": "rook-csi-rbd-node", "kind": "Secret", "data": {"userID": "csi-rbd-node", "userKey": "<user-key>"}}, {"name": "ceph-rbd", "kind": "StorageClass", "data": {"pool": "<pool>"}}, {"name": "monitoring-endpoint", "kind": "CephCluster", "data": {"MonitoringEndpoint": "xxx.xxx.xxx.xxx", "MonitoringPort": "xxxx"}}, {"name": "rook-ceph-dashboard-link", "kind": "Secret", "data": {"userID": "cephdashboard-link", "userKey": "<user-key>"}}, {"name": "rook-csi-rbd-provisioner", "kind": "Secret", "data": {"userID": "csi-rbd-provisioner", "userKey": "<user-key>"}}, {"name": "rook-csi-cephfs-provisioner", "kind": "Secret", "data": {"adminID": "csi-cephfsprovisioner", "adminKey": "<admin-key>"}}, {"name": "rook-csi-cephfs-node", "kind": "Secret", "data": {"adminID": "csi-cephfs-node", "adminKey": "<admin-key>"}}, {"name": "cephfs", "kind": "StorageClass", "data": {"fsName": "cephfs", "pool": "cephfs data"}}, {"name": "ceph-rgw", "kind": "StorageClass", "data": {"endpoint": "xxx.xxx.xxx.xxx.xxx", "poolPrefix": "default"}}, {"name": "rgw-admin-ops-user", "kind": "Secret", "data": {"accessKey": "<access-key>", "secretKey": "<secret-key>"}}]

- 4. Upload the generated JSON file.
  - a. Log in to the OpenShift web console.
  - b. Click Workloads → Secrets.
  - c. Set project to openshift-storage.
  - d. Click on rook-ceph-external-cluster-details.
  - e. Click Actions (;) → Edit Secret
  - f. Click Browse and upload the external-cluster-config.json file.
  - g. Click Save.

#### Verification steps

- To verify that the OpenShift Data Foundation cluster is healthy and data is resilient, navigate to Storage → Data foundation → Storage Systems tab and then click on the storage system name.
  - On the **Overview** → **Block** and **File** tab, check the Status card to confirm that the *Storage* Cluster has a green tick indicating it is healthy.
- If you added a Metadata Server for file storage:
  - a. Click **Workloads** → **Pods** and verify that **csi-cephfsplugin-\*** pods are created new and are in the **Running** state.
  - b. Click Storage → Storage Classes and verify that the ocs-external-storagecluster-cephfs storage class is created.
- If you added the Ceph Object Gateway for object storage:
  - a. Click Storage → Storage Classes and verify that the ocs-external-storagecluster-cephrgw storage class is created.

- b. To verify that the OpenShift Data Foundation cluster is healthy and data is resilient, navigate to **Storage** → **Data foundation** → **Storage Systems** tab and then click on the storage system name.
- c. Click the **Object** tab and confirm *Object Service* and *Data resiliency* has a green tick indicating it is healthy.

# CHAPTER 7. HOW TO USE DEDICATED WORKER NODES FOR RED HAT OPENSHIFT DATA FOUNDATION

Any Red Hat OpenShift Container Platform subscription requires an OpenShift Data Foundation subscription. However, you can save on the OpenShift Container Platform subscription costs if you are using infrastructure nodes to schedule OpenShift Data Foundation resources.

It is important to maintain consistency across environments with or without Machine API support. Because of this, it is highly recommended in all cases to have a special category of nodes labeled as either worker or infra or have both roles. See the Section 7.3, "Manual creation of infrastructure nodes" section for more information.

# 7.1. ANATOMY OF AN INFRASTRUCTURE NODE

Infrastructure nodes for use with OpenShift Data Foundation have a few attributes. The **infra** node-role label is required to ensure the node does not consume RHOCP entitlements. The **infra** node-role label is responsible for ensuring only OpenShift Data Foundation entitlements are necessary for the nodes running OpenShift Data Foundation.

Labeled with node-role.kubernetes.io/infra

Adding an OpenShift Data Foundation taint with a **NoSchedule** effect is also required so that the **infra** node will only schedule OpenShift Data Foundation resources.

Tainted with node.ocs.openshift.io/storage="true"

The label identifies the RHOCP node as an **infra** node so that RHOCP subscription cost is not applied. The taint prevents non OpenShift Data Foundation resources to be scheduled on the tainted nodes.

#### **NOTE**

Adding storage taint on nodes might require toleration handling for the other **daemonset** pods such as **openshift-dns daemonset**. For information about how to manage the tolerations, see Knowledgebase article: https://access.redhat.com/solutions/6592171.

Example of the taint and labels required on infrastructure node that will be used to run OpenShift Data Foundation services:

spec:

taints:

- effect: NoSchedule

key: node.ocs.openshift.io/storage

value: "true" metadata:

creationTimestamp: null

labels:

node-role.kubernetes.io/worker: "" node-role.kubernetes.io/infra: ""

cluster.ocs.openshift.io/openshift-storage: ""

# 7.2. MACHINE SETS FOR CREATING INFRASTRUCTURE NODES

If the Machine API is supported in the environment, then labels should be added to the templates for

the Machine Sets that will be provisioning the infrastructure nodes. Avoid the anti-pattern of adding labels manually to nodes created by the machine API. Doing so is analogous to adding labels to pods created by a deployment. In both cases, when the pod/node fails, the replacement pod/node will not have the appropriate labels.

#### **NOTE**

In EC2 environments, you will need three machine sets, each configured to provision infrastructure nodes in a distinct availability zone (such as us-east-2a, us-east-2b, us-east-2c). Currently, OpenShift Data Foundation does not support deploying in more than three availability zones.

The following Machine Set template example creates nodes with the appropriate taint and labels required for infrastructure nodes. This will be used to run OpenShift Data Foundation services.

template:

metadata:

creationTimestamp: null

labels:

machine.openshift.io/cluster-api-cluster: kb-s25vf machine.openshift.io/cluster-api-machine-role: worker machine.openshift.io/cluster-api-machine-type: worker

machine.openshift.io/cluster-api-machineset: kb-s25vf-infra-us-west-2a

spec:

taints:

- effect: NoSchedule

key: node.ocs.openshift.io/storage

value: "true" metadata:

creationTimestamp: null

labels:

node-role.kubernetes.io/infra: ""

cluster.ocs.openshift.io/openshift-storage: ""

## **IMPORTANT**

If you add a taint to the infrastructure nodes, you also need to add tolerations to the taint for other workloads, for example, the fluentd pods. For more information, see the Red Hat Knowledgebase solution Infrastructure Nodes in OpenShift 4.

# 7.3. MANUAL CREATION OF INFRASTRUCTURE NODES

Only when the Machine API is not supported in the environment should labels be directly applied to nodes. Manual creation requires that at least 3 RHOCP worker nodes are available to schedule OpenShift Data Foundation services, and that these nodes have sufficient CPU and memory resources. To avoid the RHOCP subscription cost, the following is required:

oc label node <node> node-role.kubernetes.io/infra=""
oc label node <node> cluster.ocs.openshift.io/openshift-storage=""

Adding a **NoSchedule** OpenShift Data Foundation taint is also required so that the **infra** node will only schedule OpenShift Data Foundation resources and repel any other non-OpenShift Data Foundation workloads.

oc adm taint node <node> node.ocs.openshift.io/storage="true":NoSchedule

#### WARNING

Do not remove the node-role node-role.kubernetes.io/worker=""

The removal of the **node-role.kubernetes.io/worker=""** can cause issues unless changes are made both to the OpenShift scheduler and to MachineConfig resources.

If already removed, it should be added again to each **infra** node. Adding node-role **node-role.kubernetes.io/infra=""** and OpenShift Data Foundation taint is sufficient to conform to entitlement exemption requirements.

# 7.4. TAINT A NODE FROM THE USER INTERFACE

This section explains the procedure to taint nodes after the OpenShift Data Foundation deployment.

#### Procedure

- 1. In the OpenShift Web Console, click **Compute** → **Nodes**, and then select the node which has to be tainted.
- 2. In the **Details** page click on **Edit taints**.
- 3. Enter the values in the **Key** <node.ocs.openshift.io/storage>, **Value** <true> and in the **Effect**<Noschedule> field.
- 4. Click Save.

#### Verification steps

- Follow the steps to verify that the node has tainted successfully:
  - Navigate to Compute → Nodes.
  - Select the node to verify its status, and then click on the **YAML** tab.
  - In the **specs** section check the values of the following parameters:

Taints:

Key: node.ocs.openshift.io/storage

Value: true

Effect: Noschedule

#### Additional resources

For more information, refer to Creating the OpenShift Data Foundation cluster on VMware vSphere .

# **CHAPTER 8. MANAGING PERSISTENT VOLUME CLAIMS**

# 8.1. CONFIGURING APPLICATION PODS TO USE OPENSHIFT DATA FOUNDATION

Follow the instructions in this section to configure OpenShift Data Foundation as storage for an application pod.

# **Prerequisites**

- You have administrative access to OpenShift Web Console.
- OpenShift Data Foundation Operator is installed and running in the openshift-storage
  namespace. In OpenShift Web Console, click Operators → Installed Operators to view installed
  operators.
- The default storage classes provided by OpenShift Data Foundation are available. In OpenShift Web Console, click Storage → StorageClasses to view default storage classes.

#### **Procedure**

- 1. Create a Persistent Volume Claim (PVC) for the application to use.
  - a. In OpenShift Web Console, click Storage → Persistent Volume Claims
  - b. Set the **Project** for the application pod.
  - c. Click Create Persistent Volume Claim
    - i. Specify a **Storage Class** provided by OpenShift Data Foundation.
    - ii. Specify the PVC Name, for example, myclaim.
    - iii. Select the required Access Mode.

## NOTE

The Access Mode, **Shared access (RWX)** is not supported in IBM FlashSystem.

- iv. For Rados Block Device (RBD), if the **Access mode** is ReadWriteOnce (**RWO**), select the required **Volume mode**. The default volume mode is **Filesystem**.
- v. Specify a **Size** as per application requirement.
- vi. Click Create and wait until the PVC is in **Bound** status.
- 2. Configure a new or existing application pod to use the new PVC.
  - For a new application pod, perform the following steps:
    - i. Click Workloads →Pods.
    - ii. Create a new application pod.

iii. Under the **spec:** section, add **volumes:** section to add the new PVC as a volume for the application pod.

#### volumes:

name: <volume\_name> persistentVolumeClaim: claimName: <pvc\_name>

For example:

#### volumes:

 name: mypd persistentVolumeClaim: claimName: myclaim

- For an existing application pod, perform the following steps:
  - i. Click Workloads → Deployment Configs.
  - ii. Search for the required deployment config associated with the application pod.
  - iii. Click on its Action menu ( : ) → Edit Deployment Config.
  - iv. Under the **spec:** section, add **volumes:** section to add the new PVC as a volume for the application pod and click **Save**.

#### volumes:

name: <volume\_name> persistentVolumeClaim: claimName: <pvc name>

For example:

#### volumes:

 name: mypd persistentVolumeClaim: claimName: myclaim

- 3. Verify that the new configuration is being used.
  - a. Click Workloads → Pods.
  - b. Set the **Project** for the application pod.
  - c. Verify that the application pod appears with a status of **Running**.
  - d. Click the application pod name to view pod details.
  - e. Scroll down to **Volumes** section and verify that the volume has a **Type** that matches your new Persistent Volume Claim, for example, **myclaim**.

# 8.2. VIEWING PERSISTENT VOLUME CLAIM REQUEST STATUS

Use this procedure to view the status of a PVC request.

#### **Prerequisites**

• Administrator access to OpenShift Data Foundation.

#### **Procedure**

- 1. Log in to OpenShift Web Console.
- 2. Click Storage → Persistent Volume Claims
- 3. Search for the required PVC name by using the **Filter** textbox. You can also filter the list of PVCs by Name or Label to narrow down the list
- 4. Check the **Status** column corresponding to the required PVC.
- 5. Click the required Name to view the PVC details.

# 8.3. REVIEWING PERSISTENT VOLUME CLAIM REQUEST EVENTS

Use this procedure to review and address Persistent Volume Claim (PVC) request events.

# Prerequisites

• Administrator access to OpenShift Web Console.

#### **Procedure**

- 1. In the OpenShift Web Console, click **Storage** → **Data Foundation**
- 2. In the **Storage systems** tab, select the storage system and then click **Overview** → **Block and** File.
- 3. Locate the **Inventory** card to see the number of PVCs with errors.
- 4. Click Storage → Persistent Volume Claims
- 5. Search for the required PVC using the **Filter** textbox.
- 6. Click on the PVC name and navigate to **Events**
- 7. Address the events as required or as directed.

## 8.4. EXPANDING PERSISTENT VOLUME CLAIMS

OpenShift Data Foundation 4.6 onwards has the ability to expand Persistent Volume Claims providing more flexibility in the management of persistent storage resources.

Expansion is supported for the following Persistent Volumes:

- PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on Ceph File System (CephFS) for volume mode Filesystem.
- PVC with ReadWriteOnce (RWO) access that is based on Ceph RADOS Block Devices (RBDs) with volume mode **Filesystem**.

PVC with ReadWriteOnce (RWO) access that is based on Ceph RADOS Block Devices (RBDs) with volume mode Block.

#### **NOTE**

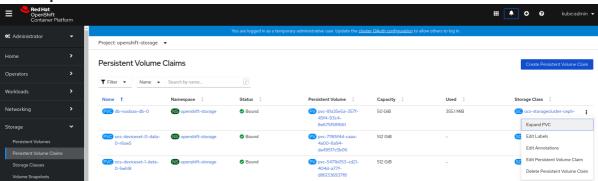

PVC expansion is not supported for OSD, MON and encrypted PVCs.

# **Prerequisites**

• Administrator access to OpenShift Web Console.

#### Procedure

- 1. In OpenShift Web Console, navigate to **Storage** → **Persistent Volume Claims**.
- 2. Click the Action Menu ( : ) next to the Persistent Volume Claim you want to expand.
- 3. Click Expand PVC:

4. Select the new size of the Persistent Volume Claim, then click **Expand**:

# **Expand Persistent Volume Claim**

Increase the capacity of claim **db-noobaa-db-0**. This can be a time-consuming process.

5. To verify the expansion, navigate to the PVC's details page and verify the **Capacity** field has the correct size requested.

#### **NOTE**

When expanding PVCs based on Ceph RADOS Block Devices (RBDs), if the PVC is not already attached to a pod the **Condition type** is **FileSystemResizePending** in the PVC's details page. Once the volume is mounted, filesystem resize succeeds and the new size is reflected in the **Capacity** field.

## 8.5. DYNAMIC PROVISIONING

# 8.5.1. About dynamic provisioning

The StorageClass resource object describes and classifies storage that can be requested, as well as provides a means for passing parameters for dynamically provisioned storage on demand. StorageClass objects can also serve as a management mechanism for controlling different levels of storage and access to the storage. Cluster Administrators (**cluster-admin**) or Storage Administrators (**storage-admin**) define and create the StorageClass objects that users can request without needing any intimate knowledge about the underlying storage volume sources.

The OpenShift Container Platform persistent volume framework enables this functionality and allows administrators to provision a cluster with persistent storage. The framework also gives users a way to request those resources without having any knowledge of the underlying infrastructure.

Many storage types are available for use as persistent volumes in OpenShift Container Platform. Storage plug-ins might support static provisioning, dynamic provisioning or both provisioning types.

# 8.5.2. Dynamic provisioning in OpenShift Data Foundation

Red Hat OpenShift Data Foundation is software-defined storage that is optimised for container environments. It runs as an operator on OpenShift Container Platform to provide highly integrated and simplified persistent storage management for containers.

OpenShift Data Foundation supports a variety of storage types, including:

- Block storage for databases
- Shared file storage for continuous integration, messaging, and data aggregation
- Object storage for archival, backup, and media storage

Version 4 uses Red Hat Ceph Storage to provide the file, block, and object storage that backs persistent volumes, and Rook.io to manage and orchestrate provisioning of persistent volumes and claims. NooBaa provides object storage, and its Multicloud Gateway allows object federation across multiple cloud environments (available as a Technology Preview).

In OpenShift Data Foundation 4, the Red Hat Ceph Storage Container Storage Interface (CSI) driver for RADOS Block Device (RBD) and Ceph File System (CephFS) handles the dynamic provisioning requests. When a PVC request comes in dynamically, the CSI driver has the following options:

- Create a PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on Ceph RBDs with volume mode **Block**
- Create a PVC with ReadWriteOnce (RWO) access that is based on Ceph RBDs with volume mode Filesystem

 Create a PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on CephFS for volume mode Filesystem

The judgment of which driver (RBD or CephFS) to use is based on the entry in the **storageclass.yaml** file.

# 8.5.3. Available dynamic provisioning plug-ins

OpenShift Container Platform provides the following provisioner plug-ins, which have generic implementations for dynamic provisioning that use the cluster's configured provider's API to create new storage resources:

Storage type	Provisioner plug-in name	Notes
OpenStack Cinder	kubernetes.io/cinder	
AWS Elastic Block Store (EBS)	kubernetes.io/aws-ebs	For dynamic provisioning when using multiple clusters in different zones, tag each node with Key=kubernetes.io/cluster/ <c luster_name="">,Value= <cluster_id> where <cluster_name> and <cluster_id> are unique per cluster.</cluster_id></cluster_name></cluster_id></c>
AWS Elastic File System (EFS)		Dynamic provisioning is accomplished through the EFS provisioner pod and not through a provisioner plug-in.
Azure Disk	kubernetes.io/azure-disk	
Azure File	kubernetes.io/azure-file	The <b>persistent-volume-binder</b> ServiceAccount requires permissions to create and get Secrets to store the Azure storage account and keys.
GCE Persistent Disk (gcePD)	kubernetes.io/gce-pd	In multi-zone configurations, it is advisable to run one OpenShift Container Platform cluster per GCE project to avoid PVs from being created in zones where no node in the current cluster exists.
VMware vSphere	kubernetes.io/vsphere- volume	
Red Hat Virtualization	csi.ovirt.org	

# **IMPORTANT**

Any chosen provisioner plug-in also requires configuration for the relevant cloud, host, or third-party provider as per the relevant documentation.

# CHAPTER 9. RECLAIMING SPACE ON TARGET VOLUMES

The deleted files or chunks of zero data Sometimes take up storage space on the Ceph cluster resulting in inaccurate reporting of the available storage space. The reclaim space operation removes such discrepancies by executing the following operations on the target volume:

- **fstrim** This operation is executed on volumes that are in **Filesystem** mode and only if the volume is mounted to a pod at the time of execution of reclaim space operation.
- **rbd sparsify** This operation is executed when the volume is not attached to any pods and reclaims the space occupied by chunks of 4M-sized zeroed data.

#### **NOTE**

- The reclaim space operation is supported only by the Ceph RBD volumes.
- The reclaim space operation involves a performance penalty when it is being executed.

For upgraded clusters, execute the following command before you proceed further.

\$ oc patch cm rook-ceph-operator-config -n openshift-storage -p \$'data:\n "CSI\_ENABLE\_CSIADDONS": "true""

You can use one of the following methods to reclaim the space:

- Enabling reclaim space operation using Annotating PersistentVolumeClaims (Recommended method to use for enabling reclaim space operation)
- Enabling reclaim space operation using ReclaimSpaceJob
- Enabling reclaim space operation using ReclaimSpaceCronJob

# 9.1. ENABLING RECLAIM SPACE OPERATION USING ANNOTATING PERSISTENT/VOLUMECLAIMS

Use this procedure to annotate **PersistentVolumeClaims** so that it can invoke the reclaim space operation automatically based on a given schedule.

#### **NOTE**

- The schedule value is in the same format as the Kubernetes CronJobs which sets the and/or interval of the recurring operation request.
- Recommended schedule interval is @weekly. If the schedule interval value is empty or in an invalid format, then the default schedule value is set to @weekly.
- Minimum supported interval between each scheduled operation is at least 24 hours. For example, @daily (At 00:00 every day) or 0 3 \* \* \* (At 3:00 every day).
- Schedule the **ReclaimSpace** operation during off-peak, maintenance window, or the interval when the workload input/output is expected to be low.
- **ReclaimSpaceCronJob** is recreated when the **schedule** is modified. It is automatically deleted when the annotation is removed.

#### **Procedure**

1. Get the persistent volume claim (PVC) details.

\$ oc get pvc data-pvc

NAME STATUS VOLUME CAPACITY ACCESS MODES STORAGECLASS AGE data-pvc Bound pvc-f37b8582-4b04-4676-88dd-e1b95c6abf74 1Gi RWO ocs-storagecluster-ceph-rbd 20h

- 2. Add annotation reclaimspace.csiaddons.openshift.io/schedule=@monthly to the PVC to create reclaimspacecronjob.
  - \$ oc annotate pvc data-pvc "reclaimspace.csiaddons.openshift.io/schedule=@monthly"
  - persistentvolumeclaim/data-pvc annotated
- 3. Verify that **reclaimspacecronjob** is created in the format, "<pvc-name>-xxxxxxx".
  - \$ oc get reclaimspacecronjobs.csiaddons.openshift.io

NAME SCHEDULE SUSPEND ACTIVE LASTSCHEDULE AGE data-pvc-1642663516 @monthly 3s

- 4. Modify the schedule to run this job automatically.
  - \$ oc annotate pvc data-pvc "reclaimspace.csiaddons.openshift.io/schedule=@weekly" -- overwrite=true
  - persistentvolumeclaim/data-pvc annotated
- 5. Verify that the schedule for **reclaimspacecronjob** has been modified.
  - \$ oc get reclaimspacecronjobs.csiaddons.openshift.io

NAME SCHEDULE SUSPEND ACTIVE LASTSCHEDULE AGE data-pvc-1642664617 @weekly 3s

# 9.2. ENABLING RECLAIM SPACE OPERATION USING RECLAIMSPACEJOB

**ReclaimSpaceJob** is a namespaced custom resource (CR) designed to invoke reclaim space operation on the target volume. This is a one time method that immediately starts the reclaim space operation. You have to repeat the creation of **ReclaimSpaceJob** CR to repeat the reclaim space operation when required.

#### NOTE

- Recommended interval between the reclaim space operations is **weekly**.
- Ensure that the minimum interval between each operation is at least **24 hours**.
- Schedule the reclaim space operation during off-peak, maintenance window, or when the workload input/output is expected to be low.

#### Procedure

1. Create and apply the following custom resource for reclaim space operation:

apiVersion: csiaddons.openshift.io/v1alpha1 kind: ReclaimSpaceJob metadata: name: sample-1 spec: target: persistentVolumeClaim: pvc-1

where,

# target

Indicates the volume target on which the operation is performed.

#### persistentVolumeClaim

Name of the PersistentVolumeClaim.

#### backOfflimit

Specifies the maximum number of retries before marking the reclaim space operation as **failed**. The default value is **6**. The allowed maximum and minimum values are **60** and **0** respectively.

#### retryDeadlineSeconds

Specifies the duration in which the operation might retire in seconds and it is relative to the start time. The value must be a positive integer. The default value is **600** seconds and the allowed maximum value is **1800** seconds.

2. Delete the custom resource after completion of the operation.

# 9.3. ENABLING RECLAIM SPACE OPERATION USING RECLAIMSPACECRONJOB

**ReclaimSpaceCronJob** invokes the reclaim space operation based on the given schedule such as daily, weekly, and so on. You have to create **ReclaimSpaceCronJob** only once for a persistent volume claim. The **CSI-addons** controller creates a **ReclaimSpaceJob** at the requested time and interval with the schedule attribute.

#### NOTE

- Recommended schedule interval is @weekly.
- Minimum interval between each scheduled operation should be at least 24 hours. For example, **@daily** (At 00:00 every day) or "0 3 \* \* \*" (At 3:00 every day).
- Schedule the ReclaimSpace operation during off-peak, maintenance window, or the interval when workload input/output is expected to be low.

#### **Procedure**

1. Create and apply the following custom resource for reclaim space operation

```
apiVersion: csiaddons.openshift.io/v1alpha1kind: ReclaimSpaceCronJob
metadata:
name: reclaimspacecronjob-sample
spec:
jobTemplate:
spec:
target:
persistentVolumeClaim: data-pvc
schedule: '@weekly'
concurrencyPolicy: Forbid
```

where,

# concurrencyPolicy

Describes the changes when a new **ReclaimSpaceJob** is scheduled by the **ReclaimSpaceCronJob**, while a previous **ReclaimSpaceJob** is still running. The default **Forbid** prevents starting a new job whereas **Replace** can be used to delete the running job potentially in a failure state and create a new one.

#### failedJobsHistoryLimit

Specifies the number of failed **ReclaimSpaceJobs** that are kept for troubleshooting.

#### jobTemplate

Specifies the **ReclaimSpaceJob.spec** structure that describes the details of the requested **ReclaimSpaceJob** operation.

#### successfulJobsHistoryLimit

Specifies the number of successful **ReclaimSpaceJob** operations.

#### schedule

Specifieds the and/or interval of the recurring operation request and it is in the same format as the Kubernetes CronJobs.

2. Delete the **ReclaimSpaceCronJob** custom resource when execution of reclaim space operation is no longer needed or when the target PVC is deleted.

# **CHAPTER 10. VOLUME SNAPSHOTS**

A volume snapshot is the state of the storage volume in a cluster at a particular point in time. These snapshots help to use storage more efficiently by not having to make a full copy each time and can be used as building blocks for developing an application.

Volume snapshot class allows an administrator to specify different attributes belonging to a volume snapshot object. The OpenShift Data Foundation operator installs default volume snapshot classes depending on the platform in use. The operator owns and controls these default volume snapshot classes and they cannot be deleted or modified.

You can create many snapshots of the same persistent volume claim (PVC) but cannot schedule periodic creation of snapshots.

- For CephFS, you can create up to 100 snapshots per PVC.
- For RADOS Block Device (RBD), you can create up to 512 snapshots per PVC.

#### **NOTE**

Persistent Volume encryption now supports volume snapshots.

# 10.1. CREATING VOLUME SNAPSHOTS

You can create a volume snapshot either from the Persistent Volume Claim (PVC) page or the Volume Snapshots page.

#### **Prerequisites**

• For a consistent snapshot, the PVC should be in **Bound** state and not be in use. Ensure to stop all IO before taking the snapshot.

#### **NOTE**

OpenShift Data Foundation only provides crash consistency for a volume snapshot of a PVC if a pod is using it. For application consistency, be sure to first tear down a running pod to ensure consistent snapshots or use any quiesce mechanism provided by the application to ensure it.

#### **Procedure**

#### From the Persistent Volume Claims page

- 1. Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console.
- 2. To create a volume snapshot, do one of the following:
  - Beside the desired PVC, click Action menu ( i ) → Create Snapshot.
  - Click on the PVC for which you want to create the snapshot and click Actions → Create Snapshot.
- 3. Enter a **Name** for the volume snapshot.
- 4. Choose the **Snapshot Class** from the drop-down list.

5. Click **Create**. You will be redirected to the Details page of the volume snapshot that is created.

#### From the Volume Snapshots page

- 1. Click **Storage** → **Volume Snapshots** from the OpenShift Web Console.
- 2. In the Volume Snapshots page, click Create Volume Snapshot
- 3. Choose the required **Project** from the drop-down list.
- 4. Choose the **Persistent Volume Claim** from the drop-down list.
- 5. Enter a **Name** for the snapshot.
- 6. Choose the Snapshot Class from the drop-down list.
- 7. Click **Create**. You will be redirected to the Details page of the volume snapshot that is created.

#### Verification steps

- Go to the **Details** page of the PVC and click the **Volume Snapshots** tab to see the list of volume snapshots. Verify that the new volume snapshot is listed.
- Click Storage → Volume Snapshots from the OpenShift Web Console. Verify that the new volume snapshot is listed.
- Wait for the volume snapshot to be in **Ready** state.

## 10.2. RESTORING VOLUME SNAPSHOTS

When you restore a volume snapshot, a new Persistent Volume Claim (PVC) gets created. The restored PVC is independent of the volume snapshot and the parent PVC.

You can restore a volume snapshot from either the Persistent Volume Claim page or the Volume Snapshots page.

#### **Procedure**

# From the Persistent Volume Claims page

You can restore volume snapshot from the Persistent Volume Claims page only if the parent PVC is present.

- 1. Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console.
- 2. Click on the PVC name with the volume snapshot to restore a volume snapshot as a new PVC.
- 3. In the **Volume Snapshots** tab, click the Action menu ( : ) next to the volume snapshot you want to restore.
- 4. Click Restore as new PVC.
- 5. Enter a name for the new PVC.

6. Select the **Storage Class** name.

#### NOTE

For Rados Block Device (RBD), you must select a storage class with the same pool as that of the parent PVC. Restoring the snapshot of an encrypted PVC using a storage class where encryption is not enabled and vice versa is not supported.

7. Select the **Access Mode** of your choice.

### **IMPORTANT**

The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocsdevpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

- 8. Optional: For RBD, select Volume mode.
- 9. Click **Restore**. You are redirected to the new PVC details page.

#### From the Volume Snapshots page

- 1. Click **Storage** → **Volume Snapshots** from the OpenShift Web Console.
- 2. In the **Volume Snapshots** tab, click the Action menu ( : ) next to the volume snapshot you want to restore.
- 3. Click Restore as new PVC.
- 4. Enter a name for the new PVC.
- 5. Select the **Storage Class** name.

#### NOTE

For Rados Block Device (RBD), you must select a storage class with the same pool as that of the parent PVC. Restoring the snapshot of an encrypted PVC using a storage class where encryption is not enabled and vice versa is not supported.

6. Select the **Access Mode** of your choice.

#### **IMPORTANT**

The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocsdevpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

- 7. Optional: For RBD, select Volume mode.
- 8. Click **Restore**. You are redirected to the new PVC details page.

#### Verification steps

- Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console and confirm that the new PVC is listed in the **Persistent Volume Claims** page.
- Wait for the new PVC to reach **Bound** state.

# 10.3. DELETING VOLUME SNAPSHOTS

#### **Prerequisites**

• For deleting a volume snapshot, the volume snapshot class which is used in that particular volume snapshot should be present.

#### Procedure

#### From Persistent Volume Claims page

- 1. Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console.
- 2. Click on the PVC name which has the volume snapshot that needs to be deleted.
- 3. In the Volume Snapshots tab, beside the desired volume snapshot, click Action menu ( i ) → Delete Volume Snapshot

#### From Volume Snapshots page

- 1. Click **Storage** → **Volume Snapshots** from the OpenShift Web Console.
- 2. In the Volume Snapshots page, beside the desired volume snapshot click Action menu ( ⋮ ) → Delete Volume Snapshot

#### Verfication steps

• Ensure that the deleted volume snapshot is not present in the **Volume Snapshots** tab of the PVC details page.

• Click **Storage** → **Volume Snapshots** and ensure that the deleted volume snapshot is not listed.

# **CHAPTER 11. VOLUME CLONING**

A clone is a duplicate of an existing storage volume that is used as any standard volume. You create a clone of a volume to make a point in time copy of the data. A persistent volume claim (PVC) cannot be cloned with a different size. You can create up to 512 clones per PVC for both CephFS and RADOS Block Device (RBD).

#### 11.1. CREATING A CLONE

#### **Prerequisites**

Source PVC must be in **Bound** state and must not be in use.

#### **NOTE**

Do not create a clone of a PVC if a Pod is using it. Doing so might cause data corruption because the PVC is not quiesced (paused).

#### **Procedure**

- 1. Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console.
- 2. To create a clone, do one of the following:
  - Beside the desired PVC, click Action menu ( i ) → Clone PVC.
  - Click on the PVC that you want to clone and click **Actions** → **Clone PVC**.
- 3. Enter a Name for the clone.
- 4. Select the access mode of your choice.

#### **IMPORTANT**

The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocsdevpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

- 5. Click **Clone**. You are redirected to the new PVC details page.
- Wait for the cloned PVC status to become **Bound**.
   The cloned PVC is now available to be consumed by the pods. This cloned PVC is independent of its dataSource PVC.

# CHAPTER 12. MANAGING CONTAINER STORAGE INTERFACE (CSI) COMPONENT PLACEMENTS

Each cluster consists of a number of dedicated nodes such as **infra** and **storage** nodes. However, an **infra** node with a custom taint will not be able to use OpenShift Data Foundation Persistent Volume Claims (PVCs) on the node. So, if you want to use such nodes, you can set tolerations to bring up **csi-plugins** on the nodes.

#### Procedure

- 1. Edit the configmap to add the toleration for the custom taint. Remember to save before exiting the editor.
  - \$ oc edit configmap rook-ceph-operator-config -n openshift-storage
- 2. Display the **configmap** to check the added toleration.
  - \$ oc get configmap rook-ceph-operator-config -n openshift-storage -o yaml

Example output of the added toleration for the taint, nodetype=infra:NoSchedule:

```
apiVersion: v1
data:
[...]
 CSI_PLUGIN_TOLERATIONS: |
  - key: nodetype
   operator: Equal
   value: infra
   effect: NoSchedule
  - key: node.ocs.openshift.io/storage
   operator: Equal
   value: "true"
   effect: NoSchedule
[...]
kind: ConfigMap
metadata:
[...]
```

#### NOTE

Ensure that all non-string values in the Tolerations **value** field has double quotation marks. For example, the values **true** which is of type boolean, and **1** which is of type int must be input as "true" and "1".

3. Restart the **rook-ceph-operator** if the **csi-cephfsplugin-\*** and **csi-rbdplugin-\*** pods fail to come up on their own on the infra nodes.

\$ oc delete -n openshift-storage pod <name of the rook\_ceph\_operator pod>

Example:

\$ oc delete -n openshift-storage pod rook-ceph-operator-5446f9b95b-jrn2j pod "rook-ceph-operator-5446f9b95b-jrn2j" deleted

# Verification step

Verify that the csi-cephfsplugin-\* and csi-rbdplugin-\* pods are running on the infra nodes.

# CHAPTER 13. CREATING EXPORTS USING NFS [TECHNOLOGY PREVIEW]

This section describes how to create exports using NFS that can then be accessed externally from the OpenShift cluster.

#### **IMPORTANT**

NFS is a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information, see Technology Preview Features Support Scope .

Follow the instructions below to create exports and access them externally from the OpenShift Cluster:

- Section 13.1, "Enabling the NFS feature"
- Section 13.2, "Creating NFS exports"
- Section 13.3, "Consuming NFS exports in-cluster"
- Section 13.4, "Consuming NFS exports externally from the OpenShift cluster"

# 13.1. ENABLING THE NFS FEATURE

In order to use the NFS feature, it needs to be enabled in the cluster.

#### **Prerequisites**

- OpenShift Data Foundation is installed and running in the openshift-storage namespace.
- The OpenShift Data Foundation installation includes a CephFilesystem.

#### Procedure

Run the following commands to enable the NFS feature:

\$ oc --namespace openshift-storage patch storageclusters.ocs.openshift.io ocs-storagecluster --type merge --patch '{"spec": {"nfs":{"enable": true}}}'

\$ oc --namespace openshift-storage patch configmap rook-ceph-operator-config --type merge --patch '{"data":{"ROOK\_CSI\_ENABLE\_NFS": "true"}}'

# Verification steps

NFS installation and configuration is complete when the following conditions are met:

- The CephNFS resource named **ocs-storagecluster-cephnfs** has a status of **Ready**.
- Check all **csi-nfsplugin-\*** pods are running:

oc -n openshift-storage describe cephnfs ocs-storagecluster-cephnfs

oc -n openshift-storage get pod | grep csi-nfsplugin

Output will be multiple pods. For example:

csi-nfsplugin-47qwq 2/2 Running 0 10s csi-nfsplugin-77947 2/2 Running 0 10s csi-nfsplugin-ct2pm 2/2 Running 0 10s csi-nfsplugin-provisioner-f85b75fbb-2rm2w csi-nfsplugin-provisioner-f85b75fbb-8nj5h 2/2 Running 0 10s

# 13.2. CREATING NFS EXPORTS

NFS exports are created by creating a Persistent Volume Claim (PVC) against the **ocs-storagecluster-ceph-nfs** StorageClass.

You can create NFS PVCs two ways:

# Create NFS PVC using a yaml.

The following is an example PVC.

#### NOTE

volumeMode: Block will not work for NFS volumes.

apiVersion: v1

kind: PersistentVolumeClaim

metadata:

name: <desired\_name>

spec:

accessModes:

- ReadWriteOnce

resources: requests: storage: 1Gi

storageClassName: ocs-storagecluster-ceph-nfs

#### <desired\_name>

Specify a name for the PVC, for example, my-nfs-export.

The export is created once the PVC reaches the **Bound** state.

Create NFS PVCs from the OpenShift Container Platform web console.

#### **Prerequisites**

• Ensure that you are logged into the OpenShift Container Platform web console and the NFS feature is enabled for the storage cluster.

#### **Procedure**

- 1. In the OpenShift Web Console, click **Storage** → **Persistent Volume Claims**
- 2. Set the **Project** to **openshift-storage**.
- 3. Click Create PersistentVolumeClaim.
  - a. Specify Storage Class, ocs-storagecluster-ceph-nfs.
  - b. Specify the PVC Name, for example, my-nfs-export.
  - c. Select the required Access Mode.
  - d. Specify a **Size** as per application requirement.
  - e. Select **Volume mode** as **Filesystem**. Note: **Block** mode is not supported for NFS PVCs
  - f. Click Create and wait until the PVC is in Bound status.

# 13.3. CONSUMING NFS EXPORTS IN-CLUSTER

Kubernetes application pods can consume NFS exports created by mounting a previously created PVC.

You can mount the PVC one of two ways:

#### Using a YAML:

Below is an example pod that uses the example PVC created in Section 13.2, "Creating NFS exports":

apiVersion: v1 kind: Pod metadata:

name: nfs-export-example

spec: containers:

name: web-server image: nginx volumeMounts:

- name: nfs-export-pvc

mountPath: /var/lib/www/html

volumes:

name: nfs-export-pvc persistentVolumeClaim: claimName: <pvc\_name>

readOnly: false

#### <pvc\_name>

Specify the PVC you have previously created, for example, my-nfs-export.

Using the OpenShift Container Platform web console.

#### **Procedure**

- 1. On the OpenShift Container Platform web console, navigate to Workloads → Pods.
- 2. Click Create Pod to create a new application pod.

- 3. Under the **metadata** section add a name. For example, **nfs-export-example**, with **namespace** as **openshift-storage**.
- 4. Under the **spec**: section, add **containers**: section with **image** and **volumeMounts** sections:

apiVersion: v1 kind: Pod metadata:

name: nfs-export-example namespace: openshift-storage

spec:

containers:

name: web-server image: nginx volumeMounts:

> name: <volume\_name> mountPath: /var/lib/www/html

## For example:

apiVersion: v1 kind: Pod metadata:

name: nfs-export-example namespace: openshift-storage

spec:

containers:

name: web-server image: nginx volumeMounts:

- name: nfs-export-pvc

mountPath: /var/lib/www/html

5. Under the **spec:** section, add **volumes:** section to add the NFS PVC as a volume for the application pod:

#### volumes:

name: <volume\_name> persistentVolumeClaim: claimName: <pvc\_name>

For example:

### volumes:

 name: nfs-export-pvc persistentVolumeClaim: claimName: my-nfs-export

# 13.4. CONSUMING NFS EXPORTS EXTERNALLY FROM THE OPENSHIFT CLUSTER

NFS clients outside of the OpenShift cluster can mount NFS exports created by a previously-created PVC.

#### **Procedure**

1. After the **nfs** flag is enabled, singe-server CephNFS is deployed by Rook. You need to fetch the value of the **ceph\_nfs** field for the **nfs-ganesha** server to use in the next step:

\$ oc get pods -n openshift-storage | grep rook-ceph-nfs

\$ oc describe pod <name of the rook-ceph-nfs pod> | grep ceph\_nfs

For example:

```
$ oc describe pod rook-ceph-nfs-ocs-storagecluster-cephnfs-a-7bb484b4bf-bbdhs | grep ceph_nfs ceph_nfs=my-nfs
```

2. Expose the NFS server outside of the OpenShift cluster by creating a Kubernetes LoadBalancer Service. The example below creates a LoadBalancer Service and references the NFS server created by OpenShift Data Foundation.

```
apiVersion: v1
kind: Service
metadata:
name: rook-ceph-nfs-ocs-storagecluster-cephnfs-load-balancer
namespace: openshift-storage
spec:
ports:
- name: nfs
port: 2049
type: LoadBalancer
externalTrafficPolicy: Local
selector:
app: rook-ceph-nfs
ceph_nfs: <my-nfs>
instance: a
```

Replace <my-nfs> with the value you got in step 1.

- 3. Collect connection information. The information external clients need to connect to an export comes from the Persistent Volume (PV) created for the PVC, and the status of the LoadBalancer Service created in the previous step.
  - a. Get the share path from the PV.
    - i. Get the name of the PV associated with the NFS export's PVC:

```
$ oc get pvc <pvc_name> --output jsonpath='{.spec.volumeName}' pvc-39c5c467-d9d3-4898-84f7-936ea52fd99d
```

Replace **<pvc\_name>** with your own PVC name. For example:

```
oc get pvc pvc-39c5c467-d9d3-4898-84f7-936ea52fd99d --output jsonpath='{.spec.volumeName}' pvc-39c5c467-d9d3-4898-84f7-936ea52fd99d
```

ii. Use the PV name obtained previously to get the NFS export's share path:

\$ oc get pv pvc-39c5c467-d9d3-4898-84f7-936ea52fd99d --output jsonpath='{.spec.csi.volumeAttributes.share}' /0001-0011-openshift-storage-00000000000001-ba9426ab-d61b-11ec-9ffd-0a580a800215

b. Get an ingress address for the NFS server. A service's ingress status may have multiple addresses. Choose the one desired to use for external clients. In the example below, there is only a single address: the host name **ingress-id.somedomain.com**.

\$ oc -n openshift-storage get service rook-ceph-nfs-ocs-storagecluster-cephnfs-load-balancer --output jsonpath='{.status.loadBalancer.ingress}' [{"hostname":"ingress-id.somedomain.com"}]

4. Connect the external client using the share path and ingress address from the previous steps. The following example mounts the export to the client's directory path /export/mount/path:

\$ mount -t nfs4 -o proto=tcp ingress-id.somedomain.com:/0001-0011-openshift-storage-0000000000001-ba9426ab-d61b-11ec-9ffd-0a580a800215 /export/mount/path

If this does not work immediately, it could be that the Kubernetes environment is still taking time to configure the network resources to allow ingress to the NFS server.
