Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.

Table of Contents

CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW	57
1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW	57
1.1.1. Installation process	58
The installation process with installer-provisioned infrastructure	59
The installation process with user-provisioned infrastructure	60
Installation process details	60
1.1.2. Verifying node state after installation	61
Installation scope	63
1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS	63
CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS	65
2.1. SELECTING A CLUSTER INSTALLATION TYPE	65
2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?	65
2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?	65
2.1.3. Do you want to use existing components in your cluster?	66
2.1.4. Do you need extra security for your cluster?	66
2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION	67
2.3. PREPARING YOUR CLUSTER FOR WORKLOADS	67
2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS	67
CHAPTER 3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION	70
3.1. PREREQUISITES	70
3.2. ABOUT THE MIRROR REGISTRY	70
3.3. PREPARING YOUR MIRROR HOST	71
3.3.1. Installing the OpenShift CLI by downloading the binary	71
Installing the OpenShift CLI on Linux	71
Installing the OpenShift CLI on Windows	72
Installing the OpenShift CLI on macOS	72
3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED	73
3.5. MIRROR REGISTRY FOR RED HAT OPENSIFT	75
3.5.1. Mirror registry for Red Hat OpenShift introduction	76
3.5.2. Mirroring on a local host with mirror registry for Red Hat OpenShift	76
3.5.3. Mirroring on a remote host with mirror registry for Red Hat OpenShift	77
3.6. UPGRADING THE MIRROR REGISTRY FOR RED HAT OPENSIFT	79
3.6.1. Uninstalling the mirror registry for Red Hat OpenShift	79
3.6.2. Mirror registry for Red Hat OpenShift flags	79
3.7. MIRRORING THE OPENSIFT CONTAINER PLATFORM IMAGE REPOSITORY	81
3.8. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT	84
3.8.1. Cluster Samples Operator assistance for mirroring	84
3.9. NEXT STEPS	85
3.10. ADDITIONAL RESOURCES	85
CHAPTER 4. INSTALLING ON AWS	86
4.1. PREPARING TO INSTALL ON AWS	86
4.1.1. Prerequisites	86
4.1.2. Requirements for installing OpenShift Container Platform on AWS	86
4.1.3. Choosing a method to install OpenShift Container Platform on AWS	86
4.1.3.1. Installing a cluster on installer-provisioned infrastructure	86
4.1.3.2. Installing a cluster on user-provisioned infrastructure	87
4.1.4. Next steps	87
4.2. CONFIGURING AN AWS ACCOUNT	87
4.2.1. Configuring Route 53	87

4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53	88
4.2.2. AWS account limits	89
4.2.3. Required AWS permissions for the IAM user	91
4.2.4. Creating an IAM user	99
4.2.5. IAM Policies and AWS authentication	100
4.2.5.1. Default permissions for IAM instance profiles	100
4.2.5.2. Specifying an existing IAM role	102
4.2.5.3. Using AWS IAM Analyzer to create policy templates	103
4.2.6. Supported AWS Marketplace regions	103
4.2.7. Supported AWS regions	104
4.2.8. Next steps	105
4.3. MANUALLY CREATING IAM FOR AWS	105
4.3.1. Alternatives to storing administrator-level secrets in the kube-system project	105
4.3.2. Manually create IAM	106
4.3.3. Upgrading clusters with manually maintained credentials	108
4.3.4. Mint mode	109
4.3.5. Mint mode with removal or rotation of the administrator-level credential	109
4.3.6. Next steps	110
4.4. INSTALLING A CLUSTER QUICKLY ON AWS	110
4.4.1. Prerequisites	110
4.4.2. Internet access for OpenShift Container Platform	111
4.4.3. Generating a key pair for cluster node SSH access	111
4.4.4. Obtaining the installation program	113
4.4.5. Deploying the cluster	114
4.4.6. Installing the OpenShift CLI by downloading the binary	116
Installing the OpenShift CLI on Linux	117
Installing the OpenShift CLI on Windows	117
Installing the OpenShift CLI on macOS	118
4.4.7. Logging in to the cluster by using the CLI	118
4.4.8. Logging in to the cluster by using the web console	119
4.4.9. Telemetry access for OpenShift Container Platform	119
4.4.10. Next steps	120
4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS	120
4.5.1. Prerequisites	120
4.5.2. Internet access for OpenShift Container Platform	121
4.5.3. Generating a key pair for cluster node SSH access	121
4.5.4. Obtaining an AWS Marketplace image	123
4.5.5. Obtaining the installation program	124
4.5.6. Creating the installation configuration file	125
4.5.6.1. Installation configuration parameters	126
4.5.6.1.1. Required configuration parameters	126
4.5.6.1.2. Network configuration parameters	128
4.5.6.1.3. Optional configuration parameters	129
4.5.6.1.4. Optional AWS configuration parameters	133
4.5.6.2. Supported AWS machine types	137
4.5.6.3. Sample customized install-config.yaml file for AWS	140
4.5.6.4. Configuring the cluster-wide proxy during installation	142
4.5.7. Deploying the cluster	144
4.5.8. Installing the OpenShift CLI by downloading the binary	146
Installing the OpenShift CLI on Linux	146
Installing the OpenShift CLI on Windows	146
Installing the OpenShift CLI on macOS	147
4.5.9. Logging in to the cluster by using the CLI	147

4.5.10. Logging in to the cluster by using the web console	148
4.5.11. Telemetry access for OpenShift Container Platform	149
4.5.12. Next steps	149
4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS	149
4.6.1. Prerequisites	149
4.6.2. Internet access for OpenShift Container Platform	150
4.6.3. Generating a key pair for cluster node SSH access	150
4.6.4. Obtaining the installation program	152
4.6.5. Network configuration phases	153
4.6.6. Creating the installation configuration file	153
4.6.6.1. Installation configuration parameters	155
4.6.6.1.1. Required configuration parameters	155
4.6.6.1.2. Network configuration parameters	156
4.6.6.1.3. Optional configuration parameters	158
4.6.6.1.4. Optional AWS configuration parameters	162
4.6.6.2. Supported AWS machine types	165
4.6.6.3. Sample customized install-config.yaml file for AWS	168
4.6.6.4. Configuring the cluster-wide proxy during installation	171
4.6.7. Cluster Network Operator configuration	172
4.6.7.1. Cluster Network Operator configuration object	173
defaultNetwork object configuration	173
Configuration for the OpenShift SDN CNI cluster network provider	174
Configuration for the OVN-Kubernetes CNI cluster network provider	175
kubeProxyConfig object configuration	177
4.6.8. Specifying advanced network configuration	178
4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster	179
4.6.10. Configuring hybrid networking with OVN-Kubernetes	180
4.6.11. Deploying the cluster	182
4.6.12. Installing the OpenShift CLI by downloading the binary	184
Installing the OpenShift CLI on Linux	184
Installing the OpenShift CLI on Windows	184
Installing the OpenShift CLI on macOS	185
4.6.13. Logging in to the cluster by using the CLI	185
4.6.14. Logging in to the cluster by using the web console	186
4.6.15. Telemetry access for OpenShift Container Platform	187
4.6.16. Next steps	187
4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK	187
4.7.1. Prerequisites	187
4.7.2. About installations in restricted networks	188
4.7.2.1. Additional limits	188
4.7.3. About using a custom VPC	189
4.7.3.1. Requirements for using your VPC	189
4.7.3.2. VPC validation	191
4.7.3.3. Division of permissions	192
4.7.3.4. Isolation between clusters	192
4.7.4. Internet access for OpenShift Container Platform	192
4.7.5. Generating a key pair for cluster node SSH access	193
4.7.6. Creating the installation configuration file	195
4.7.6.1. Installation configuration parameters	197
4.7.6.1.1. Required configuration parameters	197
4.7.6.1.2. Network configuration parameters	199
4.7.6.1.3. Optional configuration parameters	200
4.7.6.1.4. Optional AWS configuration parameters	204

4.7.6.2. Sample customized install-config.yaml file for AWS	208
4.7.6.3. Configuring the cluster-wide proxy during installation	211
4.7.7. Deploying the cluster	212
4.7.8. Installing the OpenShift CLI by downloading the binary	214
Installing the OpenShift CLI on Linux	214
Installing the OpenShift CLI on Windows	215
Installing the OpenShift CLI on macOS	215
4.7.9. Logging in to the cluster by using the CLI	216
4.7.10. Disabling the default OperatorHub sources	216
4.7.11. Telemetry access for OpenShift Container Platform	217
4.7.12. Next steps	217
4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC	217
4.8.1. Prerequisites	217
4.8.2. About using a custom VPC	218
4.8.2.1. Requirements for using your VPC	218
4.8.2.2. VPC validation	221
4.8.2.3. Division of permissions	221
4.8.2.4. Isolation between clusters	222
4.8.3. Internet access for OpenShift Container Platform	222
4.8.4. Generating a key pair for cluster node SSH access	222
4.8.5. Obtaining the installation program	224
4.8.6. Creating the installation configuration file	225
4.8.6.1. Installation configuration parameters	226
4.8.6.1.1. Required configuration parameters	226
4.8.6.1.2. Network configuration parameters	228
4.8.6.1.3. Optional configuration parameters	229
4.8.6.1.4. Optional AWS configuration parameters	234
4.8.6.2. Supported AWS machine types	237
4.8.6.3. Sample customized install-config.yaml file for AWS	241
4.8.6.4. Configuring the cluster-wide proxy during installation	243
4.8.7. Deploying the cluster	245
4.8.8. Installing the OpenShift CLI by downloading the binary	246
Installing the OpenShift CLI on Linux	247
Installing the OpenShift CLI on Windows	247
Installing the OpenShift CLI on macOS	248
4.8.9. Logging in to the cluster by using the CLI	248
4.8.10. Logging in to the cluster by using the web console	249
4.8.11. Telemetry access for OpenShift Container Platform	249
4.8.12. Next steps	250
4.9. INSTALLING A PRIVATE CLUSTER ON AWS	250
4.9.1. Prerequisites	250
4.9.2. Private clusters	250
4.9.2.1. Private clusters in AWS	251
4.9.2.1.1. Limitations	251
4.9.3. About using a custom VPC	252
4.9.3.1. Requirements for using your VPC	252
4.9.3.2. VPC validation	254
4.9.3.3. Division of permissions	255
4.9.3.4. Isolation between clusters	255
4.9.4. Internet access for OpenShift Container Platform	255
4.9.5. Generating a key pair for cluster node SSH access	256
4.9.6. Obtaining the installation program	258
4.9.7. Manually creating the installation configuration file	258

4.9.7.1. Installation configuration parameters	259
4.9.7.1.1. Required configuration parameters	260
4.9.7.1.2. Network configuration parameters	261
4.9.7.1.3. Optional configuration parameters	263
4.9.7.1.4. Optional AWS configuration parameters	268
4.9.7.2. Supported AWS machine types	271
4.9.7.3. Sample customized install-config.yaml file for AWS	274
4.9.7.4. Configuring the cluster-wide proxy during installation	277
4.9.8. Deploying the cluster	278
4.9.9. Installing the OpenShift CLI by downloading the binary	280
Installing the OpenShift CLI on Linux	280
Installing the OpenShift CLI on Windows	281
Installing the OpenShift CLI on macOS	281
4.9.10. Logging in to the cluster by using the CLI	281
4.9.11. Logging in to the cluster by using the web console	282
4.9.12. Telemetry access for OpenShift Container Platform	283
4.9.13. Next steps	283
4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION	283
4.10.1. Prerequisites	283
4.10.2. AWS government and secret regions	284
4.10.3. Private clusters	285
4.10.3.1. Private clusters in AWS	285
4.10.3.1.1. Limitations	286
4.10.4. About using a custom VPC	286
4.10.4.1. Requirements for using your VPC	286
4.10.4.2. VPC validation	289
4.10.4.3. Division of permissions	289
4.10.4.4. Isolation between clusters	289
4.10.5. Internet access for OpenShift Container Platform	290
4.10.6. Generating a key pair for cluster node SSH access	290
4.10.7. Obtaining an AWS Marketplace image	292
4.10.8. Obtaining the installation program	293
4.10.9. Manually creating the installation configuration file	294
4.10.9.1. Installation configuration parameters	295
4.10.9.1.1. Required configuration parameters	295
4.10.9.1.2. Network configuration parameters	296
4.10.9.1.3. Optional configuration parameters	298
4.10.9.1.4. Optional AWS configuration parameters	302
4.10.9.2. Supported AWS machine types	305
4.10.9.3. Sample customized install-config.yaml file for AWS	308
4.10.9.4. AWS regions without a published RHCOS AMI	311
4.10.9.5. Uploading a custom RHCOS AMI in AWS	311
4.10.9.6. Configuring the cluster-wide proxy during installation	314
4.10.10. Deploying the cluster	315
4.10.11. Installing the OpenShift CLI by downloading the binary	317
Installing the OpenShift CLI on Linux	317
Installing the OpenShift CLI on Windows	318
Installing the OpenShift CLI on macOS	318
4.10.12. Logging in to the cluster by using the CLI	319
4.10.13. Logging in to the cluster by using the web console	319
4.10.14. Telemetry access for OpenShift Container Platform	320
4.10.15. Next steps	320
4.11. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING	

CLOUDFORMATION TEMPLATES	321
4.11.1. Prerequisites	321
4.11.2. Internet access for OpenShift Container Platform	322
4.11.3. Required AWS infrastructure components	322
4.11.3.1. Other infrastructure components	322
4.11.3.2. Cluster machines	330
4.11.3.3. Certificate signing requests management	330
4.11.3.4. Supported AWS machine types	330
4.11.3.5. Required AWS permissions for the IAM user	334
4.11.4. Obtaining an AWS Marketplace image	342
4.11.5. Obtaining the installation program	342
4.11.6. Generating a key pair for cluster node SSH access	343
4.11.7. Creating the installation files for AWS	345
4.11.7.1. Optional: Creating a separate /var partition	345
4.11.7.2. Creating the installation configuration file	347
4.11.7.3. Configuring the cluster-wide proxy during installation	349
4.11.7.4. Creating the Kubernetes manifest and Ignition config files	350
4.11.8. Extracting the infrastructure name	352
4.11.9. Creating a VPC in AWS	353
4.11.9.1. CloudFormation template for the VPC	355
4.11.10. Creating networking and load balancing components in AWS	360
4.11.10.1. CloudFormation template for the network and load balancers	364
4.11.11. Creating security group and roles in AWS	372
4.11.11.1. CloudFormation template for security objects	375
4.11.12. Accessing RHCOS AMIs with stream metadata	386
4.11.13. RHCOS AMIs for the AWS infrastructure	386
4.11.13.1. AWS regions without a published RHCOS AMI	387
4.11.13.2. Uploading a custom RHCOS AMI in AWS	388
4.11.14. Creating the bootstrap node in AWS	390
4.11.14.1. CloudFormation template for the bootstrap machine	395
4.11.15. Creating the control plane machines in AWS	399
4.11.15.1. CloudFormation template for control plane machines	405
4.11.16. Creating the worker nodes in AWS	413
4.11.16.1. CloudFormation template for worker machines	419
4.11.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	422
4.11.18. Installing the OpenShift CLI by downloading the binary	423
Installing the OpenShift CLI on Linux	424
Installing the OpenShift CLI on Windows	424
Installing the OpenShift CLI on macOS	425
4.11.19. Logging in to the cluster by using the CLI	425
4.11.20. Approving the certificate signing requests for your machines	426
4.11.21. Initial Operator configuration	428
4.11.21.1. Image registry storage configuration	429
4.11.21.1.1. Configuring registry storage for AWS with user-provisioned infrastructure	430
4.11.21.1.2. Configuring storage for the image registry in non-production clusters	430
4.11.22. Deleting the bootstrap resources	431
4.11.23. Creating the Ingress DNS Records	431
4.11.24. Completing an AWS installation on user-provisioned infrastructure	434
4.11.25. Logging in to the cluster by using the web console	435
4.11.26. Telemetry access for OpenShift Container Platform	436
4.11.27. Additional resources	436
4.11.28. Next steps	436
4.12. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED	

INFRASTRUCTURE	436
4.12.1. Prerequisites	437
4.12.2. About installations in restricted networks	438
4.12.2.1. Additional limits	438
4.12.3. Internet access for OpenShift Container Platform	438
4.12.4. Required AWS infrastructure components	439
4.12.4.1. Other infrastructure components	439
4.12.4.2. Cluster machines	447
4.12.4.3. Certificate signing requests management	447
4.12.4.4. Supported AWS machine types	447
4.12.4.5. Required AWS permissions for the IAM user	451
4.12.5. Generating a key pair for cluster node SSH access	459
4.12.6. Creating the installation files for AWS	460
4.12.6.1. Optional: Creating a separate /var partition	461
4.12.6.2. Creating the installation configuration file	463
4.12.6.3. Configuring the cluster-wide proxy during installation	465
4.12.6.4. Creating the Kubernetes manifest and Ignition config files	467
4.12.7. Extracting the infrastructure name	469
4.12.8. Creating a VPC in AWS	469
4.12.8.1. CloudFormation template for the VPC	471
4.12.9. Creating networking and load balancing components in AWS	477
4.12.9.1. CloudFormation template for the network and load balancers	481
4.12.10. Creating security group and roles in AWS	488
4.12.10.1. CloudFormation template for security objects	491
4.12.11. Accessing RHCOS AMIs with stream metadata	502
4.12.12. RHCOS AMIs for the AWS infrastructure	502
4.12.13. Creating the bootstrap node in AWS	504
4.12.13.1. CloudFormation template for the bootstrap machine	508
4.12.14. Creating the control plane machines in AWS	512
4.12.14.1. CloudFormation template for control plane machines	519
4.12.15. Creating the worker nodes in AWS	526
4.12.15.1. CloudFormation template for worker machines	532
4.12.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	535
4.12.17. Logging in to the cluster by using the CLI	537
4.12.18. Approving the certificate signing requests for your machines	537
4.12.19. Initial Operator configuration	540
4.12.19.1. Disabling the default OperatorHub sources	541
4.12.19.2. Image registry storage configuration	541
4.12.19.2.1. Configuring registry storage for AWS with user-provisioned infrastructure	542
4.12.19.2.2. Configuring storage for the image registry in non-production clusters	542
4.12.20. Deleting the bootstrap resources	543
4.12.21. Creating the Ingress DNS Records	543
4.12.22. Completing an AWS installation on user-provisioned infrastructure	546
4.12.23. Logging in to the cluster by using the web console	547
4.12.24. Telemetry access for OpenShift Container Platform	548
4.12.25. Additional resources	548
4.12.26. Next steps	548
4.13. UNINSTALLING A CLUSTER ON AWS	549
4.13.1. Removing a cluster that uses installer-provisioned infrastructure	549
4.13.2. Deleting AWS resources with the Cloud Credential Operator utility	549
CHAPTER 5. INSTALLING ON AZURE	552
5.1. PREPARING TO INSTALL ON AZURE	552

5.1.1. Prerequisites	552
5.1.2. Requirements for installing OpenShift Container Platform on Azure	552
5.1.3. Choosing a method to install OpenShift Container Platform on Azure	552
5.1.3.1. Installing a cluster on installer-provisioned infrastructure	552
5.1.3.2. Installing a cluster on user-provisioned infrastructure	553
5.1.4. Next steps	553
5.2. CONFIGURING AN AZURE ACCOUNT	553
5.2.1. Azure account limits	553
5.2.2. Configuring a public DNS zone in Azure	556
5.2.3. Increasing Azure account limits	557
5.2.4. Required Azure roles	558
5.2.5. Creating a service principal	558
5.2.6. Supported Azure Marketplace regions	561
5.2.7. Supported Azure regions	561
Supported Azure public regions	562
Supported Azure Government regions	563
5.2.8. Next steps	563
5.3. MANUALLY CREATING IAM FOR AZURE	563
5.3.1. Alternatives to storing administrator-level secrets in the kube-system project	563
5.3.2. Manually create IAM	564
5.3.3. Upgrading clusters with manually maintained credentials	565
5.3.4. Next steps	567
5.4. INSTALLING A CLUSTER QUICKLY ON AZURE	567
5.4.1. Prerequisites	567
5.4.2. Internet access for OpenShift Container Platform	567
5.4.3. Generating a key pair for cluster node SSH access	568
5.4.4. Obtaining the installation program	569
5.4.5. Deploying the cluster	570
5.4.6. Installing the OpenShift CLI by downloading the binary	573
Installing the OpenShift CLI on Linux	573
Installing the OpenShift CLI on Windows	573
Installing the OpenShift CLI on macOS	574
5.4.7. Logging in to the cluster by using the CLI	574
5.4.8. Telemetry access for OpenShift Container Platform	575
5.4.9. Next steps	575
5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS	575
5.5.1. Prerequisites	575
5.5.2. Internet access for OpenShift Container Platform	576
5.5.3. Generating a key pair for cluster node SSH access	576
5.5.4. Selecting an Azure Marketplace image	578
5.5.5. Obtaining the installation program	580
5.5.6. Creating the installation configuration file	580
5.5.6.1. Installation configuration parameters	582
5.5.6.1.1. Required configuration parameters	582
5.5.6.1.2. Network configuration parameters	584
5.5.6.1.3. Optional configuration parameters	585
5.5.6.1.4. Additional Azure configuration parameters	590
5.5.6.2. Sample customized install-config.yaml file for Azure	592
5.5.6.3. Configuring the cluster-wide proxy during installation	594
5.5.7. Updating manifests for Marketplace installation	595
5.5.8. Deploying the cluster	596
5.5.9. Installing the OpenShift CLI by downloading the binary	598
Installing the OpenShift CLI on Linux	598

Installing the OpenShift CLI on Windows	598
Installing the OpenShift CLI on macOS	599
5.5.10. Logging in to the cluster by using the CLI	599
5.5.11. Telemetry access for OpenShift Container Platform	600
5.5.12. Next steps	600
5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS	600
5.6.1. Prerequisites	600
5.6.2. Internet access for OpenShift Container Platform	601
5.6.3. Generating a key pair for cluster node SSH access	601
5.6.4. Obtaining the installation program	603
5.6.5. Creating the installation configuration file	604
5.6.5.1. Installation configuration parameters	605
5.6.5.1.1. Required configuration parameters	606
5.6.5.1.2. Network configuration parameters	607
5.6.5.1.3. Optional configuration parameters	609
5.6.5.1.4. Additional Azure configuration parameters	614
5.6.5.2. Sample customized install-config.yaml file for Azure	616
5.6.5.3. Configuring the cluster-wide proxy during installation	618
5.6.6. Network configuration phases	619
5.6.7. Specifying advanced network configuration	620
5.6.8. Cluster Network Operator configuration	621
5.6.8.1. Cluster Network Operator configuration object	621
defaultNetwork object configuration	622
Configuration for the OpenShift SDN CNI cluster network provider	623
Configuration for the OVN-Kubernetes CNI cluster network provider	624
kubeProxyConfig object configuration	626
5.6.9. Configuring hybrid networking with OVN-Kubernetes	627
5.6.10. Deploying the cluster	629
5.6.11. Installing the OpenShift CLI by downloading the binary	630
Installing the OpenShift CLI on Linux	630
Installing the OpenShift CLI on Windows	631
Installing the OpenShift CLI on macOS	631
5.6.12. Logging in to the cluster by using the CLI	632
5.6.13. Telemetry access for OpenShift Container Platform	632
5.6.14. Next steps	632
5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET	633
5.7.1. Prerequisites	633
5.7.2. About reusing a VNet for your OpenShift Container Platform cluster	633
5.7.2.1. Requirements for using your VNet	633
5.7.2.1.1. Network security group requirements	634
5.7.2.2. Division of permissions	635
5.7.2.3. Isolation between clusters	635
5.7.3. Internet access for OpenShift Container Platform	635
5.7.4. Generating a key pair for cluster node SSH access	636
5.7.5. Obtaining the installation program	637
5.7.6. Creating the installation configuration file	638
5.7.6.1. Installation configuration parameters	640
5.7.6.1.1. Required configuration parameters	640
5.7.6.1.2. Network configuration parameters	642
5.7.6.1.3. Optional configuration parameters	643
5.7.6.1.4. Additional Azure configuration parameters	647
5.7.6.2. Sample customized install-config.yaml file for Azure	649
5.7.6.3. Configuring the cluster-wide proxy during installation	651

5.7.7. Deploying the cluster	653
5.7.8. Installing the OpenShift CLI by downloading the binary	654
Installing the OpenShift CLI on Linux	654
Installing the OpenShift CLI on Windows	655
Installing the OpenShift CLI on macOS	655
5.7.9. Logging in to the cluster by using the CLI	656
5.7.10. Telemetry access for OpenShift Container Platform	656
5.7.11. Next steps	657
5.8. INSTALLING A PRIVATE CLUSTER ON AZURE	657
5.8.1. Prerequisites	657
5.8.2. Private clusters	657
5.8.2.1. Private clusters in Azure	658
5.8.2.1.1. Limitations	658
5.8.2.2. User-defined outbound routing	658
Private cluster with network address translation	659
Private cluster with Azure Firewall	659
Private cluster with a proxy configuration	659
Private cluster with no internet access	659
5.8.3. About reusing a VNet for your OpenShift Container Platform cluster	660
5.8.3.1. Requirements for using your VNet	660
5.8.3.1.1. Network security group requirements	661
5.8.3.2. Division of permissions	661
5.8.3.3. Isolation between clusters	662
5.8.4. Internet access for OpenShift Container Platform	662
5.8.5. Generating a key pair for cluster node SSH access	662
5.8.6. Obtaining the installation program	664
5.8.7. Manually creating the installation configuration file	665
5.8.7.1. Installation configuration parameters	666
5.8.7.1.1. Required configuration parameters	666
5.8.7.1.2. Network configuration parameters	667
5.8.7.1.3. Optional configuration parameters	669
5.8.7.1.4. Additional Azure configuration parameters	673
5.8.7.2. Sample customized install-config.yaml file for Azure	675
5.8.7.3. Configuring the cluster-wide proxy during installation	677
5.8.8. Deploying the cluster	679
5.8.9. Installing the OpenShift CLI by downloading the binary	680
Installing the OpenShift CLI on Linux	680
Installing the OpenShift CLI on Windows	681
Installing the OpenShift CLI on macOS	681
5.8.10. Logging in to the cluster by using the CLI	682
5.8.11. Telemetry access for OpenShift Container Platform	682
5.8.12. Next steps	683
5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION	683
5.9.1. Prerequisites	683
5.9.2. Azure government regions	683
5.9.3. Private clusters	683
5.9.3.1. Private clusters in Azure	684
5.9.3.1.1. Limitations	684
5.9.3.2. User-defined outbound routing	685
Private cluster with network address translation	685
Private cluster with Azure Firewall	685
Private cluster with a proxy configuration	685
Private cluster with no internet access	686

5.9.4. About reusing a VNet for your OpenShift Container Platform cluster	686
5.9.4.1. Requirements for using your VNet	686
5.9.4.1.1. Network security group requirements	687
5.9.4.2. Division of permissions	688
5.9.4.3. Isolation between clusters	688
5.9.5. Internet access for OpenShift Container Platform	688
5.9.6. Generating a key pair for cluster node SSH access	688
5.9.7. Obtaining the installation program	690
5.9.8. Manually creating the installation configuration file	691
5.9.8.1. Installation configuration parameters	692
5.9.8.1.1. Required configuration parameters	692
5.9.8.1.2. Network configuration parameters	694
5.9.8.1.3. Optional configuration parameters	695
5.9.8.1.4. Additional Azure configuration parameters	700
5.9.8.2. Sample customized install-config.yaml file for Azure	702
5.9.8.3. Configuring the cluster-wide proxy during installation	704
5.9.9. Deploying the cluster	706
5.9.10. Installing the OpenShift CLI by downloading the binary	707
Installing the OpenShift CLI on Linux	707
Installing the OpenShift CLI on Windows	708
Installing the OpenShift CLI on macOS	708
5.9.11. Logging in to the cluster by using the CLI	709
5.9.12. Telemetry access for OpenShift Container Platform	709
5.9.13. Next steps	710
5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES	710
5.10.1. Prerequisites	710
5.10.2. Internet access for OpenShift Container Platform	711
5.10.3. Configuring your Azure project	711
5.10.3.1. Azure account limits	711
5.10.3.2. Configuring a public DNS zone in Azure	714
5.10.3.3. Increasing Azure account limits	715
5.10.3.4. Certificate signing requests management	716
5.10.3.5. Required Azure roles	716
5.10.3.6. Creating a service principal	716
5.10.3.7. Supported Azure regions	719
Supported Azure public regions	719
Supported Azure Government regions	721
5.10.4. Selecting an Azure Marketplace image	721
5.10.5. Obtaining the installation program	723
5.10.6. Generating a key pair for cluster node SSH access	724
5.10.7. Creating the installation files for Azure	725
5.10.7.1. Optional: Creating a separate /var partition	725
5.10.7.2. Creating the installation configuration file	728
5.10.7.3. Configuring the cluster-wide proxy during installation	730
5.10.7.4. Exporting common variables for ARM templates	731
5.10.7.5. Creating the Kubernetes manifest and Ignition config files	732
5.10.8. Creating the Azure resource group and identity	735
5.10.9. Uploading the RHCOS cluster image and bootstrap Ignition config file	736
5.10.10. Example for creating DNS zones	737
5.10.11. Creating a VNet in Azure	738
5.10.11.1. ARM template for the VNet	738
5.10.12. Deploying the RHCOS cluster image for the Azure infrastructure	740
5.10.12.1. ARM template for image storage	741

5.10.13. Networking requirements for user-provisioned infrastructure	742
5.10.13.1. Setting the cluster node hostnames through DHCP	742
5.10.13.2. Network connectivity requirements	742
5.10.14. Creating networking and load balancing components in Azure	743
5.10.14.1. ARM template for the network and load balancers	744
5.10.15. Creating the bootstrap machine in Azure	749
5.10.15.1. ARM template for the bootstrap machine	750
5.10.16. Creating the control plane machines in Azure	755
5.10.16.1. ARM template for control plane machines	756
5.10.17. Wait for bootstrap completion and remove bootstrap resources in Azure	761
5.10.18. Creating additional worker machines in Azure	762
5.10.18.1. ARM template for worker machines	763
5.10.19. Installing the OpenShift CLI by downloading the binary	768
Installing the OpenShift CLI on Linux	768
Installing the OpenShift CLI on Windows	769
Installing the OpenShift CLI on macOS	769
5.10.20. Logging in to the cluster by using the CLI	769
5.10.21. Approving the certificate signing requests for your machines	770
5.10.22. Adding the Ingress DNS records	773
5.10.23. Completing an Azure installation on user-provisioned infrastructure	774
5.10.24. Telemetry access for OpenShift Container Platform	775
5.11. UNINSTALLING A CLUSTER ON AZURE	775
5.11.1. Removing a cluster that uses installer-provisioned infrastructure	775
CHAPTER 6. INSTALLING ON GCP	777
6.1. PREPARING TO INSTALL ON GCP	777
6.1.1. Prerequisites	777
6.1.2. Requirements for installing OpenShift Container Platform on GCP	777
6.1.3. Choosing a method to install OpenShift Container Platform on GCP	777
6.1.3.1. Installing a cluster on installer-provisioned infrastructure	777
6.1.3.2. Installing a cluster on user-provisioned infrastructure	778
6.1.4. Next steps	778
6.2. CONFIGURING A GCP PROJECT	778
6.2.1. Creating a GCP project	778
6.2.2. Enabling API services in GCP	779
6.2.3. Configuring DNS for GCP	779
6.2.4. GCP account limits	780
6.2.5. Creating a service account in GCP	782
6.2.5.1. Required GCP permissions	782
6.2.6. Supported GCP regions	783
6.2.7. Next steps	784
6.3. MANUALLY CREATING IAM FOR GCP	784
6.3.1. Alternatives to storing administrator-level secrets in the kube-system project	784
6.3.2. Manually create IAM	785
6.3.3. Upgrading clusters with manually maintained credentials	787
6.3.4. Mint mode	788
6.3.5. Mint mode with removal or rotation of the administrator-level credential	789
6.3.6. Next steps	789
6.4. INSTALLING A CLUSTER QUICKLY ON GCP	789
6.4.1. Prerequisites	789
6.4.2. Internet access for OpenShift Container Platform	790
6.4.3. Generating a key pair for cluster node SSH access	790
6.4.4. Obtaining the installation program	792

6.4.5. Deploying the cluster	793
6.4.6. Installing the OpenShift CLI by downloading the binary	795
Installing the OpenShift CLI on Linux	795
Installing the OpenShift CLI on Windows	796
Installing the OpenShift CLI on macOS	796
6.4.7. Logging in to the cluster by using the CLI	797
6.4.8. Telemetry access for OpenShift Container Platform	797
6.4.9. Next steps	798
6.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS	798
6.5.1. Prerequisites	798
6.5.2. Internet access for OpenShift Container Platform	798
6.5.3. Generating a key pair for cluster node SSH access	799
6.5.4. Obtaining the installation program	801
6.5.5. Creating the installation configuration file	801
6.5.5.1. Installation configuration parameters	803
6.5.5.1.1. Required configuration parameters	803
6.5.5.1.2. Network configuration parameters	805
6.5.5.1.3. Optional configuration parameters	806
6.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	811
6.5.5.2. Sample customized install-config.yaml file for GCP	814
6.5.5.3. Using custom machine types	817
6.5.5.4. Configuring the cluster-wide proxy during installation	817
6.5.6. Using a GCP Marketplace image	819
6.5.7. Deploying the cluster	820
6.5.8. Installing the OpenShift CLI by downloading the binary	821
Installing the OpenShift CLI on Linux	822
Installing the OpenShift CLI on Windows	822
Installing the OpenShift CLI on macOS	823
6.5.9. Logging in to the cluster by using the CLI	823
6.5.10. Telemetry access for OpenShift Container Platform	824
6.5.11. Next steps	824
6.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS	824
6.6.1. Prerequisites	824
6.6.2. Internet access for OpenShift Container Platform	825
6.6.3. Generating a key pair for cluster node SSH access	825
6.6.4. Obtaining the installation program	827
6.6.5. Creating the installation configuration file	828
6.6.5.1. Installation configuration parameters	829
6.6.5.1.1. Required configuration parameters	829
6.6.5.1.2. Network configuration parameters	831
6.6.5.1.3. Optional configuration parameters	832
6.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	837
6.6.5.2. Sample customized install-config.yaml file for GCP	840
6.6.6. Additional resources	843
6.6.6.1. Using custom machine types	843
6.6.6.2. Configuring the cluster-wide proxy during installation	843
6.6.7. Network configuration phases	845
6.6.8. Specifying advanced network configuration	845
6.6.9. Cluster Network Operator configuration	846
6.6.9.1. Cluster Network Operator configuration object	847
defaultNetwork object configuration	848
Configuration for the OpenShift SDN CNI cluster network provider	848
Configuration for the OVN-Kubernetes CNI cluster network provider	849

kubeProxyConfig object configuration	851
6.6.10. Deploying the cluster	852
6.6.11. Installing the OpenShift CLI by downloading the binary	853
Installing the OpenShift CLI on Linux	853
Installing the OpenShift CLI on Windows	854
Installing the OpenShift CLI on macOS	854
6.6.12. Logging in to the cluster by using the CLI	855
6.6.13. Telemetry access for OpenShift Container Platform	855
6.6.14. Next steps	856
6.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK	856
6.7.1. Prerequisites	856
6.7.2. About installations in restricted networks	857
6.7.2.1. Additional limits	857
6.7.3. Internet access for OpenShift Container Platform	857
6.7.4. Generating a key pair for cluster node SSH access	858
6.7.5. Creating the installation configuration file	860
6.7.5.1. Installation configuration parameters	862
6.7.5.1.1. Required configuration parameters	862
6.7.5.1.2. Network configuration parameters	864
6.7.5.1.3. Optional configuration parameters	865
6.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	869
6.7.5.2. Sample customized install-config.yaml file for GCP	872
6.7.5.3. Create an Ingress Controller with global access on GCP	875
6.7.5.4. Using custom machine types	876
6.7.5.5. Configuring the cluster-wide proxy during installation	877
6.7.6. Deploying the cluster	878
6.7.7. Installing the OpenShift CLI by downloading the binary	880
Installing the OpenShift CLI on Linux	880
Installing the OpenShift CLI on Windows	881
Installing the OpenShift CLI on macOS	881
6.7.8. Logging in to the cluster by using the CLI	882
6.7.9. Disabling the default OperatorHub sources	882
6.7.10. Telemetry access for OpenShift Container Platform	883
6.7.11. Next steps	883
6.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC	883
6.8.1. Prerequisites	883
6.8.2. About using a custom VPC	883
6.8.2.1. Requirements for using your VPC	884
6.8.2.2. VPC validation	884
6.8.2.3. Division of permissions	884
6.8.2.4. Isolation between clusters	884
6.8.3. Internet access for OpenShift Container Platform	885
6.8.4. Generating a key pair for cluster node SSH access	885
6.8.5. Obtaining the installation program	887
6.8.6. Creating the installation configuration file	888
6.8.6.1. Installation configuration parameters	889
6.8.6.1.1. Required configuration parameters	889
6.8.6.1.2. Network configuration parameters	891
6.8.6.1.3. Optional configuration parameters	892
6.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters	897
6.8.6.2. Sample customized install-config.yaml file for GCP	900
6.8.6.3. Create an Ingress Controller with global access on GCP	903
6.8.7. Additional resources	904

6.8.7.1. Using custom machine types	904
6.8.7.2. Configuring the cluster-wide proxy during installation	904
6.8.8. Deploying the cluster	906
6.8.9. Installing the OpenShift CLI by downloading the binary	907
Installing the OpenShift CLI on Linux	908
Installing the OpenShift CLI on Windows	908
Installing the OpenShift CLI on macOS	909
6.8.10. Logging in to the cluster by using the CLI	909
6.8.11. Telemetry access for OpenShift Container Platform	910
6.8.12. Next steps	910
6.9. INSTALLING A PRIVATE CLUSTER ON GCP	910
6.9.1. Prerequisites	910
6.9.2. Private clusters	910
6.9.2.1. Private clusters in GCP	911
6.9.2.1.1. Limitations	912
6.9.3. About using a custom VPC	912
6.9.3.1. Requirements for using your VPC	912
6.9.3.2. Division of permissions	913
6.9.3.3. Isolation between clusters	913
6.9.4. Internet access for OpenShift Container Platform	913
6.9.5. Generating a key pair for cluster node SSH access	914
6.9.6. Obtaining the installation program	915
6.9.7. Manually creating the installation configuration file	916
6.9.7.1. Installation configuration parameters	917
6.9.7.1.1. Required configuration parameters	918
6.9.7.1.2. Network configuration parameters	919
6.9.7.1.3. Optional configuration parameters	920
6.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters	925
6.9.7.2. Sample customized install-config.yaml file for GCP	928
6.9.7.3. Create an Ingress Controller with global access on GCP	931
6.9.8. Additional resources	932
6.9.8.1. Using custom machine types	932
6.9.8.2. Configuring the cluster-wide proxy during installation	932
6.9.9. Deploying the cluster	934
6.9.10. Installing the OpenShift CLI by downloading the binary	935
Installing the OpenShift CLI on Linux	935
Installing the OpenShift CLI on Windows	936
Installing the OpenShift CLI on macOS	936
6.9.11. Logging in to the cluster by using the CLI	937
6.9.12. Telemetry access for OpenShift Container Platform	937
6.9.13. Next steps	938
6.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES	938
6.10.1. Prerequisites	938
6.10.2. Certificate signing requests management	938
6.10.3. Internet access for OpenShift Container Platform	939
6.10.4. Configuring your GCP project	939
6.10.4.1. Creating a GCP project	939
6.10.4.2. Enabling API services in GCP	939
6.10.4.3. Configuring DNS for GCP	940
6.10.4.4. GCP account limits	941
6.10.4.5. Creating a service account in GCP	942
6.10.4.5.1. Required GCP permissions	943

6.10.4.6. Supported GCP regions	944
6.10.4.7. Installing and configuring CLI tools for GCP	945
6.10.5. Creating the installation files for GCP	945
6.10.5.1. Optional: Creating a separate /var partition	946
6.10.5.2. Creating the installation configuration file	948
6.10.5.3. Using custom machine types	950
6.10.5.4. Configuring the cluster-wide proxy during installation	950
6.10.5.5. Creating the Kubernetes manifest and Ignition config files	951
6.10.6. Exporting common variables	953
6.10.6.1. Extracting the infrastructure name	953
6.10.6.2. Exporting common variables for Deployment Manager templates	954
6.10.7. Creating a VPC in GCP	955
6.10.7.1. Deployment Manager template for the VPC	956
6.10.8. Networking requirements for user-provisioned infrastructure	957
6.10.8.1. Setting the cluster node hostnames through DHCP	957
6.10.8.2. Network connectivity requirements	957
6.10.9. Creating load balancers in GCP	959
6.10.9.1. Deployment Manager template for the external load balancer	960
6.10.9.2. Deployment Manager template for the internal load balancer	961
6.10.10. Creating a private DNS zone in GCP	963
6.10.10.1. Deployment Manager template for the private DNS	964
6.10.11. Creating firewall rules in GCP	965
6.10.11.1. Deployment Manager template for firewall rules	966
6.10.12. Creating IAM roles in GCP	968
6.10.12.1. Deployment Manager template for IAM roles	970
6.10.13. Creating the RHCOS cluster image for the GCP infrastructure	970
6.10.14. Creating the bootstrap machine in GCP	971
6.10.14.1. Deployment Manager template for the bootstrap machine	973
6.10.15. Creating the control plane machines in GCP	975
6.10.15.1. Deployment Manager template for control plane machines	977
6.10.16. Wait for bootstrap completion and remove bootstrap resources in GCP	979
6.10.17. Creating additional worker machines in GCP	980
6.10.17.1. Deployment Manager template for worker machines	982
6.10.18. Installing the OpenShift CLI by downloading the binary	983
Installing the OpenShift CLI on Linux	983
Installing the OpenShift CLI on Windows	983
Installing the OpenShift CLI on macOS	984
6.10.19. Logging in to the cluster by using the CLI	984
6.10.20. Approving the certificate signing requests for your machines	985
6.10.21. Optional: Adding the ingress DNS records	988
6.10.22. Completing a GCP installation on user-provisioned infrastructure	989
6.10.23. Telemetry access for OpenShift Container Platform	992
6.10.24. Next steps	992
6.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES	992
6.11.1. Prerequisites	992
6.11.2. Certificate signing requests management	993
6.11.3. Internet access for OpenShift Container Platform	993
6.11.4. Configuring the GCP project that hosts your cluster	993
6.11.4.1. Creating a GCP project	993
6.11.4.2. Enabling API services in GCP	994
6.11.4.3. GCP account limits	995
6.11.4.4. Creating a service account in GCP	996

6.11.4.4.1. Required GCP permissions	997
6.11.4.5. Supported GCP regions	998
6.11.4.6. Installing and configuring CLI tools for GCP	999
6.11.5. Configuring the GCP project that hosts your shared VPC network	999
6.11.5.1. Configuring DNS for GCP	1000
6.11.5.2. Creating a VPC in GCP	1001
6.11.5.2.1. Deployment Manager template for the VPC	1002
6.11.6. Creating the installation files for GCP	1004
6.11.6.1. Manually creating the installation configuration file	1004
6.11.6.2. Sample customized install-config.yaml file for GCP	1005
6.11.6.3. Using custom machine types	1007
6.11.6.4. Configuring the cluster-wide proxy during installation	1007
6.11.6.5. Creating the Kubernetes manifest and Ignition config files	1008
6.11.7. Exporting common variables	1011
6.11.7.1. Extracting the infrastructure name	1011
6.11.7.2. Exporting common variables for Deployment Manager templates	1012
6.11.8. Networking requirements for user-provisioned infrastructure	1013
6.11.8.1. Setting the cluster node hostnames through DHCP	1013
6.11.8.2. Network connectivity requirements	1013
6.11.9. Creating load balancers in GCP	1014
6.11.9.1. Deployment Manager template for the external load balancer	1016
6.11.9.2. Deployment Manager template for the internal load balancer	1017
6.11.10. Creating a private DNS zone in GCP	1019
6.11.10.1. Deployment Manager template for the private DNS	1020
6.11.11. Creating firewall rules in GCP	1021
6.11.11.1. Deployment Manager template for firewall rules	1022
6.11.12. Creating IAM roles in GCP	1024
6.11.12.1. Deployment Manager template for IAM roles	1026
6.11.13. Creating the RHCOS cluster image for the GCP infrastructure	1027
6.11.14. Creating the bootstrap machine in GCP	1028
6.11.14.1. Deployment Manager template for the bootstrap machine	1030
6.11.15. Creating the control plane machines in GCP	1031
6.11.15.1. Deployment Manager template for control plane machines	1033
6.11.16. Wait for bootstrap completion and remove bootstrap resources in GCP	1035
6.11.17. Creating additional worker machines in GCP	1036
6.11.17.1. Deployment Manager template for worker machines	1038
6.11.18. Installing the OpenShift CLI by downloading the binary	1039
6.11.18.1. Installing the OpenShift CLI on Linux	1039
6.11.18.2. Installing the OpenShift CLI on Windows	1040
6.11.18.3. Installing the OpenShift CLI on macOS	1040
6.11.19. Logging in to the cluster by using the CLI	1041
6.11.20. Approving the certificate signing requests for your machines	1041
6.11.21. Adding the ingress DNS records	1044
6.11.22. Adding ingress firewall rules	1046
6.11.22.1. Creating cluster-wide firewall rules for a shared VPC in GCP	1046
6.11.23. Completing a GCP installation on user-provisioned infrastructure	1047
6.11.24. Telemetry access for OpenShift Container Platform	1050
6.11.25. Next steps	1050
6.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	1050
6.12.1. Prerequisites	1050
6.12.2. About installations in restricted networks	1051
6.12.2.1. Additional limits	1051

6.12.3. Internet access for OpenShift Container Platform	1051
6.12.4. Configuring your GCP project	1052
6.12.4.1. Creating a GCP project	1052
6.12.4.2. Enabling API services in GCP	1052
6.12.4.3. Configuring DNS for GCP	1053
6.12.4.4. GCP account limits	1054
6.12.4.5. Creating a service account in GCP	1055
6.12.4.5.1. Required GCP permissions	1056
6.12.4.6. Supported GCP regions	1057
6.12.4.7. Installing and configuring CLI tools for GCP	1058
6.12.5. Creating the installation files for GCP	1058
6.12.5.1. Optional: Creating a separate /var partition	1058
6.12.5.2. Creating the installation configuration file	1061
6.12.5.3. Using custom machine types	1063
6.12.5.4. Configuring the cluster-wide proxy during installation	1063
6.12.5.5. Creating the Kubernetes manifest and Ignition config files	1065
6.12.6. Exporting common variables	1067
6.12.6.1. Extracting the infrastructure name	1067
6.12.6.2. Exporting common variables for Deployment Manager templates	1067
6.12.7. Creating a VPC in GCP	1068
6.12.7.1. Deployment Manager template for the VPC	1069
6.12.8. Networking requirements for user-provisioned infrastructure	1070
6.12.8.1. Setting the cluster node hostnames through DHCP	1070
6.12.8.2. Network connectivity requirements	1071
6.12.9. Creating load balancers in GCP	1072
6.12.9.1. Deployment Manager template for the external load balancer	1074
6.12.9.2. Deployment Manager template for the internal load balancer	1075
6.12.10. Creating a private DNS zone in GCP	1076
6.12.10.1. Deployment Manager template for the private DNS	1078
6.12.11. Creating firewall rules in GCP	1078
6.12.11.1. Deployment Manager template for firewall rules	1079
6.12.12. Creating IAM roles in GCP	1082
6.12.12.1. Deployment Manager template for IAM roles	1083
6.12.13. Creating the RHCOS cluster image for the GCP infrastructure	1084
6.12.14. Creating the bootstrap machine in GCP	1084
6.12.14.1. Deployment Manager template for the bootstrap machine	1087
6.12.15. Creating the control plane machines in GCP	1088
6.12.15.1. Deployment Manager template for control plane machines	1090
6.12.16. Wait for bootstrap completion and remove bootstrap resources in GCP	1092
6.12.17. Creating additional worker machines in GCP	1093
6.12.17.1. Deployment Manager template for worker machines	1095
6.12.18. Logging in to the cluster by using the CLI	1096
6.12.19. Disabling the default OperatorHub sources	1096
6.12.20. Approving the certificate signing requests for your machines	1097
6.12.21. Optional: Adding the ingress DNS records	1100
6.12.22. Completing a GCP installation on user-provisioned infrastructure	1101
6.12.23. Telemetry access for OpenShift Container Platform	1104
6.12.24. Next steps	1104
6.13. UNINSTALLING A CLUSTER ON GCP	1104
6.13.1. Removing a cluster that uses installer-provisioned infrastructure	1104
CHAPTER 7. INSTALLING ON BARE METAL	1106
7.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION	1106

7.1.1. Prerequisites	1106
7.1.2. Planning a bare metal cluster for OpenShift Virtualization	1106
7.1.3. Choosing a method to install OpenShift Container Platform on bare metal	1106
7.1.3.1. Installing a cluster on installer-provisioned infrastructure	1107
7.1.3.2. Installing a cluster on user-provisioned infrastructure	1107
7.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL	1107
7.2.1. Prerequisites	1107
7.2.2. Internet access for OpenShift Container Platform	1108
7.2.3. Requirements for a cluster with user-provisioned infrastructure	1108
7.2.3.1. Required machines	1108
7.2.3.2. Minimum resource requirements	1109
7.2.3.3. Certificate signing requests management	1110
7.2.3.4. Networking requirements for user-provisioned infrastructure	1110
7.2.3.4.1. Setting the cluster node hostnames through DHCP	1111
7.2.3.4.2. Network connectivity requirements	1111
NTP configuration for user-provisioned infrastructure	1112
7.2.3.5. User-provisioned DNS requirements	1112
7.2.3.5.1. Example DNS configuration for user-provisioned clusters	1114
7.2.3.6. Load balancing requirements for user-provisioned infrastructure	1116
7.2.3.6.1. Example load balancer configuration for user-provisioned clusters	1118
7.2.4. Preparing the user-provisioned infrastructure	1120
7.2.5. Validating DNS resolution for user-provisioned infrastructure	1122
7.2.6. Generating a key pair for cluster node SSH access	1125
7.2.7. Obtaining the installation program	1126
7.2.8. Installing the OpenShift CLI by downloading the binary	1127
Installing the OpenShift CLI on Linux	1127
Installing the OpenShift CLI on Windows	1128
Installing the OpenShift CLI on macOS	1128
7.2.9. Manually creating the installation configuration file	1129
7.2.9.1. Installation configuration parameters	1130
7.2.9.1.1. Required configuration parameters	1130
7.2.9.1.2. Network configuration parameters	1131
7.2.9.1.3. Optional configuration parameters	1133
7.2.9.2. Sample install-config.yaml file for bare metal	1137
7.2.9.3. Configuring the cluster-wide proxy during installation	1139
7.2.9.4. Configuring a three-node cluster	1141
7.2.10. Creating the Kubernetes manifest and Ignition config files	1142
7.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1143
7.2.11.1. Installing RHCOS by using an ISO image	1144
7.2.11.2. Installing RHCOS by using PXE or iPXE booting	1148
7.2.11.3. Advanced RHCOS installation configuration	1153
7.2.11.3.1. Using advanced networking options for PXE and ISO installations	1153
7.2.11.3.2. Disk partitioning	1154
7.2.11.3.2.1. Creating a separate /var partition	1155
7.2.11.3.2.2. Retaining existing partitions	1157
7.2.11.3.3. Identifying Ignition configs	1158
7.2.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1158
7.2.11.3.4. Advanced RHCOS installation reference	1159
7.2.11.3.4.1. Networking and bonding options for ISO installations	1159
Configuring DHCP or static IP addresses	1160
Configuring an IP address without a static hostname	1160
Specifying multiple network interfaces	1161
Configuring default gateway and route	1161

Disabling DHCP on a single interface	1161
Combining DHCP and static IP configurations	1161
Configuring VLANs on individual interfaces	1161
Providing multiple DNS servers	1162
Bonding multiple network interfaces to a single interface	1162
Bonding multiple network interfaces to a single interface	1162
Using network teaming	1162
7.2.11.3.4.2. coreos-installer options for ISO installations	1163
7.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1165
7.2.11.4. Enabling multipathing with kernel arguments on RHCOS	1167
7.2.11.5. Updating the bootloader using bootupd	1169
7.2.12. Waiting for the bootstrap process to complete	1170
7.2.13. Logging in to the cluster by using the CLI	1171
7.2.14. Approving the certificate signing requests for your machines	1172
7.2.15. Initial Operator configuration	1174
7.2.15.1. Image registry removed during installation	1175
7.2.15.2. Image registry storage configuration	1176
7.2.15.2.1. Configuring registry storage for bare metal and other manual installations	1176
7.2.15.2.2. Configuring storage for the image registry in non-production clusters	1177
7.2.15.2.3. Configuring block registry storage	1178
7.2.16. Completing installation on user-provisioned infrastructure	1178
7.2.17. Telemetry access for OpenShift Container Platform	1181
7.2.18. Next steps	1181
7.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS	1181
7.3.1. Prerequisites	1182
7.3.2. Internet access for OpenShift Container Platform	1182
7.3.3. Requirements for a cluster with user-provisioned infrastructure	1182
7.3.3.1. Required machines	1182
7.3.3.2. Minimum resource requirements	1183
7.3.3.3. Certificate signing requests management	1184
7.3.3.4. Networking requirements for user-provisioned infrastructure	1184
7.3.3.4.1. Setting the cluster node hostnames through DHCP	1185
7.3.3.4.2. Network connectivity requirements	1185
NTP configuration for user-provisioned infrastructure	1186
7.3.3.5. User-provisioned DNS requirements	1186
7.3.3.5.1. Example DNS configuration for user-provisioned clusters	1188
7.3.3.6. Load balancing requirements for user-provisioned infrastructure	1191
7.3.3.6.1. Example load balancer configuration for user-provisioned clusters	1193
7.3.4. Preparing the user-provisioned infrastructure	1195
7.3.5. Validating DNS resolution for user-provisioned infrastructure	1197
7.3.6. Generating a key pair for cluster node SSH access	1199
7.3.7. Obtaining the installation program	1201
7.3.8. Installing the OpenShift CLI by downloading the binary	1202
Installing the OpenShift CLI on Linux	1202
Installing the OpenShift CLI on Windows	1202
Installing the OpenShift CLI on macOS	1203
7.3.9. Manually creating the installation configuration file	1203
7.3.9.1. Installation configuration parameters	1204
7.3.9.1.1. Required configuration parameters	1204
7.3.9.1.2. Network configuration parameters	1206
7.3.9.1.3. Optional configuration parameters	1207
7.3.9.2. Sample install-config.yaml file for bare metal	1212
7.3.10. Network configuration phases	1215

7.3.11. Specifying advanced network configuration	1215
7.3.12. Cluster Network Operator configuration	1216
7.3.12.1. Cluster Network Operator configuration object	1217
defaultNetwork object configuration	1218
Configuration for the OpenShift SDN CNI cluster network provider	1218
Configuration for the OVN-Kubernetes CNI cluster network provider	1219
kubeProxyConfig object configuration	1221
7.3.13. Creating the Ignition config files	1222
7.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1223
7.3.14.1. Installing RHCOS by using an ISO image	1224
7.3.14.2. Installing RHCOS by using PXE or iPXE booting	1227
7.3.14.3. Advanced RHCOS installation configuration	1232
7.3.14.3.1. Using advanced networking options for PXE and ISO installations	1232
7.3.14.3.2. Disk partitioning	1233
7.3.14.3.2.1. Creating a separate /var partition	1234
7.3.14.3.2.2. Retaining existing partitions	1236
7.3.14.3.3. Identifying Ignition configs	1237
7.3.14.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1238
7.3.14.3.4. Advanced RHCOS installation reference	1238
7.3.14.3.4.1. Networking and bonding options for ISO installations	1239
Configuring DHCP or static IP addresses	1239
Configuring an IP address without a static hostname	1240
Specifying multiple network interfaces	1240
Configuring default gateway and route	1240
Disabling DHCP on a single interface	1240
Combining DHCP and static IP configurations	1241
Configuring VLANs on individual interfaces	1241
Providing multiple DNS servers	1241
Bonding multiple network interfaces to a single interface	1241
Bonding multiple network interfaces to a single interface	1242
Using network teaming	1242
7.3.14.3.4.2. coreos-installer options for ISO installations	1242
7.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations	1245
7.3.14.4. Enabling multipathing with kernel arguments on RHCOS	1246
7.3.14.5. Updating the bootloader using bootupd	1248
7.3.15. Waiting for the bootstrap process to complete	1249
7.3.16. Logging in to the cluster by using the CLI	1250
7.3.17. Approving the certificate signing requests for your machines	1251
7.3.18. Initial Operator configuration	1254
7.3.18.1. Image registry removed during installation	1255
7.3.18.2. Image registry storage configuration	1255
7.3.18.3. Configuring block registry storage	1255
7.3.19. Completing installation on user-provisioned infrastructure	1256
7.3.20. Telemetry access for OpenShift Container Platform	1258
7.3.21. Next steps	1259
7.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK	1259
7.4.1. Prerequisites	1259
7.4.2. About installations in restricted networks	1259
7.4.2.1. Additional limits	1260
7.4.3. Internet access for OpenShift Container Platform	1260
7.4.4. Requirements for a cluster with user-provisioned infrastructure	1261
7.4.4.1. Required machines	1261
7.4.4.2. Minimum resource requirements	1261

7.4.4.3. Certificate signing requests management	1262
7.4.4.4. Networking requirements for user-provisioned infrastructure	1262
7.4.4.4.1. Setting the cluster node hostnames through DHCP	1263
7.4.4.4.2. Network connectivity requirements	1263
NTP configuration for user-provisioned infrastructure	1264
7.4.4.5. User-provisioned DNS requirements	1264
7.4.4.5.1. Example DNS configuration for user-provisioned clusters	1266
7.4.4.6. Load balancing requirements for user-provisioned infrastructure	1269
7.4.4.6.1. Example load balancer configuration for user-provisioned clusters	1271
7.4.5. Preparing the user-provisioned infrastructure	1273
7.4.6. Validating DNS resolution for user-provisioned infrastructure	1275
7.4.7. Generating a key pair for cluster node SSH access	1277
7.4.8. Manually creating the installation configuration file	1279
7.4.8.1. Installation configuration parameters	1280
7.4.8.1.1. Required configuration parameters	1280
7.4.8.1.2. Network configuration parameters	1282
7.4.8.1.3. Optional configuration parameters	1283
7.4.8.2. Sample install-config.yaml file for bare metal	1288
7.4.8.3. Configuring the cluster-wide proxy during installation	1291
7.4.8.4. Configuring a three-node cluster	1292
7.4.9. Creating the Kubernetes manifest and Ignition config files	1293
7.4.10. Configuring chrony time service	1295
7.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1296
7.4.11.1. Installing RHCOS by using an ISO image	1297
7.4.11.2. Installing RHCOS by using PXE or iPXE booting	1300
7.4.11.3. Advanced RHCOS installation configuration	1306
7.4.11.3.1. Using advanced networking options for PXE and ISO installations	1306
7.4.11.3.2. Disk partitioning	1307
7.4.11.3.2.1. Creating a separate /var partition	1308
7.4.11.3.2.2. Retaining existing partitions	1310
7.4.11.3.3. Identifying Ignition configs	1311
7.4.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1311
7.4.11.3.4. Advanced RHCOS installation reference	1312
7.4.11.3.4.1. Networking and bonding options for ISO installations	1312
Configuring DHCP or static IP addresses	1313
Configuring an IP address without a static hostname	1313
Specifying multiple network interfaces	1314
Configuring default gateway and route	1314
Disabling DHCP on a single interface	1314
Combining DHCP and static IP configurations	1314
Configuring VLANs on individual interfaces	1314
Providing multiple DNS servers	1315
Bonding multiple network interfaces to a single interface	1315
Bonding multiple network interfaces to a single interface	1315
Using network teaming	1315
7.4.11.3.4.2. coreos-installer options for ISO installations	1316
7.4.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1318
7.4.11.4. Enabling multipathing with kernel arguments on RHCOS	1320
7.4.11.5. Updating the bootloader using bootupd	1322
7.4.12. Waiting for the bootstrap process to complete	1323
7.4.13. Logging in to the cluster by using the CLI	1324
7.4.14. Approving the certificate signing requests for your machines	1324
7.4.15. Initial Operator configuration	1327

7.4.15.1. Disabling the default OperatorHub sources	1328
7.4.15.2. Image registry storage configuration	1329
7.4.15.2.1. Changing the image registry's management state	1329
7.4.15.2.2. Configuring registry storage for bare metal and other manual installations	1329
7.4.15.2.3. Configuring storage for the image registry in non-production clusters	1331
7.4.15.2.4. Configuring block registry storage	1331
7.4.16. Completing installation on user-provisioned infrastructure	1332
7.4.17. Telemetry access for OpenShift Container Platform	1334
7.4.18. Next steps	1335
CHAPTER 8. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL	1336
8.1. OVERVIEW	1336
8.2. PREREQUISITES	1337
8.2.1. Node requirements	1337
8.2.2. Planning a bare metal cluster for OpenShift Virtualization	1339
8.2.3. Firmware requirements for installing with virtual media	1339
8.2.4. Network requirements	1340
8.2.4.1. Increase the network MTU	1341
8.2.4.2. Configuring NICs	1341
8.2.4.3. DNS requirements	1342
8.2.4.4. Dynamic Host Configuration Protocol (DHCP) requirements	1343
8.2.4.5. Reserving IP addresses for nodes with the DHCP server	1343
8.2.4.6. Network Time Protocol (NTP)	1345
8.2.4.7. State-driven network configuration requirements (Technology Preview)	1345
8.2.4.8. Port access for the out-of-band management IP address	1345
8.2.5. Configuring nodes	1345
Configuring nodes when using the provisioning network	1345
Configuring nodes without the provisioning network	1346
Configuring nodes for Secure Boot manually	1347
Configuring the Compatibility Support Module for Fujitsu iRMC	1347
8.2.6. Out-of-band management	1348
8.2.7. Required data for installation	1348
8.2.8. Validation checklist for nodes	1348
8.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION	1349
8.3.1. Installing RHEL on the provisioner node	1349
8.3.2. Preparing the provisioner node for OpenShift Container Platform installation	1349
8.3.3. Retrieving the OpenShift Container Platform installer	1352
8.3.4. Extracting the OpenShift Container Platform installer	1352
8.3.5. Creating an RHCOS images cache (optional)	1353
8.3.6. Configuration files	1355
8.3.6.1. Configuring the install-config.yaml file	1355
8.3.6.2. Setting proxy settings within the install-config.yaml file (optional)	1357
8.3.6.3. Modifying the install-config.yaml file for no provisioning network (optional)	1358
8.3.6.4. Modifying the install-config.yaml file for dual-stack network (optional)	1358
8.3.6.5. Configuring managed Secure Boot in the install-config.yaml file (optional)	1359
8.3.6.6. Additional install-config parameters	1359
8.3.6.7. BMC addressing	1364
IPMI	1365
Redfish network boot	1365
8.3.6.8. BMC addressing for Dell iDRAC	1366
8.3.6.9. BMC addressing for HPE iLO	1368
8.3.6.10. BMC addressing for Fujitsu iRMC	1370
8.3.6.11. Root device hints	1371

8.3.6.12. Creating the OpenShift Container Platform manifests	1372
8.3.6.13. Configuring NTP for disconnected clusters (optional)	1373
8.3.6.14. (Optional) Configure network components to run on the control plane	1375
8.3.7. Creating a disconnected registry (optional)	1377
8.3.7.1. Preparing the registry node to host the mirrored registry (optional)	1377
8.3.7.2. Generating the self-signed certificate (optional)	1377
8.3.7.3. Creating the registry podman container (optional)	1378
8.3.7.4. Copy and update the pull-secret (optional)	1379
8.3.7.5. Mirroring the repository (optional)	1379
8.3.7.6. Modify the install-config.yaml file to use the disconnected registry (optional)	1380
8.3.8. Deploying routers on worker nodes	1381
8.3.9. Validation checklist for installation	1382
8.3.10. Deploying the cluster via the OpenShift Container Platform installer	1382
8.3.11. Following the installation	1382
8.3.12. Verifying static IP address configuration	1382
8.3.13. Preparing to reinstall a cluster on bare metal	1383
8.4. INSTALLER-PROVISIONED POST-INSTALLATION CONFIGURATION	1383
8.4.1. Configuring NTP for disconnected clusters (optional)	1383
8.4.2. Enabling a provisioning network after installation	1386
8.4.3. Configuring an external load balancer	1388
8.5. EXPANDING THE CLUSTER	1390
8.5.1. Preparing the bare metal node	1390
8.5.2. Replacing a bare-metal control plane node	1392
8.5.3. Diagnosing a duplicate MAC address when provisioning a new host in the cluster	1396
8.5.4. Provisioning the bare metal node	1397
8.6. TROUBLESHOOTING	1398
8.6.1. Troubleshooting the installer workflow	1398
8.6.2. Troubleshooting install-config.yaml	1401
8.6.3. Bootstrap VM issues	1401
8.6.3.1. Bootstrap VM cannot boot up the cluster nodes	1403
8.6.3.2. Inspecting logs	1403
8.6.4. Cluster nodes will not PXE boot	1404
8.6.5. The API is not accessible	1405
8.6.6. Cleaning up previous installations	1406
8.6.7. Issues with creating the registry	1406
8.6.8. Miscellaneous issues	1407
8.6.8.1. Addressing the runtime network not ready error	1407
8.6.8.2. Cluster nodes not getting the correct IPv6 address over DHCP	1408
8.6.8.3. Cluster nodes not getting the correct hostname over DHCP	1408
8.6.8.4. Routes do not reach endpoints	1410
8.6.8.5. Failed Ignition during Firstboot	1411
8.6.8.6. NTP out of sync	1411
8.6.9. Reviewing the installation	1413
CHAPTER 9. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE	1415
9.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE	1415
9.1.1. Prerequisites	1415
9.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE	1415
9.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE	1415
9.2.1. Prerequisites	1415
9.2.2. Internet access for OpenShift Container Platform	1416
9.2.3. Requirements for a cluster with user-provisioned infrastructure	1416
9.2.3.1. Required machines	1416

9.2.3.2. Minimum resource requirements	1417
9.2.3.3. Minimum IBM Z system environment	1417
Hardware requirements	1418
Operating system requirements	1418
IBM Z network connectivity requirements	1418
Disk storage for the z/VM guest virtual machines	1418
Storage / Main Memory	1418
9.2.3.4. Preferred IBM Z system environment	1419
Hardware requirements	1419
Operating system requirements	1419
IBM Z network connectivity requirements	1419
Disk storage for the z/VM guest virtual machines	1419
Storage / Main Memory	1419
9.2.3.5. Certificate signing requests management	1420
9.2.3.6. Networking requirements for user-provisioned infrastructure	1420
9.2.3.6.1. Network connectivity requirements	1420
NTP configuration for user-provisioned infrastructure	1421
9.2.3.7. User-provisioned DNS requirements	1422
9.2.3.7.1. Example DNS configuration for user-provisioned clusters	1423
9.2.3.8. Load balancing requirements for user-provisioned infrastructure	1426
9.2.3.8.1. Example load balancer configuration for user-provisioned clusters	1428
9.2.4. Preparing the user-provisioned infrastructure	1430
9.2.5. Validating DNS resolution for user-provisioned infrastructure	1431
9.2.6. Generating a key pair for cluster node SSH access	1433
9.2.7. Obtaining the installation program	1435
9.2.8. Installing the OpenShift CLI by downloading the binary	1436
Installing the OpenShift CLI on Linux	1436
Installing the OpenShift CLI on Windows	1436
Installing the OpenShift CLI on macOS	1437
9.2.9. Manually creating the installation configuration file	1437
9.2.9.1. Installation configuration parameters	1438
9.2.9.1.1. Required configuration parameters	1438
9.2.9.1.2. Network configuration parameters	1440
9.2.9.1.3. Optional configuration parameters	1441
9.2.9.2. Sample install-config.yaml file for IBM Z	1445
9.2.9.3. Configuring the cluster-wide proxy during installation	1448
9.2.9.4. Configuring a three-node cluster	1449
9.2.10. Cluster Network Operator configuration	1450
9.2.10.1. Cluster Network Operator configuration object	1451
defaultNetwork object configuration	1451
Configuration for the OpenShift SDN CNI cluster network provider	1452
Configuration for the OVN-Kubernetes CNI cluster network provider	1453
kubeProxyConfig object configuration	1455
9.2.11. Creating the Kubernetes manifest and Ignition config files	1455
9.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1457
9.2.12.1. Advanced RHCOS installation reference	1460
9.2.12.1.1. Networking and bonding options for ISO installations	1460
Configuring DHCP or static IP addresses	1461
Configuring an IP address without a static hostname	1461
Specifying multiple network interfaces	1462
Configuring default gateway and route	1462
Disabling DHCP on a single interface	1462
Combining DHCP and static IP configurations	1462

Configuring VLANs on individual interfaces	1462
Providing multiple DNS servers	1463
Bonding multiple network interfaces to a single interface	1463
Bonding multiple network interfaces to a single interface	1463
Using network teaming	1464
9.2.13. Waiting for the bootstrap process to complete	1464
9.2.14. Logging in to the cluster by using the CLI	1465
9.2.15. Approving the certificate signing requests for your machines	1465
9.2.16. Initial Operator configuration	1468
9.2.16.1. Image registry storage configuration	1469
9.2.16.1.1. Configuring registry storage for IBM Z	1469
9.2.16.1.2. Configuring storage for the image registry in non-production clusters	1471
9.2.17. Completing installation on user-provisioned infrastructure	1471
9.2.18. Telemetry access for OpenShift Container Platform	1474
9.2.19. Collecting debugging information	1474
9.2.20. Next steps	1475
9.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	1475
9.3.1. Prerequisites	1475
9.3.2. About installations in restricted networks	1476
9.3.2.1. Additional limits	1476
9.3.3. Internet access for OpenShift Container Platform	1476
9.3.4. Requirements for a cluster with user-provisioned infrastructure	1477
9.3.4.1. Required machines	1477
9.3.4.2. Minimum resource requirements	1477
9.3.4.3. Minimum IBM Z system environment	1478
Hardware requirements	1478
Operating system requirements	1478
IBM Z network connectivity requirements	1479
Disk storage for the z/VM guest virtual machines	1479
Storage / Main Memory	1479
9.3.4.4. Preferred IBM Z system environment	1479
Hardware requirements	1479
Operating system requirements	1479
IBM Z network connectivity requirements	1480
Disk storage for the z/VM guest virtual machines	1480
Storage / Main Memory	1480
9.3.4.5. Certificate signing requests management	1480
9.3.4.6. Networking requirements for user-provisioned infrastructure	1480
9.3.4.6.1. Setting the cluster node hostnames through DHCP	1481
9.3.4.6.2. Network connectivity requirements	1481
NTP configuration for user-provisioned infrastructure	1482
9.3.4.7. User-provisioned DNS requirements	1482
9.3.4.7.1. Example DNS configuration for user-provisioned clusters	1484
9.3.4.8. Load balancing requirements for user-provisioned infrastructure	1486
9.3.4.8.1. Example load balancer configuration for user-provisioned clusters	1488
9.3.5. Preparing the user-provisioned infrastructure	1490
9.3.6. Validating DNS resolution for user-provisioned infrastructure	1492
9.3.7. Generating a key pair for cluster node SSH access	1494
9.3.8. Manually creating the installation configuration file	1496
9.3.8.1. Installation configuration parameters	1497
9.3.8.1.1. Required configuration parameters	1497
9.3.8.1.2. Network configuration parameters	1499
9.3.8.1.3. Optional configuration parameters	1500

9.3.8.2. Sample install-config.yaml file for IBM Z	1504
9.3.8.3. Configuring the cluster-wide proxy during installation	1507
9.3.8.4. Configuring a three-node cluster	1509
9.3.9. Cluster Network Operator configuration	1510
9.3.9.1. Cluster Network Operator configuration object	1510
defaultNetwork object configuration	1511
Configuration for the OpenShift SDN CNI cluster network provider	1512
Configuration for the OVN-Kubernetes CNI cluster network provider	1513
kubeProxyConfig object configuration	1515
9.3.10. Creating the Kubernetes manifest and Ignition config files	1515
9.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1517
9.3.11.1. Advanced RHCOS installation reference	1520
9.3.11.1.1. Networking and bonding options for ISO installations	1521
Configuring DHCP or static IP addresses	1521
Configuring an IP address without a static hostname	1522
Specifying multiple network interfaces	1522
Configuring default gateway and route	1522
Disabling DHCP on a single interface	1522
Combining DHCP and static IP configurations	1523
Configuring VLANs on individual interfaces	1523
Providing multiple DNS servers	1523
Bonding multiple network interfaces to a single interface	1523
Bonding multiple network interfaces to a single interface	1524
Using network teaming	1524
9.3.12. Waiting for the bootstrap process to complete	1524
9.3.13. Logging in to the cluster by using the CLI	1525
9.3.14. Approving the certificate signing requests for your machines	1526
9.3.15. Initial Operator configuration	1528
9.3.15.1. Disabling the default OperatorHub sources	1529
9.3.15.2. Image registry storage configuration	1530
9.3.15.2.1. Configuring registry storage for IBM Z	1530
9.3.15.2.2. Configuring storage for the image registry in non-production clusters	1531
9.3.16. Completing installation on user-provisioned infrastructure	1532
9.3.17. Telemetry access for OpenShift Container Platform	1535
9.3.18. Collecting debugging information	1535
9.3.19. Next steps	1535
CHAPTER 10. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE	1537
10.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE	1537
10.1.1. Prerequisites	1537
10.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE	1537
10.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE	1537
10.2.1. Prerequisites	1537
10.2.2. Internet access for OpenShift Container Platform	1538
10.2.3. Machine requirements for a cluster with user-provisioned infrastructure	1538
10.2.3.1. Required machines	1538
10.2.3.2. Network connectivity requirements	1539
10.2.3.3. IBM Z network connectivity requirements	1539
10.2.3.4. Host machine resource requirements	1539
10.2.3.5. Minimum IBM Z system environment	1540
Hardware requirements	1540
Operating system requirements	1540

10.2.3.6. Minimum resource requirements	1540
10.2.3.7. Preferred IBM Z system environment	1541
Hardware requirements	1541
Operating system requirements	1541
10.2.3.8. Preferred resource requirements	1541
10.2.3.9. Certificate signing requests management	1541
10.2.3.10. Networking requirements for user-provisioned infrastructure	1542
10.2.3.10.1. Setting the cluster node hostnames through DHCP	1542
10.2.3.10.2. Network connectivity requirements	1542
NTP configuration for user-provisioned infrastructure	1544
10.2.3.11. User-provisioned DNS requirements	1544
10.2.3.11.1. Example DNS configuration for user-provisioned clusters	1546
10.2.3.12. Load balancing requirements for user-provisioned infrastructure	1548
10.2.3.12.1. Example load balancer configuration for user-provisioned clusters	1550
10.2.4. Preparing the user-provisioned infrastructure	1552
10.2.5. Validating DNS resolution for user-provisioned infrastructure	1554
10.2.6. Generating a key pair for cluster node SSH access	1556
10.2.7. Obtaining the installation program	1558
10.2.8. Installing the OpenShift CLI by downloading the binary	1559
Installing the OpenShift CLI on Linux	1559
Installing the OpenShift CLI on Windows	1559
Installing the OpenShift CLI on macOS	1560
10.2.9. Manually creating the installation configuration file	1560
10.2.9.1. Installation configuration parameters	1561
10.2.9.1.1. Required configuration parameters	1561
10.2.9.1.2. Network configuration parameters	1563
10.2.9.1.3. Optional configuration parameters	1564
10.2.9.2. Sample install-config.yaml file for IBM Z	1568
10.2.9.3. Configuring the cluster-wide proxy during installation	1571
10.2.9.4. Configuring a three-node cluster	1572
10.2.10. Cluster Network Operator configuration	1573
10.2.10.1. Cluster Network Operator configuration object	1574
defaultNetwork object configuration	1574
Configuration for the OpenShift SDN CNI cluster network provider	1575
Configuration for the OVN-Kubernetes CNI cluster network provider	1576
kubeProxyConfig object configuration	1578
10.2.11. Creating the Kubernetes manifest and Ignition config files	1578
10.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1580
10.2.12.1. Fast-track installation by using a prepackaged QCOW2 disk image	1580
10.2.12.2. Full installation on a new QCOW2 disk image	1582
10.2.13. Waiting for the bootstrap process to complete	1583
10.2.14. Logging in to the cluster by using the CLI	1584
10.2.15. Approving the certificate signing requests for your machines	1584
10.2.16. Initial Operator configuration	1587
10.2.16.1. Image registry storage configuration	1588
10.2.16.1.1. Configuring registry storage for IBM Z	1588
10.2.16.1.2. Configuring storage for the image registry in non-production clusters	1590
10.2.17. Completing installation on user-provisioned infrastructure	1590
10.2.18. Telemetry access for OpenShift Container Platform	1593
10.2.19. Collecting debugging information	1593
10.2.20. Next steps	1594
10.3. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	1594

10.3.1. Prerequisites	1594
10.3.2. About installations in restricted networks	1595
10.3.2.1. Additional limits	1595
10.3.3. Internet access for OpenShift Container Platform	1595
10.3.4. Machine requirements for a cluster with user-provisioned infrastructure	1596
10.3.4.1. Required machines	1596
10.3.4.2. Network connectivity requirements	1596
10.3.4.3. IBM Z network connectivity requirements	1597
10.3.4.4. Host machine resource requirements	1597
10.3.4.5. Minimum IBM Z system environment	1597
Hardware requirements	1597
Operating system requirements	1597
10.3.4.6. Minimum resource requirements	1598
10.3.4.7. Preferred IBM Z system environment	1598
Hardware requirements	1598
Operating system requirements	1598
10.3.4.8. Preferred resource requirements	1598
10.3.4.9. Certificate signing requests management	1599
10.3.4.10. Networking requirements for user-provisioned infrastructure	1599
10.3.4.10.1. Network connectivity requirements	1599
NTP configuration for user-provisioned infrastructure	1600
10.3.4.11. User-provisioned DNS requirements	1601
10.3.4.11.1. Example DNS configuration for user-provisioned clusters	1602
10.3.4.12. Load balancing requirements for user-provisioned infrastructure	1605
10.3.4.12.1. Example load balancer configuration for user-provisioned clusters	1607
10.3.5. Preparing the user-provisioned infrastructure	1609
10.3.6. Validating DNS resolution for user-provisioned infrastructure	1610
10.3.7. Generating a key pair for cluster node SSH access	1612
10.3.8. Manually creating the installation configuration file	1614
10.3.8.1. Installation configuration parameters	1615
10.3.8.1.1. Required configuration parameters	1615
10.3.8.1.2. Network configuration parameters	1617
10.3.8.1.3. Optional configuration parameters	1618
10.3.8.2. Sample install-config.yaml file for IBM Z	1622
10.3.8.3. Configuring the cluster-wide proxy during installation	1625
10.3.8.4. Configuring a three-node cluster	1627
10.3.9. Cluster Network Operator configuration	1628
10.3.9.1. Cluster Network Operator configuration object	1628
defaultNetwork object configuration	1629
Configuration for the OpenShift SDN CNI cluster network provider	1630
Configuration for the OVN-Kubernetes CNI cluster network provider	1631
kubeProxyConfig object configuration	1633
10.3.10. Creating the Kubernetes manifest and Ignition config files	1633
10.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1635
10.3.11.1. Fast-track installation by using a prepackaged QCOW2 disk image	1636
10.3.11.2. Full installation on a new QCOW2 disk image	1637
10.3.12. Waiting for the bootstrap process to complete	1638
10.3.13. Logging in to the cluster by using the CLI	1639
10.3.14. Approving the certificate signing requests for your machines	1639
10.3.15. Initial Operator configuration	1642
10.3.15.1. Disabling the default OperatorHub sources	1643
10.3.15.2. Image registry storage configuration	1643
10.3.15.2.1. Configuring registry storage for IBM Z	1644

10.3.15.2.2. Configuring storage for the image registry in non-production clusters	1645
10.3.16. Completing installation on user-provisioned infrastructure	1646
10.3.17. Telemetry access for OpenShift Container Platform	1648
10.3.18. Collecting debugging information	1648
10.3.19. Next steps	1649
CHAPTER 11. INSTALLING ON IBM POWER SYSTEMS	1650
11.1. PREPARING TO INSTALL ON IBM POWER SYSTEMS	1650
11.1.1. Prerequisites	1650
11.1.2. Choosing a method to install OpenShift Container Platform on IBM Power Systems	1650
11.2. INSTALLING A CLUSTER ON IBM POWER SYSTEMS	1650
11.2.1. Prerequisites	1650
11.2.2. Internet access for OpenShift Container Platform	1651
11.2.3. Requirements for a cluster with user-provisioned infrastructure	1651
11.2.3.1. Required machines	1651
11.2.3.2. Minimum resource requirements	1652
11.2.3.3. Minimum IBM Power Systems requirements	1652
Hardware requirements	1652
Operating system requirements	1652
Disk storage for the IBM Power guest virtual machines	1653
Network for the PowerVM guest virtual machines	1653
Storage / main memory	1653
11.2.3.4. Recommended IBM Power system requirements	1653
Hardware requirements	1653
Operating system requirements	1653
Disk storage for the IBM Power guest virtual machines	1653
Network for the PowerVM guest virtual machines	1653
Storage / main memory	1653
11.2.3.5. Certificate signing requests management	1654
11.2.3.6. Networking requirements for user-provisioned infrastructure	1654
11.2.3.6.1. Network connectivity requirements	1654
NTP configuration for user-provisioned infrastructure	1655
11.2.3.7. User-provisioned DNS requirements	1655
11.2.3.7.1. Example DNS configuration for user-provisioned clusters	1657
11.2.3.8. Load balancing requirements for user-provisioned infrastructure	1659
11.2.3.8.1. Example load balancer configuration for user-provisioned clusters	1661
11.2.4. Preparing the user-provisioned infrastructure	1663
11.2.5. Validating DNS resolution for user-provisioned infrastructure	1664
11.2.6. Generating a key pair for cluster node SSH access	1667
11.2.7. Obtaining the installation program	1668
11.2.8. Installing the OpenShift CLI by downloading the binary	1669
Installing the OpenShift CLI on Linux	1669
Installing the OpenShift CLI on Windows	1670
Installing the OpenShift CLI on macOS	1670
11.2.9. Manually creating the installation configuration file	1671
11.2.9.1. Installation configuration parameters	1672
11.2.9.1.1. Required configuration parameters	1672
11.2.9.1.2. Network configuration parameters	1673
11.2.9.1.3. Optional configuration parameters	1675
11.2.9.2. Sample install-config.yaml file for IBM Z	1680
11.2.9.3. Sample install-config.yaml file for IBM Power Systems	1680
11.2.9.4. Configuring the cluster-wide proxy during installation	1682
11.2.9.5. Configuring a three-node cluster	1684

11.2.10. Cluster Network Operator configuration	1685
11.2.10.1. Cluster Network Operator configuration object	1685
defaultNetwork object configuration	1686
Configuration for the OpenShift SDN CNI cluster network provider	1687
Configuration for the OVN-Kubernetes CNI cluster network provider	1688
kubeProxyConfig object configuration	1690
11.2.11. Creating the Kubernetes manifest and Ignition config files	1690
11.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1692
11.2.12.1. Installing RHCOS by using an ISO image	1693
11.2.12.1.1. Advanced RHCOS installation reference	1696
11.2.12.1.1.1. Networking and bonding options for ISO installations	1696
Configuring DHCP or static IP addresses	1696
Configuring an IP address without a static hostname	1697
Specifying multiple network interfaces	1697
Configuring default gateway and route	1697
Disabling DHCP on a single interface	1698
Combining DHCP and static IP configurations	1698
Configuring VLANs on individual interfaces	1698
Providing multiple DNS servers	1698
Bonding multiple network interfaces to a single interface	1698
Bonding multiple network interfaces to a single interface	1699
Using network teaming	1699
11.2.12.2. Installing RHCOS by using PXE booting	1699
11.2.13. Waiting for the bootstrap process to complete	1704
11.2.14. Logging in to the cluster by using the CLI	1705
11.2.15. Approving the certificate signing requests for your machines	1705
11.2.16. Initial Operator configuration	1708
11.2.16.1. Image registry storage configuration	1709
11.2.16.1.1. Configuring registry storage for IBM Z	1709
11.2.16.1.2. Configuring registry storage for IBM Power Systems	1709
11.2.16.1.3. Configuring storage for the image registry in non-production clusters	1711
11.2.17. Completing installation on user-provisioned infrastructure	1711
11.2.18. Telemetry access for OpenShift Container Platform	1714
11.2.19. Next steps	1715
11.3. INSTALLING A CLUSTER ON IBM POWER SYSTEMS IN A RESTRICTED NETWORK	1715
11.3.1. Prerequisites	1715
11.3.2. About installations in restricted networks	1715
11.3.2.1. Additional limits	1716
11.3.3. Internet access for OpenShift Container Platform	1716
11.3.4. Requirements for a cluster with user-provisioned infrastructure	1716
11.3.4.1. Required machines	1717
11.3.4.2. Minimum resource requirements	1717
11.3.4.3. Minimum IBM Power Systems requirements	1717
Hardware requirements	1718
Operating system requirements	1718
Disk storage for the IBM Power guest virtual machines	1718
Network for the PowerVM guest virtual machines	1718
Storage / main memory	1718
11.3.4.4. Recommended IBM Power system requirements	1718
Hardware requirements	1718
Operating system requirements	1718
Disk storage for the IBM Power guest virtual machines	1718
Network for the PowerVM guest virtual machines	1719

Storage / main memory	1719
11.3.4.5. Certificate signing requests management	1719
11.3.4.6. Networking requirements for user-provisioned infrastructure	1719
11.3.4.6.1. Network connectivity requirements	1719
NTP configuration for user-provisioned infrastructure	1720
11.3.4.7. User-provisioned DNS requirements	1721
11.3.4.7.1. Example DNS configuration for user-provisioned clusters	1722
11.3.4.8. Load balancing requirements for user-provisioned infrastructure	1725
11.3.4.8.1. Example load balancer configuration for user-provisioned clusters	1727
11.3.5. Preparing the user-provisioned infrastructure	1729
11.3.6. Validating DNS resolution for user-provisioned infrastructure	1730
11.3.7. Generating a key pair for cluster node SSH access	1732
11.3.8. Manually creating the installation configuration file	1734
11.3.8.1. Installation configuration parameters	1735
11.3.8.1.1. Required configuration parameters	1735
11.3.8.1.2. Network configuration parameters	1736
11.3.8.1.3. Optional configuration parameters	1738
11.3.8.2. Sample install-config.yaml file for IBM Z	1742
11.3.8.3. Sample install-config.yaml file for IBM Power Systems	1742
11.3.8.4. Configuring the cluster-wide proxy during installation	1745
11.3.8.5. Configuring a three-node cluster	1747
11.3.9. Cluster Network Operator configuration	1748
11.3.9.1. Cluster Network Operator configuration object	1748
defaultNetwork object configuration	1749
Configuration for the OpenShift SDN CNI cluster network provider	1750
Configuration for the OVN-Kubernetes CNI cluster network provider	1751
kubeProxyConfig object configuration	1753
11.3.10. Creating the Kubernetes manifest and Ignition config files	1753
11.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1755
11.3.11.1. Installing RHCOS by using an ISO image	1756
11.3.11.1.1. Advanced RHCOS installation reference	1759
11.3.11.1.1.1. Networking and bonding options for ISO installations	1759
Configuring DHCP or static IP addresses	1759
Configuring an IP address without a static hostname	1760
Specifying multiple network interfaces	1760
Configuring default gateway and route	1760
Disabling DHCP on a single interface	1761
Combining DHCP and static IP configurations	1761
Configuring VLANs on individual interfaces	1761
Providing multiple DNS servers	1761
Bonding multiple network interfaces to a single interface	1761
Bonding multiple network interfaces to a single interface	1762
Using network teaming	1762
11.3.11.2. Installing RHCOS by using PXE booting	1762
11.3.12. Waiting for the bootstrap process to complete	1767
11.3.13. Logging in to the cluster by using the CLI	1768
11.3.14. Approving the certificate signing requests for your machines	1768
11.3.15. Initial Operator configuration	1771
11.3.15.1. Disabling the default OperatorHub sources	1772
11.3.15.2. Image registry storage configuration	1772
11.3.15.2.1. Changing the image registry's management state	1773
11.3.15.2.2. Configuring registry storage for IBM Z	1773
11.3.15.2.3. Configuring registry storage for IBM Power Systems	1773

11.3.15.2.4. Configuring storage for the image registry in non-production clusters	1774
11.3.16. Completing installation on user-provisioned infrastructure	1775
11.3.17. Telemetry access for OpenShift Container Platform	1778
11.3.18. Next steps	1778
CHAPTER 12. INSTALLING ON OPENSTACK	1779
12.1. PREPARING TO INSTALL ON OPENSTACK	1779
12.1.1. Prerequisites	1779
12.1.2. Choosing a method to install OpenShift Container Platform on OpenStack	1779
12.1.2.1. Installing a cluster on installer-provisioned infrastructure	1779
12.1.2.2. Installing a cluster on user-provisioned infrastructure	1779
12.2. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS	1780
12.2.1. Prerequisites	1780
12.2.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	1780
12.2.2.1. Control plane machines	1781
12.2.2.2. Compute machines	1781
12.2.2.3. Bootstrap machine	1782
12.2.3. Internet access for OpenShift Container Platform	1782
12.2.4. Enabling Swift on RHOSP	1782
12.2.5. Configuring an image registry with custom storage on clusters that run on RHOSP	1783
12.2.6. Verifying external network access	1785
12.2.7. Defining parameters for the installation program	1786
12.2.8. Obtaining the installation program	1788
12.2.9. Creating the installation configuration file	1788
12.2.9.1. Configuring the cluster-wide proxy during installation	1790
12.2.10. Installation configuration parameters	1791
12.2.10.1. Required configuration parameters	1792
12.2.10.2. Network configuration parameters	1793
12.2.10.3. Optional configuration parameters	1794
12.2.10.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	1798
12.2.10.5. Optional RHOSP configuration parameters	1799
12.2.10.6. Custom subnets in RHOSP deployments	1803
12.2.10.7. Deploying a cluster with bare metal machines	1804
12.2.10.8. Cluster deployment on RHOSP provider networks	1805
12.2.10.8.1. RHOSP provider network requirements for cluster installation	1806
12.2.10.8.2. Deploying a cluster that has a primary interface on a provider network	1807
12.2.10.9. Sample customized install-config.yaml file for RHOSP	1809
12.2.11. Setting compute machine affinity	1809
12.2.12. Generating a key pair for cluster node SSH access	1811
12.2.13. Enabling access to the environment	1813
12.2.13.1. Enabling access with floating IP addresses	1813
12.2.13.2. Completing installation without floating IP addresses	1814
12.2.14. Deploying the cluster	1815
12.2.15. Verifying cluster status	1816
12.2.16. Logging in to the cluster by using the CLI	1817
12.2.17. Telemetry access for OpenShift Container Platform	1818
12.2.18. Next steps	1818
12.3. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR	1818
12.3.1. Prerequisites	1818
12.3.2. About Kuryr SDN	1819
12.3.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	1819
12.3.3.1. Increasing quota	1821
12.3.3.2. Configuring Neutron	1821

12.3.3.3. Configuring Octavia	1822
12.3.3.3.1. The Octavia OVN Driver	1825
12.3.3.4. Known limitations of installing with Kuryr	1826
RHOSP general limitations	1826
RHOSP version limitations	1826
RHOSP environment limitations	1826
RHOSP upgrade limitations	1827
12.3.3.5. Control plane machines	1827
12.3.3.6. Compute machines	1827
12.3.3.7. Bootstrap machine	1828
12.3.4. Internet access for OpenShift Container Platform	1828
12.3.5. Enabling Swift on RHOSP	1828
12.3.6. Verifying external network access	1829
12.3.7. Defining parameters for the installation program	1830
12.3.8. Obtaining the installation program	1831
12.3.9. Creating the installation configuration file	1832
12.3.9.1. Configuring the cluster-wide proxy during installation	1834
12.3.10. Installation configuration parameters	1835
12.3.10.1. Required configuration parameters	1835
12.3.10.2. Network configuration parameters	1837
12.3.10.3. Optional configuration parameters	1838
12.3.10.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	1842
12.3.10.5. Optional RHOSP configuration parameters	1843
12.3.10.6. Custom subnets in RHOSP deployments	1847
12.3.10.7. Sample customized install-config.yaml file for RHOSP with Kuryr	1848
12.3.10.8. Cluster deployment on RHOSP provider networks	1849
12.3.10.8.1. RHOSP provider network requirements for cluster installation	1850
12.3.10.8.2. Deploying a cluster that has a primary interface on a provider network	1851
12.3.10.9. Kuryr ports pools	1852
12.3.10.10. Adjusting Kuryr ports pools during installation	1852
12.3.11. Setting compute machine affinity	1854
12.3.12. Generating a key pair for cluster node SSH access	1856
12.3.13. Enabling access to the environment	1858
12.3.13.1. Enabling access with floating IP addresses	1858
12.3.13.2. Completing installation without floating IP addresses	1859
12.3.14. Deploying the cluster	1860
12.3.15. Verifying cluster status	1861
12.3.16. Logging in to the cluster by using the CLI	1862
12.3.17. Telemetry access for OpenShift Container Platform	1863
12.3.18. Next steps	1863
12.4. INSTALLING A CLUSTER ON OPENSTACK THAT SUPPORTS SR-IOV-CONNECTED COMPUTE MACHINES	1863
12.4.1. Prerequisites	1863
12.4.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	1864
12.4.2.1. Control plane machines	1865
12.4.2.2. Compute machines	1865
12.4.2.3. Bootstrap machine	1865
12.4.3. Internet access for OpenShift Container Platform	1866
12.4.4. Enabling Swift on RHOSP	1866
12.4.5. Verifying external network access	1867
12.4.6. Defining parameters for the installation program	1867
12.4.7. Obtaining the installation program	1869
12.4.8. Creating the installation configuration file	1869

12.4.8.1. Configuring the cluster-wide proxy during installation	1870
12.4.9. Installation configuration parameters	1872
12.4.9.1. Required configuration parameters	1872
12.4.9.2. Network configuration parameters	1874
12.4.9.3. Optional configuration parameters	1875
12.4.9.4. Custom subnets in RHOSP deployments	1880
12.4.9.5. Deploying a cluster with bare metal machines	1881
12.4.9.6. Sample customized install-config.yaml file for RHOSP	1882
12.4.10. Generating a key pair for cluster node SSH access	1883
12.4.11. Enabling access to the environment	1884
12.4.11.1. Enabling access with floating IP addresses	1885
12.4.11.2. Completing installation without floating IP addresses	1886
12.4.12. Creating SR-IOV networks for compute machines	1887
12.4.13. Deploying the cluster	1888
12.4.14. Verifying cluster status	1889
12.4.15. Logging in to the cluster by using the CLI	1890
12.4.16. Preparing a cluster that runs on RHOSP for SR-IOV	1890
12.4.16.1. Enabling the RHOSP metadata service as a mountable drive	1890
12.4.16.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver	1891
12.4.17. Telemetry access for OpenShift Container Platform	1892
12.4.18. Next steps	1892
12.5. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE	1893
12.5.1. Prerequisites	1893
12.5.2. Internet access for OpenShift Container Platform	1893
12.5.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	1894
12.5.3.1. Control plane machines	1895
12.5.3.2. Compute machines	1895
12.5.3.3. Bootstrap machine	1895
12.5.4. Downloading playbook dependencies	1896
12.5.5. Downloading the installation playbooks	1897
12.5.6. Obtaining the installation program	1898
12.5.7. Generating a key pair for cluster node SSH access	1899
12.5.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	1900
12.5.9. Verifying external network access	1901
12.5.10. Enabling access to the environment	1902
12.5.10.1. Enabling access with floating IP addresses	1902
12.5.10.2. Completing installation without floating IP addresses	1903
12.5.11. Defining parameters for the installation program	1904
12.5.12. Creating the installation configuration file	1905
12.5.13. Installation configuration parameters	1907
12.5.13.1. Required configuration parameters	1907
12.5.13.2. Network configuration parameters	1909
12.5.13.3. Optional configuration parameters	1910
12.5.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	1914
12.5.13.5. Optional RHOSP configuration parameters	1915
12.5.13.6. Custom subnets in RHOSP deployments	1919
12.5.13.7. Sample customized install-config.yaml file for RHOSP	1920
12.5.13.8. Setting a custom subnet for machines	1920
12.5.13.9. Emptying compute machine pools	1921
12.5.13.10. Cluster deployment on RHOSP provider networks	1922
12.5.13.10.1. RHOSP provider network requirements for cluster installation	1923
12.5.13.10.2. Deploying a cluster that has a primary interface on a provider network	1924
12.5.14. Creating the Kubernetes manifest and Ignition config files	1925

12.5.15. Preparing the bootstrap Ignition files	1927
12.5.16. Creating control plane Ignition config files on RHOSP	1930
12.5.17. Creating network resources on RHOSP	1930
12.5.17.1. Deploying a cluster with bare metal machines	1932
12.5.18. Creating the bootstrap machine on RHOSP	1933
12.5.19. Creating the control plane machines on RHOSP	1934
12.5.20. Logging in to the cluster by using the CLI	1935
12.5.21. Deleting bootstrap resources from RHOSP	1935
12.5.22. Creating compute machines on RHOSP	1936
12.5.23. Approving the certificate signing requests for your machines	1937
12.5.24. Verifying a successful installation	1939
12.5.25. Telemetry access for OpenShift Container Platform	1940
12.5.26. Next steps	1940
12.6. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE	1940
12.6.1. Prerequisites	1940
12.6.2. About Kuryr SDN	1941
12.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	1941
12.6.3.1. Increasing quota	1943
12.6.3.2. Configuring Neutron	1943
12.6.3.3. Configuring Octavia	1944
12.6.3.3.1. The Octavia OVN Driver	1947
12.6.3.4. Known limitations of installing with Kuryr	1948
RHOSP general limitations	1948
RHOSP version limitations	1948
RHOSP environment limitations	1948
RHOSP upgrade limitations	1949
12.6.3.5. Control plane machines	1949
12.6.3.6. Compute machines	1949
12.6.3.7. Bootstrap machine	1950
12.6.4. Internet access for OpenShift Container Platform	1950
12.6.5. Downloading playbook dependencies	1950
12.6.6. Downloading the installation playbooks	1951
12.6.7. Obtaining the installation program	1952
12.6.8. Generating a key pair for cluster node SSH access	1953
12.6.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	1955
12.6.10. Verifying external network access	1956
12.6.11. Enabling access to the environment	1957
12.6.11.1. Enabling access with floating IP addresses	1957
12.6.11.2. Completing installation without floating IP addresses	1958
12.6.12. Defining parameters for the installation program	1959
12.6.13. Creating the installation configuration file	1960
12.6.14. Installation configuration parameters	1962
12.6.14.1. Required configuration parameters	1962
12.6.14.2. Network configuration parameters	1963
12.6.14.3. Optional configuration parameters	1965
12.6.14.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	1970
12.6.14.5. Optional RHOSP configuration parameters	1971
12.6.14.6. Custom subnets in RHOSP deployments	1975
12.6.14.7. Sample customized install-config.yaml file for RHOSP with Kuryr	1976
12.6.14.8. Cluster deployment on RHOSP provider networks	1977
12.6.14.8.1. RHOSP provider network requirements for cluster installation	1978
12.6.14.8.2. Deploying a cluster that has a primary interface on a provider network	1979
12.6.14.9. Kuryr ports pools	1980

12.6.14.10. Adjusting Kuryr ports pools during installation	1981
12.6.14.11. Setting a custom subnet for machines	1982
12.6.14.12. Emptying compute machine pools	1983
12.6.14.13. Modifying the network type	1984
12.6.15. Creating the Kubernetes manifest and Ignition config files	1984
12.6.16. Preparing the bootstrap Ignition files	1987
12.6.17. Creating control plane Ignition config files on RHOSP	1989
12.6.18. Creating network resources on RHOSP	1990
12.6.19. Creating the bootstrap machine on RHOSP	1992
12.6.20. Creating the control plane machines on RHOSP	1992
12.6.21. Logging in to the cluster by using the CLI	1993
12.6.22. Deleting bootstrap resources from RHOSP	1993
12.6.23. Creating compute machines on RHOSP	1994
12.6.24. Approving the certificate signing requests for your machines	1995
12.6.25. Verifying a successful installation	1997
12.6.26. Telemetry access for OpenShift Container Platform	1998
12.6.27. Next steps	1998
12.7. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN SR-IOV INFRASTRUCTURE	1998
12.7.1. Prerequisites	1998
12.7.2. Internet access for OpenShift Container Platform	1999
12.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	1999
12.7.3.1. Control plane machines	2000
12.7.3.2. Compute machines	2000
12.7.3.3. Bootstrap machine	2001
12.7.4. Downloading playbook dependencies	2001
12.7.5. Downloading the installation playbooks	2002
12.7.6. Obtaining the installation program	2003
12.7.7. Generating a key pair for cluster node SSH access	2004
12.7.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	2006
12.7.9. Verifying external network access	2007
12.7.10. Enabling access to the environment	2007
12.7.10.1. Enabling access with floating IP addresses	2008
12.7.10.2. Completing installation without floating IP addresses	2009
12.7.11. Defining parameters for the installation program	2010
12.7.12. Creating the installation configuration file	2011
12.7.13. Installation configuration parameters	2013
12.7.13.1. Required configuration parameters	2013
12.7.13.2. Network configuration parameters	2014
12.7.13.3. Optional configuration parameters	2016
12.7.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2020
12.7.13.5. Optional RHOSP configuration parameters	2021
12.7.13.6. Sample customized install-config.yaml file for RHOSP	2025
12.7.13.7. Custom subnets in RHOSP deployments	2026
12.7.13.8. Setting a custom subnet for machines	2026
12.7.13.9. Emptying compute machine pools	2027
12.7.14. Creating the Kubernetes manifest and Ignition config files	2028
12.7.15. Preparing the bootstrap Ignition files	2030
12.7.16. Creating control plane Ignition config files on RHOSP	2032
12.7.17. Creating network resources on RHOSP	2033
12.7.17.1. Deploying a cluster with bare metal machines	2035
12.7.18. Creating the bootstrap machine on RHOSP	2036
12.7.19. Creating the control plane machines on RHOSP	2037
12.7.20. Logging in to the cluster by using the CLI	2037

12.7.21. Deleting bootstrap resources from RHOSP	2038
12.7.22. Creating SR-IOV networks for compute machines	2039
12.7.23. Creating compute machines that run on SR-IOV networks	2040
12.7.24. Approving the certificate signing requests for your machines	2043
12.7.25. Verifying a successful installation	2046
12.7.26. Preparing a cluster that runs on RHOSP for SR-IOV	2046
12.7.26.1. Enabling the RHOSP metadata service as a mountable drive	2046
12.7.26.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver	2047
12.7.27. Telemetry access for OpenShift Container Platform	2048
12.7.28. Additional resources	2048
12.7.29. Next steps	2048
12.8. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK	2049
12.8.1. Prerequisites	2049
12.8.2. About installations in restricted networks	2049
12.8.2.1. Additional limits	2049
12.8.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	2050
12.8.3.1. Control plane machines	2051
12.8.3.2. Compute machines	2051
12.8.3.3. Bootstrap machine	2051
12.8.4. Internet access for OpenShift Container Platform	2051
12.8.5. Enabling Swift on RHOSP	2052
12.8.6. Defining parameters for the installation program	2052
12.8.7. Creating the RHCOS image for restricted network installations	2054
12.8.8. Creating the installation configuration file	2055
12.8.8.1. Configuring the cluster-wide proxy during installation	2057
12.8.8.2. Installation configuration parameters	2059
12.8.8.2.1. Required configuration parameters	2059
12.8.8.2.2. Network configuration parameters	2061
12.8.8.2.3. Optional configuration parameters	2062
12.8.8.2.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2066
12.8.8.2.5. Optional RHOSP configuration parameters	2067
12.8.8.3. Sample customized install-config.yaml file for restricted OpenStack installations	2071
12.8.9. Setting compute machine affinity	2072
12.8.10. Generating a key pair for cluster node SSH access	2074
12.8.11. Enabling access to the environment	2076
12.8.11.1. Enabling access with floating IP addresses	2076
12.8.11.2. Completing installation without floating IP addresses	2077
12.8.12. Deploying the cluster	2078
12.8.13. Verifying cluster status	2079
12.8.14. Logging in to the cluster by using the CLI	2080
12.8.15. Disabling the default OperatorHub sources	2081
12.8.16. Telemetry access for OpenShift Container Platform	2081
12.8.17. Next steps	2081
12.9. UNINSTALLING A CLUSTER ON OPENSTACK	2081
12.9.1. Removing a cluster that uses installer-provisioned infrastructure	2082
12.10. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE	2082
12.10.1. Downloading playbook dependencies	2082
12.10.2. Removing a cluster from RHOSP that uses your own infrastructure	2083
CHAPTER 13. INSTALLING ON RHV	2085
13.1. PREPARING TO INSTALL ON RED HAT VIRTUALIZATION (RHV)	2085
13.1.1. Prerequisites	2085
13.1.2. Choosing a method to install OpenShift Container Platform on RHV	2085

13.1.2.1. Installing a cluster on installer-provisioned infrastructure	2085
13.1.2.2. Installing a cluster on user-provisioned infrastructure	2085
13.2. INSTALLING A CLUSTER QUICKLY ON RHV	2086
13.2.1. Prerequisites	2086
13.2.2. Internet access for OpenShift Container Platform	2087
13.2.3. Requirements for the RHV environment	2087
13.2.4. Verifying the requirements for the RHV environment	2089
13.2.5. Preparing the network environment on RHV	2091
13.2.6. Installing OpenShift Container Platform on RHV in insecure mode	2091
13.2.7. Generating a key pair for cluster node SSH access	2092
13.2.8. Obtaining the installation program	2094
13.2.9. Deploying the cluster	2095
13.2.10. Installing the OpenShift CLI by downloading the binary	2098
Installing the OpenShift CLI on Linux	2098
Installing the OpenShift CLI on Windows	2098
Installing the OpenShift CLI on macOS	2099
13.2.11. Logging in to the cluster by using the CLI	2099
13.2.12. Verifying cluster status	2100
13.2.13. Accessing the OpenShift Container Platform web console on RHV	2100
13.2.14. Telemetry access for OpenShift Container Platform	2101
13.2.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2101
13.2.15.1. CPU load increases and nodes go into a Not Ready state	2101
13.2.15.2. Trouble connecting the OpenShift Container Platform cluster API	2102
13.2.16. Post-installation tasks	2102
13.3. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS	2102
13.3.1. Prerequisites	2103
13.3.2. Internet access for OpenShift Container Platform	2104
13.3.3. Requirements for the RHV environment	2104
13.3.4. Verifying the requirements for the RHV environment	2106
13.3.5. Preparing the network environment on RHV	2108
13.3.6. Installing OpenShift Container Platform on RHV in insecure mode	2108
13.3.7. Generating a key pair for cluster node SSH access	2109
13.3.8. Obtaining the installation program	2111
13.3.9. Creating the installation configuration file	2112
13.3.9.1. Example install-config.yaml files for Red Hat Virtualization (RHV)	2115
Example default install-config.yaml file	2115
Example minimal install-config.yaml file	2116
Example Custom machine pools in an install-config.yaml file	2116
Example non-enforcing affinity group	2117
Example removing all affinity groups for a non-production lab setup	2117
13.3.9.2. Installation configuration parameters	2118
13.3.9.2.1. Required configuration parameters	2118
13.3.9.2.2. Network configuration parameters	2120
13.3.9.2.3. Optional configuration parameters	2121
13.3.9.2.4. Additional Red Hat Virtualization (RHV) configuration parameters	2125
13.3.9.2.5. Additional RHV parameters for machine pools	2127
13.3.10. Deploying the cluster	2130
13.3.11. Installing the OpenShift CLI by downloading the binary	2132
Installing the OpenShift CLI on Linux	2132
Installing the OpenShift CLI on Windows	2132
Installing the OpenShift CLI on macOS	2133
13.3.12. Logging in to the cluster by using the CLI	2133
13.3.13. Verifying cluster status	2134

13.3.14. Accessing the OpenShift Container Platform web console on RHV	2135
13.3.15. Telemetry access for OpenShift Container Platform	2135
13.3.16. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2135
13.3.16.1. CPU load increases and nodes go into a Not Ready state	2135
13.3.16.2. Trouble connecting the OpenShift Container Platform cluster API	2136
13.3.17. Post-installation tasks	2136
13.3.18. Next steps	2136
13.4. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE	2137
13.4.1. Prerequisites	2137
13.4.2. Internet access for OpenShift Container Platform	2138
13.4.3. Requirements for the RHV environment	2138
13.4.4. Verifying the requirements for the RHV environment	2140
13.4.5. Networking requirements for user-provisioned infrastructure	2141
13.4.5.1. Network connectivity requirements	2142
NTP configuration for user-provisioned infrastructure	2143
13.4.6. Setting up the installation machine	2143
13.4.7. Installing OpenShift Container Platform on RHV in insecure mode	2144
13.4.8. Generating a key pair for cluster node SSH access	2145
13.4.9. Obtaining the installation program	2147
13.4.10. Downloading the Ansible playbooks	2147
13.4.11. The inventory.yml file	2148
13.4.12. Specifying the RHCOS image settings	2152
13.4.13. Creating the install config file	2152
13.4.14. Customizing install-config.yaml	2153
13.4.15. Generate manifest files	2155
13.4.16. Making control-plane nodes non-schedulable	2156
13.4.17. Building the Ignition files	2156
13.4.18. Creating templates and virtual machines	2157
13.4.19. Creating the bootstrap machine	2158
13.4.20. Creating the control plane nodes	2159
13.4.21. Verifying cluster status	2159
13.4.22. Removing the bootstrap machine	2160
13.4.23. Creating the worker nodes and completing the installation	2160
13.4.24. Telemetry access for OpenShift Container Platform	2162
13.5. INSTALLING A CLUSTER ON RHV IN A RESTRICTED NETWORK	2162
13.5.1. Prerequisites	2162
13.5.2. About installations in restricted networks	2163
13.5.2.1. Additional limits	2163
13.5.3. Internet access for OpenShift Container Platform	2163
13.5.4. Requirements for the RHV environment	2164
13.5.5. Verifying the requirements for the RHV environment	2165
13.5.6. Networking requirements for user-provisioned infrastructure	2167
13.5.6.1. Network connectivity requirements	2168
NTP configuration for user-provisioned infrastructure	2169
13.5.7. User-provisioned DNS requirements	2169
13.5.7.1. Example DNS configuration for user-provisioned clusters	2171
13.5.7.2. Load balancing requirements for user-provisioned infrastructure	2173
13.5.7.2.1. Example load balancer configuration for user-provisioned clusters	2175
13.5.8. Setting up the installation machine	2177
13.5.9. Setting up the CA certificate for RHV	2178
13.5.10. Generating a key pair for cluster node SSH access	2179
13.5.11. Downloading the Ansible playbooks	2180
13.5.12. The inventory.yml file	2181

13.5.13. Specifying the RHCOS image settings	2185
13.5.14. Creating the install config file	2185
13.5.15. Sample install-config.yaml file for IBM Z	2186
13.5.16. Sample install-config.yaml file for RHV	2186
13.5.16.1. Configuring the cluster-wide proxy during installation	2189
13.5.17. Customizing install-config.yaml	2190
13.5.18. Generate manifest files	2192
13.5.19. Making control-plane nodes non-schedulable	2193
13.5.20. Building the Ignition files	2193
13.5.21. Creating templates and virtual machines	2194
13.5.22. Creating the bootstrap machine	2195
13.5.23. Creating the control plane nodes	2196
13.5.24. Verifying cluster status	2196
13.5.25. Removing the bootstrap machine	2197
13.5.26. Creating the worker nodes and completing the installation	2197
13.5.27. Telemetry access for OpenShift Container Platform	2199
13.5.28. Disabling the default OperatorHub sources	2199
13.6. UNINSTALLING A CLUSTER ON RHV	2200
13.6.1. Removing a cluster that uses installer-provisioned infrastructure	2200
13.6.2. Removing a cluster that uses user-provisioned infrastructure	2200
CHAPTER 14. INSTALLING ON VSPHERE	2202
14.1. PREPARING TO INSTALL ON VSPHERE	2202
14.1.1. Prerequisites	2202
14.1.2. Choosing a method to install OpenShift Container Platform on vSphere	2202
14.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2202
14.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2203
14.1.3. VMware vSphere infrastructure requirements	2203
14.1.4. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2204
14.2. INSTALLING A CLUSTER ON VSPHERE	2204
14.2.1. Prerequisites	2204
14.2.2. Internet access for OpenShift Container Platform	2204
14.2.3. VMware vSphere infrastructure requirements	2205
14.2.4. Network connectivity requirements	2206
14.2.5. vCenter requirements	2207
Required vCenter account privileges	2207
Using OpenShift Container Platform with vMotion	2216
Cluster resources	2216
Cluster limits	2216
Networking requirements	2217
Required IP Addresses	2217
DNS records	2217
14.2.6. Generating a key pair for cluster node SSH access	2218
14.2.7. Obtaining the installation program	2219
14.2.8. Adding vCenter root CA certificates to your system trust	2220
14.2.9. Deploying the cluster	2221
14.2.10. Installing the OpenShift CLI by downloading the binary	2224
Installing the OpenShift CLI on Linux	2224
Installing the OpenShift CLI on Windows	2224
Installing the OpenShift CLI on macOS	2225
14.2.11. Logging in to the cluster by using the CLI	2225
14.2.12. Creating registry storage	2226

14.2.12.1. Image registry removed during installation	2226
14.2.12.2. Image registry storage configuration	2226
14.2.12.2.1. Configuring registry storage for VMware vSphere	2226
14.2.12.2.2. Configuring block registry storage for VMware vSphere	2228
14.2.13. Backing up VMware vSphere volumes	2229
14.2.14. Steal clock accounting	2230
14.2.15. Telemetry access for OpenShift Container Platform	2230
14.2.16. Next steps	2230
14.3. INSTALLING A CLUSTER ON VSPHERE WITH CUSTOMIZATIONS	2230
14.3.1. Prerequisites	2230
14.3.2. Internet access for OpenShift Container Platform	2231
14.3.3. VMware vSphere infrastructure requirements	2231
14.3.4. Network connectivity requirements	2232
14.3.5. vCenter requirements	2233
Required vCenter account privileges	2233
Using OpenShift Container Platform with vMotion	2242
Cluster resources	2242
Cluster limits	2242
Networking requirements	2243
Required IP Addresses	2243
DNS records	2243
14.3.6. Generating a key pair for cluster node SSH access	2244
14.3.7. Obtaining the installation program	2245
14.3.8. Adding vCenter root CA certificates to your system trust	2246
14.3.9. Creating the installation configuration file	2247
14.3.9.1. Installation configuration parameters	2248
14.3.9.1.1. Required configuration parameters	2249
14.3.9.1.2. Network configuration parameters	2250
14.3.9.1.3. Optional configuration parameters	2252
14.3.9.1.4. Additional VMware vSphere configuration parameters	2257
14.3.9.1.5. Optional VMware vSphere machine pool configuration parameters	2258
14.3.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2259
14.3.9.3. Configuring the cluster-wide proxy during installation	2260
14.3.10. Deploying the cluster	2262
14.3.11. Installing the OpenShift CLI by downloading the binary	2263
Installing the OpenShift CLI on Linux	2263
Installing the OpenShift CLI on Windows	2264
Installing the OpenShift CLI on macOS	2264
14.3.12. Logging in to the cluster by using the CLI	2265
14.3.13. Creating registry storage	2265
14.3.13.1. Image registry removed during installation	2265
14.3.13.2. Image registry storage configuration	2266
14.3.13.2.1. Configuring registry storage for VMware vSphere	2266
14.3.13.2.2. Configuring block registry storage for VMware vSphere	2267
14.3.14. Backing up VMware vSphere volumes	2269
14.3.15. Steal clock accounting	2269
14.3.16. Telemetry access for OpenShift Container Platform	2269
14.3.17. Next steps	2270
14.4. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2270
14.4.1. Prerequisites	2270
14.4.2. Internet access for OpenShift Container Platform	2271
14.4.3. VMware vSphere infrastructure requirements	2271
14.4.4. Network connectivity requirements	2272

14.4.5. vCenter requirements	2273
Required vCenter account privileges	2273
Using OpenShift Container Platform with vMotion	2281
Cluster resources	2281
Cluster limits	2282
Networking requirements	2282
Required IP Addresses	2282
DNS records	2282
14.4.6. Generating a key pair for cluster node SSH access	2283
14.4.7. Obtaining the installation program	2285
14.4.8. Adding vCenter root CA certificates to your system trust	2285
14.4.9. Creating the installation configuration file	2286
14.4.9.1. Installation configuration parameters	2288
14.4.9.1.1. Required configuration parameters	2288
14.4.9.1.2. Network configuration parameters	2290
14.4.9.1.3. Optional configuration parameters	2291
14.4.9.1.4. Additional VMware vSphere configuration parameters	2295
14.4.9.1.5. Optional VMware vSphere machine pool configuration parameters	2296
14.4.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2297
14.4.9.3. Configuring the cluster-wide proxy during installation	2299
14.4.10. Network configuration phases	2300
14.4.11. Specifying advanced network configuration	2301
14.4.12. Cluster Network Operator configuration	2302
14.4.12.1. Cluster Network Operator configuration object	2302
defaultNetwork object configuration	2303
Configuration for the OpenShift SDN CNI cluster network provider	2304
Configuration for the OVN-Kubernetes CNI cluster network provider	2305
kubeProxyConfig object configuration	2307
14.4.13. Deploying the cluster	2307
14.4.14. Installing the OpenShift CLI by downloading the binary	2309
Installing the OpenShift CLI on Linux	2309
Installing the OpenShift CLI on Windows	2310
Installing the OpenShift CLI on macOS	2310
14.4.15. Logging in to the cluster by using the CLI	2310
14.4.16. Creating registry storage	2311
14.4.16.1. Image registry removed during installation	2311
14.4.16.2. Image registry storage configuration	2311
14.4.16.2.1. Configuring registry storage for VMware vSphere	2312
14.4.16.2.2. Configuring block registry storage for VMware vSphere	2313
14.4.17. Backing up VMware vSphere volumes	2315
14.4.18. Steal clock accounting	2315
14.4.19. Telemetry access for OpenShift Container Platform	2315
14.4.20. Next steps	2315
14.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE	2316
14.5.1. Prerequisites	2316
14.5.2. Internet access for OpenShift Container Platform	2316
14.5.3. VMware vSphere infrastructure requirements	2317
14.5.4. Requirements for a cluster with user-provisioned infrastructure	2318
14.5.4.1. Required machines	2318
14.5.4.2. Minimum resource requirements	2318
14.5.4.3. Certificate signing requests management	2319
14.5.4.4. Networking requirements for user-provisioned infrastructure	2319
14.5.4.4.1. Network connectivity requirements	2319

Ethernet adaptor hardware address requirements	2321
NTP configuration for user-provisioned infrastructure	2321
14.5.4.5. User-provisioned DNS requirements	2321
14.5.4.5.1. Example DNS configuration for user-provisioned clusters	2323
14.5.4.6. Load balancing requirements for user-provisioned infrastructure	2325
14.5.4.6.1. Example load balancer configuration for user-provisioned clusters	2327
14.5.5. Preparing the user-provisioned infrastructure	2329
14.5.6. Validating DNS resolution for user-provisioned infrastructure	2330
14.5.7. Generating a key pair for cluster node SSH access	2333
14.5.8. Obtaining the installation program	2334
14.5.9. Manually creating the installation configuration file	2335
14.5.9.1. Sample install-config.yaml file for VMware vSphere	2336
14.5.9.2. Configuring the cluster-wide proxy during installation	2338
14.5.10. Creating the Kubernetes manifest and Ignition config files	2339
14.5.11. Extracting the infrastructure name	2341
14.5.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2342
14.5.13. Adding more compute machines to a cluster in vSphere	2346
14.5.14. Disk partitioning	2347
Creating a separate /var partition	2347
14.5.15. Updating the bootloader using bootupd	2349
14.5.16. Installing the OpenShift CLI by downloading the binary	2351
Installing the OpenShift CLI on Linux	2351
Installing the OpenShift CLI on Windows	2351
Installing the OpenShift CLI on macOS	2352
14.5.17. Waiting for the bootstrap process to complete	2352
14.5.18. Logging in to the cluster by using the CLI	2353
14.5.19. Approving the certificate signing requests for your machines	2354
14.5.20. Initial Operator configuration	2356
14.5.20.1. Image registry removed during installation	2357
14.5.20.2. Image registry storage configuration	2358
14.5.20.2.1. Configuring registry storage for VMware vSphere	2358
14.5.20.2.2. Configuring storage for the image registry in non-production clusters	2359
14.5.20.2.3. Configuring block registry storage for VMware vSphere	2360
14.5.21. Completing installation on user-provisioned infrastructure	2361
14.5.22. Backing up VMware vSphere volumes	2364
14.5.23. Telemetry access for OpenShift Container Platform	2364
14.5.24. Next steps	2364
14.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2364
14.6.1. Prerequisites	2365
14.6.2. Internet access for OpenShift Container Platform	2365
14.6.3. VMware vSphere infrastructure requirements	2366
14.6.4. Requirements for a cluster with user-provisioned infrastructure	2366
14.6.4.1. Required machines	2367
14.6.4.2. Minimum resource requirements	2367
14.6.4.3. Certificate signing requests management	2368
14.6.4.4. Networking requirements for user-provisioned infrastructure	2368
14.6.4.4.1. Network connectivity requirements	2368
Ethernet adaptor hardware address requirements	2369
NTP configuration for user-provisioned infrastructure	2370
14.6.4.5. User-provisioned DNS requirements	2370
14.6.4.5.1. Example DNS configuration for user-provisioned clusters	2372
14.6.4.6. Load balancing requirements for user-provisioned infrastructure	2374
14.6.4.6.1. Example load balancer configuration for user-provisioned clusters	2376

14.6.5. Preparing the user-provisioned infrastructure	2378
14.6.6. Validating DNS resolution for user-provisioned infrastructure	2379
14.6.7. Generating a key pair for cluster node SSH access	2381
14.6.8. Obtaining the installation program	2383
14.6.9. Manually creating the installation configuration file	2384
14.6.9.1. Sample install-config.yaml file for VMware vSphere	2385
14.6.9.2. Configuring the cluster-wide proxy during installation	2387
14.6.10. Network configuration phases	2388
14.6.11. Specifying advanced network configuration	2389
14.6.12. Cluster Network Operator configuration	2390
14.6.12.1. Cluster Network Operator configuration object	2390
defaultNetwork object configuration	2391
Configuration for the OpenShift SDN CNI cluster network provider	2392
Configuration for the OVN-Kubernetes CNI cluster network provider	2393
kubeProxyConfig object configuration	2395
14.6.13. Creating the Ignition config files	2395
14.6.14. Extracting the infrastructure name	2396
14.6.15. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2397
14.6.16. Adding more compute machines to a cluster in vSphere	2401
14.6.17. Disk partitioning	2402
Creating a separate /var partition	2402
14.6.18. Updating the bootloader using bootupd	2404
14.6.19. Waiting for the bootstrap process to complete	2406
14.6.20. Logging in to the cluster by using the CLI	2407
14.6.21. Approving the certificate signing requests for your machines	2407
14.6.21.1. Initial Operator configuration	2410
14.6.21.2. Image registry removed during installation	2411
14.6.21.3. Image registry storage configuration	2411
14.6.21.3.1. Configuring block registry storage for VMware vSphere	2412
14.6.22. Completing installation on user-provisioned infrastructure	2413
14.6.23. Backing up VMware vSphere volumes	2415
14.6.24. Telemetry access for OpenShift Container Platform	2416
14.6.25. Next steps	2416
14.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK	2416
14.7.1. Prerequisites	2416
14.7.2. About installations in restricted networks	2417
14.7.2.1. Additional limits	2417
14.7.3. Internet access for OpenShift Container Platform	2417
14.7.4. VMware vSphere infrastructure requirements	2418
14.7.5. Network connectivity requirements	2419
14.7.6. vCenter requirements	2420
Required vCenter account privileges	2420
Using OpenShift Container Platform with vMotion	2429
Cluster resources	2429
Cluster limits	2429
Networking requirements	2430
Required IP Addresses	2430
DNS records	2430
14.7.7. Generating a key pair for cluster node SSH access	2431
14.7.8. Adding vCenter root CA certificates to your system trust	2432
14.7.9. Creating the RHCOS image for restricted network installations	2433
14.7.10. Creating the installation configuration file	2434
14.7.10.1. Installation configuration parameters	2436

14.7.10.1.1. Required configuration parameters	2437
14.7.10.1.2. Network configuration parameters	2438
14.7.10.1.3. Optional configuration parameters	2439
14.7.10.1.4. Additional VMware vSphere configuration parameters	2443
14.7.10.1.5. Optional VMware vSphere machine pool configuration parameters	2444
14.7.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2445
14.7.10.3. Configuring the cluster-wide proxy during installation	2447
14.7.11. Deploying the cluster	2448
14.7.12. Installing the OpenShift CLI by downloading the binary	2450
Installing the OpenShift CLI on Linux	2450
Installing the OpenShift CLI on Windows	2451
Installing the OpenShift CLI on macOS	2451
14.7.13. Logging in to the cluster by using the CLI	2451
14.7.14. Disabling the default OperatorHub sources	2452
14.7.15. Creating registry storage	2452
14.7.15.1. Image registry removed during installation	2453
14.7.15.2. Image registry storage configuration	2453
14.7.15.2.1. Configuring registry storage for VMware vSphere	2453
14.7.16. Steal clock accounting	2455
14.7.17. Telemetry access for OpenShift Container Platform	2455
14.7.18. Next steps	2455
14.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	2455
14.8.1. Prerequisites	2456
14.8.2. About installations in restricted networks	2456
14.8.2.1. Additional limits	2457
14.8.3. Internet access for OpenShift Container Platform	2457
14.8.4. VMware vSphere infrastructure requirements	2457
14.8.5. Requirements for a cluster with user-provisioned infrastructure	2458
14.8.5.1. Required machines	2458
14.8.5.2. Minimum resource requirements	2459
14.8.5.3. Certificate signing requests management	2459
14.8.5.4. Networking requirements for user-provisioned infrastructure	2460
14.8.5.4.1. Network connectivity requirements	2460
Ethernet adaptor hardware address requirements	2461
NTP configuration for user-provisioned infrastructure	2461
14.8.5.5. User-provisioned DNS requirements	2462
14.8.5.5.1. Example DNS configuration for user-provisioned clusters	2463
14.8.5.6. Load balancing requirements for user-provisioned infrastructure	2465
14.8.5.6.1. Example load balancer configuration for user-provisioned clusters	2467
14.8.6. Preparing the user-provisioned infrastructure	2469
14.8.7. Validating DNS resolution for user-provisioned infrastructure	2471
14.8.8. Generating a key pair for cluster node SSH access	2473
14.8.9. Manually creating the installation configuration file	2475
14.8.9.1. Sample install-config.yaml file for VMware vSphere	2476
14.8.9.2. Configuring the cluster-wide proxy during installation	2478
14.8.10. Creating the Kubernetes manifest and Ignition config files	2479
14.8.11. Configuring chrony time service	2481
14.8.12. Extracting the infrastructure name	2483
14.8.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2483
14.8.14. Adding more compute machines to a cluster in vSphere	2487
14.8.15. Disk partitioning	2488
Creating a separate /var partition	2488

14.8.16. Updating the bootloader using bootupd	2490
14.8.17. Waiting for the bootstrap process to complete	2492
14.8.18. Logging in to the cluster by using the CLI	2493
14.8.19. Approving the certificate signing requests for your machines	2493
14.8.20. Initial Operator configuration	2496
14.8.20.1. Disabling the default OperatorHub sources	2497
14.8.20.2. Image registry storage configuration	2497
14.8.20.2.1. Configuring registry storage for VMware vSphere	2497
14.8.20.2.2. Configuring storage for the image registry in non-production clusters	2499
14.8.20.2.3. Configuring block registry storage for VMware vSphere	2500
14.8.21. Completing installation on user-provisioned infrastructure	2501
14.8.22. Backing up VMware vSphere volumes	2503
14.8.23. Telemetry access for OpenShift Container Platform	2504
14.8.24. Next steps	2504
14.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE	2504
14.9.1. Removing a cluster that uses installer-provisioned infrastructure	2504
14.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR	2505
14.10.1. About the vSphere Problem Detector Operator	2505
14.10.2. Running the vSphere Problem Detector Operator checks	2505
14.10.3. Viewing the events from the vSphere Problem Detector Operator	2506
14.10.4. Viewing the logs from the vSphere Problem Detector Operator	2507
14.10.5. Configuration checks run by the vSphere Problem Detector Operator	2507
14.10.6. About the storage class configuration check	2509
14.10.7. Metrics for the vSphere Problem Detector Operator	2509
14.10.8. Additional resources	2510
CHAPTER 15. INSTALLING ON VMC	2511
15.1. PREPARING TO INSTALL ON VMC	2511
15.1.1. Prerequisites	2511
15.1.2. Choosing a method to install OpenShift Container Platform on VMC	2511
15.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	2511
15.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on VMC	2512
15.1.3. VMware vSphere infrastructure requirements	2512
15.1.4. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	2513
15.2. INSTALLING A CLUSTER ON VMC	2513
15.2.1. Setting up VMC for vSphere	2513
15.2.1.1. VMC Sizer tool	2515
15.2.2. vSphere prerequisites	2515
15.2.3. Internet access for OpenShift Container Platform	2516
15.2.4. VMware vSphere infrastructure requirements	2516
15.2.5. Network connectivity requirements	2517
15.2.6. vCenter requirements	2518
Required vCenter account privileges	2518
Using OpenShift Container Platform with vMotion	2527
Cluster resources	2527
Cluster limits	2527
Networking requirements	2528
Required IP Addresses	2528
DNS records	2528
15.2.7. Generating a key pair for cluster node SSH access	2529
15.2.8. Obtaining the installation program	2530

15.2.9. Adding vCenter root CA certificates to your system trust	2531
15.2.10. Deploying the cluster	2532
15.2.11. Installing the OpenShift CLI by downloading the binary	2535
Installing the OpenShift CLI on Linux	2535
Installing the OpenShift CLI on Windows	2536
Installing the OpenShift CLI on macOS	2536
15.2.12. Logging in to the cluster by using the CLI	2536
15.2.13. Creating registry storage	2537
15.2.13.1. Image registry removed during installation	2537
15.2.13.2. Image registry storage configuration	2537
15.2.13.2.1. Configuring registry storage for VMware vSphere	2538
15.2.13.2.2. Configuring block registry storage for VMware vSphere	2539
15.2.14. Backing up VMware vSphere volumes	2540
15.2.15. Steal clock accounting	2541
15.2.16. Telemetry access for OpenShift Container Platform	2541
15.2.17. Next steps	2541
15.3. INSTALLING A CLUSTER ON VMC WITH CUSTOMIZATIONS	2541
15.3.1. Setting up VMC for vSphere	2542
15.3.1.1. VMC Sizer tool	2544
15.3.2. vSphere prerequisites	2544
15.3.3. Internet access for OpenShift Container Platform	2545
15.3.4. VMware vSphere infrastructure requirements	2545
15.3.5. Network connectivity requirements	2546
15.3.6. vCenter requirements	2547
Required vCenter account privileges	2547
Using OpenShift Container Platform with vMotion	2556
Cluster resources	2556
Cluster limits	2556
Networking requirements	2557
Required IP Addresses	2557
DNS records	2557
15.3.7. Generating a key pair for cluster node SSH access	2558
15.3.8. Obtaining the installation program	2559
15.3.9. Adding vCenter root CA certificates to your system trust	2560
15.3.10. Creating the installation configuration file	2561
15.3.10.1. Installation configuration parameters	2562
15.3.10.1.1. Required configuration parameters	2563
15.3.10.1.2. Network configuration parameters	2564
15.3.10.1.3. Optional configuration parameters	2566
15.3.10.1.4. Additional VMware vSphere configuration parameters	2571
15.3.10.1.5. Optional VMware vSphere machine pool configuration parameters	2572
15.3.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2573
15.3.10.3. Configuring the cluster-wide proxy during installation	2574
15.3.11. Deploying the cluster	2576
15.3.12. Installing the OpenShift CLI by downloading the binary	2577
Installing the OpenShift CLI on Linux	2577
Installing the OpenShift CLI on Windows	2578
Installing the OpenShift CLI on macOS	2578
15.3.13. Logging in to the cluster by using the CLI	2579
15.3.14. Creating registry storage	2579
15.3.14.1. Image registry removed during installation	2579
15.3.14.2. Image registry storage configuration	2580
15.3.14.2.1. Configuring registry storage for VMware vSphere	2580

15.3.14.2.2. Configuring block registry storage for VMware vSphere	2582
15.3.15. Backing up VMware vSphere volumes	2583
15.3.16. Steal clock accounting	2583
15.3.17. Telemetry access for OpenShift Container Platform	2584
15.3.18. Next steps	2584
15.4. INSTALLING A CLUSTER ON VMC WITH NETWORK CUSTOMIZATIONS	2584
15.4.1. Setting up VMC for vSphere	2584
15.4.1.1. VMC Sizer tool	2586
15.4.2. vSphere prerequisites	2587
15.4.3. Internet access for OpenShift Container Platform	2587
15.4.4. VMware vSphere infrastructure requirements	2587
15.4.5. Network connectivity requirements	2588
15.4.6. vCenter requirements	2589
Required vCenter account privileges	2589
Using OpenShift Container Platform with vMotion	2598
Cluster resources	2598
Cluster limits	2598
Networking requirements	2599
Required IP Addresses	2599
DNS records	2599
15.4.7. Generating a key pair for cluster node SSH access	2600
15.4.8. Obtaining the installation program	2601
15.4.9. Adding vCenter root CA certificates to your system trust	2602
15.4.10. Creating the installation configuration file	2603
15.4.10.1. Installation configuration parameters	2604
15.4.10.1.1. Required configuration parameters	2605
15.4.10.1.2. Network configuration parameters	2606
15.4.10.1.3. Optional configuration parameters	2608
15.4.10.1.4. Additional VMware vSphere configuration parameters	2613
15.4.10.1.5. Optional VMware vSphere machine pool configuration parameters	2614
15.4.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2615
15.4.10.3. Configuring the cluster-wide proxy during installation	2616
15.4.11. Network configuration phases	2618
15.4.12. Specifying advanced network configuration	2618
15.4.13. Cluster Network Operator configuration	2620
15.4.13.1. Cluster Network Operator configuration object	2620
defaultNetwork object configuration	2621
Configuration for the OpenShift SDN CNI cluster network provider	2621
Configuration for the OVN-Kubernetes CNI cluster network provider	2623
kubeProxyConfig object configuration	2624
15.4.14. Deploying the cluster	2625
15.4.15. Installing the OpenShift CLI by downloading the binary	2626
Installing the OpenShift CLI on Linux	2627
Installing the OpenShift CLI on Windows	2627
Installing the OpenShift CLI on macOS	2628
15.4.16. Logging in to the cluster by using the CLI	2628
15.4.17. Creating registry storage	2629
15.4.17.1. Image registry removed during installation	2629
15.4.17.2. Image registry storage configuration	2629
15.4.17.2.1. Configuring registry storage for VMware vSphere	2629
15.4.17.2.2. Configuring block registry storage for VMware vSphere	2631
15.4.18. Backing up VMware vSphere volumes	2632
15.4.19. Steal clock accounting	2632

15.4.20. Telemetry access for OpenShift Container Platform	2633
15.4.21. Next steps	2633
15.5. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK	2633
15.5.1. Setting up VMC for vSphere	2633
15.5.1.1. VMC Sizer tool	2635
15.5.2. vSphere prerequisites	2636
15.5.3. About installations in restricted networks	2636
15.5.3.1. Additional limits	2636
15.5.4. Internet access for OpenShift Container Platform	2637
15.5.5. VMware vSphere infrastructure requirements	2637
15.5.6. Network connectivity requirements	2638
15.5.7. vCenter requirements	2639
Required vCenter account privileges	2639
Using OpenShift Container Platform with vMotion	2648
Cluster resources	2648
Cluster limits	2648
Networking requirements	2649
Required IP Addresses	2649
DNS records	2649
15.5.8. Generating a key pair for cluster node SSH access	2650
15.5.9. Adding vCenter root CA certificates to your system trust	2651
15.5.10. Creating the RHCOS image for restricted network installations	2652
15.5.11. Creating the installation configuration file	2653
15.5.11.1. Installation configuration parameters	2655
15.5.11.1.1. Required configuration parameters	2656
15.5.11.1.2. Network configuration parameters	2657
15.5.11.1.3. Optional configuration parameters	2658
15.5.11.1.4. Additional VMware vSphere configuration parameters	2662
15.5.11.1.5. Optional VMware vSphere machine pool configuration parameters	2663
15.5.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2664
15.5.11.3. Configuring the cluster-wide proxy during installation	2666
15.5.12. Deploying the cluster	2667
15.5.13. Installing the OpenShift CLI by downloading the binary	2669
Installing the OpenShift CLI on Linux	2669
Installing the OpenShift CLI on Windows	2670
Installing the OpenShift CLI on macOS	2670
15.5.14. Logging in to the cluster by using the CLI	2670
15.5.15. Disabling the default OperatorHub sources	2671
15.5.16. Creating registry storage	2671
15.5.16.1. Image registry removed during installation	2671
15.5.16.2. Image registry storage configuration	2672
15.5.16.2.1. Configuring registry storage for VMware vSphere	2672
15.5.17. Steal clock accounting	2674
15.5.18. Telemetry access for OpenShift Container Platform	2674
15.5.19. Next steps	2674
15.6. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE	2674
15.6.1. Setting up VMC for vSphere	2675
15.6.1.1. VMC Sizer tool	2676
15.6.2. vSphere prerequisites	2677
15.6.3. Internet access for OpenShift Container Platform	2677
15.6.4. VMware vSphere infrastructure requirements	2677
15.6.5. Requirements for a cluster with user-provisioned infrastructure	2678
15.6.5.1. Required machines	2678

15.6.5.2. Minimum resource requirements	2679
15.6.5.3. Certificate signing requests management	2679
15.6.5.4. Networking requirements for user-provisioned infrastructure	2679
15.6.5.4.1. Network connectivity requirements	2680
NTP configuration for user-provisioned infrastructure	2681
15.6.5.5. User-provisioned DNS requirements	2681
15.6.5.5.1. Example DNS configuration for user-provisioned clusters	2683
15.6.5.6. Load balancing requirements for user-provisioned infrastructure	2685
15.6.5.6.1. Example load balancer configuration for user-provisioned clusters	2687
15.6.6. Preparing the user-provisioned infrastructure	2689
15.6.7. Validating DNS resolution for user-provisioned infrastructure	2690
15.6.8. Generating a key pair for cluster node SSH access	2693
15.6.9. Obtaining the installation program	2694
15.6.10. Manually creating the installation configuration file	2695
15.6.10.1. Sample install-config.yaml file for VMware vSphere	2696
15.6.10.2. Configuring the cluster-wide proxy during installation	2698
15.6.11. Creating the Kubernetes manifest and Ignition config files	2699
15.6.12. Extracting the infrastructure name	2701
15.6.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2702
15.6.14. Adding more compute machines to a cluster in vSphere	2706
15.6.15. Disk partitioning	2707
Creating a separate /var partition	2707
15.6.16. Updating the bootloader using bootupd	2709
15.6.17. Installing the OpenShift CLI by downloading the binary	2711
Installing the OpenShift CLI on Linux	2711
Installing the OpenShift CLI on Windows	2711
Installing the OpenShift CLI on macOS	2712
15.6.18. Waiting for the bootstrap process to complete	2712
15.6.19. Logging in to the cluster by using the CLI	2713
15.6.20. Approving the certificate signing requests for your machines	2714
15.6.21. Initial Operator configuration	2716
15.6.21.1. Image registry removed during installation	2717
15.6.21.2. Image registry storage configuration	2718
15.6.21.2.1. Configuring registry storage for VMware vSphere	2718
15.6.21.2.2. Configuring storage for the image registry in non-production clusters	2719
15.6.21.2.3. Configuring block registry storage for VMware vSphere	2720
15.6.22. Completing installation on user-provisioned infrastructure	2721
15.6.23. Backing up VMware vSphere volumes	2724
15.6.24. Telemetry access for OpenShift Container Platform	2724
15.6.25. Next steps	2724
15.7. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE AND NETWORK CUSTOMIZATIONS	2724
15.7.1. Setting up VMC for vSphere	2725
15.7.1.1. VMC Sizer tool	2726
15.7.2. vSphere prerequisites	2727
15.7.3. Internet access for OpenShift Container Platform	2727
15.7.4. VMware vSphere infrastructure requirements	2728
15.7.5. Requirements for a cluster with user-provisioned infrastructure	2728
15.7.5.1. Required machines	2728
15.7.5.2. Minimum resource requirements	2729
15.7.5.3. Certificate signing requests management	2729
15.7.5.4. Networking requirements for user-provisioned infrastructure	2730
15.7.5.4.1. Network connectivity requirements	2730

NTP configuration for user-provisioned infrastructure	2731
15.7.5.5. User-provisioned DNS requirements	2731
15.7.5.5.1. Example DNS configuration for user-provisioned clusters	2733
15.7.5.6. Load balancing requirements for user-provisioned infrastructure	2735
15.7.5.6.1. Example load balancer configuration for user-provisioned clusters	2737
15.7.6. Preparing the user-provisioned infrastructure	2739
15.7.7. Validating DNS resolution for user-provisioned infrastructure	2740
15.7.8. Generating a key pair for cluster node SSH access	2743
15.7.9. Obtaining the installation program	2744
15.7.10. Manually creating the installation configuration file	2745
15.7.10.1. Sample install-config.yaml file for VMware vSphere	2746
15.7.10.2. Configuring the cluster-wide proxy during installation	2748
15.7.11. Specifying advanced network configuration	2749
15.7.12. Cluster Network Operator configuration	2751
15.7.12.1. Cluster Network Operator configuration object	2751
defaultNetwork object configuration	2752
Configuration for the OpenShift SDN CNI cluster network provider	2752
Configuration for the OVN-Kubernetes CNI cluster network provider	2753
kubeProxyConfig object configuration	2755
15.7.13. Creating the Ignition config files	2756
15.7.14. Extracting the infrastructure name	2757
15.7.15. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2758
15.7.16. Adding more compute machines to a cluster in vSphere	2762
15.7.17. Disk partitioning	2763
Creating a separate /var partition	2763
15.7.18. Updating the bootloader using bootupd	2765
15.7.19. Waiting for the bootstrap process to complete	2766
15.7.20. Logging in to the cluster by using the CLI	2767
15.7.21. Approving the certificate signing requests for your machines	2768
15.7.22. Initial Operator configuration	2770
15.7.22.1. Image registry removed during installation	2771
15.7.22.2. Image registry storage configuration	2772
15.7.22.2.1. Configuring block registry storage for VMware vSphere	2772
15.7.23. Completing installation on user-provisioned infrastructure	2773
15.7.24. Backing up VMware vSphere volumes	2776
15.7.25. Telemetry access for OpenShift Container Platform	2776
15.7.26. Next steps	2776
15.8. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	2776
15.8.1. Setting up VMC for vSphere	2777
15.8.1.1. VMC Sizer tool	2778

CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

The OpenShift Container Platform installation program offers you flexibility. You can use the installation program to deploy a cluster on infrastructure that the installation program provisions and the cluster maintains or deploy a cluster on infrastructure that you prepare and maintain.

These two basic types of OpenShift Container Platform clusters are frequently called installer-provisioned infrastructure clusters and user-provisioned infrastructure clusters.

Both types of clusters have the following characteristics:

- Highly available infrastructure with no single points of failure is available by default
- Administrators maintain control over what updates are applied and when

You use the same installation program to deploy both types of clusters. The main assets generated by the installation program are the Ignition config files for the bootstrap, master, and worker machines. With these three configurations and correctly configured infrastructure, you can start an OpenShift Container Platform cluster.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installation. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel. The ultimate target is a running cluster. By meeting dependencies instead of running commands, the installation program is able to recognize and use existing components instead of running the commands to create them again.

The following diagram shows a subset of the installation targets and dependencies:

Figure 1.1. OpenShift Container Platform installation targets and dependencies

After installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. It includes the **kubelet**, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.8 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as an Atomic OSTree repository that is embedded in a container image that is rolled out across the cluster by an Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using rpm-ostree. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, via in-place upgrades that keep the entire platform up-to-date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

1.1.1. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from the appropriate [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. This site manages:

- REST API for accounts
- Registry tokens, which are the pull secrets that you use to obtain the required components

- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics

In OpenShift Container Platform 4.8, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type.

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster.
- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named **install-config.yaml**, Kubernetes manifests, and Ignition config files for your machine types.

IMPORTANT

It is possible to modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all configuration files that you want to use again.

IMPORTANT

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

The installation process with user-provisioned infrastructure

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself, including:

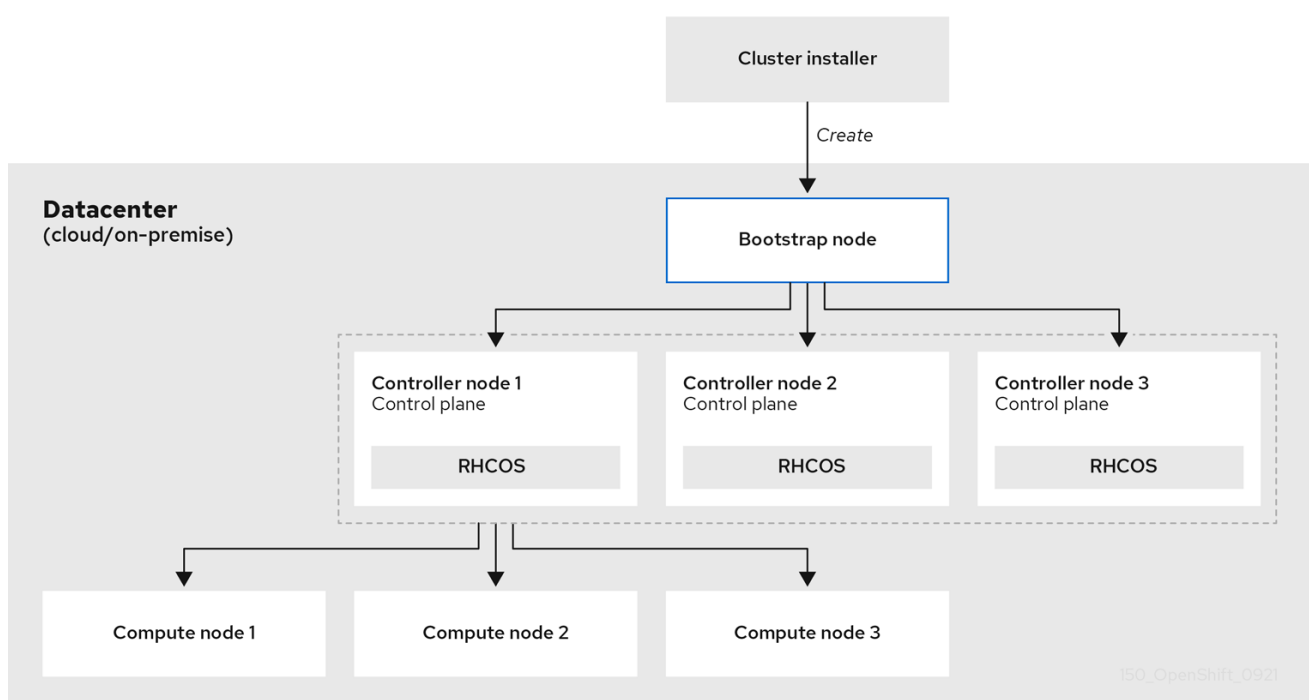

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

Installation process details

Because each machine in the cluster requires information about the cluster when it is provisioned, OpenShift Container Platform uses a temporary *bootstrap* machine during initial configuration to provide the required information to the permanent control plane. It boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines (also known as the master machines) that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

Figure 1.2. Creating the bootstrap, control plane, and compute machines

150_OpenShift_0921

After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. (Requires manual intervention if you provision the infrastructure)
2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.
3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. (Requires manual intervention if you provision the infrastructure)
4. The temporary control plane schedules the production control plane to the production control plane machines.
5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.
6. The temporary control plane shuts down and passes control to the production control plane.
7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.
8. The installation program shuts down the bootstrap machine. (Requires manual intervention if you provision the infrastructure)
9. The control plane sets up the compute nodes.
10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operation, including the creation of compute machines in supported environments.

1.1.2. Verifying node state after installation

The OpenShift Container Platform installation completes when the following installation health checks are successful:

- The provisioning host can access the OpenShift Container Platform web console.
- All control plane nodes are ready.
- All cluster Operators are available.

NOTE

After the installation completes, the specific cluster Operators responsible for the worker nodes continuously attempt to provision all worker nodes. It can take some time before all worker nodes report as **READY**. For installations on bare metal, wait a minimum of 60 minutes before troubleshooting a worker node. For installations on all other platforms, wait a minimum of 40 minutes before troubleshooting a worker node. A **DEGRADED** state for the cluster Operators responsible for the worker nodes depends on the Operators' own resources and not on the state of the nodes.

After your installation completes, you can continue to monitor the condition of the nodes in your cluster using the following steps.

Prerequisites

- The installation program resolves successfully in the terminal.

Procedure

1. Show the status of all worker nodes:

```
$ oc get nodes
```

Example output

NAME	STATUS	ROLES	AGE	VERSION
example-compute1.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute2.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute4.example.com	Ready	worker	14m	v1.21.6+bb8d50a
example-control1.example.com	Ready	master	52m	v1.21.6+bb8d50a
example-control2.example.com	Ready	master	55m	v1.21.6+bb8d50a
example-control3.example.com	Ready	master	55m	v1.21.6+bb8d50a

2. Show the phase of all worker machine nodes:

```
$ oc get machines -A
```

Example output

NAMESPACE	NAME	PHASE	TYPE	REGION	ZONE	AGE
openshift-machine-api	example-zbbt6-master-0	Running				95m
openshift-machine-api	example-zbbt6-master-1	Running				95m
openshift-machine-api	example-zbbt6-master-2	Running				95m
openshift-machine-api	example-zbbt6-worker-0-25bhp	Running				49m

openshift-machine-api	example-zbbt6-worker-0-8b4c2	Running	49m
openshift-machine-api	example-zbbt6-worker-0-jkbqt	Running	49m
openshift-machine-api	example-zbbt6-worker-0-ql5b	Running	49m

Additional resources

- [Following the installation](#)
- [Validating an installation](#)

Installation scope

The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

Additional resources

- See [Available cluster customizations](#) for details about OpenShift Container Platform configuration resources.

1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS

In OpenShift Container Platform 4.8, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Amazon Web Services (AWS)
- Google Cloud Platform (GCP)
- Microsoft Azure
- Red Hat OpenStack Platform (RHOSP) version 13 and 16
 - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- Red Hat Virtualization (RHV)
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

IMPORTANT

After installation, the following changes are not supported:

- Mixing cloud provider platforms
- Mixing cloud provider components, such as using a persistent storage framework from a differing platform than what the cluster is installed on

In OpenShift Container Platform 4.8, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
- Azure
- GCP
- RHOSP
- RHV
- VMware vSphere
- VMware Cloud on AWS
- Bare metal
- IBM Z or LinuxONE
- IBM Power Systems

Depending on the supported cases for the platform, installations on user-provisioned infrastructure allow you to run machines with full internet access, place your cluster behind a proxy, or perform a *restricted network installation*. In a restricted network installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a restricted network installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The [OpenShift Container Platform 4.x Tested Integrations](#) page contains details about integration testing for different platforms.

Additional resources

- See [Supported installation methods for different platforms](#) for more information about the types of installations that are available for each supported platform.
- See [Selecting a cluster installation method and preparing it for users](#) for information about choosing an installation method and preparing the required resources.

CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you that you have all of the required resources to prepare the cluster for users.

2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP)
- Red Hat Virtualization (RHV)
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use [OpenShift Dedicated](#) or [OpenShift Online](#). You can also use OpenShift as a managed service on Azure, AWS, IBM Cloud, or Google Cloud. For more information about managed services, see the [OpenShift Products](#) page. If you install an OpenShift Container Platform cluster with a cloud virtual machine as a virtual bare metal, the corresponding cloud-based storage is not supported.

2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves

the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines as part of the installation process for OpenShift Container Platform. See [Comparing OpenShift Container Platform 3 and OpenShift Container Platform 4](#).

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see [OpenShift Migration Best Practices](#). Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called *installer provisioned infrastructure* installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#). These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#).

For installer-provisioned infrastructure installations, you can use an existing [VPC in AWS](#), [vNet in Azure](#), or [VPC in GCP](#). You can also reuse part of your networking infrastructure so that your cluster in [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#) can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for [RHOSP](#), [RHOSP with Kuryr](#), [RHV](#), [vSphere](#), and [bare metal](#).

If you want to reuse extensive cloud infrastructure, you can complete a *user-provisioned infrastructure* installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#), you can use the provided templates to help you stand up all of the required components. Otherwise, you can use the provider-agnostic installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use [RHOSP](#), [RHOSP on SR-IOV](#), [RHV](#), [IBM Z or LinuxONE](#), [IBM Power](#), or [vSphere](#), use the specific installation instructions to deploy your cluster. If you use other supported hardware, follow the [bare metal installation](#) procedure.

2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on [AWS](#), [Azure](#), or [GCP](#).

If you need to install your cluster that has limited access to the internet, such as a disconnected or restricted network cluster, you can [mirror the installation packages](#) and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for [AWS](#), [GCP](#), [IBM Z or LinuxONE](#), [IBM Z or LinuxONE with RHEL KVM](#), [IBM Power](#), [vSphere](#), [VMC on AWS](#), or [bare metal](#). You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for [AWS](#), [GCP](#), [VMC on AWS](#), [RHOSP](#), [RHV](#), and [vSphere](#).

If you need to deploy your cluster to an [AWS GovCloud region](#) or [Azure government region](#), you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use [FIPS Validated / Modules in Process cryptographic libraries](#) during installation.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by [customizing](#) the Operators that make up your cluster and integrate you cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- [Persistent storage](#)
- [An identity provider](#)
- [Monitoring core OpenShift Container Platform components](#)

2.3. PREPARING YOUR CLUSTER FOR WORKLOADS

Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application [build strategy](#), you might need to make provisions for [low-latency](#) workloads or to [protect sensitive workloads](#). You can also configure [monitoring](#) for application workloads. If you plan to run [Windows workloads](#), you must enable [hybrid networking with OVN-Kubernetes](#) during the installation process; hybrid networking cannot be enabled after your cluster is installed.

2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

**NOTE**

Not all installation options are supported for all platforms, as shown in the following tables. A checkmark indicates that the option is supported and links to the relevant section.

Table 2.1. Installer-provisioned infrastructure options

	AWS	Azure	GCP	RHOS P	RHV	Bare metal	vSphe re	VMC	IBM Z	IBM Power
Default	✓	✓	✓		✓	✓	✓	✓		
Custom	✓	✓	✓	✓	✓		✓	✓		
Network customization	✓	✓	✓	✓			✓	✓		
Restricted network	✓		✓	✓	✓	✓	✓	✓

Restricted network	✓		✓				✓	✓	✓	✓	✓	✓	
Shared VPC hosted outside of cluster project			✓										

CHAPTER 3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can use the procedures in this section to ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the Internet. If you do not have access to a mirror host, use the [Mirroring an Operator catalog](#) procedure to copy images to a device you can move across network boundaries with.

3.1. PREREQUISITES

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
 - [Red Hat Quay](#)
 - [JFrog Artifactory](#)
 - [Sonatype Nexus Repository](#)
 - [Harbor](#)

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay [for proof-of-concept purposes](#) or [by using the Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

3.2. ABOUT THE MIRROR REGISTRY

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory, Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, a small-scale container registry included with OpenShift Container Platform subscriptions.

You can use any container registry that supports [Docker v2-2](#), such as Red Hat Quay, the *mirror registry for Red Hat OpenShift*, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

**IMPORTANT**

The internal registry of the OpenShift Container Platform cluster cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

**NOTE**

Red Hat does not test third party registries with OpenShift Container Platform.

Additional information

For information on viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

3.3. PREPARING YOUR MIRROR HOST

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvfz <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

WARNING

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

WARNING

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

Prerequisites

- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** [pull secret from the Red Hat OpenShift Cluster Manager](#) and save it to a **.json** file.
2. Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0 1
BGVtbYk3ZHAtdXs=
```

- 1 For **<user_name>** and **<password>**, specify the user name and password that you configured for your registry.

3. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret.text | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

4. Save the file either as `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`. The contents of the file resemble the following example:

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

5. Edit the new file and add a section that describes your registry to it:

```
"auths": {
  "<mirror_registry>": { 1
    "auth": "<credentials>", 2
    "email": "you@example.com"
  }
},
```

- 1 For **<mirror_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**
- 2 For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHA tqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

3.5. MIRROR REGISTRY FOR RED HAT OPENSIFT

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip these steps and go straight to [Mirroring the OpenShift Container Platform image repository](#).

Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 with Podman 3.3 and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Passwordless **sudo** access on the target host.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.

- About 8.7 GB for OpenShift Container Platform 4.8 Release images, or about 668 GB for OpenShift Container Platform 4.8 Release images and OpenShift Container Platform 4.8 Red Hat Operator images. Up to 1 TB per stream or more is suggested.

IMPORTANT

These requirements are based on local testing results with only Release images and Operator images tested. Storage requirements can vary based on your organization's needs. Some users might require more space, for example, when they mirror multiple z-streams. You can use standard Red Hat Quay functionality to remove unnecessary images and free up space.

3.5.1. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The *mirror registry for Red Hat OpenShift* addresses this need and is included in every OpenShift subscription. It is available for download on the [OpenShift console Downloads](#) page.

The *mirror registry for Red Hat OpenShift* allows users to install a small-scale version of Red Hat Quay and its required components using the **mirror-registry** command line interface (CLI) tool. The *mirror registry for Red Hat OpenShift* is deployed automatically with pre-configured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The *mirror registry for Red Hat OpenShift* provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

The *mirror registry for Red Hat OpenShift* is limited to hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the *mirror registry for Red Hat OpenShift*. Content built by customers should not be hosted by the *mirror registry for Red Hat OpenShift*.

Unlike Red Hat Quay, the *mirror registry for Red Hat OpenShift* is not a highly-available registry and only local file system storage is supported. Using the *mirror registry for Red Hat OpenShift* with more than one cluster is discouraged, because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the *mirror registry for Red Hat OpenShift* to install a cluster that can host a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

Use of the *mirror registry for Red Hat OpenShift* is optional if another container registry is already available in the install environment.

3.5.2. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a local host using the **mirror-registry** installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **/etc/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ sudo ./mirror-registry install \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the registry by running the following command:

```
$ podman login --authfile pull-secret.txt \
  -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false 1
```

- 1** You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at **https://<host.example.com>:8443** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring an Operator catalog" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.5.3. Mirroring on a remote host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a remote host using the **mirror-registry** tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

NOTE

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **/etc/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ sudo ./mirror-registry install -v \
  --targetHostname <host_example_com> \
  --targetUsername <example_user> \
  -k ~/.ssh/my_ssh_key \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

```
$ podman login --authfile pull-secret.txt \
  -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false 1
```

- 1 You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

NOTE

You can also log in by accessing the UI at **https://<host.example.com>:8443** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring an Operator catalog" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.6. UPGRADING THE MIRROR REGISTRY FOR RED HAT OPENSIFT

- You can upgrade the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ sudo ./mirror-registry upgrade
```

**NOTE**

- Users who upgrade the *mirror registry for Red Hat OpenShift* with the **./mirror-registry upgrade** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayHostname <host_example_com>** and **--quayRoot <example_directory_name>**, you must include that string to properly upgrade the mirror registry.

3.6.1. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ sudo ./mirror-registry uninstall -v \
  --quayRoot <example_directory_name>
```

**NOTE**

- Deleting the *mirror registry for Red Hat OpenShift* will prompt the user before deletion. You can use **--autoApprove** to skip this prompt.
- Users who install the *mirror registry for Red Hat OpenShift* with the **--quayRoot** flag must include the **--quayRoot** flag when uninstalling. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayRoot example_directory_name**, you must include that string to properly uninstall the mirror registry.

3.6.2. Mirror registry for Red Hat OpenShift flags

The following flags are available for the *mirror registry for Red Hat OpenShift*:

Flags	Description
--autoApprove	A boolean value that disables interactive prompts. If set to true , the quayRoot directory is automatically deleted when uninstalling the mirror registry. Defaults to false if left unspecified.

Flags	Description
--initPassword	The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.
--initUser string	Shows the username of the initial user. Defaults to init if left unspecified.
--quayHostname	The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to SERVER_HOSTNAME in the Quay config.yaml . Must resolve by DNS. Defaults to <targetHostname>:8443 if left unspecified. ^[1]
--quayRoot, -r	The directory where container image layer and configuration data is saved, including rootCA.key , rootCA.pem , and rootCA.srl certificates. Requires about 8.7 GB for OpenShift Container Platform 4.8 Release images, or about 668 GB for OpenShift Container Platform 4.8 Release images and OpenShift Container Platform 4.8 Red Hat Operator images. Defaults to /etc/quay-install if left unspecified.
--ssh-key, -k	The path of your SSH identity key. Defaults to ~/ssh/quay_installer if left unspecified.
--sslCert	The path to the SSL/TLS public key / certificate. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.
--sslCheckSkip	Skips the check for the certificate hostname against the SERVER_HOSTNAME in the config.yaml file. ^[2]
--sslKey	The path to the SSL/TLS private key used for HTTPS communication. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.
--targetHostname, -H	The hostname of the target you want to install Quay to. Defaults to \$HOST , for example, a local host, if left unspecified.
--targetUsername, -u	The user on the target host which will be used for SSH. Defaults to \$USER , for example, the current user if left unspecified.
--verbose, -v	Shows debug logs and Ansible playbook outputs.
--version	Shows the version for the <i>mirror registry for Red Hat OpenShift</i>

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname.
2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.

Additional resources

- [Using SSL to protect connections to Red Hat Quay](#)
- [Configuring the system to trust the certificate authority](#)
- [Mirroring the OpenShift Container Platform image repository](#)
- [Mirroring an Operator catalog](#)

3.7. MIRRORING THE OPENSIFT CONTAINER PLATFORM IMAGE REPOSITORY

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

Prerequisites

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the [pull secret from the Red Hat OpenShift Cluster Manager](#) and modified it to include authentication to your mirror repository.
- If you use self-signed certificates that do not set a Subject Alternative Name, you must precede the **oc** commands in this procedure with **GODEBUG=x509ignoreCN=0**. If you do not set this variable, the **oc** commands will fail with the following error:

```
x509: certificate relies on legacy Common Name field, use SANs or temporarily enable
Common Name matching with GODEBUG=x509ignoreCN=0
```

Procedure

Complete the following steps on the mirror host:

1. Review the [OpenShift Container Platform downloads page](#) to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the [Repository Tags](#) page.
2. Set the required environment variables:
 - a. Export the release version:

```
$ OCP_RELEASE=<release_version>
```

For **<release_version>**, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as **4.5.4**.

- b. Export the local registry name and host port:

```
$ LOCAL_REGISTRY='<local_registry_host_name>:<local_registry_host_port>'
```

For **<local_registry_host_name>**, specify the registry domain name for your mirror repository, and for **<local_registry_host_port>**, specify the port that it serves content on.

- c. Export the local repository name:

```
$ LOCAL_REPOSITORY='<local_repository_name>'
```

For **<local_repository_name>**, specify the name of the repository to create in your registry, such as **ocp4/openshift4**.

- d. Export the name of the repository to mirror:

```
$ PRODUCT_REPO='openshift-release-dev'
```

For a production release, you must specify **openshift-release-dev**.

- e. Export the path to your registry pull secret:

```
$ LOCAL_SECRET_JSON='<path_to_pull_secret>'
```

For **<path_to_pull_secret>**, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

- f. Export the release mirror:

```
$ RELEASE_NAME="ocp-release"
```

For a production release, you must specify **ocp-release**.

- g. Export the type of architecture for your server, such as **x86_64**:

```
$ ARCHITECTURE=<server_architecture>
```

- h. Export the path to the directory to host the mirrored images:

```
$ REMOVABLE_MEDIA_PATH=<path> 1
```

- 1** Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:

- If your mirror host does not have internet access, take the following actions:
 - i. Connect the removable media to a system that is connected to the internet.
 - ii. Review the images and configuration manifests to mirror:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE} --dry-run
```

- iii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.
- iv. Mirror the images to a directory on the removable media:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-dir=${REMOVABLE_MEDIA_PATH}/mirror quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE}
```

- v. Take the media to the restricted network environment and upload the images to the local container registry.

```
$ oc image mirror -a ${LOCAL_SECRET_JSON} --from-dir=${REMOVABLE_MEDIA_PATH}/mirror "file://openshift/release:${OCP_RELEASE}*" ${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} 1
```

- 1** For **REMOVABLE_MEDIA_PATH**, you must use the same path that you specified when you mirrored the images.

- If the local container registry is connected to the mirror host, take the following actions:
 - i. Directly push the release images to the local registry by using following command:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \ --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} \ --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \ --to-release-image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}
```

This command pulls the release information as a digest, and its output includes the **imageContentSources** data that you require when you install your cluster.

- ii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.

NOTE

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

- 4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:
 - If your mirror host does not have internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}"
```

- If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
${ARCHITECTURE}"
```

IMPORTANT

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

If you are in a disconnected environment, use the **--image** flag as part of `must-gather` and point to the payload image.

5. For clusters using installer-provisioned infrastructure, run the following command:

```
$ openshift-install
```

3.8. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

3.8.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named **imagestreamtag-to-image** in the **openshift-cluster-samples-operator** namespace. The **imagestreamtag-to-image** config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is **<image_stream_name>_<image_stream_tag_name>**.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to **Removed**. If you choose to change it to **Managed**, it installs samples.

NOTE

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operators's objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to **Removed**, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
- Mirror the samples you want to the mirrored registry using the new config map as your guide.
- Add any of the image streams you did not mirror to the **skippedImagestreams** list of the Cluster Samples Operator configuration object.
- Set **samplesRegistry** of the Cluster Samples Operator configuration object to the mirrored registry.
- Then set the Cluster Samples Operator to **Managed** to install the image streams you have mirrored.

3.9. NEXT STEPS

- [Mirror](#) the OperatorHub images for the Operators that you want to install in your cluster.
- Install a cluster on infrastructure that you provision in your restricted network, such as on [VMware vSphere](#), [bare metal](#), or [Amazon Web Services](#).

3.10. ADDITIONAL RESOURCES

- See [Gathering data about specific features](#) for more information about using must-gather.

CHAPTER 4. INSTALLING ON AWS

4.1. PREPARING TO INSTALL ON AWS

4.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

4.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See [Configuring an AWS account](#) for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for AWS](#) for other options, including [configuring the Cloud Credential Operator \(CCO\) to use the Amazon Web Services Security Token Service \(AWS STS\)](#).

4.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

4.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- [Installing a cluster quickly on AWS](#) You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- [Installing a customized cluster on AWS](#) You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- [Installing a cluster on AWS with network customizations](#) You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- [Installing a cluster on AWS in a restricted network](#) You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the

installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

4.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.
- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

4.1.4. Next steps

- [Configuring an AWS account](#)

4.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

4.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.

**NOTE**

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see [Registering Domain Names Using Amazon Route 53](#) in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See [Making Amazon Route 53 the DNS Service for an Existing Domain](#) in the AWS documentation.
3. Create a public hosted zone for your domain or subdomain. See [Creating a Public Hosted Zone](#) in the AWS documentation.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. Extract the new authoritative name servers from the hosted zone records. See [Getting the Name Servers for a Public Hosted Zone](#) in the AWS documentation.
5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: [Adding or Changing Name Servers or Glue Records](#).
6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See [Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain](#) in the AWS documentation for an example high level procedure.

4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses **us-gov-west-1** region for Route53 and tagging API clients.

The Ingress Operator uses <https://tagging.us-gov-west-1.amazonaws.com> as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the [Service Endpoints](#) in the AWS documentation about GovCloud (US).

**IMPORTANT**

Private, disconnected installations are not supported for AWS GovCloud when you install in the **us-gov-east-1** region.

Example Route 53 configuration

```
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
```

```
url: https://route53.us-gov.amazonaws.com 1
- name: tagging
url: https://tagging.us-gov-west-1.amazonaws.com 2
```

- 1** Route 53 defaults to <https://route53.us-gov.amazonaws.com> for both AWS GovCloud (US) regions.
- 2** Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

4.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default [Service Limits](#) affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of clusters available by default	Default AWS limit	Description
Instance Limits	Varies	Varies	<p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> ● One bootstrap machine, which is removed after installation ● Three control plane nodes (also known as the master nodes) ● Three worker nodes <p>These instance type counts are within a new account's default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</p> <p>In most regions, the bootstrap and worker machines use an m4.large machines and the control plane machines use m4.xlarge instances. In some regions, including all regions that do not support these instance types, m5.large and m5.xlarge instances are used instead.</p>

Component	Number of clusters available by default	Default AWS limit	Description
Elastic IPs (EIPs)	0 to 1	5 EIPs per account	<p>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each availability zone within a region. Each private subnet requires a NAT Gateway, and each NAT gateway requires a separate elastic IP. Review the AWS region map to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit.</p> <div style="display: flex; align-items: flex-start; margin-top: 10px;">  <div> <p>IMPORTANT</p> <p>To use the us-east-1 region, you must increase the EIP limit for your account.</p> </div> </div>
Virtual Private Clouds (VPCs)	5	5 VPCs per region	Each cluster creates its own VPC.
Elastic Load Balancing (ELB/NLB)	3	20 per region	By default, each cluster creates internal and external network load balancers for the master API server and a single classic elastic load balancer for the router. Deploying more Kubernetes Service objects with type LoadBalancer will create additional load balancers .
NAT Gateways	5	5 per availability zone	The cluster deploys one NAT gateway in each availability zone.
Elastic Network Interfaces (ENIs)	At least 12	350 per region	<p>The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the us-east-1 region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the AWS region map to determine how many availability zones are in each region.</p> <p>Additional ENIs are created for additional machines and elastic load balancers that are created by cluster usage and deployed workloads.</p>

Component	Number of clusters available by default	Default AWS limit	Description
VPC Gateway	20	20 per account	Each cluster creates a single VPC Gateway for S3 access.
S3 buckets	99	100 buckets per account	Because the installation process creates a temporary bucket and the registry component in each cluster creates a bucket, you can create only 99 OpenShift Container Platform clusters per AWS account.
Security Groups	250	2,500 per account	Each cluster creates 10 distinct security groups.

4.2.3. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 4.1. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**

- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**

- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.2. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.3. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**

- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 4.4. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

Example 4.5. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

Example 4.6. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**

- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.7. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.8. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.9. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3:DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 4.10. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**

- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

Example 4.11. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

Example 4.12. Additional IAM and S3 permissions that are required to create manifests

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**

- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

NOTE

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

Example 4.13. Optional permissions for instance and quota checks for installation

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

4.2.4. Creating an IAM user

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the [Creating an IAM User in Your AWS Account](#) procedure in the AWS documentation, set the following options:

Procedure

1. Specify the IAM user name and select **Programmatic access**.
2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

NOTE

While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.
4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.
5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.

IMPORTANT

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

Additional resources

- See [Manually creating IAM for AWS](#) for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster **kube-system** project.

4.2.5. IAM Policies and AWS authentication

By default, the installation program creates instance profiles for the bootstrap, control plane, and compute instances with the necessary permissions for the cluster to operate.

However, you can create your own IAM roles and specify them as part of the installation process. You might need to specify your own roles to deploy the cluster or to manage the cluster after installation. For example:

- Your organization's security policies require that you use a more restrictive set of permissions to install the cluster.
- After the installation, the cluster is configured with an Operator that requires access to additional services.

If you choose to specify your own IAM roles, you can take the following steps:

- Begin with the default policies and adapt as required. For more information, see "Default permissions for IAM instance profiles".
- Use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template that is based on the cluster's activity. For more information see, "Using AWS IAM Analyzer to create policy templates".

4.2.5.1. Default permissions for IAM instance profiles

By default, the installation program creates IAM instance profiles for the bootstrap, control plane and worker instances with the necessary permissions for the cluster to operate.

The following lists specify the default permissions for control plane and compute machines:

Example 4.14. Default IAM role permissions for control plane instance profiles

- **ec2:AttachVolume**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**

- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteVolume**
- **ec2:Describe***
- **ec2:DetachVolume**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyVolume**
- **ec2:RevokeSecurityGroupIngress**
- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerPolicy**
- **elasticloadbalancing:CreateLoadBalancerListeners**

Example 4.15. Default IAM role permissions for compute instance profiles

- **ec2:DescribeInstances**
- **ec2:DescribeRegions**

4.2.5.2. Specifying an existing IAM role

Instead of allowing the installation program to create IAM instance profiles with the default permissions, you can use the **install-config.yaml** file to specify an existing IAM role for control plane and compute instances.

Prerequisites

- You have an existing **install-config.yaml** file.

Procedure

1. Update **compute.platform.aws.iamRole** with an existing role for the control plane machines.

Sample **install-config.yaml** file with an IAM role for compute instances

```
compute:
  - hyperthreading: Enabled
    name: worker
  platform:
    aws:
      iamRole: ExampleRole
```

2. Update **controlPlane.platform.aws.iamRole** with an existing role for the compute machines.

Sample **install-config.yaml** file with an IAM role for control plane instances

```
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      iamRole: ExampleRole
```

3. Save the file and reference it when installing the OpenShift Container Platform cluster.

Additional resources

- See [Deploying the cluster](#).

4.2.5.3. Using AWS IAM Analyzer to create policy templates

The minimal set of permissions that the control plane and compute instance profiles require depends on how the cluster is configured for its daily operation.

One way to determine which permissions the cluster instances require is to use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template:

- A policy template contains the permissions the cluster has used over a specified period of time.
- You can then use the template to create policies with fine-grained permissions.

Procedure

The overall process could be:

1. Ensure that CloudTrail is enabled. CloudTrail records all of the actions and events in your AWS account, including the API calls that are required to create a policy template. For more information, see the AWS documentation for [working with CloudTrail](#).
2. Create an instance profile for control plane instances and an instance profile for compute instances. Be sure to assign each role a permissive policy, such as PowerUserAccess. For more information, see the AWS documentation for [creating instance profile roles](#).
3. Install the cluster in a development environment and configure it as required. Be sure to deploy all of applications the cluster will host in a production environment.
4. Test the cluster thoroughly. Testing the cluster ensures that all of the required API calls are logged.
5. Use the IAM Access Analyzer to create a policy template for each instance profile. For more information, see the AWS documentation for [generating policies based on the CloudTrail logs](#).
6. Create and add a fine-grained policy to each instance profile.
7. Remove the permissive policy from each instance profile.
8. Deploy a production cluster using the existing instance profiles with the new policies.

NOTE

You can add [IAM Conditions](#) to your policy to make it more restrictive and compliant with your organization security requirements.

4.2.6. Supported AWS Marketplace regions

Installing an OpenShift Container Platform cluster using an AWS Marketplace image is available to customers who purchase the offer in North America.

While the offer must be purchased in North America, you can deploy the cluster to any of the following supported partitions:

- Public

- GovCloud

**NOTE**

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported for the AWS secret regions.

4.2.7. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following public regions:

**NOTE**

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

- **af-south-1** (Cape Town)
- **ap-east-1** (Hong Kong)
- **ap-northeast-1** (Tokyo)
- **ap-northeast-2** (Seoul)
- **ap-northeast-3** (Osaka)
- **ap-south-1** (Mumbai)
- **ap-southeast-1** (Singapore)
- **ap-southeast-2** (Sydney)
- **ca-central-1** (Central)
- **eu-central-1** (Frankfurt)
- **eu-north-1** (Stockholm)
- **eu-south-1** (Milan)
- **eu-west-1** (Ireland)
- **eu-west-2** (London)
- **eu-west-3** (Paris)
- **me-south-1** (Bahrain)
- **sa-east-1** (São Paulo)
- **us-east-1** (N. Virginia)
- **us-east-2** (Ohio)
- **us-west-1** (N. California)

- **us-west-2** (Oregon)

The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

The AWS C2S Secret Region is supported:

- **us-iso-east-1**

4.2.8. Next steps

- Install an OpenShift Container Platform cluster:
 - [Quickly install a cluster](#) with default options on installer-provisioned infrastructure
 - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
 - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
 - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

4.3. MANUALLY CREATING IAM FOR AWS

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

4.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**
You can use the CCO utility (**ccoctl**) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.

NOTE

This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually.**

You can set the **credentialsMode** parameter for the CCO to **Manual** to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**

If you are using the CCO with the **credentialsMode** parameter set to **Mint**, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

Additional resources

- To learn how to use the CCO utility (**ccoctl**) to configure the CCO to use the AWS STS, see [Using manual mode with STS](#).
- To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see [Rotating or removing cloud provider credentials](#).
- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

4.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

Example install-config.yaml configuration file

```

apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...

```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use:

```
$ openshift-install version
```

Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --
credentials-requests --cloud=aws
```

This command creates a YAML file for each **CredentialsRequest** object.

Sample CredentialsRequest object

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: cloud-credential-operator-iam-ro
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: cloud-credential-operator-iam-ro-creds
    namespace: openshift-cloud-credential-operator
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
    - effect: Allow
      action:
      - iam:GetUser

```

```
- iam:GetUserPolicy
- iam:ListAccessKeys
resource: "*"
```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object. The format for the secret data varies for each cloud provider.
7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

4.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.8.9 to 4.8.10, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
 - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
 - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:

- a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
- b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

Text to add

```
...
metadata:
  annotations:
    cloudcredential.openshift.io/upgradeable-to: <version_number>
...
```

Where **<version_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
 - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
 - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
 - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

4.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the **admin** credential is stored in the **kube-system** namespace and then used by the CCO to process the **CredentialsRequest** objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires **admin** credential storage in a cluster **kube-system** secret.

4.3.5. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all **CredentialsRequest** objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

4.3.6. Next steps

- Install an OpenShift Container Platform cluster:
 - [Installing a cluster quickly on AWS](#) with default options on installer-provisioned infrastructure
 - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
 - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
 - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

4.4. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

4.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

■

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **aws** as the platform to target.
- c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

NOTE

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- d. Select the AWS region to deploy the cluster to.
- e. Select the base domain for the Route 53 service that you configured for your cluster.
- f. Enter a descriptive name for your cluster.
- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

4.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

4.4.10. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

4.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

■

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.5.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

NOTE

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in secret regions.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

- Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
- Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
      type: m5.4xlarge
  replicas: 3
metadata:
  name: test-cluster
platform:
  aws:
```

```
region: us-east-2 2
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'
```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

4.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
- iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
- iv. Select the AWS region to deploy the cluster to.
- v. Select the base domain for the Route 53 service that you configured for your cluster.

- vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
 3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.1. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String

Parameter	Description	Values
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name>.<baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform.<platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.2. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .

Parameter	Description	Values
networking.serviceNetwork	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	<p>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p> </div> </div>

4.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.3. Optional parameters

Parameter	Description	Values
additionalTrustBundle	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String
compute	<p>The configuration for the machines that comprise the compute nodes.</p>	<p>Array of MachinePool objects. For details, see the following "Machine-pool" table.</p>

Parameter	Description	Values
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
<p>credentialsMode</p>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 517 595 864" style="display: inline-block; vertical-align: top;">  </div> <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p>	<p>Mint, Passthrough, Manual, or an empty string ("").</p>
<p>fips</p>	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="485 1312 595 1659" style="display: inline-block; vertical-align: top;">  </div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> <div data-bbox="485 1704 595 1899" style="display: inline-block; vertical-align: top;">  </div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p>	<p>false or true</p>

Parameter	Description	Values
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: center;">  <div> <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.5.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.4. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.

Parameter	Description	Values
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .
compute.platform.aws.rootVolume.type	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
compute.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
compute.platform.aws.type	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
compute.platform.aws.zones	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
compute.aws.region	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .

Parameter	Description	Values
controlPlane.platform.aws.amiID	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
controlPlane.platform.aws.iamRole	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
controlPlane.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.

Parameter	Description	Values
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

Parameter	Description	Values
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.5.6.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.16. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x

4.5.6.3. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

apiVersion: v1

baseDomain: example.com **1**

```

credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
        - us-west-2c
      replicas: 3
  metadata:
    name: test-cluster 10
  networking:
    clusterNetwork:
      - cidr: 10.128.0.0/14
        hostPrefix: 23
    machineNetwork:
      - cidr: 10.0.0.0/16
    networkType: OpenShiftSDN
    serviceNetwork:
      - 172.30.0.0/16
  platform:
    aws:
      region: us-west-2 11
      userTags:
        adminContact: jdoe
        costCenter: 7536
      amiID: ami-96c6f8f7 12
      serviceEndpoints: 13
        - name: ec2
          url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    fips: false 14
  sshKey: ssh-ed25519 AAAA... 15
  pullSecret: '{"auths": ...}' 16

```

1 10 11 16 Required. The installation program prompts you for this value.

- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 13 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 14 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 15 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.5.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

2 A proxy URL to use for creating HTTPS connections outside the cluster.

3

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For

- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

4.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.5.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https     reencrypt/Redirect    None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.5.12. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

4.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

 Agent pid 31874**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

 \$ ssh-add <path>/<file_name> **1**

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output Identity added: /home/<you>/<path>/<file_name> (<computer_name>)**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

4.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
 - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
 - iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.5. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .

Parameter	Description	Values
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.6.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.6. Network parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

4.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.7. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>  <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.6.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.8. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .

Parameter	Description	Values
compute.platform.aws.rootVolume.type	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
compute.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
compute.platform.aws.type	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
compute.platform.aws.zones	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
compute.aws.region	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .
controlPlane.platform.aws.amiID	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
controlPlane.platform.aws.iamRole	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
controlPlane.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN

Parameter	Description	Values
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.

Parameter	Description	Values
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.6.6.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.17. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x
r4.2xlarge		x	x
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x
t3a.xlarge			x
t3a.2xlarge			x

4.6.6.3. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
        - us-west-2c
    replicas: 3
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 12
  userTags:
    adminContact: jdoe
    costCenter: 7536
  amiID: ami-96c6f8f7 13
  serviceEndpoints: 14

```

```

- name: ec2
  url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fips: false 15
  sshKey: ssh-ed25519 AAAA... 16
  pullSecret: '{"auths": ...}' 17

```

- 1 10 12 17** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.
- 3 7 11** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 13** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14** The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 16** You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.6.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
```

```
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
```

...

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.6.7. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

clusterNetwork

IP address pools from which pod IP addresses are allocated.

serviceNetwork

IP address pool for services.

defaultNetwork.type

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

4.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 4.9. Cluster Network Operator configuration object

Field	Type	Description
metadata.name	string	The name of the CNO object. This name is always cluster .
spec.clusterNetwork	array	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec: clusterNetwork: - cidr: 10.128.0.0/19 hostPrefix: 23 - cidr: 10.128.32.0/19 hostPrefix: 23</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.serviceNetwork	array	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec: serviceNetwork: - 172.30.0.0/14</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.defaultNetwork	object	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
spec.kubeProxyConfig	object	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 4.10. defaultNetwork object

Field	Type	Description
type	string	<p>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
openshiftSDNConfig	object	This object is only valid for the OpenShift SDN cluster network provider.
ovnKubernetesConfig	object	This object is only valid for the OVN-Kubernetes cluster network provider.

Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 4.11. openshiftSDNConfig object

Field	Type	Description
mode	string	<p>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</p> <p>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.</p> <p>This value cannot be changed after cluster installation.</p>
vxlanPort	integer	<p>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</p>

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 4.12. ovnKubernetesConfig object

Field	Type	Description
-------	------	-------------

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</p> <p>This value cannot be changed after cluster installation.</p>
genevePort	integer	The port to use for all Geneve packets. The default value is 6081 . This value cannot be changed after cluster installation.
ipsecConfig	object	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
policyAuditConfig	object	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 4.13. **policyAuditConfig** object

Field	Type	Description
rateLimit	integer	The maximum number of messages to generate every second per node. The default value is 20 messages per second.
maxFileSize	integer	The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

Field	Type	Description
destination	string	<p>One of the following additional audit log targets:</p> <p>libc The libc syslog() function of the journald process on the host.</p> <p>udp:<host>:<port> A syslog server. Replace <host>:<port> with the host and port of the syslog server.</p> <p>unix:<file> A Unix Domain Socket file specified by <file>.</p> <p>null Do not send the audit logs to any additional target.</p>
syslogFacility	string	The syslog facility, such as kern , as defined by RFC5424. The default value is local0 .

Example OVN-Kubernetes configuration

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 4.14. kubeProxyConfig object

Field	Type	Description
iptablesSyncPeriod	string	<p>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p>NOTE</p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.</p> </div> </div>

Field	Type	Description
proxyArguments.iptables-min-sync-period	array	<p>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is:</p> <pre>kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</pre>

4.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

NOTE

For more information on using a Network Load Balancer (NLB) on AWS, see [Configuring Ingress cluster traffic on AWS using a Network Load Balancer](#).

4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

Prerequisites

- Create the **install-config.yaml** file and complete any modifications to it.

Procedure

Create an Ingress Controller backed by an AWS NLB on a new cluster.

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- For **<installation_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1** For **<installation_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
      aws:
        type: NLB
    type: LoadBalancerService
```

4. Save the **cluster-ingress-default-ingresscontroller.yaml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-ingress-default-ingresscontroller.yaml** file. The installation program deletes the **manifests/** directory when creating the cluster.

4.6.10. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

<installation_directory>

Specifies the directory name that contains the **manifests/** directory for your cluster.

- Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.

2

Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for

NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

4.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

4.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.6.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.6.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.6.16. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

4.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
 - Contains the mirror registry

- Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

NOTE

If you are configuring a proxy, be sure to also review this site list.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.7.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

4.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

4.7.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in

the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkAclAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> ● AWS::EC2::InternetGateway ● AWS::EC2::VPCElasticGatewayAttachment ● AWS::EC2::RouteTable ● AWS::EC2::Route ● AWS::EC2::SubnetRouteTableAssociation ● AWS::EC2::NatGateway ● AWS::EC2::EIP 	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>80</td> <td>Inbound HTTP traffic</td> </tr> <tr> <td>443</td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td>22</td> <td>Inbound SSH traffic</td> </tr> <tr> <td>1024 - 65535</td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td>0 - 65535</td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	80	Inbound HTTP traffic	443	Inbound HTTPS traffic	22	Inbound SSH traffic	1024 - 65535	Inbound ephemeral traffic	0 - 65535	Outbound ephemeral traffic
Port	Reason													
80	Inbound HTTP traffic													
443	Inbound HTTPS traffic													
22	Inbound SSH traffic													
1024 - 65535	Inbound ephemeral traffic													
0 - 65535	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

4.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.7.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.

- iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
 - iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.

- a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<mirror_host_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  /-----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

- c. Define the subnets for the VPC to install the cluster in:

```
subnets:
- subnet-1
- subnet-2
- subnet-3
```

- d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: quay.example.com/openshift-release-dev/ocp-release
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: registry.example.com/ocp/release
```

To complete these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.15. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String

Parameter	Description	Values
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.16. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .

Parameter	Description	Values
networking.serviceNetwork	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	<p>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p> </div> </div>

4.7.6.1.3. Optional configuration parameters

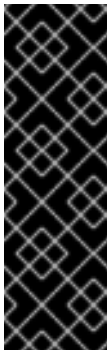

Optional installation configuration parameters are described in the following table:

Table 4.17. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="486 510 595 862" style="display: inline-block; vertical-align: top;">  </div> <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 1310 595 1662" style="display: inline-block; vertical-align: top;">  </div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> <div data-bbox="486 1706 595 1899" style="display: inline-block; vertical-align: top;">  </div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p>	false or true
imageContentSources	<p>Sources and repositories for the release-image content.</p>	<p>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</p>

Parameter	Description	Values
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.7.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.18. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.

Parameter	Description	Values
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .
compute.platform.aws.rootVolume.type	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
compute.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
compute.platform.aws.type	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
compute.platform.aws.zones	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
compute.aws.region	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .

Parameter	Description	Values
controlPlane.platform.aws.amiID	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
controlPlane.platform.aws.iamRole	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
controlPlane.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.

Parameter	Description	Values
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

Parameter	Description	Values
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.7.6.2. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
        type: m5.xlarge
      replicas: 3
    compute: 7
  - hyperthreading: Enabled 8
    name: worker
    platform:
      aws:
        rootVolume:
          iops: 2000

```

```

    size: 500
    type: io1 9
    type: c5.4xlarge
    zones:
    - us-west-2c

    - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

```

1 10 11 Required. The installation program prompts you for this value.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.

- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 For **<local_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or
- 19 Provide the contents of the certificate file that you used for your mirror registry.
- 20 Provide the **imageContentSources** section from the output of the command to mirror the repository.

4.7.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
```

```
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
```

...

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/./openshift_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

4.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvfz <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.7.10. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \  
-p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Global Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

4.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

4.7.12. Next steps

- [Validate an installation](#).
- [Customize your cluster](#).
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#) .
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#) .

4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

4.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.8.2. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see [VPC with public and private subnets \(NAT\)](#) in the AWS documentation.
Record each subnet ID. Completing the installation requires that you enter these values in the **platform** section of the **install-config.yaml** file. See [Finding a subnet ID](#) in the AWS documentation.
- The VPC's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.
- The VPC must have a public internet gateway attached to it. For each availability zone:
 - The public subnet requires a route to the internet gateway.
 - The public subnet requires a NAT gateway with an EIP address.
 - The private subnet requires a route to the NAT gateway in public subnet.
- The VPC must not use the **kubernetes.io/cluster/.*: owned** tag.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Top secret region

- `ec2.<region>.c2s.ic.gov`
- `elasticloadbalancing.<region>.c2s.ic.gov`
- `s3.<region>.c2s.ic.gov`

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description						
VPC	<ul style="list-style-type: none"> • <code>AWS::EC2::VPC</code> • <code>AWS::EC2::VPCEndpoint</code> 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.						
Public subnets	<ul style="list-style-type: none"> • <code>AWS::EC2::Subnet</code> • <code>AWS::EC2::SubnetNetworkAclAssociation</code> 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.						
Internet gateway	<ul style="list-style-type: none"> • <code>AWS::EC2::InternetGateway</code> • <code>AWS::EC2::VPCGatewayAttachment</code> • <code>AWS::EC2::RouteTable</code> • <code>AWS::EC2::Route</code> • <code>AWS::EC2::SubnetRouteTableAssociation</code> • <code>AWS::EC2::NatGateway</code> • <code>AWS::EC2::EIP</code> 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.						
Network access control	<ul style="list-style-type: none"> • <code>AWS::EC2::NetworkAcl</code> • <code>AWS::EC2::NetworkAclEntry</code> 	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>80</td> <td>Inbound HTTP traffic</td> </tr> <tr> <td>443</td> <td>Inbound HTTPS traffic</td> </tr> </tbody> </table>	Port	Reason	80	Inbound HTTP traffic	443	Inbound HTTPS traffic
Port	Reason							
80	Inbound HTTP traffic							
443	Inbound HTTPS traffic							

Component	AWS type	Description	
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
		0 - 65535	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

4.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions

that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
-
```

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:

- i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
 - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
 - iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
 3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.19. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.20. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p>

4.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.21. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.8.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.22. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .

Parameter	Description	Values
compute.platform.aws.rootVolume.type	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
compute.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
compute.platform.aws.type	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
compute.platform.aws.zones	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
compute.aws.region	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .
controlPlane.platform.aws.amiID	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
controlPlane.platform.aws.iamRole	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
controlPlane.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .

Parameter	Description	Values
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.8.6.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.18. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
---------------	-----------	---------------	---------

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x
r4.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x

Instance type	Bootstrap	Control plane	Compute
t3a.xlarge			x
t3a.2xlarge			x

4.8.6.3. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
      - us-west-2c
      replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:

```

```

- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
aws:
  region: us-west-2 11
  userTags:
    adminContact: jdoe
    costCenter: 7536
  subnets: 12
  - subnet-1
  - subnet-2
  - subnet-3
  amiID: ami-96c6f8f7 13
  serviceEndpoints: 14
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  hostedZone: Z3URY6TWQ91KVV 15
fips: false 16
sshKey: ssh-ed25519 AAAA... 17
pullSecret: '{"auths": ...}' 18

```

- 1 10 11 18** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.
- 3 7** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and

- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.8.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

4.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.8.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.8.12. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

4.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can [manually create and maintain IAM credentials](#) .

4.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

<<<<<<< HEAD By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.9.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> ● AWS::EC2::InternetGateway ● AWS::EC2::VPCGatewayAttachment ● AWS::EC2::RouteTable ● AWS::EC2::Route ● AWS::EC2::SubnetRouteTableAssociation ● AWS::EC2::NatGateway ● AWS::EC2::EIP 	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>80</td> <td>Inbound HTTP traffic</td> </tr> <tr> <td>443</td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td>22</td> <td>Inbound SSH traffic</td> </tr> <tr> <td>1024 - 65535</td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td>0 - 65535</td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	80	Inbound HTTP traffic	443	Inbound HTTPS traffic	22	Inbound SSH traffic	1024 - 65535	Inbound ephemeral traffic	0 - 65535	Outbound ephemeral traffic
Port	Reason													
80	Inbound HTTP traffic													
443	Inbound HTTPS traffic													
22	Inbound SSH traffic													
1024 - 65535	Inbound ephemeral traffic													
0 - 65535	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

4.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

4.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.23. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name>.<baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .

Parameter	Description	Values
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.24. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	<p>Object</p>  <p>NOTE</p> <p>You cannot modify parameters specified by the networking object after installation.</p>

Parameter	Description	Values
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

4.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.25. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.26. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .

Parameter	Description	Values
<code>compute.platform.aws.rootVolume.type</code>	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
<code>compute.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
<code>compute.platform.aws.type</code>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
<code>compute.platform.aws.zones</code>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
<code>compute.aws.region</code>	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .
<code>controlPlane.platform.aws.amiID</code>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<code>controlPlane.platform.aws.iamRole</code>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<code>controlPlane.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN

Parameter	Description	Values
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.

Parameter	Description	Values
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.9.7.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.19. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x
r4.2xlarge		x	x
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x
t3a.xlarge			x
t3a.2xlarge			x

4.9.7.3. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
      - us-west-2c
    replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
  subnets: 12
  - subnet-1

```

```

- subnet-2
- subnet-3
amiID: ami-96c6f8f7 13
serviceEndpoints: 14
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV 15
fips: false 16
sshKey: ssh-ed25519 AAAA... 17
publish: Internal 18
pullSecret: '{"auths": ...}' 19

```

- 1 10 11 19** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.
- 3 7** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12** If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14** The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15** The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

4.9.7.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

4.9.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.9.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.9.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.9.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) into a government or secret region. To configure the region, modify parameters in the **install-config.yaml** file before you install the cluster.

4.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.

- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.10.2. AWS government and secret regions

OpenShift Container Platform supports deploying a cluster to [AWS GovCloud \(US\)](#) regions and the [AWS Commercial Cloud Services \(C2S\) Top Secret Region](#). These regions are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

These regions do not have published Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Images (AMI) to select, so you must upload a custom AMI that belongs to that region.

The following AWS GovCloud partitions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

The following AWS Top Secret Region partition is supported:

- **us-iso-east-1**

NOTE

The maximum supported MTU in an AWS Top Secret Region is not the same as AWS commercial. For more information about configuring MTU during installation, see the *Cluster Network Operator configuration object* section in *Installing a cluster on AWS with network customizations*

The AWS government or secret region, and accompanying custom AMI, must be manually configured in the **install-config.yaml** file since RHCOS AMIs are not provided by Red Hat for those regions.

IMPORTANT

If you are deploying to the C2S Secret Region, you must also define a custom CA certificate in the **additionalTrustBundle** field of the **install-config.yaml** file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the **AWS_CA_BUNDLE** environment variable, or define the CA bundle in the **ca_bundle** field of the AWS config file.

4.10.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

NOTE

Public zones are not supported in Route 53 in AWS GovCloud or Top Secret Regions. Therefore, clusters must be private if they are deployed to an AWS government or secret region.

<<<<<<<< HEAD By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.10.3.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets

- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.10.3.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.10.4. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.10.4.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description												
VPC	<ul style="list-style-type: none"> ● AWS::EC2::VPC ● AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.												
Public subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::SubnetNetworkAclAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.												
Internet gateway	<ul style="list-style-type: none"> ● AWS::EC2::InternetGateway ● AWS::EC2::VPCGatewayAttachment ● AWS::EC2::RouteTable ● AWS::EC2::Route ● AWS::EC2::SubnetRouteTableAssociation ● AWS::EC2::NatGateway ● AWS::EC2::EIP 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.												
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>80</td> <td>Inbound HTTP traffic</td> </tr> <tr> <td>443</td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td>22</td> <td>Inbound SSH traffic</td> </tr> <tr> <td>1024 - 65535</td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td>0 - 65535</td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	80	Inbound HTTP traffic	443	Inbound HTTPS traffic	22	Inbound SSH traffic	1024 - 65535	Inbound ephemeral traffic	0 - 65535	Outbound ephemeral traffic
Port	Reason													
80	Inbound HTTP traffic													
443	Inbound HTTPS traffic													
22	Inbound SSH traffic													
1024 - 65535	Inbound ephemeral traffic													
0 - 65535	Outbound ephemeral traffic													

Component	AWS type	Description
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

4.10.4.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.10.4.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.10.4.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.10.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.10.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.10.7. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

**NOTE**

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in secret regions.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
```

```

amiID: ami-06c4d345f7c207239 1
type: m5.4xlarge
replicas: 3
metadata:
  name: test-cluster
platform:
  aws:
    region: us-gov-west-1 2
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'

```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

4.10.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.10.9. Manually creating the installation configuration file

When installing OpenShift Container Platform on Amazon Web Services (AWS) into a region requiring a custom Red Hat Enterprise Linux CoreOS (RHCOS) AMI, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

- Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

- Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

4.10.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.10.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.27. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name>.<baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .

Parameter	Description	Values
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

4.10.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.28. Network parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p>  <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p>

4.10.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.29. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>  <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

4.10.9.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.30. Optional AWS parameters

Parameter	Description	Values
compute.platform.aws.amiID	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
compute.platform.aws.iamRole	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
compute.platform.aws.rootVolume.iops	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example 4000 .
compute.platform.aws.rootVolume.size	The size in GiB of the root volume.	Integer, for example 500 .

Parameter	Description	Values
compute.platform.aws.rootVolume.type	The type of the root volume.	Valid AWS EBS volume type , such as io1 .
compute.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid key ID or the key ARN
compute.platform.aws.type	The EC2 instance type for the compute machines.	Valid AWS instance type, such as m4.2xlarge . See the Instance types for machines table that follows.
compute.platform.aws.zones	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
compute.aws.region	The AWS region that the installation program creates compute resources in.	Any valid AWS region , such as us-east-1 .
controlPlane.platform.aws.amiID	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
controlPlane.platform.aws.iamRole	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
controlPlane.platform.aws.rootVolume.kmsKeyARN	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid key ID and the key ARN

Parameter	Description	Values
controlPlane.platform.aws.type	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as m5.xlarge . See the Instance types for machines table that follows.
controlPlane.platform.aws.zones	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as us-east-1c , in a YAML sequence .
controlPlane.aws.region	The AWS region that the installation program creates control plane resources in.	Valid AWS region , such as us-east-1 .
platform.aws.amiID	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
platform.aws.hostedZone	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example Z3URY6TWQ91KVV .
platform.aws.serviceEndpoints.name	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid AWS service endpoint name.

Parameter	Description	Values
platform.aws.serviceEndpoints.url	The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.	Valid AWS service endpoint URL.
platform.aws.userTags	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.
platform.aws.subnets	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

4.10.9.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.20. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x
r4.2xlarge		x	x
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x
t3a.xlarge			x
t3a.2xlarge			x

4.10.9.3. Sample customized install-config.yaml file for AWS

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-gov-west-1a
        - us-gov-west-1b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
        - us-gov-west-1c
    replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-gov-west-1
    userTags:
      adminContact: jdoe
      costCenter: 7536
  subnets: 11
    - subnet-1

```

```

- subnet-2
- subnet-3
amiID: ami-96c6f8f7 12
serviceEndpoints: 13
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV 14
fips: false 15
sshKey: ssh-ed25519 AAAA... 16
publish: Internal 17
pullSecret: '{"auths": ...}' 18
additionalTrustBundle: | 19
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

```

1 **10** **18** Required.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.

3 **7** If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 **8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 **9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

11 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

12 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

13 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

- 14 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to
- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 17 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.
- 19 The custom CA certificate. This is required when deploying to the AWS C2S Top Secret Region because the AWS API requires a custom CA trust bundle.

4.10.9.4. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster. This is required if you are deploying your cluster to an AWS government or secret region. AWS government and secret regions are supported by the AWS SDK.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the **us-east-1** AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the **install-config.yaml** file.

4.10.9.5. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

- 1 The AWS profile name that holds your AWS credentials, like **govcloud**.

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

- 1 The AWS region, like **us-gov-east-1**.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

- 1 The RHCOS VMDK version, like **4.8.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
    "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" \ ❶
  --disk-container "file://<file_path>/containers.json" ❷
```

- ❶ The description of your RHCOS disk being imported, like **rhcos-\${RHCOS_VERSION}-x86_64-aws.x86_64**.
- ❷ The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ ❶
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❷
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
[DeleteOnTermination=true,SnapshotId=<snapshot_ID>]' ❹
```

- ❶ The RHCOS VMDK architecture type, like **x86_64**, **s390x**, or **ppc64le**.

- 2 The **Description** from the imported snapshot.
- 3 The name of the RHCOS AMI.
- 4 The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

4.10.9.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
```

```
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
```

...

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.10.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

4.10.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvfz <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.10.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.10.13. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.10.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.10.15. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

4.11. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

4.11.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or UNIX\)](#) in the AWS documentation.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.11.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.11.3. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

4.11.3.1. Other infrastructure components

- A VPC
- DNS entries

- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.
Internet gateway	<ul style="list-style-type: none"> • AWS::EC2::InternetGateway • AWS::EC2::VPCGatewayAttachment • AWS::EC2::RouteTable • AWS::EC2::Route • AWS::EC2::SubnetRouteTableAssociation • AWS::EC2::NatGateway • AWS::EC2::EIP 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

Component	AWS type	Description	
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic

Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes (also known as the master nodes). Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	AWS::Route53::HostedZone	The hosted zone for your internal DNS.

Component	AWS type	Description
etcd record sets	AWS::Route53::RecordSet	The registration records for etcd for your control plane machines.
Public load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your public subnets.
External API server record	AWS::Route53::RecordSetGroup	Alias records for the external API server.
External listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the external load balancer.
External target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the external load balancer.
Private load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your private subnets.
Internal API server record	AWS::Route53::RecordSetGroup	Alias records for the internal API server.
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 22623 for the internal load balancer.
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the internal load balancer.

Component	AWS type	Description
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.

Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
MasterSecurityGroup	AWS::EC2::SecurityGroup	icmp	0
		tcp	22
		tcp	6443
		tcp	22623
WorkerSecurityGroup	AWS::EC2::SecurityGroup	icmp	0
		tcp	22
BootstrapSecurityGroup	AWS::EC2::SecurityGroup	tcp	22
		tcp	19531

Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
MasterIngress Etcd	etcd	tcp	2379- 2380
MasterIngress Vxlan	Vxlan packets	udp	4789
MasterIngress WorkerVxlan	Vxlan packets	udp	4789
MasterIngress Internal	Internal cluster communication and Kubernetes proxy metrics	tcp	9000 - 9999

Ingress group	Description	IP protocol	Port range
MasterIngress WorkerInternal	Internal cluster communication	tcp	9000 - 9999
MasterIngress Kube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
MasterIngress WorkerKube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
MasterIngress IngressServices	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress WorkerIngress Services	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress Geneve	Geneve packets	udp	6081
MasterIngress WorkerGeneve	Geneve packets	udp	6081
MasterIngress IpsecIke	IPsec IKE packets	udp	500
MasterIngress WorkerIpsecIke	IPsec IKE packets	udp	500
MasterIngress IpsecNat	IPsec NAT-T packets	udp	4500
MasterIngress WorkerIpsecNat	IPsec NAT-T packets	udp	4500
MasterIngress IpsecEsp	IPsec ESP packets	50	All
MasterIngress WorkerIpsecEsp	IPsec ESP packets	50	All

Ingress group	Description	IP protocol	Port range
MasterIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
MasterIngress WorkerInternal UDP	Internal cluster communication	udp	9000 - 9999
MasterIngress IngressServices UDP	Kubernetes Ingress services	udp	30000 - 32767
MasterIngress WorkerIngress ServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
WorkerIngress Vxlan	Vxlan packets	udp	4789
WorkerIngress WorkerVxlan	Vxlan packets	udp	4789
WorkerIngress Internal	Internal cluster communication	tcp	9000 - 9999
WorkerIngress WorkerInternal	Internal cluster communication	tcp	9000 - 9999
WorkerIngress Kube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250
WorkerIngress WorkerKube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250
WorkerIngress IngressServices	Kubernetes Ingress services	tcp	30000 - 32767

Ingress group	Description	IP protocol	Port range
WorkerIngress WorkerIngress Services	Kubernetes Ingress services	tcp	30000 - 32767
WorkerIngress Geneve	Geneve packets	udp	6081
WorkerIngress MasterGeneve	Geneve packets	udp	6081
WorkerIngress IpsecIke	IPsec IKE packets	udp	500
WorkerIngress MasterIpsecIke	IPsec IKE packets	udp	500
WorkerIngress IpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress MasterIpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress IpsecEsp	IPsec ESP packets	50	All
WorkerIngress MasterIpsecEsp	IPsec ESP packets	50	All
WorkerIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress MasterInternal UDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress IngressServicesUDP	Kubernetes Ingress services	udp	30000 - 32767
WorkerIngress MasterIngress ServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	Allow	ec2:*	*
	Allow	elasticloadbalancing .*	*
	Allow	iam:PassRole	*
	Allow	s3:GetObject	*
Worker	Allow	ec2:Describe*	*
Bootstrap	Allow	ec2:Describe*	*
	Allow	ec2:AttachVolume	*
	Allow	ec2:DetachVolume	*

4.11.3.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

4.11.3.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

4.11.3.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.21. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r4.2xlarge		x	x
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x

Instance type	Bootstrap	Control plane	Compute
t3a.large			x
t3a.xlarge			x
t3a.2xlarge			x

4.11.3.5. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 4.22. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**

- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**

- **ec2:TerminateInstances**

Example 4.23. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.24. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**

- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 4.25. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

Example 4.26. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**

- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

Example 4.27. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**

- **route53:UpdateHostedZoneComment**

Example 4.28. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.29. S3 permissions that cluster Operators require

- **s3>DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**

- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.30. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3>DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 4.31. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**
- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**

- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

Example 4.32. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

Example 4.33. Additional IAM and S3 permissions that are required to create manifests

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3>ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

NOTE

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

Example 4.34. Optional permissions for instance and quota checks for installation

- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

4.11.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

NOTE

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in secret regions.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. If you use the CloudFormation template to deploy your worker nodes, you must update the `worker0.type.properties.ImageID` parameter with this value.

4.11.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.11.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

4.11.7. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

4.11.7.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **var** partition or a subdirectory of **var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> ❶
      partitions:
        - label: var
          start_mib: <partition_start_offset> ❷
          size_mib: <partition_size> ❸
  filesystems:
    - device: /dev/disk/by-partlabel/var
      path: /var
```

```
format: xfs
mount_options: [defaults, prjquota] 4
with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

4.11.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

NOTE

The AWS access key ID and secret access key are stored in **~/.aws/credentials** in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
- v. Select the base domain for the Route 53 service that you configured for your cluster.
- vi. Enter a descriptive name for your cluster.
- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

- Optional: Back up the **install-config.yaml** file.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

4.11.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
```

```
noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2** A proxy URL to use for creating HTTPS connections outside the cluster.
- 3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4** If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.11.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation_directory>/manifests/cluster-scheduler-02-config.yaml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the **<installation_directory>/manifests/cluster-scheduler-02-config.yaml** file.
- b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.

- c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```

apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}

```

- 1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

```

.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign

```

4.11.8. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

4.11.9. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
```

```

{
  "ParameterKey": "VpcCidr", 1
  "ParameterValue": "10.0.0.0/16" 2
},
{
  "ParameterKey": "AvailabilityZoneCount", 3
  "ParameterValue": "1" 4
},
{
  "ParameterKey": "SubnetBits", 5
  "ParameterValue": "12" 6
}
]

```

- 1** The CIDR block for the VPC.
 - 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
 - 3** The number of availability zones to deploy the VPC in.
 - 4** Specify an integer between **1** and **3**.
 - 5** The size of each subnet in each availability zone.
 - 6** Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
 3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

IMPORTANT

You must enter the command on a single line.

```

$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3

```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

VpcId	The ID of your VPC.
PublicSubnetIds	The IDs of the new public subnets.
PrivateSubnetIds	The IDs of the new private subnets.

4.11.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

Example 4.35. CloudFormation template for the VPC

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\{3\}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\/(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number
```

      ]

```

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

4.11.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of

AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1 For the **<route53_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
]
```

```

{
  "ParameterKey": "HostedZoneId", 5
  "ParameterValue": "<random_string>" 6
},
{
  "ParameterKey": "HostedZoneName", 7
  "ParameterValue": "example.com" 8
},
{
  "ParameterKey": "PublicSubnets", 9
  "ParameterValue": "subnet-<random_string>" 10
},
{
  "ParameterKey": "PrivateSubnets", 11
  "ParameterValue": "subnet-<random_string>" 12
},
{
  "ParameterKey": "VpcId", 13
  "ParameterValue": "vpc-<random_string>" 14
}
]

```

- 1 A short, representative cluster name to use for hostnames, etc.
- 2 Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- 3 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 4 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 5 The Route 53 public zone ID to register the targets with.
- 6 Specify the Route 53 public zone ID, which as a format similar to **Z21XYZABCZ2A4**. You can obtain this value from the AWS console.
- 7 The Route 53 zone to register the targets with.
- 8 Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 9 The public subnets that you created for your VPC.
- 10 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 11 The private subnets that you created for your VPC.
- 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
- 13 The VPC that you created for the cluster.

- 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

PrivateHostedZoneId	Hosted zone ID for the private DNS.
ExternalApiLoadBalancerName	Full name of the external API load balancer.
InternalApiLoadBalancerName	Full name of the internal API load balancer.
ApiServerDnsName	Full hostname of the API server.
RegisterNlbIpTargetsLambda	Lambda ARN useful to help register/deregister IP targets for these load balancers.
ExternalApiTargetGroupArn	ARN of external API target group.
InternalApiTargetGroupArn	ARN of internal API target group.
InternalServiceTargetGroupArn	ARN of internal service target group.

4.11.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

Example 4.36. CloudFormation template for the network and load balancers

AWSTemplateFormatVersion: [2010-09-09](#)

Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:

ClusterName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of [27](#) characters.

Description: A short, representative cluster name to use for host names and other identifying

names.

Type: String

InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

HostedZoneld:

Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneld

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

PublicSubnets:
 default: "Public Subnets"
 PrivateSubnets:
 default: "Private Subnets"
 HostedZoneName:
 default: "Public Hosted Zone Name"
 HostedZoneId:
 default: "Public Hosted Zone ID"

```

```

Outputs:
  PrivateHostedZoneId:
    Description: Hosted zone ID for the private DNS, which is required for private records.
    Value: !Ref IntDns
  ExternalApiLoadBalancerName:
    Description: Full name of the external API load balancer.
    Value: !GetAtt ExtApiElb.LoadBalancerFullName
  InternalApiLoadBalancerName:
    Description: Full name of the internal API load balancer.
    Value: !GetAtt IntApiElb.LoadBalancerFullName
  ApiServerDnsName:
    Description: Full hostname of the API server, which is required for the Ignition config files.
    Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]
  RegisterNlbIpTargetsLambda:
    Description: Lambda ARN useful to help register or deregister IP targets for these load
balancers.
    Value: !GetAtt RegisterNlbIpTargets.Arn
  ExternalApiTargetGroupArn:

```

Description: ARN of the external API target group.
 Value: !Ref ExternalApiTargetGroup
 InternalApiTargetGroupArn:
 Description: ARN of the internal API target group.
 Value: !Ref InternalApiTargetGroup
 InternalServiceTargetGroupArn:
 Description: ARN of the internal service target group.
 Value: !Ref InternalServiceTargetGroup

IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- You can view details about your hosted zones by navigating to the [AWS Route 53 console](#).
- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

4.11.11. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

- You created and configured a VPC and associated subnets in AWS.

Procedure

- Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "VpcCidr", 3
    "ParameterValue": "10.0.0.0/16" 4
  },
  {
    "ParameterKey": "PrivateSubnets", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "VpcId", 7
    "ParameterValue": "vpc-<random_string>" 8
  }
]
```

- 1** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
 - 2** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
 - 3** The CIDR block for the VPC.
 - 4** Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
 - 5** The private subnets that you created for your VPC.
 - 6** Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
 - 7** The VPC that you created for the cluster.
 - 8** Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
 - Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

MasterSecurityGroupID	Master Security Group ID
WorkerSecurityGroupID	Worker Security Group ID
MasterInstanceProfile	Master IAM Instance Profile
WorkerInstanceProfile	Worker IAM Instance Profile

4.11.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

Example 4.37. CloudFormation template for security objects

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-
    4][0-9]|25[0-5])(\V(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Cluster Information"
        Parameters:
          - InfrastructureName
      - Label:
          default: "Network Configuration"
        Parameters:
          - VpcId
          - VpcCidr
          - PrivateSubnets
    ParameterLabels:
      InfrastructureName:
        default: "Infrastructure Name"
      VpcId:
        default: "VPC ID"
      VpcCidr:
        default: "VPC CIDR"
      PrivateSubnets:
        default: "Private Subnets"

```

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

4.11.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
 - Print the current **x86_64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for the **us-west-1** region. The AMI must belong to the same region as the cluster.

4.11.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.31. RHCOS AMIs

AWS zone	AWS AMI
af-south-1	ami-0ce5aa99b7d576c79

AWS zone	AWS AMI
ap-east-1	ami-0f6debc614042ce76
ap-northeast-1	ami-0423a1bf292f34dc3
ap-northeast-2	ami-0889161041cb9d77f
ap-northeast-3	ami-00564b0d6cbb676b1
ap-south-1	ami-0650f4166d12cceed
ap-southeast-1	ami-0b09ad848356811c7
ap-southeast-2	ami-013484d0474ab5860
ca-central-1	ami-03291c3e2b74c32b9
eu-central-1	ami-0510f6f15c25b29d4
eu-north-1	ami-03a3119ba25eb55b1
eu-south-1	ami-04f719435625c1313
eu-west-1	ami-08e20744bd1c89c8e
eu-west-2	ami-0c190f5d05b071c7a
eu-west-3	ami-0eb0bf894fdf1d416
me-south-1	ami-073928aa740f738bd
sa-east-1	ami-01242f1bac18cc0fd
us-east-1	ami-05ed2cc6e70392ff9
us-east-2	ami-00b3a5054da356288
us-west-1	ami-021f626622b5238f3
us-west-2	ami-0c9fd8b47bfd717e8

4.11.13.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you

can upload a custom AMI prior to installing the cluster. This is required if you are deploying your cluster to an AWS government or secret region. AWS government and secret regions are supported by the AWS SDK.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the **us-east-1** AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the **install-config.yaml** file.

4.11.13.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

- 1 The AWS profile name that holds your AWS credentials, like **govcloud**.

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

- 1 The AWS region, like **us-gov-east-1**.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

- 1 The RHCOS VMDK version, like **4.8.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
    "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" ❶
  --disk-container "file://<file_path>/containers.json" ❷
```

❶ The description of your RHCOS disk being imported, like **rhcos-\${RHCOS_VERSION}-x86_64-aws.x86_64**.

❷ The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

```

    }
  ]
}

```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```

$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 3
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>' 4

```

- 1** The RHCOS VMDK architecture type, like **x86_64**, **s390x**, or **ppc64le**.
- 2** The **Description** from the imported snapshot.
- 3** The name of the RHCOS AMI.
- 4** The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

4.11.14. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

IMPORTANT

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

IMPORTANT

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1 **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

- c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcossAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroupID", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcID", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbPTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbPTargets-<random_string>" 18
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 19
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 21
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:"
  }
]
```

```

<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 23
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4 Specify a valid **AWS::EC2::Image::Id** value.
- 5 CIDR block to allow SSH access to the bootstrap node.
- 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
- 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 9 The master security group ID (for registering temporary rules)
- 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 11 The VPC created resources will belong to.
- 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- 13 Location to fetch bootstrap Ignition config file from.
- 14 Specify the S3 bucket and file name in the form **s3://<bucket_name>/bootstrap.ign**.
- 15 Whether or not to register a network load balancer (NLB).
- 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 17 The ARN for NLB IP target registration lambda group.
- 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 19 The ARN for external API load balancer target group.
- 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

- 21 The ARN for internal API load balancer target group.
 - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 23 The ARN for internal service load balancer target group.
 - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
3. Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
 4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

Bootstrap InstanceId	The bootstrap Instance ID.
Bootstrap PublicIp	The bootstrap node public IP address.
Bootstrap PrivateIp	The bootstrap node private IP address.

4.11.14.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

Example 4.38. CloudFormation template for the bootstrap machine

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AllowedBootstrapSshCidr:
    AllowedPattern: ^((([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-
    4][0-9]|25[0-5])|([0-9]{1}[0-9]|2[0-9]|3[0-2]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
    Default: 0.0.0.0/0
    Description: CIDR block to allow SSH access to the bootstrap node.
    Type: String
  PublicSubnet:
    Description: The public subnet to launch the bootstrap node into.
    Type: AWS::EC2::Subnet::Id
  MasterSecurityGroupId:
    Description: The master security group ID for registering temporary rules.
    Type: AWS::EC2::SecurityGroup::Id
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  BootstrapIgnitionLocation:
    Default: s3://my-s3-bucket/bootstrap.ign

```

Description: Ignition config file location.

Type: String

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"

- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group.

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- RhcosAmi

- BootstrapIgnitionLocation

- MasterSecurityGroupId

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- AllowedBootstrapSshCidr

- PublicSubnet

- Label:

default: "Load Balancer Automation"

Parameters:

- AutoRegisterELB

- RegisterNlbTargetsLambdaArn

- ExternalApiTargetGroupArn

- InternalApiTargetGroupArn

- InternalServiceTargetGroupArn

ParameterLabels:

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

AllowedBootstrapSshCidr:

default: "Allowed SSH Source"

PublicSubnet:
 default: "Public Subnet"
 RhcosAmi:
 default: "Red Hat Enterprise Linux CoreOS AMI ID"
 BootstrapIgnitionLocation:
 default: "Bootstrap Ignition Source"
 MasterSecurityGroupId:
 default: "Master Security Group ID"
 AutoRegisterELB:
 default: "Use Provided ELB Automation"

Conditions:

DoRegistration: !Equals ["yes", !Ref AutoRegisterELB]

Resources:

BootstrapIamRole:

  TargetIp: !GetAtt BootstrapInstance.PrivateIp

```

Outputs:**BootstrapInstanceId:**

Description: Bootstrap Instance ID.

Value: !Ref BootstrapInstance

BootstrapPublicIp:

Description: The bootstrap node public IP address.

Value: !GetAtt BootstrapInstance.PublicIp

BootstrapPrivateIp:

Description: The bootstrap node private IP address.

Value: !GetAtt BootstrapInstance.PrivateIp

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

4.11.15. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcOSAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneId", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupID", 17
    "ParameterValue": "sg-<random_string>" 18
  },
  {
    "ParameterKey": "IgnitionLocation", 19
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
  },
  {
    "ParameterKey": "CertificateAuthorities", 21
    "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
  },
  {
    "ParameterKey": "MasterInstanceProfileName", 23
    "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
  }
]
```

```

    },
    {
      "ParameterKey": "MasterInstanceType", 25
      "ParameterValue": "m5.xlarge" 26
    },
    {
      "ParameterKey": "AutoRegisterELB", 27
      "ParameterValue": "yes" 28
    },
    {
      "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
      "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
    },
    {
      "ParameterKey": "ExternalApiTargetGroupArn", 31
      "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
    },
    {
      "ParameterKey": "InternalApiTargetGroupArn", 33
      "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
    },
    {
      "ParameterKey": "InternalServiceTargetGroupArn", 35
      "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
    }
  ]
}

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster_name>.<domain_name>** where **<domain_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

include the trailing period (.) that is displayed in the AWS console.

- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes (also known as the master nodes).
- 18 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, https://api-int.<cluster_name>.<domain_name>:22623/config/master.
- 21 The base64 encoded certificate authority string to use.
- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines.
- 26 Allowed values:
 - **m4.xlarge**
 - **m4.2xlarge**
 - **m4.4xlarge**
 - **m4.10xlarge**
 - **m4.16xlarge**
 - **m5.xlarge**
 - **m5.2xlarge**
 - **m5.4xlarge**
 - **m5.8xlarge**
 - **m5.12xlarge**
 - **m5.16xlarge**
 - **m5a.xlarge**
 - **m5a.2xlarge**
 - **m5a.4xlarge**

- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**

- **r5.24xlarge**
 - **r5a.xlarge**
 - **r5a.2xlarge**
 - **r5a.4xlarge**
 - **r5a.8xlarge**
 - **r5a.12xlarge**
 - **r5a.16xlarge**
 - **r5a.24xlarge**
- 27 Whether or not to register a network load balancer (NLB).
 - 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
 - 29 The ARN for NLB IP target registration lambda group.
 - 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 31 The ARN for external API load balancer target group.
 - 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 33 The ARN for internal API load balancer target group.
 - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 35 The ARN for internal service load balancer target group.
 - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
 3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
 4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

**NOTE**

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

4.11.15.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

Example 4.39. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
```

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
Type: AWS::EC2::Image::Id

AutoRegisterDNS:
Default: "yes"
AllowedValues:
- "yes"
- "no"

Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?
Type: String

PrivateHostedZoneId:
Description: The Route53 private zone ID to register the etcd targets with, such as Z21XYZABCZ2A4.
Type: String

PrivateHostedZoneName:
Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit the trailing period.
Type: String

Master0Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

Master1Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

Master2Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:
Description: The master security group ID to associate with master nodes.
Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:
Default: https://api-int.\$CLUSTER_NAME.\$DOMAIN:22623/config/master
Description: Ignition config file location.
Type: String

CertificateAuthorities:
Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
Description: Base64 encoded certificate authority string to use.
Type: String

MasterInstanceProfileName:
Description: IAM profile to associate with master nodes.
Type: String

MasterInstanceType:
Default: m5.xlarge
Type: String
AllowedValues:
- "m4.xlarge"
- "m4.2xlarge"
- "m4.4xlarge"
- "m4.10xlarge"
- "m4.16xlarge"
- "m5.xlarge"
- "m5.2xlarge"
- "m5.4xlarge"
- "m5.8xlarge"
- "m5.12xlarge"
- "m5.16xlarge"

- "m5a.xlarge"
- "m5a.2xlarge"
- "m5a.4xlarge"
- "m5a.8xlarge"
- "m5a.12xlarge"
- "m5a.16xlarge"
- "c4.2xlarge"
- "c4.4xlarge"
- "c4.8xlarge"
- "c5.2xlarge"
- "c5.4xlarge"
- "c5.9xlarge"
- "c5.12xlarge"
- "c5.18xlarge"
- "c5.24xlarge"
- "c5a.2xlarge"
- "c5a.4xlarge"
- "c5a.8xlarge"
- "c5a.12xlarge"
- "c5a.16xlarge"
- "c5a.24xlarge"
- "r4.xlarge"
- "r4.2xlarge"
- "r4.4xlarge"
- "r4.8xlarge"
- "r4.16xlarge"
- "r5.xlarge"
- "r5.2xlarge"
- "r5.4xlarge"
- "r5.8xlarge"
- "r5.12xlarge"
- "r5.16xlarge"
- "r5.24xlarge"
- "r5a.xlarge"
- "r5a.2xlarge"
- "r5a.4xlarge"
- "r5a.8xlarge"
- "r5a.12xlarge"
- "r5a.16xlarge"
- "r5a.24xlarge"

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"
- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbIpTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:**AWS::CloudFormation::Interface:****ParameterGroups:****- Label:**

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- MasterInstanceType

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

4.11.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupId", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
  } 10
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  },
  {
    "ParameterKey": "WorkerInstanceProfileName", 13
    "ParameterValue": "" 14
  },
  {
    "ParameterKey": "WorkerInstanceType", 15
  }
]
```

```

    "ParameterValue": "m4.2xlarge" 16
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 A subnet, preferably private, to start the worker nodes on.
- 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 7 The worker security group ID to associate with worker nodes.
- 8 Specify the **WorkerSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
- 9 The location to fetch the bootstrap Ignition config file from.
- 10 Specify the generated Ignition config location, https://api-int.<cluster_name>.<domain_name>:22623/config/worker.
- 11 Base64 encoded certificate authority string to use.
- 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 13 The IAM profile to associate with worker nodes.
- 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 15 The type of AWS instance to use for the control plane machines.
- 16 Allowed values:
 - **m4.large**
 - **m4.xlarge**
 - **m4.2xlarge**
 - **m4.4xlarge**
 - **m4.10xlarge**
 - **m4.16xlarge**
 - **m5.large**
 - **m5.xlarge**

- **m5.2xlarge**
- **m5.4xlarge**
- **m5.8xlarge**
- **m5.12xlarge**
- **m5.16xlarge**
- **m5a.large**
- **m5a.xlarge**
- **m5a.2xlarge**
- **m5a.4xlarge**
- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.large**
- **c4.xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.large**
- **c5.xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.large**
- **c5a.xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**

- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.large**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.large**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.large**
- **r5a.xlarge**
- **r5a.2xlarge**
- **r5a.4xlarge**
- **r5a.8xlarge**
- **r5a.12xlarge**
- **r5a.16xlarge**
- **r5a.24xlarge**
- **t3.large**
- **t3.xlarge**
- **t3.2xlarge**

- **t3a.large**
 - **t3a.xlarge**
 - **t3a.2xlarge**
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
 3. Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
 4. Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
 5. Launch the CloudFormation template to create a stack of AWS resources that represent a worker node:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-
11eb-348f-sd9888c65b59
```

NOTE

The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

- Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

IMPORTANT

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

4.11.16.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

Example 4.40. CloudFormation template for worker machines

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  WorkerSecurityGroupId:
    Description: The master security group ID to associate with master nodes.
    Type: AWS::EC2::SecurityGroup::Id
  IgnitionLocation:
    Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
    Description: Ignition config file location.
    Type: String
  CertificateAuthorities:
    Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
    Description: Base64 encoded certificate authority string to use.
    Type: String
  WorkerInstanceProfileName:
    Description: IAM profile to associate with master nodes.
    Type: String
  WorkerInstanceType:
    Default: m5.large
    Type: String
    AllowedValues:
      - "m4.large"
      - "m4.xlarge"
      - "m4.2xlarge"

```

- "m4.4xlarge"
- "m4.10xlarge"
- "m4.16xlarge"

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

4.11.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
INFO API v1.19.0+9f84db3 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.
- You can view details about the running instances that are created by using the [AWS EC2 console](#).

4.11.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

4.11.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.11.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

- Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0  Ready   master   63m   v1.21.0
master-1  Ready   master   63m   v1.21.0
master-2  Ready   master   64m   v1.21.0
```

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br  15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper  Pending
csr-8vnps  15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper  Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrap** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.21.0
master-1  Ready   master 73m  v1.21.0
master-2  Ready   master 74m  v1.21.0
worker-0  Ready   worker 11m  v1.21.0
worker-1  Ready   worker 11m  v1.21.0
```

NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

4.11.21. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

Prerequisites

- Your control plane has initialized.

Procedure

- Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.8.2	True	False	False	19m
baremetal	4.8.2	True	False	False	37m
cloud-credential	4.8.2	True	False	False	40m

storage	4.8.2	True	False	False	37m

2. Configure the Operators that are not available.

4.11.21.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See [Configuring the registry for AWS user-provisioned infrastructure](#) for more information.

4.11.21.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
 - **REGISTRY_STORAGE_S3_ACCESSKEY**
 - **REGISTRY_STORAGE_S3_SECRETKEY**

Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

Example configuration

```
storage:
  s3:
    bucket: <bucket-name>
    region: <region-name>
```

WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

4.11.21.1.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

■

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

4.11.22. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

Prerequisites

- You completed the initial Operator configuration for your cluster.

Procedure

1. Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

1 **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

4.11.23. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

Procedure

- Determine the routes to create.

- To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
- To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}{end}{end}' routes
```

Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

- Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

Example output

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)
AGE				
router-default	LoadBalancer	172.30.62.215	ab3...28.us-east-2.elb.amazonaws.com	80:31499/TCP,443:30693/TCP
		5m		

- Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName ==
"<external_ip>").CanonicalHostedZoneNameID' 1
```

- For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
  --dns-name "<domain_name>" 1
  --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
  `<domain_name>.`].Id' 2
  --output text
```

- 1** **2** For **<domain_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

5. Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", 2
>     "Type": "A",
>     "AliasTarget": {
>       "HostedZoneId": "<hosted_zone_id>", 3
>       "DNSName": "<external_ip>.", 4
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'
```

- 1** For **<private_hosted_zone_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2** For **<cluster_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3** For **<hosted_zone_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4** For **<external_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ ❶
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", ❷
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", ❸
>       "DNSName": "<external_ip>.", ❹
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'
```

- ❶ For **<public_hosted_zone_id>**, specify the public hosted zone for your domain.
- ❷ For **<cluster_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- ❸ For **<hosted_zone_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- ❹ For **<external_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

4.11.24. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

Procedure

- From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete ❶
```

- ❶ For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```

INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-
Wt6NL"
INFO Time elapsed: 1s

```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.11.25. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.11.26. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.11.27. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

4.11.28. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.12. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

IMPORTANT

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

4.12.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [created a mirror registry on your mirror host](#) and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.

- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

4.12.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

4.12.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

4.12.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.12.4. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

4.12.4.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups

- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description				
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.				
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.				
Internet gateway	<ul style="list-style-type: none"> • AWS::EC2::InternetGateway • AWS::EC2::VPCGatewayAttachment • AWS::EC2::RouteTable • AWS::EC2::Route • AWS::EC2::SubnetRouteTableAssociation • AWS::EC2::NatGateway • AWS::EC2::EIP 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.				
Network access control	<ul style="list-style-type: none"> • AWS::EC2::NetworkACL • AWS::EC2::NetworkACLEntry 	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td> </td> <td> </td> </tr> </tbody> </table>	Port	Reason		
Port	Reason					

Component	AWS type	Description										
		<table border="1"> <tr> <td>80</td> <td>Inbound HTTP traffic</td> </tr> <tr> <td>443</td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td>22</td> <td>Inbound SSH traffic</td> </tr> <tr> <td>1024 - 65535</td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td>0 - 65535</td> <td>Outbound ephemeral traffic</td> </tr> </table>	80	Inbound HTTP traffic	443	Inbound HTTPS traffic	22	Inbound SSH traffic	1024 - 65535	Inbound ephemeral traffic	0 - 65535	Outbound ephemeral traffic
80	Inbound HTTP traffic											
443	Inbound HTTPS traffic											
22	Inbound SSH traffic											
1024 - 65535	Inbound ephemeral traffic											
0 - 65535	Outbound ephemeral traffic											
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.										

Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes (also known as the master nodes). Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	AWS::Route53::HostedZone	The hosted zone for your internal DNS.
etcd record sets	AWS::Route53::RecordSet	The registration records for etcd for your control plane machines.

Component	AWS type	Description
Public load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your public subnets.
External API server record	AWS::Route53::RecordSetGroup	Alias records for the external API server.
External listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the external load balancer.
External target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the external load balancer.
Private load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your private subnets.
Internal API server record	AWS::Route53::RecordSetGroup	Alias records for the internal API server.
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 22623 for the internal load balancer.
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the internal load balancer.
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.

Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
MasterSecurityGroup	AWS::EC2::Security Group	icmp	0
		tcp	22
		tcp	6443
		tcp	22623
WorkerSecurityGroup	AWS::EC2::Security Group	icmp	0
		tcp	22
BootstrapSecurityGroup	AWS::EC2::Security Group	tcp	22
		tcp	19531

Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
MasterIngress Etcd	etcd	tcp	2379- 2380
MasterIngress Vxlan	Vxlan packets	udp	4789
MasterIngress WorkerVxlan	Vxlan packets	udp	4789
MasterIngress Internal	Internal cluster communication and Kubernetes proxy metrics	tcp	9000 - 9999
MasterIngress WorkerInternal	Internal cluster communication	tcp	9000 - 9999
MasterIngress Kube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259

Ingress group	Description	IP protocol	Port range
MasterIngress WorkerKube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
MasterIngress IngressServices	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress WorkerIngress Services	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress Geneve	Geneve packets	udp	6081
MasterIngress WorkerGeneve	Geneve packets	udp	6081
MasterIngress IpsecIke	IPsec IKE packets	udp	500
MasterIngress WorkerIpsecIke	IPsec IKE packets	udp	500
MasterIngress IpsecNat	IPsec NAT-T packets	udp	4500
MasterIngress WorkerIpsecNat	IPsec NAT-T packets	udp	4500
MasterIngress IpsecEsp	IPsec ESP packets	50	All
MasterIngress WorkerIpsecEsp	IPsec ESP packets	50	All
MasterIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
MasterIngress WorkerInternalUDP	Internal cluster communication	udp	9000 - 9999

Ingress group	Description	IP protocol	Port range
MasterIngressIngressServicesUDP	Kubernetes Ingress services	udp	30000 - 32767
MasterIngressWorkerIngressServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
WorkerIngressVxlan	Vxlan packets	udp	4789
WorkerIngressWorkerVxlan	Vxlan packets	udp	4789
WorkerIngressInternal	Internal cluster communication	tcp	9000 - 9999
WorkerIngressWorkerInternal	Internal cluster communication	tcp	9000 - 9999
WorkerIngressKube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250
WorkerIngressWorkerKube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250
WorkerIngressIngressServices	Kubernetes Ingress services	tcp	30000 - 32767
WorkerIngressWorkerIngressServices	Kubernetes Ingress services	tcp	30000 - 32767
WorkerIngressGeneve	Geneve packets	udp	6081
WorkerIngressMasterGeneve	Geneve packets	udp	6081

Ingress group	Description	IP protocol	Port range
WorkerIngress IpsecIke	IPsec IKE packets	udp	500
WorkerIngress MasterIpsecIke	IPsec IKE packets	udp	500
WorkerIngress IpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress MasterIpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress IpsecEsp	IPsec ESP packets	50	All
WorkerIngress MasterIpsecEsp	IPsec ESP packets	50	All
WorkerIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress MasterInternal UDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress IngressServices UDP	Kubernetes Ingress services	udp	30000 - 32767
WorkerIngress MasterIngress ServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	Allow	ec2:*	*

Role	Effect	Action	Resource
	Allow	elasticloadbalancing :*	*
	Allow	iam:PassRole	*
	Allow	s3:GetObject	*
Worker	Allow	ec2:Describe*	*
Bootstrap	Allow	ec2:Describe*	*
	Allow	ec2:AttachVolume	*
	Allow	ec2:DetachVolume	*

4.12.4.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

4.12.4.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

4.12.4.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.41. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
i3.large	x		

Instance type	Bootstrap	Control plane	Compute
m4.large			x
m4.xlarge		x	x
m4.2xlarge		x	x
m4.4xlarge		x	x
m4.10xlarge		x	x
m4.16xlarge		x	x
m5.large			x
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x
c5.xlarge			x
c5.2xlarge		x	x
c5.4xlarge		x	x
c5.9xlarge		x	x
c5.12xlarge		x	x
c5.18xlarge		x	x
c5.24xlarge		x	x
c5a.xlarge			x
c5a.2xlarge		x	x
c5a.4xlarge		x	x
c5a.8xlarge		x	x
c5a.12xlarge		x	x
c5a.16xlarge		x	x
c5a.24xlarge		x	x
r4.large			x
r4.xlarge		x	x
r4.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
r4.4xlarge		x	x
r4.8xlarge		x	x
r4.16xlarge		x	x
r5.large			x
r5.xlarge		x	x
r5.2xlarge		x	x
r5.4xlarge		x	x
r5.8xlarge		x	x
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x

Instance type	Bootstrap	Control plane	Compute
t3a.xlarge			x
t3a.2xlarge			x

4.12.4.5. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 4.42. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**

- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.43. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.44. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**

- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 4.45. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

Example 4.46. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**

- **iam:DeleteRole**
- **iam:DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

Example 4.47. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.48. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.49. S3 permissions that cluster Operators require

- **s3>DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**

- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.50. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2>DeleteNetworkInterface**
- **ec2>DeleteVolume**
- **elasticloadbalancing>DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3>DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 4.51. Required permissions to delete network resources

- **ec2>DeleteDhcpOptions**
- **ec2>DeleteInternetGateway**
- **ec2>DeleteNatGateway**
- **ec2>DeleteRoute**
- **ec2>DeleteRouteTable**
- **ec2>DeleteSubnet**
- **ec2>DeleteVpc**
- **ec2>DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**

- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

**NOTE**

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

Example 4.52. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

Example 4.53. Additional IAM and S3 permissions that are required to create manifests

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3>ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

Example 4.54. Optional permissions for instance and quota checks for installation

- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

4.12.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

■

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

4.12.6. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and

customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

4.12.6.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

- Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

- Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> ❶
      partitions:
        - label: var
          start_mib: <partition_start_offset> ❷
          size_mib: <partition_size> ❸
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] ❹
          with_mount_unit: true
```

- ❶ The storage device name of the disk that you want to partition.
- ❷ When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- ❸ The size of the data partition in mebibytes.
- ❹ The **prjquota** mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

4.12.6.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

NOTE

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
 - a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<local_registry>": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<local_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- If your cluster is on AWS, you added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.12.6.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
- b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
- c. Save and exit the file.

5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- 1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

4.12.7. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

4.12.8. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1** The CIDR block for the VPC.
- 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
- 3** The number of availability zones to deploy the VPC in.
- 4** Specify an integer between **1** and **3**.
- 5** The size of each subnet in each availability zone.
- 6** Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.

- Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
- Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> ❶
  --template-body file://<template>.yaml ❷
  --parameters file://<parameters>.json ❸
```

- ❶ **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- ❷ **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- ❸ **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

VpcId	The ID of your VPC.
PublicSubnetIds	The IDs of the new public subnets.
PrivateSubnetIds	The IDs of the new private subnets.

4.12.8.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

Example 4.55. CloudFormation template for the VPC

AWSTemplateFormatVersion: 2010-09-09

Description: Template for Best Practice VPC with 1-3 AZs

Parameters:

VpcCidr:

AllowedPattern: ^(((0-9){1-9}|0-9|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\{3\}([0-9]{1-9}|0-9|1[0-9]{2}|2[0-4][0-9]|25[0-5])\(\{(1[6-9]|2[0-4])\}\)\$

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.

Default: 10.0.0.0/16

Description: CIDR block for VPC.

Type: String

AvailabilityZoneCount:

ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"

MinValue: 1

MaxValue: 3

Default: 1

Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"

Type: Number

SubnetBits:

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.

MinValue: 5

MaxValue: 13

Default: 12

Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"

Type: Number

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Network Configuration"

Parameters:

- VpcCidr

- SubnetBits

- Label:

default: "Availability Zones"

Parameters:

- AvailabilityZoneCount

PrivateSubnet3, !Ref "AWS::NoValue"]]
    ]

```

4.12.9. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1 For the **<route53_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
  {
    "ParameterKey": "HostedZoneId", 5
    "ParameterValue": "<random_string>" 6
  },
  {
    "ParameterKey": "HostedZoneName", 7
    "ParameterValue": "example.com" 8
  },
  {
    "ParameterKey": "PublicSubnets", 9
    "ParameterValue": "subnet-<random_string>" 10
  },
  {
    "ParameterKey": "PrivateSubnets", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "VpcId", 13
    "ParameterValue": "vpc-<random_string>" 14
  }
]
```

- 1 A short, representative cluster name to use for hostnames, etc.
- 2 Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- 3 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 4 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 5 The Route 53 public zone ID to register the targets with.

- 6 Specify the Route 53 public zone ID, which is in a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
 - 7 The Route 53 zone to register the targets with.
 - 8 Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
 - 9 The public subnets that you created for your VPC.
 - 10 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
 - 11 The private subnets that you created for your VPC.
 - 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
 - 13 The VPC that you created for the cluster.
 - 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.

3

<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

- 4 You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

PrivateHostedZoneId	Hosted zone ID for the private DNS.
ExternalApiLoadBalancerName	Full name of the external API load balancer.
InternalApiLoadBalancerName	Full name of the internal API load balancer.
ApiServerDnsName	Full hostname of the API server.
RegisterNlbIpTargetsLambda	Lambda ARN useful to help register/deregister IP targets for these load balancers.
ExternalApiTargetGroupArn	ARN of external API target group.
InternalApiTargetGroupArn	ARN of internal API target group.
InternalServiceTargetGroupArn	ARN of internal service target group.

4.12.9.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

Example 4.56. CloudFormation template for the network and load balancers

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
  ClusterName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, representative cluster name to use for host names and other identifying
    names.
    Type: String
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  HostedZoneId:
    Description: The Route53 public zone ID to register the targets with, such as
    Z21IXYZABCZ2A4.
    Type: String
  HostedZoneName:
    Description: The Route53 zone to register the targets with, such as example.com. Omit the
    trailing period.
    Type: String
    Default: "example.com"
  PublicSubnets:
    Description: The internet-facing subnets.
    Type: List<AWS::EC2::Subnet::Id>
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Cluster Information"
        Parameters:
          - ClusterName
          - InfrastructureName
  
```

- Label:
 - default: "Network Configuration"
- Parameters:
 - VpcId
 - PublicSubnets
 - PrivateSubnets
- Label:
 - default: "DNS"
- Parameters:
 - HostedZoneName
 - HostedZoneId
- ParameterLabels:
 - ClusterName:
 - default: "Cluster Name"
 - InfrastructureName:
 - default: "Infrastructure Name"
 - VpcId:
 - default: "VPC ID"
 - PublicSubnets:
 - default: "Public Subnets"
 - PrivateSubnets:
 - default: "Private Subnets"
 - HostedZoneName:
 - default: "Public Hosted Zone Name"
 - HostedZoneId:
 - default: "Public Hosted Zone ID"

  InfrastructureName: !Ref InfrastructureName
  Subnets: !Ref PublicSubnets

```

RegisterPrivateSubnetTags:

```

Type: Custom::SubnetRegister
Properties:
  ServiceToken: !GetAtt RegisterSubnetTags.Arn
  InfrastructureName: !Ref InfrastructureName
  Subnets: !Ref PrivateSubnets

```

Outputs:**PrivateHostedZoneId:**

Description: Hosted zone ID for the private DNS, which is required for private records.

Value: !Ref IntDns

ExternalApiLoadBalancerName:

Description: Full name of the external API load balancer.

Value: !GetAtt ExtApiElb.LoadBalancerFullName

InternalApiLoadBalancerName:

Description: Full name of the internal API load balancer.

Value: !GetAtt IntApiElb.LoadBalancerFullName

ApiServerDnsName:

Description: Full hostname of the API server, which is required for the Ignition config files.

Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]

RegisterNlbPTargetsLambda:

Description: Lambda ARN useful to help register or deregister IP targets for these load balancers.

Value: !GetAtt RegisterNlbPTargets.Arn

ExternalApiTargetGroupArn:

Description: ARN of the external API target group.

Value: !Ref ExternalApiTargetGroup

InternalApiTargetGroupArn:

Description: ARN of the internal API target group.

Value: !Ref InternalApiTargetGroup

InternalServiceTargetGroupArn:

Description: ARN of the internal service target group.

Value: !Ref InternalServiceTargetGroup

IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

Type: CNAME

TTL: 10

ResourceRecords:

- !GetAtt IntApiElb.DNSName

Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

4.12.10. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "VpcCidr", 3
    "ParameterValue": "10.0.0.0/16" 4
  },
  {
    "ParameterKey": "PrivateSubnets", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "VpcId", 7
    "ParameterValue": "vpc-<random_string>" 8
  }
]
```

- 1** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3** The CIDR block for the VPC.
- 4** Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
- 5** The private subnets that you created for your VPC.
- 6** Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.

- 7 The VPC that you created for the cluster.
 - 8 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
 3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

MasterSecurityGroupID	Master Security Group ID
------------------------------	--------------------------

WorkerSecurityGroupID	Worker Security Group ID
MasterInstanceProfile	Master IAM Instance Profile
WorkerInstanceProfile	Worker IAM Instance Profile

4.12.10.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

Example 4.57. CloudFormation template for security objects

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((([0-9]{1,3}[0-9]{1,3}|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\.)\.)\.(0-9){3}([0-9]{1,3}|1[0-9]{2}|2[0-
    4][0-9]|25[0-5])\.(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Cluster Information"
        Parameters:
          - InfrastructureName

```

- Label:
 default: "Network Configuration"
Parameters:
- VpcId
- VpcCidr
- PrivateSubnets
ParameterLabels:
InfrastructureName:
 default: "Infrastructure Name"
VpcId:
 default: "VPC ID"
VpcCidr:
 default: "VPC CIDR"
PrivateSubnets:
 default: "Private Subnets"

Resources:

4.12.11. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
 - Print the current **x86_64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for the **us-west-1** region. The AMI must belong to the same region as the cluster.

4.12.12. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

**NOTE**

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.32. RHCOS AMIs

AWS zone	AWS AMI
af-south-1	ami-0ce5aa99b7d576c79
ap-east-1	ami-0f6debc614042ce76
ap-northeast-1	ami-0423a1bf292f34dc3
ap-northeast-2	ami-0889161041cb9d77f
ap-northeast-3	ami-00564b0d6cbb676b1
ap-south-1	ami-0650f4166d12cceed
ap-southeast-1	ami-0b09ad848356811c7
ap-southeast-2	ami-013484d0474ab5860
ca-central-1	ami-03291c3e2b74c32b9

AWS zone	AWS AMI
us-west-1	ami-021f626622b5238f3
us-west-2	ami-0c9fd8b47bfd717e8

4.12.13. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

IMPORTANT

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

IMPORTANT

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1 **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

- c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
]
```

```

{
  "ParameterKey": "MasterSecurityGroupId", 9
  "ParameterValue": "sg-<random_string>" 10
},
{
  "ParameterKey": "VpcId", 11
  "ParameterValue": "vpc-<random_string>" 12
},
{
  "ParameterKey": "BootstrapIgnitionLocation", 13
  "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
},
{
  "ParameterKey": "AutoRegisterELB", 15
  "ParameterValue": "yes" 16
},
{
  "ParameterKey": "RegisterNlbPTargetsLambdaArn", 17
  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbPTargets-<random_string>" 18
},
{
  "ParameterKey": "ExternalApiTargetGroupArn", 19
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
},
{
  "ParameterKey": "InternalApiTargetGroupArn", 21
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
},
{
  "ParameterKey": "InternalServiceTargetGroupArn", 23
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
}
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4 Specify a valid **AWS::EC2::Image::Id** value.
- 5 CIDR block to allow SSH access to the bootstrap node.
- 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7 The public subnet that is associated with your VPC to launch the bootstrap node into.

- 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
 - 9 The master security group ID (for registering temporary rules)
 - 10 Specify the **MasterSecurityGroupid** value from the output of the CloudFormation template for the security group and roles.
 - 11 The VPC created resources will belong to.
 - 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
 - 13 Location to fetch bootstrap Ignition config file from.
 - 14 Specify the S3 bucket and file name in the form **s3://<bucket_name>/bootstrap.ign**.
 - 15 Whether or not to register a network load balancer (NLB).
 - 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
 - 17 The ARN for NLB IP target registration lambda group.
 - 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 19 The ARN for external API load balancer target group.
 - 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 21 The ARN for internal API load balancer target group.
 - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 23 The ARN for internal service load balancer target group.
 - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
3. Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
 4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

IMPORTANT

You must enter the command on a single line.

■

```
$ aws cloudformation create-stack --stack-name <name> ❶
  --template-body file://<template>.yaml ❷
  --parameters file://<parameters>.json ❸
  --capabilities CAPABILITY_NAMED_IAM ❹
```

- ❶ **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- ❷ **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- ❸ **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- ❹ You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

Bootstrap InstanceId	The bootstrap Instance ID.
Bootstrap PublicIp	The bootstrap node public IP address.
Bootstrap PrivateIp	The bootstrap node private IP address.

4.12.13.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

Example 4.58. CloudFormation template for the bootstrap machine

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
```

InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: **27**

MinLength: **1**

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of **27** characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: `AWS::EC2::Image::Id`

AllowedBootstrapSshCidr:

AllowedPattern: `^((([0-9][1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9][1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])|([0-9]|1[0-9]|2[0-9]|3[0-2]))$`

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.

Default: **0.0.0.0/0**

Description: CIDR block to allow SSH access to the bootstrap node.

Type: String

PublicSubnet:

Description: The public subnet to launch the bootstrap node into.

Type: `AWS::EC2::Subnet::Id`

MasterSecurityGroupId:

Description: The master security group ID for registering temporary rules.

Type: `AWS::EC2::SecurityGroup::Id`

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: `AWS::EC2::VPC::Id`

BootstrapIgnitionLocation:

Default: `s3://my-s3-bucket/bootstrap.ign`

Description: Ignition config file location.

Type: String

AutoRegisterELB:

Default: `"yes"`

AllowedValues:

- `"yes"`

- `"no"`

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group.

Type: String

Metadata:

`AWS::CloudFormation::Interface:`

ParameterGroups:

- Label:

Additional resources

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

4.12.14. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcospAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneId", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
  }
]
```

```

    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 17
    "ParameterValue": "sg-<random_string>" 18
  },
  {
    "ParameterKey": "IgnitionLocation", 19
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
  }, 20
  {
    "ParameterKey": "CertificateAuthorities", 21
    "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
  },
  {
    "ParameterKey": "MasterInstanceProfileName", 23
    "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
  },
  {
    "ParameterKey": "MasterInstanceType", 25
    "ParameterValue": "m5.xlarge" 26
  },
  {
    "ParameterKey": "AutoRegisterELB", 27
    "ParameterValue": "yes" 28
  },
  {
    "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 31
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 33
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 35
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:

```

```

| <account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
|   }
| ]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster_name>.<domain_name>** where **<domain_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes (also known as the master nodes).
- 18 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, https://api-int.<cluster_name>.<domain_name>:22623/config/master.
- 21 The base64 encoded certificate authority string to use.
- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines.

26

Allowed values:

- **m4.xlarge**
- **m4.2xlarge**
- **m4.4xlarge**
- **m4.10xlarge**
- **m4.16xlarge**
- **m5.xlarge**
- **m5.2xlarge**
- **m5.4xlarge**
- **m5.8xlarge**
- **m5.12xlarge**
- **m5.16xlarge**
- **m5a.xlarge**
- **m5a.2xlarge**
- **m5a.4xlarge**
- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**

- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.xlarge**
- **r5a.2xlarge**
- **r5a.4xlarge**
- **r5a.8xlarge**
- **r5a.12xlarge**
- **r5a.16xlarge**
- **r5a.24xlarge**

- 27** Whether or not to register a network load balancer (NLB).
- 28** Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 29** The ARN for NLB IP target registration lambda group.
- 30** Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 31** The ARN for external API load balancer target group.

- 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an
 - 33 The ARN for internal API load balancer target group.
 - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
 - 35 The ARN for internal service load balancer target group.
 - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
 3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
 4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

4.12.14.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

Example 4.59. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AutoRegisterDNS:
    Default: "yes"
    AllowedValues:
      - "yes"
      - "no"
    Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone
information?
    Type: String
  PrivateHostedZoneId:
    Description: The Route53 private zone ID to register the etcd targets with, such as
Z211XYZABCZ2A4.
    Type: String
  PrivateHostedZoneName:
    Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit
the trailing period.
    Type: String
  Master0Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  Master1Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  Master2Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  MasterSecurityGroupId:
    Description: The master security group ID to associate with master nodes.
    Type: AWS::EC2::SecurityGroup::Id
  IgnitionLocation:
```

Default: `https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master`

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: `data:text/plain;charset=utf-8;base64,ABC...xYZ==`

Description: Base64 encoded certificate authority string to use.

Type: String

MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

MasterInstanceType:

Default: `m5.xlarge`

Type: String

AllowedValues:

- "m4.xlarge"
- "m4.2xlarge"
- "m4.4xlarge"
- "m4.10xlarge"
- "m4.16xlarge"
- "m5.xlarge"
- "m5.2xlarge"
- "m5.4xlarge"
- "m5.8xlarge"
- "m5.12xlarge"
- "m5.16xlarge"
- "m5a.xlarge"
- "m5a.2xlarge"
- "m5a.4xlarge"
- "m5a.8xlarge"
- "m5a.12xlarge"
- "m5a.16xlarge"
- "c4.2xlarge"
- "c4.4xlarge"
- "c4.8xlarge"
- "c5.2xlarge"
- "c5.4xlarge"
- "c5.9xlarge"
- "c5.12xlarge"
- "c5.18xlarge"
- "c5.24xlarge"
- "c5a.2xlarge"
- "c5a.4xlarge"
- "c5a.8xlarge"
- "c5a.12xlarge"
- "c5a.16xlarge"
- "c5a.24xlarge"
- "r4.xlarge"
- "r4.2xlarge"
- "r4.4xlarge"
- "r4.8xlarge"
- "r4.16xlarge"
- "r5.xlarge"
- "r5.2xlarge"
- "r5.4xlarge"
- "r5.8xlarge"
- "r5.12xlarge"

- "r5.16xlarge"
- "r5.24xlarge"
- "r5a.xlarge"
- "r5a.2xlarge"
- "r5a.4xlarge"
- "r5a.8xlarge"
- "r5a.12xlarge"
- "r5a.16xlarge"
- "r5a.24xlarge"

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"
- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:

```

4.12.15. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
```

```

    "ParameterKey": "WorkerSecurityGroupd", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
10
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  },
  {
    "ParameterKey": "WorkerInstanceProfileName", 13
    "ParameterValue": "" 14
  },
  {
    "ParameterKey": "WorkerInstanceType", 15
    "ParameterValue": "m4.2xlarge" 16
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 A subnet, preferably private, to start the worker nodes on.
- 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 7 The worker security group ID to associate with worker nodes.
- 8 Specify the **WorkerSecurityGroupd** value from the output of the CloudFormation template for the security group and roles.
- 9 The location to fetch the bootstrap Ignition config file from.
- 10 Specify the generated Ignition config location, https://api-int.<cluster_name>.<domain_name>:22623/config/worker.
- 11 Base64 encoded certificate authority string to use.
- 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 13 The IAM profile to associate with worker nodes.
- 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.

15 The type of AWS instance to use for the control plane machines.

16 Allowed values:

- **m4.large**
- **m4.xlarge**
- **m4.2xlarge**
- **m4.4xlarge**
- **m4.10xlarge**
- **m4.16xlarge**
- **m5.large**
- **m5.xlarge**
- **m5.2xlarge**
- **m5.4xlarge**
- **m5.8xlarge**
- **m5.12xlarge**
- **m5.16xlarge**
- **m5a.large**
- **m5a.xlarge**
- **m5a.2xlarge**
- **m5a.4xlarge**
- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.large**
- **c4.xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.large**
- **c5.xlarge**

- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.large**
- **c5a.xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.large**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.large**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.large**

- **r5a.xlarge**
 - **r5a.2xlarge**
 - **r5a.4xlarge**
 - **r5a.8xlarge**
 - **r5a.12xlarge**
 - **r5a.16xlarge**
 - **r5a.24xlarge**
 - **t3.large**
 - **t3.xlarge**
 - **t3.2xlarge**
 - **t3a.large**
 - **t3a.xlarge**
 - **t3a.2xlarge**
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
 3. Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
 4. Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
 5. Launch the CloudFormation template to create a stack of AWS resources that represent a worker node:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.

- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

NOTE

The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

7. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

IMPORTANT

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

4.12.15.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

Example 4.60. CloudFormation template for worker machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  WorkerSecurityGroupId:
    Description: The master security group ID to associate with master nodes.
```

Type: AWS::EC2::SecurityGroup::Id
IgnitionLocation:
Default: https://api-int.\$CLUSTER_NAME.\$DOMAIN:22623/config/worker
Description: Ignition config file location.
Type: String
CertificateAuthorities:
Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
Description: Base64 encoded certificate authority string to use.
Type: String
WorkerInstanceProfileName:
Description: IAM profile to associate with master nodes.
Type: String
WorkerInstanceType:
Default: m5.large
Type: String
AllowedValues:
- "m4.large"
- "m4.xlarge"
- "m4.2xlarge"
- "m4.4xlarge"
- "m4.10xlarge"
- "m4.16xlarge"
- "m5.large"
- "m5.xlarge"
- "m5.2xlarge"
- "m5.4xlarge"
- "m5.8xlarge"
- "m5.12xlarge"
- "m5.16xlarge"
- "m5a.large"
- "m5a.xlarge"
- "m5a.2xlarge"
- "m5a.4xlarge"
- "m5a.8xlarge"
- "m5a.12xlarge"
- "m5a.16xlarge"
- "c4.large"
- "c4.xlarge"
- "c4.2xlarge"
- "c4.4xlarge"
- "c4.8xlarge"
- "c5.large"
- "c5.xlarge"
- "c5.2xlarge"
- "c5.4xlarge"
- "c5.9xlarge"
- "c5.12xlarge"
- "c5.18xlarge"
- "c5.24xlarge"
- "c5a.large"
- "c5a.xlarge"
- "c5a.2xlarge"
- "c5a.4xlarge"
- "c5a.8xlarge"
- "c5a.12xlarge"
- "c5a.16xlarge"

- "c5a.24xlarge"
- "r4.large"
- "r4.xlarge"
- "r4.2xlarge"
- "r4.4xlarge"
- "r4.8xlarge"
- "r4.16xlarge"
- "r5.large"
- "r5.xlarge"
- "r5.2xlarge"
- "r5.4xlarge"
- "r5.8xlarge"
- "r5.12xlarge"
- "r5.16xlarge"
- "r5.24xlarge"
- "r5a.large"
- "r5a.xlarge"
- "r5a.2xlarge"
- "r5a.4xlarge"
- "r5a.8xlarge"
- "r5a.12xlarge"
- "r5a.16xlarge"
- "r5a.24xlarge"
- "t3.large"
- "t3.xlarge"
- "t3.2xlarge"
- "t3a.large"
- "t3a.xlarge"
- "t3a.2xlarge"

```

4.12.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at  
https://api.mycluster.example.com:6443...  
INFO API v1.19.0+9f84db3 up  
INFO Waiting up to 30m0s for bootstrapping to complete...  
INFO It is now safe to remove the bootstrap resources  
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.

- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.

4.12.17. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.12.18. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```

NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.21.0
master-1  Ready   master 63m  v1.21.0
master-2  Ready   master 64m  v1.21.0

```

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```

NAME      AGE  REQUESTOR                                     CONDITION
csr-8b2br 15m  system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m  system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...

```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrap** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}\n{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

NOTE

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.21.0
master-1  Ready   master 73m  v1.21.0
master-2  Ready   master 74m  v1.21.0
worker-0  Ready   worker 11m  v1.21.0
worker-1  Ready   worker 11m  v1.21.0
```

NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

4.12.19. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

Prerequisites

- Your control plane has initialized.

Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.8.2	True	False	False	19m
baremetal	4.8.2	True	False	False	37m
cloud-credential	4.8.2	True	False	False	40m
cluster-autoscaler	4.8.2	True	False	False	37m
config-operator	4.8.2	True	False	False	38m

console	4.8.2	True	False	False	26m
csi-snapshot-controller	4.8.2	True	False	False	37m
dns	4.8.2	True	False	False	37m
etcd	4.8.2	True	False	False	36m
image-registry	4.8.2	True	False	False	31m
ingress	4.8.2	True	False	False	30m
insights	4.8.2	True	False	False	31m
kube-apiserver	4.8.2	True	False	False	26m
kube-controller-manager	4.8.2	True	False	False	36m
kube-scheduler	4.8.2	True	False	False	36m
kube-storage-version-migrator	4.8.2	True	False	False	37m
machine-api	4.8.2	True	False	False	29m
machine-approver	4.8.2	True	False	False	37m

operator-lifecycle-manager-catalog	4.8.2	True	False	False	37m
operator-lifecycle-manager-packageserver	4.8.2	True	False	False	32m
service-ca	4.8.2	True	False	False	38m
storage	4.8.2	True	False	False	37m

2. Configure the Operators that are not available.

4.12.19.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p [{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Global Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

4.12.19.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

4.12.19.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
 - **REGISTRY_STORAGE_S3_ACCESSKEY**
 - **REGISTRY_STORAGE_S3_SECRETKEY**

Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

Example configuration

```
storage:  
  s3:  
    bucket: <bucket-name>  
    region: <region-name>
```

WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

4.12.19.2.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

WARNING

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

4.12.20. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

Prerequisites

- You completed the initial Operator configuration for your cluster.

Procedure

- Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

1 **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

4.12.21. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

Procedure

1. Determine the routes to create.

- To create a wildcard record, use ***.apps.<cluster_name>.<domain_name>**, where **<cluster_name>** is your cluster name, and **<domain_name>** is the Route 53 base domain for your OpenShift Container Platform cluster.
- To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}{end}' routes
```

Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

Example output

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)
AGE				
router-default	LoadBalancer	172.30.62.215	ab3...28.us-east-2.elb.amazonaws.com	80:31499/TCP,443:30693/TCP
		5m		

3. Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID' 1
```

- 1** For **<external_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

Example output

Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

- Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
  --dns-name "<domain_name>" 1
  --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
  `<domain_name>.`].Id' 2
  --output text
```

- For **<domain_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

- Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", 2
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", 3
>       "DNSName": "<external_ip>.", 4
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'
```

- For **<private_hosted_zone_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- For **<cluster_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- For **<hosted_zone_id>**, specify the public hosted zone ID for the load balancer that you obtained.

- 4 For **<external_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", 2
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", 3
>       "DNSName": "<external_ip>.", 4
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'
```

- 1 For **<public_hosted_zone_id>**, specify the public hosted zone for your domain.
- 2 For **<cluster_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted_zone_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

4.12.22. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

Procedure

- From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-
Wt6NL"
INFO Time elapsed: 1s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the [Cluster registration](#) page.

4.12.23. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.12.24. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

4.12.25. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

4.12.26. Next steps

- [Validate an installation.](#)
- [Customize your cluster.](#)
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.

- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#).
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

4.13. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

4.13.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$ ./openshift-install destroy cluster \  
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

2. Optional: Delete the **<installation_directory>** directory and the OpenShift Container Platform installation program.

4.13.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (**ccoctl**) to remove the AWS resources that **ccoctl** created during installation.

Prerequisites

- Extract and prepare the **ccoctl** binary.
- Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

Procedure

- Delete the AWS resources that **ccoctl** created:

```
$ ccoctl aws delete --name=<name> --region=<aws_region>
```

where:

- **<name>** matches the name used to originally create and tag the cloud resources.
- **<aws-region>** is the AWS region in which cloud resources will be deleted.

Example output:

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted
from the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-
oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-
credential-o associated with IAM Role <name>-openshift-cloud-credential-operator-
cloud-credential-o deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-
credential-o deleted
2021/04/08 17:51:07 Policy <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
associated with IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
deleted
2021/04/08 17:51:07 IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-
credentials deleted
2021/04/08 17:51:08 Policy <name>-openshift-image-registry-installer-cloud-credentials
associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials

2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-
credentials deleted
2021/04/08 17:51:09 Policy <name>-openshift-ingress-operator-cloud-credentials
associated with IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials
deleted
2021/04/08 17:51:11 Policy <name>-openshift-machine-api-aws-cloud-credentials
associated with IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials
deleted
2021/04/08 17:51:39 Identity Provider with ARN arn:aws:iam::<aws_account_id>:oidc-
provider/<name>-oidc.s3.<aws_region>.amazonaws.com deleted
```

Verification

You can verify that the resources are deleted by querying AWS. For more information, refer to AWS documentation.

CHAPTER 5. INSTALLING ON AZURE

5.1. PREPARING TO INSTALL ON AZURE

5.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

5.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See [Configuring an Azure account](#) for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for Azure](#) for other options.

5.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when

creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

5.1.4. Next steps

- [Configuring an Azure account](#)

5.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

5.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> • One bootstrap machine, which is removed after installation • Three control plane machines • Three compute machines <p>Because the bootstrap machine uses Standard_D4s_v3 machines, which use 4 vCPUs, the control plane machines use Standard_D8s_v3 virtual machines, which use 8 vCPUs, and the worker machines use Standard_D4s_v3 virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p> <p>By default, the installation program distributes control plane and compute machines across all availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</p>

Component	Number of components required by default	Default Azure limit	Description				
OS Disk	7		<p>VM OS disk must be able to sustain a minimum throughput of 5000 IOPS / 200MBps. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by Standard_D8s_v3, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to ReadOnly for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>				
VNet	1	1000 per region	Each default cluster requires one Virtual Network (VNet), which contains two subnets.				
Network interfaces	6	65,536 per region	Each default cluster requires six network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.				
Network security groups	2	5000	<p>Each default cluster Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tbody> <tr> <td>control plane</td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td>node</td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </tbody> </table>	control plane	Allows the control plane machines to be reached on port 6443 from anywhere	node	Allows worker nodes to be reached from the internet on ports 80 and 443
control plane	Allows the control plane machines to be reached on port 6443 from anywhere						
node	Allows worker nodes to be reached from the internet on ports 80 and 443						

Component	Number of components required by default	Default Azure limit	Description						
Network load balancers	3	1000 per region	<p>Each cluster creates the following load balancers:</p> <table border="1"> <tr> <td>default</td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td>internal</td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td>external</td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.</p>	default	Public IP address that load balances requests to ports 80 and 443 across worker machines	internal	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	external	Public IP address that load balances requests to port 6443 across control plane machines
default	Public IP address that load balances requests to ports 80 and 443 across worker machines								
internal	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
external	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>						

5.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

**NOTE**

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

5.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

Procedure

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
 - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
 - b. From the **Subscription** list, select the subscription to modify.
 - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
 - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
 - a. Click **Provide details** and provide the required details in the **Quota details** window.
 - b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

5.2.4. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Owner**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

5.2.5. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the [Azure CLI](#).
- Install the **jq** package.
- Your Azure account has the required roles for the subscription that you use.

Procedure

1. Log in to the Azure CLI:

```
$ az login
```

Log in to Azure in the web console by using your credentials.

2. If your Azure account uses subscriptions, ensure that you are using the right subscription.
 - a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

```

    }
  }
]

```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

Example output

```

{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", ❶
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}

```

- ❶ Ensure that the value of the **tenantId** parameter is the UUID of the correct subscription.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id> ❶
```

- ❶ Substitute the value of the **id** for the subscription that you want to use for **<id>**.

- d. If you changed the active subscription, display your account information again:

```
$ az account show
```

Example output

```

{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}

```

3. Record the values of the **tenantId** and **id** parameters from the previous output. You need these values during OpenShift Container Platform installation.
4. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> 1
```

- 1** Replace **<service_principal>** with the name to assign to the service principal.

Example output

```
Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the
required format used for service principal names
Retrying role assignment creation: 1/36
Retrying role assignment creation: 2/36
Retrying role assignment creation: 3/36
Retrying role assignment creation: 4/36
{
  "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
  "displayName": "<service_principal>",
  "name": "http://<service_principal>",
  "password": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
}
```

5. Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
6. Grant additional permissions to the service principal.
 - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.
 - To operate the Cloud Credential Operator (CCO) in *mint mode*, the app registration service principal also requires the **Azure Active Directory Graph/Application.ReadWrite.OwnedBy** API permission.
 - To operate the CCO in *passthrough mode*, the app registration service principal does not require additional API permissions.

For more information about CCO modes, see "About the Cloud Credential Operator" in the "Managing cloud provider credentials" section of the *Authentication and authorization* guide.

NOTE

If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

- a. To assign the **User Access Administrator** role, run the following command:

```
$ az role assignment create --role "User Access Administrator" \
  --assignee-object-id $(az ad sp list --filter "appid eq '<appid>'" \
    | jq '[0].id' -r) 1
```

- 1** Replace **<appid>** with the **appid** parameter value for your service principal.

- b. To assign the **Azure Active Directory Graph** permission, run the following command:

```
$ az ad app permission add --id <appid> \ 1
  --api 00000002-0000-0000-c000-000000000000 \
  --api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role
```

- 1** Replace **<appid>** with the **appid** parameter value for your service principal.

Example output

```
Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api
00000002-0000-0000-c000-000000000000" is needed to make the change effective
```

For more information about the specific permissions that you grant with this command, see the [GUID Table for Windows Azure Active Directory Permissions](#) .

- c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

```
$ az ad app permission grant --id <appid> \ 1
  --api 00000002-0000-0000-c000-000000000000
```

- 1** Replace **<appid>** with the **appid** parameter value for your service principal.

Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

5.2.6. Supported Azure Marketplace regions

Installing a cluster by using the Azure Marketplace image is available to customers who purchase the offer in North America and EMEA.

While the offer must be purchased in North America or EMEA, you can deploy the cluster to any of the Azure public partitions that OpenShift Container Platform supports.

NOTE

Deploying a cluster by using the Azure Marketplace image is not supported for the Azure Government regions.

5.2.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)

- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)

Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

5.2.8. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

5.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

5.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can set the **credentialsMode** parameter for the CCO to **Manual** when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

5.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use:

```
$ openshift-install version
```

Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --
credentials-requests --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
  name: openshift-image-registry-azure
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object. The format for the secret data varies for each cloud provider.
7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

5.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.8.9 to 4.8.10, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials

for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
 - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
 - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
 - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
 - b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

Text to add

```
...
metadata:
  annotations:
    cloudcredential.openshift.io/upgradeable-to: <version_number>
...
```

Where **<version_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
 - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
 - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
 - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

5.3.4. Next steps

- Install an OpenShift Container Platform cluster:
 - [Installing a cluster quickly on Azure](#) with default options on installer-provisioned infrastructure
 - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
 - [Install a cluster with network customizations on installer-provisioned infrastructure](#)

5.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure that uses the default configuration options.

5.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the directory name to store the files that the installation program creates.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **azure** as the platform to target.
- c. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
 - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
 - **azure tenant id** The tenant ID. Specify the **tenantid** value in your account output.
 - **azure service principal client id** The value of the **appid** parameter for the service principal.
 - **azure service principal client secret** The value of the **password** parameter for the service principal.
- d. Select the region to deploy the cluster to.
- e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- f. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.4.9. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

5.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.5.4. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

Example output

```
Offer          Publisher  Sku          Urn          Version
-----
rh-ocp-worker RedHat     rh-ocp-worker  RedHat:rh-ocp-worker:rh-ocpworker:4.8.2021122100  4.8.2021122100
rh-ocp-worker RedHat     rh-ocp-worker-gen1  RedHat:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100  4.8.2021122100
```

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

Example output

```
Offer          Publisher      Sku              Urn
-----
rh-ocp-worker  redhat-limited rh-ocp-worker    redhat-limited:rh-ocp-worker:rh-ocp-
worker:4.8.2021122100  4.8.2021122100
rh-ocp-worker  redhat-limited rh-ocp-worker-gen1  redhat-limited:rh-ocp-worker:rh-ocp-
worker-gen1:4.8.2021122100  4.8.2021122100
```

NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

- Record the image details of your offer. You must update the **99_openshift-cluster-api_worker-machineset-[0-2].yaml** files in the section titled "Updating Manifests for Marketplace Installation" before completing the installation.

5.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

- Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
- Select your infrastructure provider.
- Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

- Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
 - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
 - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
 - **azure service principal client id** The value of the **appId** parameter for the service principal.
 - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.

- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
 3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.1. Required parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

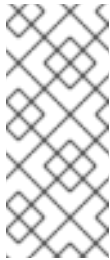

5.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.2. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p>

5.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.3. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 30px; height: 30px; background-color: black; margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 30px; height: 30px; background-color: black; margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

5.5.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.4. Additional Azure parameters

Parameter	Description	Values
compute.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 128 .
compute.platform.azure.osDisk.diskType	Defines the type of disk.	standard_LRS , premium_LRS , or standardSSD_LRS . The default is premium_LRS .
controlPlane.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 1024 .
controlPlane.platform.azure.osDisk.diskType	Defines the type of disk.	premium_LRS or standardSSD_LRS . The default is premium_LRS .
platform.azure.baseDomainResourceGroupName	The name of the resource group that contains the DNS zone for your base domain.	String, for example production_cluster .

Parameter	Description	Values
platform.azure.resourceGroupName	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example existing_resource_group .
platform.azure.outboundType	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	LoadBalancer or UserDefinedRouting . The default is LoadBalancer .
platform.azure.region	The name of the Azure region that hosts your cluster.	Any valid region name, such as centralus .
platform.azure.zone	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"] .
platform.azure.networkResourceGroupName	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName .	String.
platform.azure.virtualNetwork	The name of the existing VNet that you want to deploy your cluster to.	String.
platform.azure.controlPlaneSubnet	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example 10.0.0.0/16 .

Parameter	Description	Values
platform.azure.computeSubnet	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.cloudName	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.	Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

5.5.6.2. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com ①
controlPlane: ②
  hyperthreading: Enabled ③ ④
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 ⑤
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: ⑥
- hyperthreading: Enabled ⑦
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 ⑧
        diskType: Standard_LRS
      zones: ⑨
- "1"
```

```

- "2"
- "3"
replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: centralus 12
    resourceGroupName: existing_resource_group 13
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
  pullSecret: '{"auths": ...}' 14
  fips: false 15
  sshKey: ssh-ed25519 AAAA... 16

```

1 10 12 14 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 Specify the name of the resource group that contains the DNS zone for your base domain.

- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

5.5.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
```

```

baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.5.7. Updating manifests for Marketplace installation

If you selected a Marketplace image for installation, you must create and modify the manifests to use the Marketplace image.

Prerequisites

- You created the **install-config.yaml** file and completed any modifications to it.

Procedure

1. Change to the directory that contains the installation program and create the manifests by running the following command:

```
$ openshift-install create manifests --dir <installation_dir>
```

2. Edit the **.spec.template.spec.providerSpec.value.image** property of the compute machine set definitions, replacing the **offer**, **publisher**, **sku**, and **version** values with the details gathered in the section titled "Selecting an Azure Marketplace image". These are the three files that must be updated:

- **<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-0.yaml**
- **<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-1.yaml**
- **<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-2.yaml**

3. In each file, replace the value of the **.spec.template.spec.providerSpec.value.image.resourceID** property with an empty value (`""`).
4. In each file, set the **type** property to **MarketplaceWithPlan**.
5. Using the first machine set file as an example, the **.spec.template.spec.providerSpec.value.image** section must look like the following example:

```
image:
  offer: rh-ocp-worker
  publisher: redhat
  resourceID: ""
  sku: rh-ocp-worker
  version: 4.8.2021122100
  type: MarketplaceWithPlan
```

5.5.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.5.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.5.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.5.12. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

5.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
 - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
 - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
 - **azure service principal client id** The value of the **appId** parameter for the service principal.
 - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.5. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name>.<baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .

Parameter	Description	Values
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

5.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.6. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	<p>Object</p>  <p>NOTE</p> <p>You cannot modify parameters specified by the networking object after installation.</p>

Parameter	Description	Values
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

5.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.7. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

5.6.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.8. Additional Azure parameters

Parameter	Description	Values
compute.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 128 .
compute.platform.azure.osDisk.diskType	Defines the type of disk.	standard_LRS , premium_LRS , or standardSSD_LRS . The default is premium_LRS .
controlPlane.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 1024 .
controlPlane.platform.azure.osDisk.diskType	Defines the type of disk.	premium_LRS or standardSSD_LRS . The default is premium_LRS .
platform.azure.baseDomainResourceGroupName	The name of the resource group that contains the DNS zone for your base domain.	String, for example production_cluster .

Parameter	Description	Values
platform.azure.resourceGroupName	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example existing_resource_group .
platform.azure.outboundType	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	LoadBalancer or UserDefinedRouting . The default is LoadBalancer .
platform.azure.region	The name of the Azure region that hosts your cluster.	Any valid region name, such as centralus .
platform.azure.zone	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"] .
platform.azure.networkResourceGroupName	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName .	String.
platform.azure.virtualNetwork	The name of the existing VNet that you want to deploy your cluster to.	String.
platform.azure.controlPlaneSubnet	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example 10.0.0.0/16 .

Parameter	Description	Values
platform.azure.computeSubnet	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.cloudName	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.	Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

5.6.5.2. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
    compute: 6
  - hyperthreading: Enabled 7
    name: worker
    platform:
      azure:
        type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
    - "1"

```

```

- "2"
- "3"
replicas: 5
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 12
    region: centralus 13
    resourceGroupName: existing_resource_group 14
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
  pullSecret: '{"auths": ...}' 15
  fips: false 16
  sshKey: ssh-ed25519 AAAA... 17

```

1 10 13 15 Required. The installation program prompts you for this value.

2 6 11 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

12 Specify the name of the resource group that contains the DNS zone for your base domain.

- 14 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

5.6.5.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
```

```

baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.6.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

5.6.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
```

```

metadata:
  name: cluster
spec:

```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```

apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800

```

Enable IPsec for the OVN-Kubernetes network provider

```

apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}

```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

5.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

clusterNetwork

IP address pools from which pod IP addresses are allocated.

serviceNetwork

IP address pool for services.

defaultNetwork.type

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

5.6.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 5.9. Cluster Network Operator configuration object

Field	Type	Description
metadata.name	string	The name of the CNO object. This name is always cluster .
spec.clusterNetwork	array	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec: clusterNetwork: - cidr: 10.128.0.0/19 hostPrefix: 23 - cidr: 10.128.32.0/19 hostPrefix: 23</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.serviceNetwork	array	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec: serviceNetwork: - 172.30.0.0/14</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.defaultNetwork	object	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
spec.kubeProxy Config	object	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 5.10. defaultNetwork object

Field	Type	Description
-------	------	-------------

Field	Type	Description
type	string	<p>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
openshiftSDNConfig	object	This object is only valid for the OpenShift SDN cluster network provider.
ovnKubernetesConfig	object	This object is only valid for the OVN-Kubernetes cluster network provider.

Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 5.11. openshiftSDNConfig object

Field	Type	Description
mode	string	<p>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</p> <p>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.</p> <p>This value cannot be changed after cluster installation.</p>
vxlanPort	integer	<p>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</p>

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 5.12. `ovnKubernetesConfig` object

Field	Type	Description
-------	------	-------------

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</p> <p>This value cannot be changed after cluster installation.</p>
genevePort	integer	The port to use for all Geneve packets. The default value is 6081 . This value cannot be changed after cluster installation.
ipsecConfig	object	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
policyAuditConfig	object	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 5.13. **policyAuditConfig** object

Field	Type	Description
rateLimit	integer	The maximum number of messages to generate every second per node. The default value is 20 messages per second.
maxFileSize	integer	The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

Field	Type	Description
destination	string	<p>One of the following additional audit log targets:</p> <p>libc The libc syslog() function of the journald process on the host.</p> <p>udp:<host>:<port> A syslog server. Replace <host>:<port> with the host and port of the syslog server.</p> <p>unix:<file> A Unix Domain Socket file specified by <file>.</p> <p>null Do not send the audit logs to any additional target.</p>
syslogFacility	string	The syslog facility, such as kern , as defined by RFC5424. The default value is local0 .

Example OVN-Kubernetes configuration

```

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

```

kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 5.14. **kubeProxyConfig** object

Field	Type	Description
iptablesSyncPeriod	string	<p>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p>NOTE</p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.</p> </div> </div>

Field	Type	Description
proxyArguments.iptables-min-sync-period	array	<p>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is:</p> <pre>kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</pre>

5.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
```

```
name: cluster
spec:
EOF
```

where:

<installation_directory>

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- 1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

5.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ ❶
--log-level=info ❷
```

- ❶ For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- ❷ To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.

To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.

To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.6.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.6.14. Next steps

- [Customize your cluster](#).

- If necessary, you can [opt out of remote health reporting](#) .

5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

5.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

5.7.2. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

5.7.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

5.7.2.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.15. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

NOTE

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

5.7.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

5.7.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.7.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following

command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
- i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
 - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
 - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
 - **azure service principal client id** The value of the **appId** parameter for the service principal.
 - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.16. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String

Parameter	Description	Values
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.17. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .

Parameter	Description	Values
networking.serviceNetwork	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	<p>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p> </div> </div>

5.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.18. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p>  <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p>  <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.

Parameter	Description	Values
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

5.7.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.19. Additional Azure parameters

Parameter	Description	Values
compute.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 128 .
compute.platform.azure.osDisk.diskType	Defines the type of disk.	standard_LRS , premium_LRS , or standardSSD_LRS . The default is premium_LRS .
controlPlane.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 1024 .

Parameter	Description	Values
controlPlane.platform.azure.osDisk.diskType	Defines the type of disk.	premium_LRS or standardSSD_LRS . The default is premium_LRS .
platform.azure.baseDomainResourceGroupName	The name of the resource group that contains the DNS zone for your base domain.	String, for example production_cluster .
platform.azure.resourceGroupName	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example existing_resource_group .
platform.azure.outboundType	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	LoadBalancer or UserDefinedRouting . The default is LoadBalancer .
platform.azure.region	The name of the Azure region that hosts your cluster.	Any valid region name, such as centralus .
platform.azure.zone	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"] .
platform.azure.networkResourceGroupName	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName .	String.

Parameter	Description	Values
platform.azure.virtualNetwork	The name of the existing VNet that you want to deploy your cluster to.	String.
platform.azure.controlPlaneSubnet	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.computeSubnet	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.cloudName	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.	Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud .

NOTE

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

5.7.6.2. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
    compute: 6

```

```

- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
  metadata:
    name: test-cluster 10
  networking:
    clusterNetwork:
      - cidr: 10.128.0.0/14
        hostPrefix: 23
    machineNetwork:
      - cidr: 10.0.0.0/16
    networkType: OpenShiftSDN
    serviceNetwork:
      - 172.30.0.0/16
  platform:
    azure:
      baseDomainResourceGroupName: resource_group 11
      region: centralus 12
      resourceGroupName: existing_resource_group 13
      networkResourceGroupName: vnet_resource_group 14
      virtualNetwork: vnet 15
      controlPlaneSubnet: control_plane_subnet 16
      computeSubnet: compute_subnet 17
      outboundType: Loadbalancer
      cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}' 18
    fips: false 19
    sshKey: ssh-ed25519 AAAA... 20

```

1 **10** **12** **18** Required. The installation program prompts you for this value.

2 **6** If you do not provide these parameters and values, the installation program provides the default value.

3 **7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 14 If you use an existing VNet, specify the name of the resource group that contains it.
- 15 If you use an existing VNet, specify its name.
- 16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 17 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 19 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 20 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

5.7.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

...

```

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.7.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.7.11. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

5.8. INSTALLING A PRIVATE CLUSTER ON AZURE

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

5.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

5.8.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

<<<<<< HEAD By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.8.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.8.2.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

5.8.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

Private cluster with network address translation

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with Azure Firewall

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with a proxy configuration

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

Private cluster with no internet access

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

5.8.3. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

5.8.3.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICs for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

5.8.3.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.20. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

5.8.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

5.8.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.8.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.8.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.8.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.8.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

5.8.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.8.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.21. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .

Parameter	Description	Values
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

5.8.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.22. Network parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p>  <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p>

5.8.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.23. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>  <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

5.8.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.24. Additional Azure parameters

Parameter	Description	Values
compute.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 128 .
compute.platform.azure.osDisk.diskType	Defines the type of disk.	standard_LRS , premium_LRS , or standardSSD_LRS . The default is premium_LRS .
controlPlane.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 1024 .
controlPlane.platform.azure.osDisk.diskType	Defines the type of disk.	premium_LRS or standardSSD_LRS . The default is premium_LRS .
platform.azure.baseDomainResourceGroupName	The name of the resource group that contains the DNS zone for your base domain.	String, for example production_cluster .

Parameter	Description	Values
platform.azure.resourceGroupName	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example existing_resource_group .
platform.azure.outboundType	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	LoadBalancer or UserDefinedRouting . The default is LoadBalancer .
platform.azure.region	The name of the Azure region that hosts your cluster.	Any valid region name, such as centralus .
platform.azure.zone	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"] .
platform.azure.networkResourceGroupName	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName .	String.
platform.azure.virtualNetwork	The name of the existing VNet that you want to deploy your cluster to.	String.
platform.azure.controlPlaneSubnet	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example 10.0.0.0/16 .

Parameter	Description	Values
platform.azure.computeSubnet	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.cloudName	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.	Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

5.8.7.2. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
    compute: 6
  - hyperthreading: Enabled 7
    name: worker
    platform:
      azure:
        type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
    - "1"

```

```

- "2"
- "3"
replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: centralus 12
    resourceGroupName: existing_resource_group 13
    networkResourceGroupName: vnet_resource_group 14
    virtualNetwork: vnet 15
    controlPlaneSubnet: control_plane_subnet 16
    computeSubnet: compute_subnet 17
    outboundType: UserDefinedRouting 18
    cloudName: AzurePublicCloud
  pullSecret: '{"auths": ...}' 19
  fips: false 20
  sshKey: ssh-ed25519 AAAA... 21
  publish: Internal 22

```

1 10 12 19 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 14 If you use an existing VNet, specify the name of the resource group that contains it.
- 15 If you use an existing VNet, specify its name.
- 16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 17 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 18 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

5.8.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to

bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.8.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

1 For **<installation_directory>**, specify the

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
```

INFO Access the OpenShift web-console here: <https://console-openshift-console.apps.mycluster.example.com>
 INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
 INFO Time elapsed: 36m22s

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.8.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.

4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.8.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.8.12. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the **install-config.yaml** file before you install the cluster.

5.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

5.9.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to [Microsoft Azure Government \(MAG\)](#) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an [Impact Level 5 Provisional Authorization](#).

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the **install-config.yaml** file. You must also update your service principal to reference the appropriate government environment.

NOTE

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the **install-config.yaml** file. Remember to also set the dedicated cloud instance, like **AzureUSGovernmentCloud**, based on the region specified.

5.9.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

<<<<<<< HEAD By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.9.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.9.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

5.9.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

Private cluster with network address translation

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with Azure Firewall

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with a proxy configuration

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

Private cluster with no internet access

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

5.9.4. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

5.9.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

5.9.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.25. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

5.9.4.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

5.9.4.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.9.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.9.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added

to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.9.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.9.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

**NOTE**

You must name this configuration file **install-config.yaml**.

**NOTE**

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

5.9.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.9.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.26. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name>.<baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

5.9.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.27. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	<p>Required if you use networking.clusterNetwork. An IP address block.</p> <p>An IPv4 network.</p>	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	<p>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is 23.</p>
networking.serviceNetwork	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	<p>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p> </div> </div>

5.9.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.28. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

5.9.8.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.29. Additional Azure parameters

Parameter	Description	Values
compute.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 128 .
compute.platform.azure.osDisk.diskType	Defines the type of disk.	standard_LRS , premium_LRS , or standardSSD_LRS . The default is premium_LRS .
controlPlane.platform.azure.osDisk.diskSizeGB	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is 1024 .
controlPlane.platform.azure.osDisk.diskType	Defines the type of disk.	premium_LRS or standardSSD_LRS . The default is premium_LRS .
platform.azure.baseDomainResourceGroupName	The name of the resource group that contains the DNS zone for your base domain.	String, for example production_cluster .

Parameter	Description	Values
platform.azure.resourceGroupName	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example existing_resource_group .
platform.azure.outboundType	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	LoadBalancer or UserDefinedRouting . The default is LoadBalancer .
platform.azure.region	The name of the Azure region that hosts your cluster.	Any valid region name, such as centralus .
platform.azure.zone	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"] .
platform.azure.networkResourceGroupName	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName .	String.
platform.azure.virtualNetwork	The name of the existing VNet that you want to deploy your cluster to.	String.
platform.azure.controlPlaneSubnet	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example 10.0.0.0/16 .

Parameter	Description	Values
platform.azure.computeSubnet	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example 10.0.0.0/16 .
platform.azure.cloudName	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.	Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

5.9.8.2. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com ①
controlPlane: ②
  hyperthreading: Enabled ③ ④
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 ⑤
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: ⑥
- hyperthreading: Enabled ⑦
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 ⑧
        diskType: Standard_LRS
      zones: ⑨
- "1"
```

```

- "2"
- "3"
replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: usgovvirginia
    resourceGroupName: existing_resource_group 12
    networkResourceGroupName: vnet_resource_group 13
    virtualNetwork: vnet 14
    controlPlaneSubnet: control_plane_subnet 15
    computeSubnet: compute_subnet 16
    outboundType: UserDefinedRouting 17
    cloudName: AzureUSGovernmentCloud 18
  pullSecret: '{"auths": ...}' 19
  fips: false 20
  sshKey: ssh-ed25519 AAAA... 21
  publish: Internal 22

```

1 10 19 Required.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 12 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 13 If you use an existing VNet, specify the name of the resource group that contains it.
- 14 If you use an existing VNet, specify its name.
- 15 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 16 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 17 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.
- 18 Specify the name of the Azure cloud environment to deploy your cluster to. Set **AzureUSGovernmentCloud** to deploy to a Microsoft Azure Government (MAG) region. The default value is **AzurePublicCloud**.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

5.9.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.9.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

...

```

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.9.13. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several [Azure Resource Manager](#) (ARM) templates are provided to assist in completing these steps or to help model your own.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

5.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See [Install the Azure CLI](#) in the Azure documentation. The documentation below was last tested using version **2.2.0** of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

NOTE

Be sure to also review this site list if you are configuring a proxy.

5.10.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.10.3. Configuring your Azure project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

5.10.3.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> • One bootstrap machine, which is removed after installation • Three control plane machines • Three compute machines <p>Because the bootstrap machine uses Standard_D4s_v3 machines, which use 4 vCPUs, the control plane machines use Standard_D8s_v3 virtual machines, which use 8 vCPUs, and the worker machines use Standard_D4s_v3 virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p> <p>By default, the installation program distributes control plane and compute machines across all availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</p>

Component	Number of components required by default	Default Azure limit	Description				
OS Disk	7		<p>VM OS disk must be able to sustain a minimum throughput of 5000 IOPS / 200MBps. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by Standard_D8s_v3, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to ReadOnly for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>				
VNet	1	1000 per region	Each default cluster requires one Virtual Network (VNet), which contains two subnets.				
Network interfaces	6	65,536 per region	Each default cluster requires six network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.				
Network security groups	2	5000	<p>Each default cluster Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tbody> <tr> <td>control plane</td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td>node</td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </tbody> </table>	control plane	Allows the control plane machines to be reached on port 6443 from anywhere	node	Allows worker nodes to be reached from the internet on ports 80 and 443
control plane	Allows the control plane machines to be reached on port 6443 from anywhere						
node	Allows worker nodes to be reached from the internet on ports 80 and 443						

Component	Number of components required by default	Default Azure limit	Description						
Network load balancers	3	1000 per region	<p>Each cluster creates the following load balancers:</p> <table border="1"> <tr> <td>default</td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td>internal</td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td>external</td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.</p>	default	Public IP address that load balances requests to ports 80 and 443 across worker machines	internal	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	external	Public IP address that load balances requests to port 6443 across control plane machines
default	Public IP address that load balances requests to ports 80 and 443 across worker machines								
internal	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
external	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>						

5.10.3.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

**NOTE**

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

You can view Azure's DNS solution by visiting this [example for creating DNS zones](#).

5.10.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

Procedure

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
 - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
 - b. From the **Subscription** list, select the subscription to modify.
 - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
 - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
 - a. Click **Provide details** and provide the required details in the **Quota details** window.
 - b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

5.10.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

5.10.3.5. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Owner**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

5.10.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the [Azure CLI](#).
- Install the **jq** package.
- Your Azure account has the required roles for the subscription that you use.

Procedure

1. Log in to the Azure CLI:

```
$ az login
```

Log in to Azure in the web console by using your credentials.

2. If your Azure account uses subscriptions, ensure that you are using the right subscription.
 - a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

Example output

```
{
  "cloudName": "AzureCloud",
```

```

    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]

```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

Example output

```

{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}

```

- 1** Ensure that the value of the **tenantId** parameter is the UUID of the correct subscription.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id> 1
```

- 1** Substitute the value of the **id** for the subscription that you want to use for **<id>**.

- d. If you changed the active subscription, display your account information again:

```
$ az account show
```

Example output

```

{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",

```

```

    "state": "Enabled",
    "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
}

```

- Record the values of the **tenantId** and **id** parameters from the previous output. You need these values during OpenShift Container Platform installation.
- Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> 1
```

- Replace **<service_principal>** with the name to assign to the service principal.

Example output

```

Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the
required format used for service principal names
Retrying role assignment creation: 1/36
Retrying role assignment creation: 2/36
Retrying role assignment creation: 3/36
Retrying role assignment creation: 4/36
{
  "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
  "displayName": "<service_principal>",
  "name": "http://<service_principal>",
  "password": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
}

```

- Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
- Grant additional permissions to the service principal.
 - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.
 - To operate the Cloud Credential Operator (CCO) in *mint mode*, the app registration service principal also requires the **Azure Active Directory Graph/Application.ReadWrite.OwnedBy** API permission.
 - To operate the CCO in *passthrough mode*, the app registration service principal does not require additional API permissions.

For more information about CCO modes, see "About the Cloud Credential Operator" in the "Managing cloud provider credentials" section of the *Authentication and authorization* guide.

NOTE

If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

- a. To assign the **User Access Administrator** role, run the following command:

```
$ az role assignment create --role "User Access Administrator" \
  --assignee-object-id $(az ad sp list --filter "appld eq '<appld>'" \
    | jq '[0].id' -r) 1
```

- 1** Replace **<appld>** with the **appld** parameter value for your service principal.

- b. To assign the **Azure Active Directory Graph** permission, run the following command:

```
$ az ad app permission add --id <appld> \ 1
  --api 00000002-0000-0000-c000-000000000000 \
  --api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role
```

- 1** Replace **<appld>** with the **appld** parameter value for your service principal.

Example output

```
Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api
00000002-0000-0000-c000-000000000000" is needed to make the change effective
```

For more information about the specific permissions that you grant with this command, see the [GUID Table for Windows Azure Active Directory Permissions](#).

- c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

```
$ az ad app permission grant --id <appld> \ 1
  --api 00000002-0000-0000-c000-000000000000
```

- 1** Replace **<appld>** with the **appld** parameter value for your service principal.

Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

5.10.3.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)

- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)

Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

5.10.4. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

Example output

```
Offer      Publisher  Sku          Urn          Version
-----
```

```

-----
rh-ocp-worker RedHat rh-ocp-worker RedHat:rh-ocp-worker:rh-
ocpworker:4.8.2021122100 4.8.2021122100
rh-ocp-worker RedHat rh-ocp-worker-gen1 RedHat:rh-ocp-worker:rh-ocp-worker-
gen1:4.8.2021122100 4.8.2021122100

```

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

Example output

```

Offer          Publisher      Sku              Urn                                                       Version
-----
rh-ocp-worker redhat-limited rh-ocp-worker    redhat-limited:rh-ocp-worker:rh-ocp-
worker:4.8.2021122100 4.8.2021122100
rh-ocp-worker redhat-limited rh-ocp-worker-gen1 redhat-limited:rh-ocp-worker:rh-ocp-
worker-gen1:4.8.2021122100 4.8.2021122100

```

NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

5. Record the image details of your offer and use them to update the **06_workers.json** Azure Resource Manager (ARM) template. Update the **storageProfile.imageReference** field by deleting the **id** parameter and adding the **offer**, **publisher**, **sku**, and **version** parameters by using the values from your offer. You can find a sample template in the "Creating additional worker machines in Azure" section.

5.10.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.10.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

5.10.7. Creating the installation files for Azure

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

5.10.7.1. Optional: Creating a separate /var partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...  
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"  
INFO Consuming Install Config from target directory  
INFO Manifests created in: $HOME/clusterconfig/manifests and  
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
    partitions:
      - label: var
        start_mib: <partition_start_offset> 2
        size_mib: <partition_size> 3
    filesystems:
      - device: /dev/disk/by-partlabel/var
        path: /var
        format: xfs
        mount_options: [defaults, prjquota] 4
        with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

5.10.7.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
 - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
 - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
 - **azure service principal client id** The value of the **appId** parameter for the service principal.
 - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
- c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting **install-config.yaml** file to set **replicas** to **0** for the **compute** pool:

```
compute:
- hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 0 1
```

1 Set to **0**.

2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.10.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all

destinations.

- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.10.7.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Export common variables found in the **install-config.yaml** to be used by the provided ARM templates:

```
$ export CLUSTER_NAME=<cluster_name> 1
$ export AZURE_REGION=<azure_region> 2
$ export SSH_KEY=<ssh_key> 3
$ export BASE_DOMAIN=<base_domain> 4
$ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group> 5
```

- 1 The value of the **.metadata.name** attribute from the **install-config.yaml** file.
- 2 The region to deploy the cluster into, for example **centralus**. This is the value of the **.platform.azure.region** attribute from the **install-config.yaml** file.
- 3 The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the **.sshKey** attribute from the **install-config.yaml** file.
- 4 The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the **.baseDomain** attribute from the **install-config.yaml** file.
- 5 The resource group where the public DNS zone exists. This is the value of the **.platform.azure.baseDomainResourceGroupName** attribute from the **install-config.yaml** file.

For example:

```
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

5.10.7.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** file.
- b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.

- c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- 1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:
 - a. Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id> 1
```

- 1 The OpenShift Container Platform cluster has been assigned an identifier (**INFRA_ID**) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the **.status.infrastructureName** attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

- b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group> 1
```

- 1 All resources created in this Azure deployment exists as part of a [resource group](#). The resource group name is also based on the **INFRA_ID**, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the **.status.platformStatus.azure.resourceGroupName** attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

5.10.8. Creating the Azure resource group and identity

You must create a Microsoft Azure [resource group](#) and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create the resource group in a supported Azure region:

```
$ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
```

2. Create an Azure identity for the resource group:

```
$ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
```

This is used to grant the required access to Operators in your cluster. For example, this allows the Ingress Operator to create a public IP and its load balancer. You must assign the Azure identity to a role.

3. Grant the Contributor role to the Azure identity:

- a. Export the following variables required by the Azure role assignment:

```
$ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
```

```
$ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
```

- b. Assign the Contributor role to the identity:

```
$ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"
```

5.10.9. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally; therefore, you must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create an Azure storage account to store the VHD cluster image:

```
$ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
```

WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your **CLUSTER_NAME** variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see [Resolve errors for storage account names](#) in the Azure documentation.

2. Export the storage account key as an environment variable:

```
$ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query "[0].value" -o tsv`
```

3. Choose the RHCOS version to use and export the URL of its VHD to an environment variable:

```
$ export VHD_URL=`curl -s https://raw.githubusercontent.com/openshift/installer/release-4.8/data/data/rhcos.json | jq -r .azure.url`
```

IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Copy the chosen VHD to a blob:

```
$ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
```

```
$ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri "${VHD_URL}"
```

To track the progress of the VHD copy task, run this script:

```
status="unknown"
while [ "$status" != "success" ]
do
  status=`az storage blob show --container-name vhd --name "rhcos.vhd" --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -o tsv --query properties.copy.status`
  echo $status
done
```

5. Create a blob storage container and upload the generated **bootstrap.ign** file:

```
$ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --public-access blob
```

```
$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
```

5.10.10. Example for creating DNS zones

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, [Azure's DNS solution](#) is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

NOTE

The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create the new public DNS zone in the resource group exported in the **BASE_DOMAIN_RESOURCE_GROUP** environment variable:

```
$ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can skip this step if you are using a public DNS zone that already exists.

2. Create the private DNS zone in the same resource group as the rest of this deployment:

```
$ az network private-dns zone create -g ${RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can learn more about [configuring a public DNS zone in Azure](#) by visiting that section.

5.10.11. Creating a VNet in Azure

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Copy the template from the **ARM template for the VNet** section of this topic and save it as **01_vnet.json** in your cluster's installation directory. This template describes the VNet that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/01_vnet.json" \
--parameters baseName="${INFRA_ID}" 1
```

- 1** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Link the VNet template to the private DNS zone:

```
$ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v "${INFRA_ID}-vnet"
-e false
```

5.10.11.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

Example 5.1. 01_vnet.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "virtualNetworkName" : "[concat(parameters('baseName'), '-vnet')]",
    "addressPrefix" : "10.0.0.0/16",
    "masterSubnetName" : "[concat(parameters('baseName'), '-master-subnet')]",
    "masterSubnetPrefix" : "10.0.0.0/24",
    "nodeSubnetName" : "[concat(parameters('baseName'), '-worker-subnet')]",
    "nodeSubnetPrefix" : "10.0.1.0/24",
    "clusterNsgName" : "[concat(parameters('baseName'), '-nsg')]"
  },
  "resources" : [
    {
      "apiVersion" : "2018-12-01",
      "type" : "Microsoft.Network/virtualNetworks",
      "name" : "[variables('virtualNetworkName')]",
      "location" : "[variables('location')]",
      "dependsOn" : [
        "[concat('Microsoft.Network/networkSecurityGroups/', variables('clusterNsgName'))]"
      ],
      "properties" : {
        "addressSpace" : {
          "addressPrefixes" : [
            "[variables('addressPrefix')]"
          ]
        },
        "subnets" : [
          {
            "name" : "[variables('masterSubnetName')]",
            "properties" : {
              "addressPrefix" : "[variables('masterSubnetPrefix')]",
              "serviceEndpoints": [],
              "networkSecurityGroup" : {
                "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',
variables('clusterNsgName'))]"
              }
            }
          },
          {

```

```

    "name" : "[variables('nodeSubnetName')]",
    "properties" : {
      "addressPrefix" : "[variables('nodeSubnetPrefix')]",
      "serviceEndpoints": [],
      "networkSecurityGroup" : {
        "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',
variables('clusterNsgName'))]"
      }
    }
  }
]
},
{
  "type" : "Microsoft.Network/networkSecurityGroups",
  "name" : "[variables('clusterNsgName')]",
  "apiVersion" : "2018-10-01",
  "location" : "[variables('location')]",
  "properties" : {
    "securityRules" : [
      {
        "name" : "apiserver_in",
        "properties" : {
          "protocol" : "Tcp",
          "sourcePortRange" : "*",
          "destinationPortRange" : "6443",
          "sourceAddressPrefix" : "*",
          "destinationAddressPrefix" : "*",
          "access" : "Allow",
          "priority" : 101,
          "direction" : "Inbound"
        }
      }
    ]
  }
}
]
}

```

5.10.12. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

Procedure

1. Copy the template from the **ARM template for image storage** section of this topic and save it as **02_storage.json** in your cluster's installation directory. This template describes the image storage that your cluster requires.
2. Export the RHCOS VHD blob URL as a variable:

```
$ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --
account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
```

3. Deploy the cluster image:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/02_storage.json" \
--parameters vhdBlobURL="${VHD_BLOB_URL}" \ 1
--parameters baseName="${INFRA_ID}" 2
```

1 The blob URL of the RHCOS VHD to be used to create master and worker machines.

2 The base name to be used in resource names; this is usually the cluster's infrastructure ID.

5.10.12.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

Example 5.2. 02_storage.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-
01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "vhdBlobURL" : {
      "type" : "string",
      "metadata" : {
        "description" : "URL pointing to the blob where the VHD to be used to create master and
worker machines is located"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "imageName" : "[concat(parameters('baseName'), '-image')]"
  },
  "resources" : [
```

```

{
  "apiVersion" : "2018-06-01",
  "type": "Microsoft.Compute/images",
  "name": "[variables('imageName')]",
  "location" : "[variables('location')]",
  "properties": {
    "storageProfile": {
      "osDisk": {
        "osType": "Linux",
        "osState": "Generalized",
        "blobUri": "[parameters('vhdBlobURL')]",
        "storageAccountType": "Standard_LRS"
      }
    }
  }
}
]
}

```

5.10.13. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **initramfs** during boot to fetch their Ignition config files.

5.10.13.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, set statically through kernel arguments, or another method, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as **localhost** or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

5.10.13.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 5.30. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	1936	Metrics
	9000-9999	Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099 .
	10250-10259	The default ports that Kubernetes reserves
	10256	openshift-sdn
UDP	4789	VXLAN and Geneve
	6081	VXLAN and Geneve
	9000-9999	Host level services, including the node exporter on ports 9100-9101 .
	500	IPsec IKE packets
	4500	IPsec NAT-T packets
TCP/UDP	30000-32767	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 5.31. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	6443	Kubernetes API

Table 5.32. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	2379-2380	etcd server and peer ports

5.10.14. Creating networking and load balancing components in Azure

You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

Procedure

1. Copy the template from the **ARM template for the network and load balancers** section of this topic and save it as **03_infra.json** in your cluster's installation directory. This template describes the networking and load balancing objects that your cluster requires.

2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/03_infra.json" \
  --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" \ 1
  --parameters baseName="${INFRA_ID}" 2
```

- 1** The name of the private DNS zone.
- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Create an **api** DNS record in the public zone for the API public load balancer. The **\${BASE_DOMAIN_RESOURCE_GROUP}** variable must point to the resource group where the public DNS zone exists.

- a. Export the following variable:

```
$ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
```

- b. Create the DNS record in a new public zone:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
```

- c. If you are adding the cluster to an existing public zone, you can create the DNS record in it instead:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
```

5.10.14.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

Example 5.3. 03_infra.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "privateDNSZoneName" : {
      "type" : "string",
      "metadata" : {
        "description" : "Name of the private DNS zone"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "virtualNetworkName" : "[concat(parameters('baseName'), '-vnet')]",
    "virtualNetworkID" : "[resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))]",
    "masterSubnetName" : "[concat(parameters('baseName'), '-master-subnet')]",
    "masterSubnetRef" : "[concat(variables('virtualNetworkID'), '/subnets/', variables('masterSubnetName'))]",
    "masterPublicIpAddressName" : "[concat(parameters('baseName'), '-master-pip')]",
    "masterPublicIpAddressID" : "[resourceId('Microsoft.Network/publicIPAddresses', variables('masterPublicIpAddressName'))]",
    "masterLoadBalancerName" : "[concat(parameters('baseName'), '-public-lb')]",
    "masterLoadBalancerID" : "[resourceId('Microsoft.Network/loadBalancers', variables('masterLoadBalancerName'))]",
    "internalLoadBalancerName" : "[concat(parameters('baseName'), '-internal-lb')]",
    "internalLoadBalancerID" : "[resourceId('Microsoft.Network/loadBalancers', variables('internalLoadBalancerName'))]",
    "skuName": "Standard"
  },
  "resources" : [
    {
      "apiVersion" : "2018-12-01",
      "type" : "Microsoft.Network/publicIPAddresses",
      "name" : "[variables('masterPublicIpAddressName')]",
      "location" : "[variables('location')]",
      "sku": {
        "name": "[variables('skuName')]"
      },
      "properties" : {
        "publicIPAllocationMethod" : "Static",
        "dnsSettings" : {
          "domainNameLabel" : "[variables('masterPublicIpAddressName')]"
        }
      }
    }
  ]
}
```

```

    }
  }
},
{
  "apiVersion" : "2018-12-01",
  "type" : "Microsoft.Network/loadBalancers",
  "name" : "[variables('masterLoadBalancerName')]",
  "location" : "[variables('location')]",
  "sku": {
    "name": "[variables('skuName')]"
  },
  "dependsOn" : [
    "[concat('Microsoft.Network/publicIPAddresses/', variables('masterPublicIpAddressName'))]"
  ],
  "properties" : {
    "frontendIPConfigurations" : [
      {
        "name" : "public-lb-ip",

      }
    ]
  }
}
]
}

```

5.10.15. Creating the bootstrap machine in Azure

You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.

- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.

Procedure

1. Copy the template from the **ARM template for the bootstrap machine** section of this topic and save it as **04_bootstrap.json** in your cluster's installation directory. This template describes the bootstrap machine that your cluster requires.
2. Export the following variables required by the bootstrap machine deployment:

```
$ export BOOTSTRAP_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --
account-key ${ACCOUNT_KEY} -c "files" -n "bootstrap.ign" -o tsv`
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url "${BOOTSTRAP_URL}
'{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '\n`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/04_bootstrap.json" \
--parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 1
--parameters sshKeyData="${SSH_KEY}" \ 2
--parameters baseName="${INFRA_ID}" 3
```

- 1** The bootstrap Ignition content for the bootstrap cluster.
- 2** The SSH RSA public key file as a string.
- 3** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

5.10.15.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

Example 5.4. 04_bootstrap.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-
01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  },
}
```

```

"bootstrapIgnition" : {
  "type" : "string",
  "minLength" : 1,
  "metadata" : {
    "description" : "Bootstrap ignition content for the bootstrap cluster"
  }
},
"sshKeyData" : {
  "type" : "securestring",
  "metadata" : {
    "description" : "SSH RSA public key file as a string."
  }
},
"bootstrapVMSize" : {
  "type" : "string",
  "defaultValue" : "Standard_D4s_v3",
  "allowedValues" : [

}

```

5.10.16. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

Procedure

1. Copy the template from the **ARM template for control plane machines** section of this topic and save it as **05_masters.json** in your cluster's installation directory. This template describes the control plane machines that your cluster requires.
2. Export the following variable needed by the control plane machine deployment:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d '\n'`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/05_masters.json" \
  --parameters masterIgnition="${MASTER_IGNITION}" \ ❶
  --parameters sshKeyData="${SSH_KEY}" \ ❷
  --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" \ ❸
  --parameters baseName="${INFRA_ID}" ❹
```

- ❶ The Ignition content for the control plane nodes (also known as the master nodes).
- ❷ The SSH RSA public key file as a string.
- ❸ The name of the private DNS zone to which the control plane nodes are attached.
- ❹ The base name to be used in resource names; this is usually the cluster's infrastructure ID.

5.10.16.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 5.5. 05_masters.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "masterIgnition" : {
      "type" : "string",
      "metadata" : {
        "description" : "Ignition content for the master nodes"
      }
    },
    "numberOfMasters" : {
      "type" : "int",
      "defaultValue" : 3,
      "minValue" : 2,
      "maxValue" : 30,
      "metadata" : {
        "description" : "Number of OpenShift masters to deploy"
      }
    },
    "sshKeyData" : {
      "type" : "securestring",
      "metadata" : {
```

```

    "description" : "SSH RSA public key file as a string"
  }
},
"privateDNSZoneName" : {
  "type" : "string",
  "metadata" : {
    "description" : "Name of the private DNS zone the master nodes are going to be attached to"
  }

      }
    }
  ]
}
]
}

```

5.10.17. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure an Azure account.

- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level info 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```
$ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --
name bootstrap_ssh_in
$ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
$ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap OSDisk --no-
wait --yes
$ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-
wait
$ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name
${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
$ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-
ssh-pip
```

NOTE

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

5.10.18. Creating additional worker machines in Azure

You can create worker machines in Microsoft Azure for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type **06_workers.json** in the file.

NOTE

If you do not use the provided ARM template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Copy the template from the **ARM template for worker machines** section of this topic and save it as **06_workers.json** in your cluster's installation directory. This template describes the worker machines that your cluster requires.
2. Export the following variable needed by the worker machine deployment:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d '\n'`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/06_workers.json" \
  --parameters workerIgnition="${WORKER_IGNITION}" \ 1
  --parameters sshKeyData="${SSH_KEY}" \ 2
  --parameters baseName="${INFRA_ID}" \ 3
```

- 1** The Ignition content for the worker nodes.
- 2** The SSH RSA public key file as a string.
- 3** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

5.10.18.1. ARM template for worker machines

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 5.6. 06_workers.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "workerIgnition" : {
      "type" : "string",
      "metadata" : {
        "description" : "Ignition content for the worker nodes"
      }
    },
    "numberOfNodes" : {
      "type" : "int",
      "defaultValue" : 3,
      "minValue" : 2,

}
```

5.10.19. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

5.10.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

5.10.21. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master  63m  v1.21.0
master-1  Ready   master  63m  v1.21.0
master-2  Ready   master  64m  v1.21.0
```

The output lists all of the machines that you created.

**NOTE**

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE  REQUESTOR                                     CONDITION
csr-8b2br 15m  system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m  system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n}}\n{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n}}\n{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.21.0
master-1  Ready   master 73m  v1.21.0
```

```

master-2 Ready   master 74m v1.21.0
worker-0 Ready   worker 11m v1.21.0
worker-1 Ready   worker 11m v1.21.0

```

NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

5.10.22. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard ***.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Microsoft Azure by using infrastructure that you provisioned.
- Install the OpenShift CLI (**oc**).
- Install the **jq** package.
- Install or update the [Azure CLI](#).

Procedure

1. Confirm the Ingress router has created a load balancer and populated the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

Example output

```

NAME          TYPE          CLUSTER-IP    EXTERNAL-IP    PORT(S)          AGE
router-default LoadBalancer  172.30.20.10  35.130.120.110 80:32288/TCP,443:31215/TCP 20

```

2. Export the Ingress router IP as a variable:

```
$ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

3. Add a ***.apps** record to the public DNS zone.
 - a. If you are adding this cluster to a new public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
```

- b. If you are adding this cluster to an already existing public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300
```

4. Add a ***.apps** record to the private DNS zone:

- a. Create a ***.apps** record by using the following command:

```
$ az network private-dns record-set a create -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps --ttl 300
```

- b. Add the ***.apps** record to the private DNS zone by using the following command:

```
$ az network private-dns record-set a add-record -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER}
```

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}{end}' routes
```

Example output

```
oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com
```

5.10.23. Completing an Azure installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure infrastructure.
- Install the **oc** CLI and log in.

Procedure

- Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

Example output

INFO Waiting up to 30m0s for the cluster to initialize...

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

IMPORTANT

- o The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- o It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.10.24. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

5.11. UNINSTALLING A CLUSTER ON AZURE

You can remove a cluster that you deployed to Microsoft Azure.

5.11.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$. /openshift-install destroy cluster \  
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

2. Optional: Delete the **<installation_directory>** directory and the OpenShift Container Platform installation program.

CHAPTER 6. INSTALLING ON GCP

6.1. PREPARING TO INSTALL ON GCP

6.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

6.1.2. Requirements for installing OpenShift Container Platform on GCP

Before installing OpenShift Container Platform on Google Cloud Platform (GCP), you must create a service account and configure a GCP project. See [Configuring a GCP project](#) for details about creating a project, enabling API services, configuring DNS, GCP account limits, and supported GCP regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for GCP](#) for other options.

6.1.3. Choosing a method to install OpenShift Container Platform on GCP

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

6.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- [Installing a cluster quickly on GCP](#) You can install OpenShift Container Platform on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- [Installing a customized cluster on GCP](#) You can install a customized cluster on GCP infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- [Installing a cluster on GCP with network customizations](#) You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- [Installing a cluster on GCP in a restricted network](#) You can install OpenShift Container Platform on GCP on installer-provisioned infrastructure by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an

active internet connection to obtain the software components. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the GCP APIs.

- **Installing a cluster into an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing GCP Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits on creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing GCP VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

6.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on GCP infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on GCP with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP infrastructure that you provide. You can use the provided Deployment Manager templates to assist with the installation.
- **Installing a cluster with shared VPC on user-provisioned infrastructure in GCP** You can use the provided Deployment Manager templates to create GCP resources in a shared VPC infrastructure.
- **Installing a cluster on GCP in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP in a restricted network with user-provisioned infrastructure. By creating an internal mirror of the installation release content, you can install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content.

6.1.4. Next steps

- [Configuring a GCP project](#)

6.2. CONFIGURING A GCP PROJECT

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

6.2.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the **api-int.<cluster_name>.<base_domain>** URL; the Premium Tier is required for internal load balancing.

6.2.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See [Enabling services](#) in the GCP documentation.

Table 6.1. Required API services

API service	Console service name
Compute Engine API	compute.googleapis.com
Google Cloud APIs	cloudapis.googleapis.com
Cloud Resource Manager API	cloudresourcemanager.googleapis.com
Google DNS API	dns.googleapis.com
IAM Service Account Credentials API	iamcredentials.googleapis.com
Identity and Access Management (IAM) API	iam.googleapis.com
Service Management API	servicemanagement.googleapis.com
Service Usage API	serviceusage.googleapis.com
Google Cloud Storage JSON API	storage-api.googleapis.com
Cloud Storage	storage-component.googleapis.com

6.2.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform

cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

NOTE

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation. Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation. You typically have four name servers.
4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).
5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.
6. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain. This process might include a request to your company's IT department or the division that controls the root domain and DNS services for your company.

6.2.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default [Quotas](#) do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.2. GCP resources used in a default cluster

Service	Component	Location	Total resources required	Resources removed after bootstrap
Service account	IAM	Global	5	0
Firewall rules	Compute	Global	11	1

Service	Component	Location	Total resources required	Resources removed after bootstrap
Forwarding rules	Compute	Global	2	0
In-use global IP addresses	Compute	Global	4	1
Health checks	Compute	Global	3	0
Images	Compute	Global	1	0
Networks	Compute	Global	2	0
Static IP addresses	Compute	Region	4	1
Routers	Compute	Global	1	0
Routes	Compute	Global	2	0
Subnetworks	Compute	Global	2	0
Target pools	Compute	Global	3	0
CPUs	Compute	Region	28	4
Persistent disk SSD (GB)	Compute	Region	896	128

NOTE

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**

- **europa-north1**
- **europa-west2**
- **europa-west3**
- **europa-west6**
- **northamerica-northeast1**
- **southamerica-east1**
- **us-west2**

You can increase resource quotas from the [GCP console](#), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.2.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.
2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

NOTE

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.
The service account key is required to create a cluster.

6.2.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.3. GCP service account permissions

Account	Roles
Control Plane	roles/compute.instanceAdmin
	roles/compute.networkAdmin
	roles/compute.securityAdmin
	roles/storage.admin
	roles/iam.serviceAccountUser
Compute	roles/compute.viewer
	roles/storage.admin

6.2.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)

- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europa-central2** (Warsaw, Poland)
- **europa-north1** (Hamina, Finland)
- **europa-west1** (St. Ghislain, Belgium)
- **europa-west2** (London, England, UK)
- **europa-west3** (Frankfurt, Germany)
- **europa-west4** (Eemshaven, Netherlands)
- **europa-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)
- **southamerica-east1** (São Paulo, Brazil)
- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

6.2.7. Next steps

- Install an OpenShift Container Platform cluster on GCP. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

6.3. MANUALLY CREATING IAM FOR GCP

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

6.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Manage cloud credentials manually.**

You can set the **credentialsMode** parameter for the CCO to **Manual** to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**

If you are using the CCO with the **credentialsMode** parameter set to **Mint**, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

Additional resources

- [Rotating or removing cloud provider credentials.](#)

For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

6.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use:

```
$ openshift-install version
```

Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --
credentials-requests --cloud=gcp
```

This command creates a YAML file for each **CredentialsRequest** object.

Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
  name: openshift-image-registry-gcs
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
```

```
kind: GCPProviderSpec
predefinedRoles:
- roles/storage.admin
- roles/iam.serviceAccountUser
skipServiceCheck: true
```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object. The format for the secret data varies for each cloud provider.
7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

6.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.8.9 to 4.8.10, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
 - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
 - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.

3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
 - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
 - b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

Text to add

```
...
  metadata:
    annotations:
      cloudcredential.openshift.io/upgradeable-to: <version_number>
  ...
```

Where **<version_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
 - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
 - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
 - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

6.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the **admin** credential is stored in the **kube-system** namespace and then used by the CCO to process the **CredentialsRequest** objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires **admin** credential storage in a cluster **kube-system** secret.

6.3.5. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all **CredentialsRequest** objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

6.3.6. Next steps

- Install an OpenShift Container Platform cluster:
 - [Installing a cluster quickly on GCP](#) with default options on installer-provisioned infrastructure
 - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
 - [Install a cluster with network customizations on installer-provisioned infrastructure](#)

6.4. INSTALLING A CLUSTER QUICKLY ON GCP

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses the default configuration options.

6.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
 - The **GOOGLE_CREDENTIALS**, **GOOGLE_CLOUD_KEYFILE_JSON**, or **GKLOUD_KEYFILE_JSON** environment variables
 - The `~/.gcp/osServiceAccount.json` file
 - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

1 For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **gcp** as the platform to target.
- c. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
- d. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
- e. Select the region to deploy the cluster to.
- f. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
- g. Enter a descriptive name for your cluster. If you provide a name that is longer than 6 characters, only the first 6 characters will be used in the infrastructure ID that is generated from the cluster name.
- h. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
```

INFO Access the OpenShift web-console here: <https://console-openshift-console.apps.mycluster.example.com>
 INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
 INFO Time elapsed: 36m22s

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
 - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
 - If you included the **Service Account Key Admin** role, you can remove it.

6.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**. To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.4.9. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

6.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Google Cloud Platform (GCP). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

6.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

6.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

- Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

- Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```

$ ./openshift-install create install-config --dir <installation_directory> 1

```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
- iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
- iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
- v. Select the region to deploy the cluster to.
- vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
- vii. Enter a descriptive name for your cluster.

- viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.4. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String

Parameter	Description	Values
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

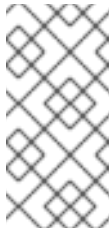

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

6.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.5. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p>

6.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.6. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

6.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 6.7. Additional GCP parameters

Parameter	Description	Values
platform.gcp.network	The name of the existing VPC that you want to deploy your cluster to.	String.
platform.gcp.region	The name of the GCP region that hosts your cluster.	Any valid region name, such as us-central1 .
platform.gcp.type	The GCP machine type .	The GCP machine type.
platform.gcp.zones	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid GCP availability zones , such as us-central1-a , in a YAML sequence .
platform.gcp.controlPlaneSubnet	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p>IMPORTANT</p> <p>The licenses parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the license API , such as the license to enable nested virtualization . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default pd-ssd or the pd-standard disk type. The control plane nodes must be the pd-ssd disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
controlPlane.platform.gcp.osDisk.encryptionKey.location	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
controlPlane.platform.gcp.osDisk.encryptionKey.projectID	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
computePlatform.gcp.osDisk.encryptionKeyName	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

6.5.5.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

apiVersion: v1

baseDomain: example.com **1**

```

controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-ssd
        diskSizeGB: 1024
        encryptionKey: 5
        kmsKey:
          name: worker-key
          keyRing: test-machine-keys
          location: global
          projectID: project-id
      replicas: 3
compute: 6 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-standard
        diskSizeGB: 128
        encryptionKey: 9
        kmsKey:
          name: worker-key
          keyRing: test-machine-keys
          location: global
          projectID: project-id
      replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 11
    region: us-central1 12

```

```
pullSecret: '{"auths": ...}' 13
fips: false 14
sshKey: ssh-ed25519 AAAA... 15
```

- 1 10 11 12 13** Required. The installation program prompts you for this value.
- 2 6** If you do not provide these parameters and values, the installation program provides the default value.
- 3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-<project_number>@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 14** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 15** You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

6.5.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: custom-6-20480
  replicas: 3
```

6.5.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.5.6. Using a GCP Marketplace image

If you want to deploy an OpenShift Container Platform cluster using a GCP Marketplace image, you must create the manifests and edit the compute machine set definitions to specify the GCP Marketplace image.

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Generate the installation manifests by running the following command:

```
$ openshift-install create manifests --dir <installation_dir>
```

2. Locate the following files:

- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-0.yaml`
- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-1.yaml`
- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-2.yaml`

3. In each file, edit the `.spec.template.spec.providerSpec.value.disks[0].image` property to reference the offer to use:

OpenShift Container Platform

```
projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-202210040145
```

OpenShift Platform Plus

```
projects/redhat-marketplace-public/global/images/redhat-coreos-opp-48-x86-64-202206140145
```

OpenShift Kubernetes Engine

```
projects/redhat-marketplace-public/global/images/redhat-coreos-oke-48-x86-64-202206140145
```

Example compute machine set with the GCP Marketplace image

```
deletionProtection: false
disks:
- autoDelete: true
  boot: true
```

```

image: projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-
202210040145
labels: null
sizeGb: 128
type: pd-ssd
kind: GCPMachineProviderSpec
machineType: n2-standard-4

```

6.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
 - The **GOOGLE_CREDENTIALS**, **GOOGLE_CLOUD_KEYFILE_JSON**, or **GCLOUD_KEYFILE_JSON** environment variables
 - The `~/gcp/osServiceAccount.json` file
 - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```

$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2

```

- 1 For **<installation_directory>**, specify the location of your customized `./install-config.yaml` file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
 - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
 - If you included the **Service Account Key Admin** role, you can remove it.

6.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.5.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.5.11. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

6.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Google Cloud Platform (GCP). By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

6.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

- Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

- Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

- Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
- Select your infrastructure provider.
- Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

- Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.

- iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
 - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
 - v. Select the region to deploy the cluster to.
 - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - vii. Enter a descriptive name for your cluster.
 - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
 3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.8. Required parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

6.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.9. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

6.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.10. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

6.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 6.11. Additional GCP parameters

Parameter	Description	Values
platform.gcp.network	The name of the existing VPC that you want to deploy your cluster to.	String.
platform.gcp.region	The name of the GCP region that hosts your cluster.	Any valid region name, such as us-central1 .
platform.gcp.type	The GCP machine type .	The GCP machine type.
platform.gcp.zones	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid GCP availability zones , such as us-central1-a , in a YAML sequence .
platform.gcp.controlPlaneSubnet	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p>IMPORTANT</p> <p>The licenses parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the license API , such as the license to enable nested virtualization . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default pd-ssd or the pd-standard disk type. The control plane nodes must be the pd-ssd disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
controlPlane.platform.gcp.osDisk.encryptionKey.location	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
controlPlane.platform.gcp.osDisk.encryptionKey.projectID	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
computePlatform.gcp.osDisk.encryptionKeyName	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

6.6.5.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

apiVersion: v1

baseDomain: example.com **1**

```

controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-ssd
        diskSizeGB: 1024
        encryptionKey: 5
        kmsKey:
          name: worker-key
          keyRing: test-machine-keys
          location: global
          projectID: project-id
      replicas: 3
compute: 6 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-standard
        diskSizeGB: 128
        encryptionKey: 9
        kmsKey:
          name: worker-key
          keyRing: test-machine-keys
          location: global
          projectID: project-id
      replicas: 3
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 12
    region: us-central1 13

```

```
pullSecret: '{"auths": ...}' 14
fips: false 15
sshKey: ssh-ed25519 AAAA... 16
```

1 10 12 13 14 Required. The installation program prompts you for this value.

2 6 11 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

5 9 Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-`<project_number>`@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

6.6.6. Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

6.6.6.1. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: custom-6-20480
  replicas: 3
```

6.6.6.2. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.6.7. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

6.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

6.6.9. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

clusterNetwork

IP address pools from which pod IP addresses are allocated.

serviceNetwork

IP address pool for services.

defaultNetwork.type

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

6.6.9.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 6.12. Cluster Network Operator configuration object

Field	Type	Description
metadata.name	string	The name of the CNO object. This name is always cluster .
spec.clusterNetwork	array	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec: clusterNetwork: - cidr: 10.128.0.0/19 hostPrefix: 23 - cidr: 10.128.32.0/19 hostPrefix: 23</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.serviceNetwork	array	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec: serviceNetwork: - 172.30.0.0/14</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>

Field	Type	Description
spec.defaultNetwork	object	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
spec.kubeProxyConfig	object	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 6.13. **defaultNetwork** object

Field	Type	Description
type	string	<p>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: center;">  <div> <p>NOTE</p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
openshiftSDNConfig	object	This object is only valid for the OpenShift SDN cluster network provider.
ovnKubernetesConfig	object	This object is only valid for the OVN-Kubernetes cluster network provider.

Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 6.14. **openshiftSDNConfig** object

Field	Type	Description
-------	------	-------------

Field	Type	Description
mode	string	<p>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</p> <p>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>
mtu	integer	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.</p> <p>This value cannot be changed after cluster installation.</p>
vxlanPort	integer	<p>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</p>

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 6.15. `ovnKubernetesConfig` object

Field	Type	Description
<code>mtu</code>	<code>integer</code>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</p> <p>This value cannot be changed after cluster installation.</p>
<code>genevePort</code>	<code>integer</code>	The port to use for all Geneve packets. The default value is 6081 . This value cannot be changed after cluster installation.
<code>ipsecConfig</code>	<code>object</code>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<code>policyAuditConfig</code>	<code>object</code>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 6.16. `policyAuditConfig` object

Field	Type	Description
<code>rateLimit</code>	<code>integer</code>	The maximum number of messages to generate every second per node. The default value is 20 messages per second.
<code>maxFileSize</code>	<code>integer</code>	The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

Field	Type	Description
destination	string	<p>One of the following additional audit log targets:</p> <p>libc The libc syslog() function of the journald process on the host.</p> <p>udp:<host>:<port> A syslog server. Replace <host>:<port> with the host and port of the syslog server.</p> <p>unix:<file> A Unix Domain Socket file specified by <file>.</p> <p>null Do not send the audit logs to any additional target.</p>
syslogFacility	string	The syslog facility, such as kern , as defined by RFC5424. The default value is local0 .

Example OVN-Kubernetes configuration

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 6.17. **kubeProxyConfig** object

Field	Type	Description
iptablesSyncPeriod	string	<p>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p>NOTE</p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.</p> </div> </div>

Field	Type	Description
proxyArguments.iptables-min-sync-period	array	<p>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is:</p> <pre>kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</pre>

6.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

1 For **<installation_directory>**, specify the

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.6.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.6.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

6.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK

In OpenShift Container Platform 4.8, you can install a cluster on Google Cloud Platform (GCP) in a restricted network by creating an internal mirror of the installation release content on an existing Google Virtual Private Cloud (VPC).

IMPORTANT

You can install an OpenShift Container Platform cluster by using mirrored installation release content, but your cluster will require internet access to use the GCP APIs.

6.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in GCP. While installing a cluster in a restricted network that uses installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
 - Contains the mirror registry
 - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to. While you might need to grant access to more sites, you must grant access to ***.googleapis.com** and **accounts.google.com**.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.7.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

6.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

6.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

- Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

- Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.7.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
 - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
 - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
 - v. Select the region to deploy the cluster to.
 - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - vii. Enter a descriptive name for your cluster.
 - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
 - a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000":{"auth": "<credentials>","email":
"you@example.com"}}}'
```

For **<mirror_host_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----

  //////////////////////////////////////
  -----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

- c. Define the network and subnets for the VPC to install the cluster in under the parent **platform.gcp** field:

```
network: <existing_vpc>
controlPlaneSubnet: <control_plane_subnet>
computeSubnet: <compute_subnet>
```

For **platform.gcp.network**, specify the name for the existing Google VPC. For **platform.gcp.controlPlaneSubnet** and **platform.gcp.computeSubnet**, specify the existing subnets to deploy the control plane machines and compute machines, respectively.

- d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
```

- mirrors:
 - <mirror_host_name>:5000/<repo_name>/release
 - source: quay.example.com/openshift-release-dev/ocp-release
- mirrors:
 - <mirror_host_name>:5000/<repo_name>/release
 - source: registry.example.com/ocp/release

To complete these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.7.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.7.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.18. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String

Parameter	Description	Values
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, gcp, openstack, ovirt, vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

6.7.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.19. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.network Type	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .

Parameter	Description	Values
networking.serviceNetwork	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	<p>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, 10.0.0.0/16.</p> <div style="display: flex; align-items: flex-start;">  <div> <p>NOTE</p> <p>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</p> </div> </div>

6.7.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.20. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.

Parameter	Description	Values
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hypertreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p>	Mint, Passthrough, Manual , or an empty string ("").
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p>  <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p>  <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.

Parameter	Description	Values
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

6.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 6.21. Additional GCP parameters

Parameter	Description	Values
platform.gcp.network	The name of the existing VPC that you want to deploy your cluster to.	String.
platform.gcp.region	The name of the GCP region that hosts your cluster.	Any valid region name, such as us-central1 .

Parameter	Description	Values
platform.gcp.type	The GCP machine type .	The GCP machine type.
platform.gcp.zones	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid GCP availability zones , such as us-central1-a , in a YAML sequence .
platform.gcp.controlPlaneSubnet	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.
platform.gcp.computeSubnet	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
platform.gcp.licenses	<p>A list of license URLs that must be applied to the compute images.</p>  <p>IMPORTANT</p> <p>The licenses parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the license API , such as the license to enable nested virtualization . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
platform.gcp.osDiskSizeGB	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
platform.gcp.osDiskType	The type of disk.	Either the default pd-ssd or the pd-standard disk type. The control plane nodes must be the pd-ssd disk type. The worker nodes can be either type.

Parameter	Description	Values
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyName	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyLocation	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
controlPlane.platform.gcp.osDisk.encryptionKey.projectID	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

Parameter	Description	Values
<code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.
<code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.osDisk.encryptionKey.location</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
<code>compute.platform.gcp.osDisk.encryptionKey.projectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

6.7.5.2. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23

```

```

machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 11
    region: us-central1 12
    network: existing_vpc 13
    controlPlaneSubnet: control_plane_subnet 14
    computeSubnet: compute_subnet 15
  pullSecret: '{"auths":{"<local_registry>":{"auth": "<credentials>","email": "you@example.com"}}}' 16

    - <local_registry>/<local_repository_name>/release
    source: quay.io/openshift-release-dev/ocp-release
  - mirrors:
    - <local_registry>/<local_repository_name>/release
    source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

```

1 10 11 12 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

5 9 Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-<project_number>@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine

management" → "Creating machine sets" → "Creating a machine set on GCP".

- 13 Specify the name of an existing VPC.
- 14 Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15 Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 16 For **<local_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 Provide the contents of the certificate file that you used for your mirror registry.
- 20 Provide the **imageContentSources** section from the output of the command to mirror the repository.

6.7.5.3. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

Procedure

Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

- Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

Sample `clientAccess` configuration to Global

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global 1
          type: GCP
          scope: Internal 2
          type: LoadBalancerService
```

- 1** Set **gcp.clientAccess** to **Global**.
- 2** Global access is only available to Ingress Controllers using internal load balancers.

6.7.5.4. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

Sample `install-config.yaml` file with a custom machine type

```

compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: custom-6-20480
  replicas: 3

```

6.7.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4

```

```
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
```

...

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.7.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
 - The **GOOGLE_CREDENTIALS**, **GOOGLE_CLOUD_KEYFILE_JSON**, or **GCLOUD_KEYFILE_JSON** environment variables
 - The `~/.gcp/osServiceAccount.json` file
 - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
 - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
 - If you included the **Service Account Key Admin** role, you can remove it.

6.7.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

- 5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.7.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

6.7.9. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \  
-p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Global Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

6.7.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.7.11. Next steps

- [Validate an installation](#).
- [Customize your cluster](#).
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#).
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#).

6.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Virtual Private Cloud (VPC) on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

6.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.8.2. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Virtual

Private Cloud (VPC) in Google Cloud Platform (GCP). By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking for the subnets.

6.8.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The subnets must be within the machine network.

The installation program does not create the following components:

- NAT gateways
- Subnets
- Route tables
- VPC network

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

6.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide one subnet for control-plane machines and one subnet for compute machines.
- The subnet's CIDRs belong to the machine CIDR that you specified.

6.8.2.3. Division of permissions

Some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

6.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed to the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

6.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
 - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
 - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
 - v. Select the region to deploy the cluster to.
 - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - vii. Enter a descriptive name for your cluster.
 - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
 3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.22. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

6.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.23. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

6.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.24. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	Whether to enable or disable simultaneous multithreading, or hyperthreading , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.  IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere, or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p>  <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start; gap: 10px;"> <div style="width: 60px; height: 150px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; gap: 10px; margin-top: 10px;"> <div style="width: 60px; height: 80px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

6.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 6.25. Additional GCP parameters

Parameter	Description	Values
platform.gcp.network	The name of the existing VPC that you want to deploy your cluster to.	String.
platform.gcp.region	The name of the GCP region that hosts your cluster.	Any valid region name, such as us-central1 .
platform.gcp.type	The GCP machine type .	The GCP machine type.
platform.gcp.zones	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid GCP availability zones , such as us-central1-a , in a YAML sequence .
platform.gcp.controlPlaneSubnet	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p>IMPORTANT</p> <p>The licenses parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the license API , such as the license to enable nested virtualization . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default pd-ssd or the pd-standard disk type. The control plane nodes must be the pd-ssd disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
controlPlane.platform.gcp.osDisk.encryptionKey.location	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
controlPlane.platform.gcp.osDisk.encryptionKey.projectID	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
computePlatform.gcp.osDisk.encryptionKeyName	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

6.8.6.2. Sample customized `install-config.yaml` file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

apiVersion: v1

baseDomain: example.com **1**

```

controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 11
    region: us-central1 12
    network: existing_vpc 13
    controlPlaneSubnet: control_plane_subnet 14

```

```

computeSubnet: compute_subnet 15
pullSecret: '{"auths": ...}' 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18

```

- 1 10 11 12 16** Required. The installation program prompts you for this value.
- 2 6** If you do not provide these parameters and values, the installation program provides the default value.
- 3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-<project_number>@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 13** Specify the name of an existing VPC.
- 14** Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15** Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 17** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 18** You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

6.8.6.3. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

Procedure

Create an Ingress Controller with global access on a new GCP cluster.

- Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> ❶
```

- For **<installation_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

- Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

Sample `clientAccess` configuration to Global

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global ❶
          type: GCP
          scope: Internal ❷
          type: LoadBalancerService
```

- Set **gcp.clientAccess** to **Global**.

- 2 Global access is only available to Ingress Controllers using internal load balancers.

6.8.7. Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

6.8.7.1. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: custom-6-20480
  replicas: 3
```

6.8.7.2. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to

bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.8.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
 - The **GOOGLE_CREDENTIALS**, **GOOGLE_CLOUD_KEYFILE_JSON**, or **GKLOUD_KEYFILE_JSON** environment variables
 - The `~/.gcp/osServiceAccount.json` file
 - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to **<installation_directory>/openshift_install.log** when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
 - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
 - If you included the **Service Account Key Admin** role, you can remove it.

6.8.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.8.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.8.12. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

6.9. INSTALLING A PRIVATE CLUSTER ON GCP

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing VPC on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

6.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

<<<<<< HEAD By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS

and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

6.9.2.1. Private clusters in GCP

To create a private cluster on Google Cloud Platform (GCP), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

The cluster still requires access to internet to access the GCP APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public network load balancers, which support public ingress
- A public DNS zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private DNS zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

Because it is not possible to limit access to external load balancers based on source tags, the private cluster uses only internal load balancers to allow access to internal instances.

The internal load balancer relies on instance groups rather than the target pools that the network load balancers use. The installation program creates instance groups for each zone, even if there is no instance in that group.

- The cluster IP address is internal only.
- One forwarding rule manages both the Kubernetes API and machine config server ports.
- The backend service is comprised of each zone's instance group and, while it exists, the bootstrap instance group.
- The firewall uses a single rule that is based on only internal source ranges.

6.9.2.1.1. Limitations

No health check for the Machine config server, `/healthz`, runs because of a difference in load balancer functionality. Two internal load balancers cannot share a single IP address, but two network load balancers can share a single external IP address. Instead, the health of an instance is determined entirely by the `/readyz` check on port 6443.

6.9.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing VPC in Google Cloud Platform (GCP). If you do, you must also use existing subnets within the VPC and routing rules.

By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself.

6.9.3.1. Requirements for using your VPC

The installation program will no longer create the following components:

- VPC
- Subnets
- Cloud router
- Cloud NAT
- NAT IP addresses

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC and subnets must meet the following characteristics:

- The VPC must be in the same GCP project that you deploy the OpenShift Container Platform cluster to.
- To allow access to the internet from the control plane and compute machines, you must configure cloud NAT on the subnets to allow egress to it. These machines do not have a public address. Even if you do not require access to the internet, you must allow egress to the VPC network to obtain the installation program and images. Because multiple cloud NATs cannot be configured on the shared subnets, the installation program cannot configure it.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist and belong to the VPC that you specified.
- The subnet CIDRs belong to the machine CIDR.
- You must provide a subnet to deploy the cluster control plane and compute machines to. You can use the same subnet for both machine types.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted.

6.9.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or Ingress rules.

The GCP credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage, and nodes.

6.9.3.3. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is preserved by firewall rules that reference the machines in your cluster by the cluster's infrastructure ID. Only traffic within the cluster is allowed.

If you deploy multiple clusters to the same VPC, the following components might share access between clusters:

- The API, which is globally available with an external publishing strategy or available throughout the network in an internal publishing strategy
- Debugging tools, such as ports on VM instances that are open to the machine CIDR for SSH and ICMP access

6.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

6.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.26. Required parameters

Parameter	Description	Values
apiVersion	The API version for the install-config.yaml content. The current version is v1 . The installer may also support older API versions.	String
baseDomain	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata.name	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform	The configuration for the specific platform upon which to perform the installation: aws , baremetal , azure , gcp , openstack , ovirt , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
pullSecret	Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

6.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.27. Network parameters

Parameter	Description	Values
networking	The configuration for the cluster network.	Object  NOTE You cannot modify parameters specified by the networking object after installation.
networking.networkType	The cluster network provider Container Network Interface (CNI) plugin to install.	Either OpenShiftSDN or OVNKubernetes . The default value is OpenShiftSDN .
networking.clusterNetwork	The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23 . If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>

Parameter	Description	Values
networking.clusterNetwork.cidr	Required if you use networking.clusterNetwork . An IP address block. An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
networking.clusterNetwork.hostPrefix	The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr . A hostPrefix value of 23 provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.	A subnet prefix. The default value is 23 .
networking.serviceNetwork	The IP address block for services. The default value is 172.30.0.0/16 . The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example: <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
networking.machineNetwork	The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example: <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>
networking.machineNetwork.cidr	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

6.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.28. Optional parameters

Parameter	Description	Values
additionalTrustBundle	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
compute	The configuration for the machines that comprise the compute nodes.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
compute.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
compute.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
compute.name	Required if you use compute . The name of the machine pool.	worker
compute.platform	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
compute.replicas	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .

Parameter	Description	Values
controlPlane	The configuration for the machines that comprise the control plane.	Array of MachinePool objects. For details, see the following "Machine-pool" table.
controlPlane.architecture	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).	String
controlPlane.hyperthreading	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	Enabled or Disabled
controlPlane.name	Required if you use controlPlane . The name of the machine pool.	master
controlPlane.platform	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	aws, azure, gcp, openstack, ovirt, vsphere , or {}
controlPlane.replicas	The number of control plane machines to provision.	The only supported value is 3 , which is the default value.

Parameter	Description	Values
credentialsMode	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="486 517 595 864" style="display: inline-block; vertical-align: middle;">  </div> <p>NOTE</p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p>	Mint, Passthrough, Manual , or an empty string ("").

Parameter	Description	Values
fips	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>IMPORTANT</p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	false or true
imageContentSources	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources.source	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources.mirrors	Specify one or more repositories that may also contain the same images.	Array of strings
publish	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	Internal or External . To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal . The default value is External .

Parameter	Description	Values
sshKey	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: <key1> <key2> <key3></pre>

6.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 6.29. Additional GCP parameters

Parameter	Description	Values
platform.gcp.network	The name of the existing VPC that you want to deploy your cluster to.	String.
platform.gcp.region	The name of the GCP region that hosts your cluster.	Any valid region name, such as us-central1 .
platform.gcp.type	The GCP machine type .	The GCP machine type.
platform.gcp.zones	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid GCP availability zones , such as us-central1-a , in a YAML sequence .
platform.gcp.controlPlaneSubnet	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
platform.gcp.computeSubnet	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
platform.gcp.licenses	<p>A list of license URLs that must be applied to the compute images.</p>  <p>IMPORTANT</p> <p>The licenses parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the license API , such as the license to enable nested virtualization . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
platform.gcp.osDiskSizeGB	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
platform.gcp.osDiskType	The type of disk.	Either the default pd-ssd or the pd-standard disk type. The control plane nodes must be the pd-ssd disk type. The worker nodes can be either type.
controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
controlPlane.platform.gcp.osDisk.encryptionKey.location	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
controlPlane.platform.gcp.osDisk.encryptionKey.projectID	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
computePlatform.gcp.osDisk.encryptionKeyName	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on Cloud KMS locations .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

6.9.7.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

- 1 10 11 12 16** Required. The installation program prompts you for this value.
- 2 6** If you do not provide these parameters and values, the installation program provides the default value.
- 3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-<project_number>@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 13** Specify the name of an existing VPC.
- 14** Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15** Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 17** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 18** You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19** How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

6.9.7.3. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

Procedure

Create an Ingress Controller with global access on a new GCP cluster.

- Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

- Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

Sample **clientAccess** configuration to Global

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global 1
          type: GCP
          scope: Internal 2
          type: LoadBalancerService
```

- 1 Set `gcp.clientAccess` to **Global**.
- 2 Global access is only available to Ingress Controllers using internal load balancers.

6.9.8. Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

6.9.8.1. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

Sample **install-config.yaml** file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: custom-6-20480
  replicas: 3
```

6.9.8.2. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of

them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.9.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

Example output

```
...
INFO Install complete!
```

```

INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.9.13. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

6.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses infrastructure that you provide.

The steps for performing a user-provided infrastructure install are outlined here. Several [Deployment Manager](#) templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

NOTE

Be sure to also review this site list if you are configuring a proxy.

6.10.2. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The

machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

6.10.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.10.4. Configuring your GCP project

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

6.10.4.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the **api-int.<cluster_name>.<base_domain>** URL; the Premium Tier is required for internal load balancing.

6.10.4.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See [Enabling services](#) in the GCP documentation.

Table 6.30. Required API services

API service	Console service name
Cloud Deployment Manager V2 API	deploymentmanager.googleapis.com
Compute Engine API	compute.googleapis.com
Google Cloud APIs	cloudapis.googleapis.com
Cloud Resource Manager API	cloudresourcemanager.googleapis.com
Google DNS API	dns.googleapis.com
IAM Service Account Credentials API	iamcredentials.googleapis.com
Identity and Access Management (IAM) API	iam.googleapis.com
Service Management API	servicemanagement.googleapis.com
Service Usage API	serviceusage.googleapis.com
Google Cloud Storage JSON API	storage-api.googleapis.com
Cloud Storage	storage-component.googleapis.com

6.10.4.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

**NOTE**

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation.
You typically have four name servers.
4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).
5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.
6. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain. This process might include a request to your company's IT department or the division that controls the root domain and DNS services for your company.

6.10.4.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default [Quotas](#) do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.31. GCP resources used in a default cluster

Service	Component	Location	Total resources required	Resources removed after bootstrap
Service account	IAM	Global	5	0
Firewall rules	Networking	Global	11	1
Forwarding rules	Compute	Global	2	0
Health checks	Compute	Global	2	0
Images	Compute	Global	1	0
Networks	Networking	Global	1	0

Service	Component	Location	Total resources required	Resources removed after bootstrap
Routers	Networking	Global	1	0
Routes	Networking	Global	2	0
Subnetworks	Compute	Global	2	0
Target pools	Networking	Global	2	0

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**
- **europa-north1**
- **europa-west2**
- **europa-west3**
- **europa-west6**
- **northamerica-northeast1**
- **southamerica-east1**
- **us-west2**

You can increase resource quotas from the [GCP console](#), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.10.4.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.
2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

NOTE

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.
The service account key is required to create a cluster.

6.10.4.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Required roles for user-provisioned GCP infrastructure

- Deployment Manager Editor

- Service Account Key Admin

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.32. GCP service account permissions

Account	Roles
Control Plane	roles/compute.instanceAdmin
	roles/compute.networkAdmin
	roles/compute.securityAdmin
	roles/storage.admin
	roles/iam.serviceAccountUser
Compute	roles/compute.viewer
	roles/storage.admin

6.10.4.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)
- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europa-central2** (Warsaw, Poland)
- **europa-north1** (Hamina, Finland)

- **europa-west1** (St. Ghislain, Belgium)
- **europa-west2** (London, England, UK)
- **europa-west3** (Frankfurt, Germany)
- **europa-west4** (Eemshaven, Netherlands)
- **europa-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)
- **southamerica-east1** (São Paulo, Brazil)
- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

6.10.4.7. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.

Prerequisites

- You created a project to host your cluster.
- You created a service account and granted it the required permissions.

Procedure

1. Install the following binaries in **\$PATH**:

- **gcloud**
- **gsutil**

See [Install the latest Cloud SDK version](#) in the GCP documentation.

2. Authenticate using the **gcloud** tool with your configured service account.
See [Authorizing with a service account](#) in the GCP documentation.

6.10.5. Creating the installation files for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster

and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

6.10.5.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...  
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"  
INFO Consuming Install Config from target directory
```

```
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

- Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

- Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> ❶
      partitions:
        - label: var
          start_mib: <partition_start_offset> ❷
          size_mib: <partition_size> ❸
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] ❹
          with_mount_unit: true
```

- The storage device name of the disk that you want to partition.
- When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- The size of the data partition in mebibytes.
- The **prjquota** mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

6.10.5.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
 - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
 - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
 - v. Select the region to deploy the cluster to.
 - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - vii. Enter a descriptive name for your cluster.
 - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
- c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting **install-config.yaml** file to set **replicas** to **0** for the **compute** pool:

```
compute:
  - hyperthreading: Enabled
    name: worker
    platform: {}
    replicas: 0 1
```

1 Set to **0**.

2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.10.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-`<number_of_cpus>-<amount_of_memory_in_mb>`

For example, **custom-6-20480**.

6.10.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3

```

```

additionalTrustBundle: | 4
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.10.5.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Optional: If you do not want the cluster to provision compute machines, remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:
 - a. Open the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** file.
 - b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.

- c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- 1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

Additional resources

- [Optional: Adding the ingress DNS records](#)

6.10.6. Exporting common variables

6.10.6.1. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your

cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

6.10.6.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

NOTE

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Generate the Ignition config files for your cluster.
- Install the **jq** package.

Procedure

1. Export the following common variables to be used by the provided Deployment Manager templates:

```
$ export BASE_DOMAIN='<base_domain>'
$ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>'
$ export NETWORK_CIDR='10.0.0.0/16'
$ export MASTER_SUBNET_CIDR='10.0.0.0/17'
$ export WORKER_SUBNET_CIDR='10.0.128.0/17'

$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
$ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
$ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
$ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
$ export REGION=`jq -r .gcp.region <installation_directory>/metadata.json`
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

6.10.7. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.

Procedure

1. Copy the template from the **Deployment Manager template for the VPC** section of this topic and save it as **01_vpc.py** on your computer. This template describes the VPC that your cluster requires.
2. Create a **01_vpc.yaml** resource definition file:

```
$ cat <<EOF >01_vpc.yaml
imports:
- path: 01_vpc.py

resources:
- name: cluster-vpc
  type: 01_vpc.py
  properties:
    infra_id: '${INFRA_ID}' 1
```

```

region: '${REGION}' 2
master_subnet_cidr: '${MASTER_SUBNET_CIDR}' 3
worker_subnet_cidr: '${WORKER_SUBNET_CIDR}' 4
EOF

```

- 1** `infra_id` is the **INFRA_ID** infrastructure name from the extraction step.
- 2** `region` is the region to deploy the cluster into, for example **us-central1**.
- 3** `master_subnet_cidr` is the CIDR for the master subnet, for example **10.0.0.0/17**.
- 4** `worker_subnet_cidr` is the CIDR for the worker subnet, for example **10.0.128.0/17**.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-vpc --config 01_vpc.yaml
```

6.10.7.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

Example 6.1. 01_vpc.py Deployment Manager template

```

def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-network',
        'type': 'compute.v1.network',
        'properties': {
            'region': context.properties['region'],
            'autoCreateSubnetworks': False
        }
    }, {
        'name': context.properties['infra_id'] + '-master-subnet',
        'type': 'compute.v1.subnetwork',
        'properties': {
            'region': context.properties['region'],
            'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
            'ipCidrRange': context.properties['master_subnet_cidr']
        }
    }, {
        'name': context.properties['infra_id'] + '-worker-subnet',
        'type': 'compute.v1.subnetwork',
        'properties': {
            'region': context.properties['region'],
            'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
            'ipCidrRange': context.properties['worker_subnet_cidr']
        }
    }, {
        'name': context.properties['infra_id'] + '-router',
        'type': 'compute.v1.router',
        'properties': {
            'region': context.properties['region'],

```

```

'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink)',
'nats': [{
  'name': context.properties['infra_id'] + '-nat-master',
  'natIpAllocateOption': 'AUTO_ONLY',
  'minPortsPerVm': 7168,
  'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
  'subnetworks': [{
    'name': '${ref.' + context.properties['infra_id'] + '-master-subnet.selfLink)',
    'sourceIpRangesToNat': ['ALL_IP_RANGES']
  }]
}, {
  'name': context.properties['infra_id'] + '-nat-worker',
  'natIpAllocateOption': 'AUTO_ONLY',
  'minPortsPerVm': 512,
  'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
  'subnetworks': [{
    'name': '${ref.' + context.properties['infra_id'] + '-worker-subnet.selfLink)',
    'sourceIpRangesToNat': ['ALL_IP_RANGES']
  }]
}]
}
}]

return {'resources': resources}

```

6.10.8. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **initramfs** during boot to fetch their Ignition config files.

6.10.8.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, set statically through kernel arguments, or another method, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as **localhost** or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.10.8.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.33. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	1936	Metrics
	9000-9999	Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099 .
	10250-10259	The default ports that Kubernetes reserves
	10256	openshift-sdn
UDP	4789	VXLAN and Geneve
	6081	VXLAN and Geneve
	9000-9999	Host level services, including the node exporter on ports 9100-9101 .
	500	IPsec IKE packets
	4500	IPsec NAT-T packets
TCP/UDP	30000-32767	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 6.34. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	6443	Kubernetes API

Table 6.35. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	2379-2380	etcd server and peer ports

6.10.9. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the internal load balancer** section of this topic and save it as **02_lb_int.py** on your computer. This template describes the internal load balancing objects that your cluster requires.
2. For an external cluster, also copy the template from the **Deployment Manager template for the external load balancer** section of this topic and save it as **02_lb_ext.py** on your computer. This template describes the external load balancing objects that your cluster requires.
3. Export the variables that the deployment template uses:

- a. Export the cluster network location:

```
$ export CLUSTER_NETWORK=(`gcloud compute networks describe ${INFRA_ID}-network --format json | jq -r .selfLink`)
```

- b. Export the control plane subnet location:

```
$ export CONTROL_SUBNET=(`gcloud compute networks subnets describe ${INFRA_ID}-master-subnet --region=${REGION} --format json | jq -r .selfLink`)
```

- c. Export the three zones that the cluster uses:

```
$ export ZONE_0=(`gcloud compute regions describe ${REGION} --format=json | jq -r .zones[0] | cut -d "/" -f9`)
```

```
$ export ZONE_1=(`gcloud compute regions describe ${REGION} --format=json | jq -r .zones[1] | cut -d "/" -f9`)
```

```
$ export ZONE_2=(`gcloud compute regions describe ${REGION} --format=json | jq -r .zones[2] | cut -d "/" -f9`)
```

4. Create a **02_infra.yaml** resource definition file:

```
$ cat <<EOF >02_infra.yaml
imports:
- path: 02_lb_ext.py
- path: 02_lb_int.py ❶
resources:
- name: cluster-lb-ext ❷
  type: 02_lb_ext.py
  properties:
    infra_id: '${INFRA_ID}' ❸
    region: '${REGION}' ❹
- name: cluster-lb-int
  type: 02_lb_int.py
  properties:
    cluster_network: '${CLUSTER_NETWORK}'
    control_subnet: '${CONTROL_SUBNET}' ❺
    infra_id: '${INFRA_ID}'
    region: '${REGION}'
    zones: ❻
    - '${ZONE_0}'
    - '${ZONE_1}'
    - '${ZONE_2}'
EOF
```

- ❶ ❷ Required only when deploying an external cluster.
- ❸ **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- ❹ **region** is the region to deploy the cluster into, for example **us-central1**.
- ❺ **control_subnet** is the URI to the control subnet.
- ❻ **zones** are the zones to deploy the control plane instances into, like **us-east1-b**, **us-east1-c**, and **us-east1-d**.

5. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml
```

6. Export the cluster IP address:

```
$ export CLUSTER_IP=$(gcloud compute addresses describe ${INFRA_ID}-cluster-ip --region=${REGION} --format json | jq -r .address)
```

7. For an external cluster, also export the cluster public IP address:

```
$ export CLUSTER_PUBLIC_IP=$(gcloud compute addresses describe ${INFRA_ID}-cluster-public-ip --region=${REGION} --format json | jq -r .address)
```

6.10.9.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

Example 6.2. `02_lb_ext.py` Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-cluster-public-ip',
        'type': 'compute.v1.address',
        'properties': {
            'region': context.properties['region']
        }
    }, {
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
        # probe for kube-apiserver
        'name': context.properties['infra_id'] + '-api-http-health-check',
        'type': 'compute.v1.httpHealthCheck',
        'properties': {
            'port': 6080,
            'requestPath': '/readyz'
        }
    }, {
        'name': context.properties['infra_id'] + '-api-target-pool',
        'type': 'compute.v1.targetPool',
        'properties': {
            'region': context.properties['region'],
            'healthChecks': ['$$(ref.' + context.properties['infra_id'] + '-api-http-health-check.selfLink)'],
            'instances': []
        }
    }, {
        'name': context.properties['infra_id'] + '-api-forwarding-rule',
        'type': 'compute.v1.forwardingRule',
        'properties': {
            'region': context.properties['region'],
            'IPAddress': '$(ref.' + context.properties['infra_id'] + '-cluster-public-ip.selfLink)',
            'target': '$(ref.' + context.properties['infra_id'] + '-api-target-pool.selfLink)',
            'portRange': '6443'
        }
    }
    ]

    return {'resources': resources}
```

6.10.9.2. Deployment Manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

Example 6.3. `02_lb_int.py` Deployment Manager template

```
def GenerateConfig(context):

    backends = []
    for zone in context.properties['zones']:
```

```

    backends.append({
      'group': '${ref.' + context.properties['infra_id'] + '-master-' + zone + '-instance-group' +
'.selfLink}'
    })

    resources = [{
      'name': context.properties['infra_id'] + '-cluster-ip',
      'type': 'compute.v1.address',
      'properties': {
        'addressType': 'INTERNAL',
        'region': context.properties['region'],
        'subnetwork': context.properties['control_subnet']
      }
    }, {
      # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
      probe for kube-apiserver
      'name': context.properties['infra_id'] + '-api-internal-health-check',
      'type': 'compute.v1.healthCheck',
      'properties': {
        'httpsHealthCheck': {
          'port': 6443,
          'requestPath': '/readyz'
        },
        'type': "HTTPS"
      }
    }, {
      'name': context.properties['infra_id'] + '-api-internal-backend-service',
      'type': 'compute.v1.regionBackendService',
      'properties': {
        'backends': backends,
        'healthChecks': ['${ref.' + context.properties['infra_id'] + '-api-internal-health-
check.selfLink)'],
        'loadBalancingScheme': 'INTERNAL',
        'region': context.properties['region'],
        'protocol': 'TCP',
        'timeoutSec': 120
      }
    }, {
      'name': context.properties['infra_id'] + '-api-internal-forwarding-rule',
      'type': 'compute.v1.forwardingRule',
      'properties': {
        'backendService': '${ref.' + context.properties['infra_id'] + '-api-internal-backend-
service.selfLink)',
        'IPAddress': '${ref.' + context.properties['infra_id'] + '-cluster-ip.selfLink)',
        'loadBalancingScheme': 'INTERNAL',
        'ports': ['6443','22623'],
        'region': context.properties['region'],
        'subnetwork': context.properties['control_subnet']
      }
    }
  ]

  for zone in context.properties['zones']:
    resources.append({
      'name': context.properties['infra_id'] + '-master-' + zone + '-instance-group',
      'type': 'compute.v1.instanceGroup',
      'properties': {

```

```

        'namedPorts': [
            {
                'name': 'ignition',
                'port': 22623
            }, {
                'name': 'https',
                'port': 6443
            }
        ],
        'network': context.properties['cluster_network'],
        'zone': zone
    }
})

return {'resources': resources}

```

You will need this template in addition to the **02_lb_ext.py** template when you create an external cluster.

6.10.10. Creating a private DNS zone in GCP

You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the private DNS** section of this topic and save it as **02_dns.py** on your computer. This template describes the private DNS objects that your cluster requires.
2. Create a **02_dns.yaml** resource definition file:

```

$ cat <<EOF >02_dns.yaml
imports:
- path: 02_dns.py

resources:
- name: cluster-dns

```

```

type: 02_dns.py
properties:
  infra_id: '${INFRA_ID}' ❶
  cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}' ❷
  cluster_network: '${CLUSTER_NETWORK}' ❸
EOF

```

- ❶ **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- ❷ **cluster_domain** is the domain for the cluster, for example **openshift.example.com**.
- ❸ **cluster_network** is the **selfLink** URL to the cluster network.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml
```

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:
 - a. Add the internal DNS entries:

```

$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-
int.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone

```

- b. For an external cluster, also add the external DNS entries:

```

$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction add ${CLUSTER_PUBLIC_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone
${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction execute --zone ${BASE_DOMAIN_ZONE_NAME}

```

6.10.10.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

Example 6.4. 02_dns.py Deployment Manager template

```

def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-private-zone',
        'type': 'dns.v1.managedZone',

```

```

'properties': {
  'description': "",
  'dnsName': context.properties['cluster_domain'] + '.',
  'visibility': 'private',
  'privateVisibilityConfig': {
    'networks': [{
      'networkUrl': context.properties['cluster_network']
    }]
  }
}
}}

return {'resources': resources}

```

6.10.11. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for firewall rules** section of this topic and save it as **03_firewall.py** on your computer. This template describes the security groups that your cluster requires.
2. Create a **03_firewall.yaml** resource definition file:

```

$ cat <<EOF >03_firewall.yaml
imports:
- path: 03_firewall.py

resources:
- name: cluster-firewall
  type: 03_firewall.py
  properties:
    allowed_external_cidr: '0.0.0.0/0' 1
    infra_id: '${INFRA_ID}' 2

```

```

cluster_network: '${CLUSTER_NETWORK}' 3
network_cidr: '${NETWORK_CIDR}' 4
EOF

```

- 1** `allowed_external_cidr` is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to `${NETWORK_CIDR}`.
- 2** `infra_id` is the `INFRA_ID` infrastructure name from the extraction step.
- 3** `cluster_network` is the `selfLink` URL to the cluster network.
- 4** `network_cidr` is the CIDR of the VPC network, for example `10.0.0.0/16`.

3. Create the deployment by using the `gcloud` CLI:

```

$ gcloud deployment-manager deployments create ${INFRA_ID}-firewall --config
03_firewall.yaml

```

6.10.11.1. Deployment Manager template for firewall rules

You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

Example 6.5. `03_firewall.py` Deployment Manager template

```

def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['22']
            }],
            'sourceRanges': [context.properties['allowed_external_cidr']],
            'targetTags': [context.properties['infra_id'] + '-bootstrap']
        }
    ], {
        'name': context.properties['infra_id'] + '-api',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['6443']
            }],
            'sourceRanges': [context.properties['allowed_external_cidr']],
            'targetTags': [context.properties['infra_id'] + '-master']
        }
    }, {
        'name': context.properties['infra_id'] + '-health-checks',
        'type': 'compute.v1.firewall',

```

```

'properties': {
  'network': context.properties[cluster_network],
  'allowed': [{
    'IPProtocol': 'tcp',
    'ports': ['6080', '6443', '22624']
  }],
  'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22'],
  'targetTags': [context.properties[infra_id] + '-master']
}
}, {
  'name': context.properties[infra_id] + '-etcd',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties[cluster_network],
    'allowed': [{
      'IPProtocol': 'tcp',
      'ports': ['2379-2380']
    }],
    'sourceTags': [context.properties[infra_id] + '-master'],
    'targetTags': [context.properties[infra_id] + '-master']
  }
}, {
  'name': context.properties[infra_id] + '-control-plane',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties[cluster_network],
    'allowed': [{
      'IPProtocol': 'tcp',
      'ports': ['10257']
    }],
    {
      'IPProtocol': 'tcp',
      'ports': ['10259']
    },
    {
      'IPProtocol': 'tcp',
      'ports': ['22623']
    }
  ],
  'sourceTags': [
    context.properties[infra_id] + '-master',
    context.properties[infra_id] + '-worker'
  ],
  'targetTags': [context.properties[infra_id] + '-master']
}
}, {
  'name': context.properties[infra_id] + '-internal-network',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties[cluster_network],
    'allowed': [{
      'IPProtocol': 'icmp'
    }],
    {
      'IPProtocol': 'tcp',
      'ports': ['22']
    }
  ],
  'sourceRanges': [context.properties[network_cidr]],
  'targetTags': [
    context.properties[infra_id] + '-master',

```

```

        context.properties['infra_id'] + '-worker'
    ]
}
}, {
  'name': context.properties['infra_id'] + '-internal-cluster',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [{
      'IPProtocol': 'udp',
      'ports': ['4789', '6081']
    }, {
      'IPProtocol': 'udp',
      'ports': ['500', '4500']
    }, {
      'IPProtocol': 'esp',
    }, {
      'IPProtocol': 'tcp',
      'ports': ['9000-9999']
    }, {
      'IPProtocol': 'udp',
      'ports': ['9000-9999']
    }, {
      'IPProtocol': 'tcp',
      'ports': ['10250']
    }, {
      'IPProtocol': 'tcp',
      'ports': ['30000-32767']
    }, {
      'IPProtocol': 'udp',
      'ports': ['30000-32767']
    }
  ],
  'sourceTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
}
]]

return {'resources': resources}

```

6.10.12. Creating IAM roles in GCP

You must create IAM roles in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for IAM roles** section of this topic and save it as **03_iam.py** on your computer. This template describes the IAM roles that your cluster requires.
2. Create a **03_iam.yaml** resource definition file:

```
$ cat <<EOF >03_iam.yaml
imports:
- path: 03_iam.py
resources:
- name: cluster-iam
  type: 03_iam.py
  properties:
    infra_id: '${INFRA_ID}' 1
EOF
```

- 1** **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-iam --config 03_iam.yaml
```

4. Export the variable for the master service account:

```
$ export MASTER_SERVICE_ACCOUNT=$(gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-m@${PROJECT_NAME}." --format json | jq -r '.[0].email')
```

5. Export the variable for the worker service account:

```
$ export WORKER_SERVICE_ACCOUNT=$(gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')
```

6. Export the variable for the subnet that hosts the compute machines:

```
$ export COMPUTE_SUBNET=$(gcloud compute networks subnets describe ${INFRA_ID}-
worker-subnet --region=${REGION} --format json | jq -r .selfLink')
```

- The templates do not create the policy bindings due to limitations of Deployment Manager, so you must create them manually:

```
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.instanceAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.securityAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/storage.admin"

$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/compute.viewer"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/storage.admin"
```

- Create a service account key and store it locally for later use:

```
$ gcloud iam service-accounts keys create service-account-key.json --iam-
account=${MASTER_SERVICE_ACCOUNT}
```

6.10.12.1. Deployment Manager template for IAM roles

You can use the following Deployment Manager template to deploy the IAM roles that you need for your OpenShift Container Platform cluster:

Example 6.6. 03_iam.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-master-node-sa',
        'type': 'iam.v1.serviceAccount',
        'properties': {
            'accountId': context.properties['infra_id'] + '-m',
            'displayName': context.properties['infra_id'] + '-master-node'
        }
    }, {
        'name': context.properties['infra_id'] + '-worker-node-sa',
        'type': 'iam.v1.serviceAccount',
        'properties': {
            'accountId': context.properties['infra_id'] + '-w',
            'displayName': context.properties['infra_id'] + '-worker-node'
        }
    }
    ]

    return {'resources': resources}
```

6.10.13. Creating the RHCOS cluster image for the GCP infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Google Cloud Platform (GCP) for your OpenShift Container Platform nodes.

Procedure

1. Obtain the RHCOS image from the [RHCOS image mirror](#) page.

IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must download an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

The file name contains the OpenShift Container Platform version number in the format **rhcos-
<version>-<arch>-gcp.<arch>.tar.gz**.

2. Create the Google storage bucket:

```
$ gsutil mb gs://<bucket_name>
```

3. Upload the RHCOS image to the Google storage bucket:

```
$ gsutil cp <downloaded_image_file_path>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz  
gs://<bucket_name>
```

4. Export the uploaded RHCOS image location as a variable:

```
$ export IMAGE_SOURCE="gs://<bucket_name>/rhcos-<version>-x86_64-  
gcp.x86_64.tar.gz"
```

5. Create the cluster image:

```
$ gcloud compute images create "${INFRA_ID}-rhcos-image" \  
--source-uri="${IMAGE_SOURCE}"
```

6.10.14. Creating the bootstrap machine in GCP

You must create the bootstrap machine in Google Cloud Platform (GCP) to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Ensure pyOpenSSL is installed.

Procedure

1. Copy the template from the **Deployment Manager template for the bootstrap machine** section of this topic and save it as **04_bootstrap.py** on your computer. This template describes the bootstrap machine that your cluster requires.
2. Export the location of the Red Hat Enterprise Linux CoreOS (RHCOS) image that the installation program requires:

```
$ export CLUSTER_IMAGE=`gcloud compute images describe ${INFRA_ID}-rhcos-image --
format json | jq -r .selfLink`
```

3. Create a bucket and upload the **bootstrap.ign** file:

```
$ gsutil mb gs://${INFRA_ID}-bootstrap-ignition
$ gsutil cp <installation_directory>/bootstrap.ign gs://${INFRA_ID}-bootstrap-ignition/
```

4. Create a signed URL for the bootstrap instance to use to access the Ignition config. Export the URL from the output as a variable:

```
$ export BOOTSTRAP_IGN=`gsutil signurl -d 1h service-account-key.json gs://${INFRA_ID}-
bootstrap-ignition/bootstrap.ign | grep "^gs:" | awk '{print $5}`
```

5. Create a **04_bootstrap.yaml** resource definition file:

```
$ cat <<EOF >04_bootstrap.yaml
imports:
- path: 04_bootstrap.py

resources:
- name: cluster-bootstrap
  type: 04_bootstrap.py
  properties:
    infra_id: '${INFRA_ID}' 1
    region: '${REGION}' 2
    zone: '${ZONE_0}' 3

    cluster_network: '${CLUSTER_NETWORK}' 4
    control_subnet: '${CONTROL_SUBNET}' 5
    image: '${CLUSTER_IMAGE}' 6
    machine_type: 'n1-standard-4' 7
    root_volume_size: '128' 8
```

```
bootstrap_ign: '${BOOTSTRAP_IGN}' 9
EOF
```

- 1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 2 **region** is the region to deploy the cluster into, for example **us-central1**.
- 3 **zone** is the zone to deploy the bootstrap instance into, for example **us-central1-b**.
- 4 **cluster_network** is the **selfLink** URL to the cluster network.
- 5 **control_subnet** is the **selfLink** URL to the control subnet.
- 6 **image** is the **selfLink** URL to the RHCOS image.
- 7 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 8 **root_volume_size** is the boot disk size for the bootstrap machine.
- 9 **bootstrap_ign** is the URL output when creating a signed URL.

6. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-bootstrap --config
04_bootstrap.yaml
```

7. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the bootstrap machine manually.
 - a. Add the bootstrap instance to the internal load balancer instance group:

```
$ gcloud compute instance-groups unmanaged add-instances \
  ${INFRA_ID}-bootstrap-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-
  bootstrap
```

- b. Add the bootstrap instance group to the internal load balancer backend service:

```
$ gcloud compute backend-services add-backend \
  ${INFRA_ID}-api-internal-backend-service --region=${REGION} --instance-
  group=${INFRA_ID}-bootstrap-instance-group --instance-group-zone=${ZONE_0}
```

6.10.14.1. Deployment Manager template for the bootstrap machine

You can use the following Deployment Manager template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

Example 6.7. 04_bootstrap.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-public-ip',
        'type': 'compute.v1.address',
```

```

    'properties': {
      'region': context.properties['region']
    }
  }, {
    'name': context.properties['infra_id'] + '-bootstrap',
    'type': 'compute.v1.instance',
    'properties': {
      'disks': [{
        'autoDelete': True,
        'boot': True,
        'initializeParams': {
          'diskSizeGb': context.properties['root_volume_size'],
          'sourceImage': context.properties['image']
        }
      }],
      'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' +
context.properties['machine_type'],
      'metadata': {
        'items': [{
          'key': 'user-data',
          'value': '{"ignition":{"config":{"replace":{"source":"' + context.properties['bootstrap_ign']
+ '"},"version":"3.1.0"}}}',
        ]
      }],
      'networkInterfaces': [{
        'subnetwork': context.properties['control_subnet'],
        'accessConfigs': [{
          'natIP': '${ref.' + context.properties['infra_id'] + '-bootstrap-public-ip.address}'
        ]
      }],
      'tags': {
        'items': [
          context.properties['infra_id'] + '-master',
          context.properties['infra_id'] + '-bootstrap'
        ]
      },
      'zone': context.properties['zone']
    }
  }, {
    'name': context.properties['infra_id'] + '-bootstrap-instance-group',
    'type': 'compute.v1.instanceGroup',
    'properties': {
      'namedPorts': [
        {
          'name': 'ignition',
          'port': 22623
        }, {
          'name': 'https',
          'port': 6443
        }
      ],
      'network': context.properties['cluster_network'],
      'zone': context.properties['zone']
    }
  }
}

```

```

}}
return {'resources': resources}

```

6.10.15. Creating the control plane machines in GCP

You must create the control plane machines in Google Cloud Platform (GCP) for your cluster to use. One way to create these machines is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.

Procedure

1. Copy the template from the **Deployment Manager template for control plane machines** section of this topic and save it as **05_control_plane.py** on your computer. This template describes the control plane machines that your cluster requires.
2. Export the following variable required by the resource definition:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign`
```

3. Create a **05_control_plane.yaml** resource definition file:

```

$ cat <<EOF >05_control_plane.yaml
imports:
- path: 05_control_plane.py

resources:
- name: cluster-control-plane
  type: 05_control_plane.py
  properties:
    infra_id: '${INFRA_ID}' 1
    zones: 2
    - '${ZONE_0}'

```

```

- '${ZONE_1}'
- '${ZONE_2}'

control_subnet: '${CONTROL_SUBNET}' 3
image: '${CLUSTER_IMAGE}' 4
machine_type: 'n1-standard-4' 5
root_volume_size: '128'
service_account_email: '${MASTER_SERVICE_ACCOUNT}' 6

ignition: '${MASTER_IGNITION}' 7
EOF

```

- 1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 2 **zones** are the zones to deploy the control plane instances into, for example **us-central1-a**, **us-central1-b**, and **us-central1-c**.
- 3 **control_subnet** is the **selfLink** URL to the control subnet.
- 4 **image** is the **selfLink** URL to the RHCOS image.
- 5 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 6 **service_account_email** is the email address for the master service account that you created.
- 7 **ignition** is the contents of the **master.ign** file.

4. Create the deployment by using the **gcloud** CLI:

```

$ gcloud deployment-manager deployments create ${INFRA_ID}-control-plane --config
05_control_plane.yaml

```

5. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the control plane machines manually.

- Run the following commands to add the control plane machines to the appropriate instance groups:

```

$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_0}-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-master-0
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_1}-instance-group --zone=${ZONE_1} --instances=${INFRA_ID}-master-1
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_2}-instance-group --zone=${ZONE_2} --instances=${INFRA_ID}-master-2

```

- For an external cluster, you must also run the following commands to add the control plane machines to the target pools:

```

$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_0}" --instances=${INFRA_ID}-master-0
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-

```

```
zone="${ZONE_1}" --instances=${INFRA_ID}-master-1
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_2}" --instances=${INFRA_ID}-master-2
```

6.10.15.1. Deployment Manager template for control plane machines

You can use the following Deployment Manager template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 6.8. 05_control_plane.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-master-0',
        'type': 'compute.v1.instance',
        'properties': {
            'disks': [{
                'autoDelete': True,
                'boot': True,
                'initializeParams': {
                    'diskSizeGb': context.properties['root_volume_size'],
                    'diskType': 'zones/' + context.properties['zones'][0] + '/diskTypes/pd-ssd',
                    'sourceImage': context.properties['image']
                }
            }],
            'machineType': 'zones/' + context.properties['zones'][0] + '/machineTypes/' +
context.properties['machine_type'],
            'metadata': {
                'items': [{
                    'key': 'user-data',
                    'value': context.properties['ignition']
                }]
            },
            'networkInterfaces': [{
                'subnetwork': context.properties['control_subnet']
            }],
            'serviceAccounts': [{
                'email': context.properties['service_account_email'],
                'scopes': ['https://www.googleapis.com/auth/cloud-platform']
            }],
            'tags': {
                'items': [
                    context.properties['infra_id'] + '-master',
                ]
            },
            'zone': context.properties['zones'][0]
        }
    ], {
        'name': context.properties['infra_id'] + '-master-1',
        'type': 'compute.v1.instance',
        'properties': {
            'disks': [{
                'autoDelete': True,
                'boot': True,
```

```

        'initializeParams': {
          'diskSizeGb': context.properties['root_volume_size'],
          'diskType': 'zones/' + context.properties['zones'][1] + '/diskTypes/pd-ssd',
          'sourceImage': context.properties['image']
        }
      }],
      'machineType': 'zones/' + context.properties['zones'][1] + '/machineTypes/' +
context.properties['machine_type'],
      'metadata': {
        'items': [{
          'key': 'user-data',
          'value': context.properties['ignition']
        }]
      },
      'networkInterfaces': [{
        'subnetwork': context.properties['control_subnet']
      }],
      'serviceAccounts': [{
        'email': context.properties['service_account_email'],
        'scopes': ['https://www.googleapis.com/auth/cloud-platform']
      }],
      'tags': {
        'items': [
          context.properties['infra_id'] + '-master',
        ]
      },
      'zone': context.properties['zones'][1]
    }
  }, {
    'name': context.properties['infra_id'] + '-master-2',
    'type': 'compute.v1.instance',
    'properties': {
      'disks': [{
        'autoDelete': True,
        'boot': True,
        'initializeParams': {
          'diskSizeGb': context.properties['root_volume_size'],
          'diskType': 'zones/' + context.properties['zones'][2] + '/diskTypes/pd-ssd',
          'sourceImage': context.properties['image']
        }
      }],
      'machineType': 'zones/' + context.properties['zones'][2] + '/machineTypes/' +
context.properties['machine_type'],
      'metadata': {
        'items': [{
          'key': 'user-data',
          'value': context.properties['ignition']
        }]
      },
      'networkInterfaces': [{
        'subnetwork': context.properties['control_subnet']
      }],
      'serviceAccounts': [{
        'email': context.properties['service_account_email'],
        'scopes': ['https://www.googleapis.com/auth/cloud-platform']
      }],
    }
  }
]

```

```

    'tags': {
      'items': [
        context.properties['infra_id'] + '-master',
      ]
    },
    'zone': context.properties['zones'][2]
  }
}
]]

return {'resources': resources}

```

6.10.16. Wait for bootstrap completion and remove bootstrap resources in GCP

After you create all of the required infrastructure in Google Cloud Platform (GCP), wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level info 2
```

1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```
$ gcloud compute backend-services remove-backend ${INFRA_ID}-api-internal-backend-
service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --
instance-group-zone=${ZONE_0}
```

```
$ gsutil rm gs://{INFRA_ID}-bootstrap-ignition/bootstrap.ign
$ gsutil rb gs://{INFRA_ID}-bootstrap-ignition
$ gcloud deployment-manager deployments delete ${INFRA_ID}-bootstrap
```

6.10.17. Creating additional worker machines in GCP

You can create worker machines in Google Cloud Platform (GCP) for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Deployment Manager template. Additional instances can be launched by including additional resources of type **06_worker.py** in the file.

NOTE

If you do not use the provided Deployment Manager template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Copy the template from the **Deployment Manager template for worker machines** section of this topic and save it as **06_worker.py** on your computer. This template describes the worker machines that your cluster requires.
2. Export the variables that the resource definition uses.
 - a. Export the subnet that hosts the compute machines:

```
$ export COMPUTE_SUBNET=$(gcloud compute networks subnets describe
${INFRA_ID}-worker-subnet --region=${REGION} --format json | jq -r '.selfLink')
```

- b. Export the email address for your service account:

```
$ export WORKER_SERVICE_ACCOUNT=$(gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')
```

- c. Export the location of the compute machine Ignition config file:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign`
```

3. Create a **06_worker.yaml** resource definition file:

```
$ cat <<EOF >06_worker.yaml
imports:
- path: 06_worker.py

resources:
- name: 'worker-0' 1
  type: 06_worker.py
  properties:
    infra_id: '${INFRA_ID}' 2
    zone: '${ZONE_0}' 3
    compute_subnet: '${COMPUTE_SUBNET}' 4
    image: '${CLUSTER_IMAGE}' 5
    machine_type: 'n1-standard-4' 6
    root_volume_size: '128'
    service_account_email: '${WORKER_SERVICE_ACCOUNT}' 7
    ignition: '${WORKER_IGNITION}' 8
- name: 'worker-1'
  type: 06_worker.py
  properties:
    infra_id: '${INFRA_ID}' 9
    zone: '${ZONE_1}' 10
    compute_subnet: '${COMPUTE_SUBNET}' 11
    image: '${CLUSTER_IMAGE}' 12
    machine_type: 'n1-standard-4' 13
    root_volume_size: '128'
    service_account_email: '${WORKER_SERVICE_ACCOUNT}' 14
    ignition: '${WORKER_IGNITION}' 15
EOF
```

- 1 **name** is the name of the worker machine, for example **worker-0**.
- 2 9 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 3 10 **zone** is the zone to deploy the worker machine into, for example **us-central1-a**.
- 4 11 **compute_subnet** is the **selfLink** URL to the compute subnet.
- 5 12 **image** is the **selfLink** URL to the RHCOS image. ¹
- 6 13 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 7 14 **service_account_email** is the email address for the worker service account that you created.
- 8 15 **ignition** is the contents of the **worker.ign** file.

4. Optional: If you want to launch additional instances, include additional resources of type **06_worker.py** in your **06_worker.yaml** resource definition file.
5. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-worker --config
06_worker.yaml
```

1. To use a GCP Marketplace image, specify the offer to use:
 - OpenShift Container Platform: <https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-202210040145>
 - OpenShift Platform Plus: <https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-opp-48-x86-64-202206140145>
 - OpenShift Kubernetes Engine: <https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-oke-48-x86-64-202206140145>

6.10.17.1. Deployment Manager template for worker machines

You can use the following Deployment Manager template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 6.9. 06_worker.py Deployment Manager template

```
def GenerateConfig(context):
    resources = [{
        'name': context.properties['infra_id'] + '-' + context.env['name'],
        'type': 'compute.v1.instance',
        'properties': {
            'disks': [{
                'autoDelete': True,
                'boot': True,
                'initializeParams': {
                    'diskSizeGb': context.properties['root_volume_size'],
                    'sourceImage': context.properties['image']
                }
            }],
            'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' +
context.properties['machine_type'],
            'metadata': {
                'items': [{
                    'key': 'user-data',
                    'value': context.properties['ignition']
                }]
            },
            'networkInterfaces': [{
                'subnetwork': context.properties['compute_subnet']
            }],
            'serviceAccounts': [{
                'email': context.properties['service_account_email'],
                'scopes': ['https://www.googleapis.com/auth/cloud-platform']
```

```

    }],
    'tags': {
      'items': [
        context.properties['infra_id'] + '-worker',
      ]
    },
    'zone': context.properties['zone']
  }
}
return {'resources': resources}

```

6.10.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.10.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

6.10.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.21.0
master-1  Ready   master 63m  v1.21.0
master-2  Ready   master 64m  v1.21.0
```

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```

NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...

```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}\n{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}\n{{end}}{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.21.0
master-1  Ready   master 73m  v1.21.0
master-2  Ready   master 74m  v1.21.0
worker-0  Ready   worker 11m  v1.21.0
worker-1  Ready   worker 11m  v1.21.0
```

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

6.10.21. Optional: Adding the ingress DNS records

If you removed the DNS zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the ingress load balancer. You can create either a wildcard ***.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

Prerequisites

- Configure a GCP account.
- Remove the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
- Create the worker machines.

Procedure

1. Wait for the Ingress router to create a load balancer and populate the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

Example output

```
NAME          TYPE          CLUSTER-IP    EXTERNAL-IP    PORT(S)          AGE
router-default LoadBalancer  172.30.18.154 35.233.157.184 80:32288/TCP,443:31215/TCP 98
```

2. Add the A record to your zones:

- To use A records:
 - i. Export the variable for the router IP address:

```
$ export ROUTER_IP=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

- ii. Add the A record to the private zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
```

```
$ gcloud dns record-sets transaction add ${ROUTER_IP} --name
\*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
${INFRA_ID}-private-zone
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone
```

- iii. For an external cluster, also add the A record to the public zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction add ${ROUTER_IP} --name
\*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction execute --zone
${BASE_DOMAIN_ZONE_NAME}
```

- To add explicit domains instead of using a wildcard, create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}{end}{end}' routes
```

Example output

```
oauth-openshift.apps.your.cluster.domain.example.com
console-openshift-console.apps.your.cluster.domain.example.com
downloads-openshift-console.apps.your.cluster.domain.example.com
alertmanager-main-openshift-monitoring.apps.your.cluster.domain.example.com
grafana-openshift-monitoring.apps.your.cluster.domain.example.com
prometheus-k8s-openshift-monitoring.apps.your.cluster.domain.example.com
```

6.10.22. Completing a GCP installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Google Cloud Platform (GCP) user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned GCP infrastructure.
- Install the **oc** CLI and log in.

Procedure

1. Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Observe the running state of your cluster.

- a. Run the following command to view the current cluster version and status:

```
$ oc get clusterversion
```

Example output

```
NAME      VERSION  AVAILABLE  PROGRESSING  SINCE  STATUS
version   False    True       24m         Working towards 4.5.4: 99% complete
```

- b. Run the following command to view the Operators managed on the control plane by the Cluster Version Operator (CVO):

```
$ oc get clusteroperators
```

Example output

```
NAME              VERSION  AVAILABLE  PROGRESSING  DEGRADED  SINCE
authentication    4.5.4   True       False        False     7m56s
cloud-credential  4.5.4   True       False        False     31m
cluster-autoscaler 4.5.4   True       False        False     16m
console           4.5.4   True       False        False     10m
csi-snapshot-controller 4.5.4   True       False        False     16m
dns               4.5.4   True       False        False     22m
etcd              4.5.4   False      False        False     25s
image-registry    4.5.4   True       False        False     16m
ingress           4.5.4   True       False        False     16m
insights          4.5.4   True       False        False     17m
kube-apiserver    4.5.4   True       False        False     19m
kube-controller-manager 4.5.4   True       False        False     20m
kube-scheduler    4.5.4   True       False        False     20m
```

kube-storage-version-migrator	4.5.4	True	False	False	16m
machine-api	4.5.4	True	False	False	22m
machine-config	4.5.4	True	False	False	22m
marketplace	4.5.4	True	False	False	16m

```

When the current cluster version is **AVAILABLE**, the installation is complete.

6.10.23. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.10.24. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- [Configure Global Access for an Ingress Controller on GCP](#).

6.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster into a shared Virtual Private Cloud (VPC) on Google Cloud Platform (GCP) that uses infrastructure that you provide. In this context, a cluster installed into a shared VPC is a cluster that is configured to use a VPC from a project different from where the cluster is being deployed.

A shared VPC enables an organization to connect resources from multiple projects to a common VPC network. You can communicate within the organization securely and efficiently by using internal IPs from that network. For more information about shared VPC, see [Shared VPC overview](#) in the GCP documentation.

The steps for performing a user-provided infrastructure installation into a shared VPC are outlined here. Several [Deployment Manager](#) templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.11.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.

- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

NOTE

Be sure to also review this site list if you are configuring a proxy.

6.11.2. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

6.11.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.11.4. Configuring the GCP project that hosts your cluster

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

6.11.4.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the **api-int.<cluster_name>.<base_domain>** URL; the Premium Tier is required for internal load balancing.

6.11.4.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See [Enabling services](#) in the GCP documentation.

Table 6.36. Required API services

API service	Console service name
Cloud Deployment Manager V2 API	deploymentmanager.googleapis.com
Compute Engine API	compute.googleapis.com
Google Cloud APIs	cloudapis.googleapis.com
Cloud Resource Manager API	cloudresourcemanager.googleapis.com
Google DNS API	dns.googleapis.com
IAM Service Account Credentials API	iamcredentials.googleapis.com
Identity and Access Management (IAM) API	iam.googleapis.com
Service Management API	servicemanagement.googleapis.com

API service	Console service name
Service Usage API	serviceusage.googleapis.com
Google Cloud Storage JSON API	storage-api.googleapis.com
Cloud Storage	storage-component.googleapis.com

6.11.4.3. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default [Quotas](#) do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.37. GCP resources used in a default cluster

Service	Component	Location	Total resources required	Resources removed after bootstrap
Service account	IAM	Global	5	0
Firewall rules	Networking	Global	11	1
Forwarding rules	Compute	Global	2	0
Health checks	Compute	Global	2	0
Images	Compute	Global	1	0
Networks	Networking	Global	1	0
Routers	Networking	Global	1	0
Routes	Networking	Global	2	0
Subnetworks	Compute	Global	2	0
Target pools	Networking	Global	2	0

NOTE

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**
- **europa-north1**
- **europa-west2**
- **europa-west3**
- **europa-west6**
- **northamerica-northeast1**
- **southamerica-east1**
- **us-west2**

You can increase resource quotas from the [GCP console](#), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.11.4.4. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.
2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

**NOTE**

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.
The service account key is required to create a cluster.

6.11.4.4.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Required roles for user-provisioned GCP infrastructure

- Deployment Manager Editor
- Service Account Key Admin

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.38. GCP service account permissions

Account	Roles
Control Plane	roles/compute.instanceAdmin

Account	Roles
	roles/compute.networkAdmin
	roles/compute.securityAdmin
	roles/storage.admin
	roles/iam.serviceAccountUser
Compute	roles/compute.viewer
	roles/storage.admin

6.11.4.5. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)
- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europa-central2** (Warsaw, Poland)
- **europa-north1** (Hamina, Finland)
- **europa-west1** (St. Ghislain, Belgium)
- **europa-west2** (London, England, UK)
- **europa-west3** (Frankfurt, Germany)
- **europa-west4** (Eemshaven, Netherlands)
- **europa-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)
- **southamerica-east1** (São Paulo, Brazil)

- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

6.11.4.6. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.

Prerequisites

- You created a project to host your cluster.
- You created a service account and granted it the required permissions.

Procedure

1. Install the following binaries in **\$PATH**:

- **gcloud**
- **gsutil**

See [Install the latest Cloud SDK version](#) in the GCP documentation.

2. Authenticate using the **gcloud** tool with your configured service account.
See [Authorizing with a service account](#) in the GCP documentation.

6.11.5. Configuring the GCP project that hosts your shared VPC network

If you use a shared Virtual Private Cloud (VPC) to host your OpenShift Container Platform cluster in Google Cloud Platform (GCP), you must configure the project that hosts it.

NOTE

If you already have a project that hosts the shared VPC network, review this section to ensure that the project meets all of the requirements to install an OpenShift Container Platform cluster.

Procedure

1. Create a project to host the shared VPC for your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

2. Create a service account in the project that hosts your shared VPC. See [Creating a service account](#) in the GCP documentation.
3. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

NOTE

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

The service account for the project that hosts the shared VPC network requires the following roles:

- Compute Network User
- Compute Security Admin
- Deployment Manager Editor
- DNS Administrator
- Security Admin
- Network Management Admin

6.11.5.1. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the project that hosts the shared VPC that you install the cluster into. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

NOTE

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation.
You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).
5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.
6. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain. This process might include a request to your company's IT department or the division that controls the root domain and DNS services for your company.

6.11.5.2. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.

Procedure

1. Copy the template from the **Deployment Manager template for the VPC** section of this topic and save it as **01_vpc.py** on your computer. This template describes the VPC that your cluster requires.
2. Export the following variables required by the resource definition:

- a. Export the control plane CIDR:

```
$ export MASTER_SUBNET_CIDR='10.0.0.0/17'
```

- b. Export the compute CIDR:

```
$ export WORKER_SUBNET_CIDR='10.0.128.0/17'
```

- c. Export the region to deploy the VPC network and cluster to:

```
$ export REGION='<region>'
```

3. Export the variable for the ID of the project that hosts the shared VPC:

```
$ export HOST_PROJECT=<host_project>
```

4. Export the variable for the email of the service account that belongs to host project:

```
$ export HOST_PROJECT_ACCOUNT=<host_service_account_email>
```

5. Create a **01_vpc.yaml** resource definition file:

```
$ cat <<EOF >01_vpc.yaml
imports:
- path: 01_vpc.py

resources:
- name: cluster-vpc
  type: 01_vpc.py
  properties:
    infra_id: '<prefix>' 1
    region: '${REGION}' 2
    master_subnet_cidr: '${MASTER_SUBNET_CIDR}' 3
    worker_subnet_cidr: '${WORKER_SUBNET_CIDR}' 4
EOF
```

- 1** **infra_id** is the prefix of the network name.
- 2** **region** is the region to deploy the cluster into, for example **us-central1**.
- 3** **master_subnet_cidr** is the CIDR for the master subnet, for example **10.0.0.0/17**.
- 4** **worker_subnet_cidr** is the CIDR for the worker subnet, for example **10.0.128.0/17**.

6. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create <vpc_deployment_name> --config
01_vpc.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT} 1
```

- 1** For **<vpc_deployment_name>**, specify the name of the VPC to deploy.

7. Export the VPC variable that other components require:

- a. Export the name of the host project network:

```
$ export HOST_PROJECT_NETWORK=<vpc_network>
```

- b. Export the name of the host project control plane subnet:

```
$ export HOST_PROJECT_CONTROL_SUBNET=<control_plane_subnet>
```

- c. Export the name of the host project compute subnet:

```
$ export HOST_PROJECT_COMPUTE_SUBNET=<compute_subnet>
```

8. Set up the shared VPC. See [Setting up Shared VPC](#) in the GCP documentation.

6.11.5.2.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

Example 6.10. 01_vpc.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-network',
        'type': 'compute.v1.network',
        'properties': {
            'region': context.properties['region'],
            'autoCreateSubnetworks': False
        }
    }, {
        'name': context.properties['infra_id'] + '-master-subnet',
        'type': 'compute.v1.subnetwork',
        'properties': {
            'region': context.properties['region'],
            'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
            'ipCidrRange': context.properties['master_subnet_cidr']
        }
    }, {
        'name': context.properties['infra_id'] + '-worker-subnet',
        'type': 'compute.v1.subnetwork',
        'properties': {
            'region': context.properties['region'],
            'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
            'ipCidrRange': context.properties['worker_subnet_cidr']
        }
    }, {
        'name': context.properties['infra_id'] + '-router',
        'type': 'compute.v1.router',
        'properties': {
            'region': context.properties['region'],
            'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
            'nats': [{
                'name': context.properties['infra_id'] + '-nat-master',
                'natIpAllocateOption': 'AUTO_ONLY',
                'minPortsPerVm': 7168,
                'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
                'subnetworks': [{
                    'name': '${ref.' + context.properties['infra_id'] + '-master-subnet.selfLink}',
                    'sourceIpRangesToNat': ['ALL_IP_RANGES']
                }]
            }]
        }
    }, {
        'name': context.properties['infra_id'] + '-nat-worker',
        'natIpAllocateOption': 'AUTO_ONLY',
        'minPortsPerVm': 512,
        'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
        'subnetworks': [{
            'name': '${ref.' + context.properties['infra_id'] + '-worker-subnet.selfLink}',
            'sourceIpRangesToNat': ['ALL_IP_RANGES']
        }]
    }
    ]
}
```

```

}}
return {'resources': resources}

```

6.11.6. Creating the installation files for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

6.11.6.1. Manually creating the installation configuration file

For user-provisioned installations of OpenShift Container Platform, you manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

**NOTE**

For some platform types, you can alternatively run `./openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

6.11.6.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
  replicas: 3
compute: 5
- hyperthreading: Enabled 6
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
  replicas: 0
metadata:
  name: test-cluster
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16

```

```

networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 7
    region: us-central1 8
  pullSecret: '{"auths": ...}'
  fips: false 9
  sshKey: ssh-ed25519 AAAA... 10
  publish: Internal 11

```

- 1 Specify the public DNS on the host project.
- 2 5 If you do not provide these parameters and values, the installation program provides the default value.
- 3 6 The **controlPlane** section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 7 Specify the main project where the VM instances reside.
- 8 Specify the region that your VPC network is in.
- 9 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

- 10 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

11

How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**. To use a shared VPC in a cluster that uses infrastructure that you provision, you must set **publish** to **Internal**. The installation program will no longer be able to access the public DNS zone for the base domain in the host project.

6.11.6.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

6.11.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.11.6.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
 - b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
 - c. Save and exit the file.
5. Remove the `privateZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  status: {}
```

- 1 Remove this section completely.

6. Configure the cloud provider for your VPC.
- a. Open the `<installation_directory>/manifests/cloud-provider-config.yaml` file.
 - b. Add the `network-project-id` parameter and set its value to the ID of project that hosts the shared VPC network.
 - c. Add the `network-name` parameter and set its value to the name of the shared VPC network that hosts the OpenShift Container Platform cluster.
 - d. Replace the value of the `subnet-name` parameter with the value of the shared VPC subnet that hosts your compute machines.

The contents of the `<installation_directory>/manifests/cloud-provider-config.yaml` resemble the following example:

```
config: |+
[global]
project-id    = example-project
regional     = true
multizone    = true
node-tags    = opensh-ptzxx-master
node-tags    = opensh-ptzxx-worker
node-instance-prefix = opensh-ptzxx
external-instance-groups-prefix = opensh-ptzxx
network-project-id = example-shared-vpc
network-name  = example-network
subnet-name   = example-worker-subnet
```

7. If you deploy a cluster that is not on a private network, open the `<installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml` file and replace the value of the `scope` parameter with `External`. The contents of the file resemble the following example:

```

apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      type: LoadBalancerService
status:
  availableReplicas: 0
  domain: ""
  selector: ""

```

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- For **<installation_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation_directory>/auth** directory:

```

.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign

```

6.11.7. Exporting common variables

6.11.7.1. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

6.11.7.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

NOTE

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Generate the Ignition config files for your cluster.
- Install the **jq** package.

Procedure

- Export the following common variables to be used by the provided Deployment Manager templates:

```
$ export BASE_DOMAIN='<base_domain>' 1
$ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>' 2
$ export NETWORK_CIDR='10.0.0.0/16'

$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 3
$ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
$ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
$ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
```

- 1 2 Supply the values for the host project.

- 3** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

6.11.8. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in `initramfs` during boot to fetch their Ignition config files.

6.11.8.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, set statically through kernel arguments, or another method, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as `localhost` or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.11.8.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.39. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	1936	Metrics
	9000-9999	Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099 .
	10250-10259	The default ports that Kubernetes reserves
	10256	openshift-sdn
UDP	4789	VXLAN and Geneve

Protocol	Port	Description
	6081	VXLAN and Geneve
	9000-9999	Host level services, including the node exporter on ports 9100-9101 .
	500	IPsec IKE packets
	4500	IPsec NAT-T packets
TCP/UDP	30000-32767	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 6.40. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	6443	Kubernetes API

Table 6.41. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	2379-2380	etcd server and peer ports

6.11.9. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the internal load balancer** section of this topic and save it as **02_lb_int.py** on your computer. This template describes the internal load balancing objects that your cluster requires.
2. For an external cluster, also copy the template from the **Deployment Manager template for the external load balancer** section of this topic and save it as **02_lb_ext.py** on your computer. This template describes the external load balancing objects that your cluster requires.
3. Export the variables that the deployment template uses:

- a. Export the cluster network location:

```
$ export CLUSTER_NETWORK=(`gcloud compute networks describe
${HOST_PROJECT_NETWORK} --project ${HOST_PROJECT} --account
${HOST_PROJECT_ACCOUNT} --format json | jq -r .selfLink`)
```

- b. Export the control plane subnet location:

```
$ export CONTROL_SUBNET=(`gcloud compute networks subnets describe
${HOST_PROJECT_CONTROL_SUBNET} --region=${REGION} --project
${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT} --format json | jq -r
.selfLink`)
```

- c. Export the three zones that the cluster uses:

```
$ export ZONE_0=(`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[0] | cut -d "/" -f9`)
```

```
$ export ZONE_1=(`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[1] | cut -d "/" -f9`)
```

```
$ export ZONE_2=(`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[2] | cut -d "/" -f9`)
```

4. Create a **02_infra.yaml** resource definition file:

```
$ cat <<EOF >02_infra.yaml
imports:
- path: 02_lb_ext.py
- path: 02_lb_int.py 1
resources:
- name: cluster-lb-ext 2
  type: 02_lb_ext.py
  properties:
    infra_id: '${INFRA_ID}' 3
    region: '${REGION}' 4
- name: cluster-lb-int
  type: 02_lb_int.py
  properties:
    cluster_network: '${CLUSTER_NETWORK}'
    control_subnet: '${CONTROL_SUBNET}' 5
    infra_id: '${INFRA_ID}'
```

```

region: '${REGION}'
zones: 6
- '${ZONE_0}'
- '${ZONE_1}'
- '${ZONE_2}'
EOF

```

- 1** **2** Required only when deploying an external cluster.
- 3** **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 4** **region** is the region to deploy the cluster into, for example **us-central1**.
- 5** **control_subnet** is the URI to the control subnet.
- 6** **zones** are the zones to deploy the control plane instances into, like **us-east1-b**, **us-east1-c**, and **us-east1-d**.

5. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml
```

6. Export the cluster IP address:

```
$ export CLUSTER_IP=`gcloud compute addresses describe ${INFRA_ID}-cluster-ip --
region=${REGION} --format json | jq -r .address`
```

7. For an external cluster, also export the cluster public IP address:

```
$ export CLUSTER_PUBLIC_IP=`gcloud compute addresses describe ${INFRA_ID}-cluster-
public-ip --region=${REGION} --format json | jq -r .address`
```

6.11.9.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

Example 6.11. 02_lb_ext.py Deployment Manager template

```

def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-cluster-public-ip',
        'type': 'compute.v1.address',
        'properties': {
            'region': context.properties['region']
        }
    }, {
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
        # probe for kube-apiserver
        'name': context.properties['infra_id'] + '-api-http-health-check',
        'type': 'compute.v1.httpHealthCheck',
        'properties': {

```

```

        'port': 6080,
        'requestPath': '/readyz'
    }
}, {
    'name': context.properties['infra_id'] + '-api-target-pool',
    'type': 'compute.v1.targetPool',
    'properties': {
        'region': context.properties['region'],
        'healthChecks': ['$(ref.' + context.properties['infra_id'] + '-api-http-health-check.selfLink)'],
        'instances': []
    }
}, {
    'name': context.properties['infra_id'] + '-api-forwarding-rule',
    'type': 'compute.v1.forwardingRule',
    'properties': {
        'region': context.properties['region'],
        'IPAddress': '$(ref.' + context.properties['infra_id'] + '-cluster-public-ip.selfLink)',
        'target': '$(ref.' + context.properties['infra_id'] + '-api-target-pool.selfLink)',
        'portRange': '6443'
    }
}
]]

return {'resources': resources}

```

6.11.9.2. Deployment Manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

Example 6.12. `02_lb_int.py` Deployment Manager template

```

def GenerateConfig(context):

    backends = []
    for zone in context.properties['zones']:
        backends.append({
            'group': '$(ref.' + context.properties['infra_id'] + '-master-' + zone + '-instance-group' +
'.selfLink)'
        })

    resources = [{
        'name': context.properties['infra_id'] + '-cluster-ip',
        'type': 'compute.v1.address',
        'properties': {
            'addressType': 'INTERNAL',
            'region': context.properties['region'],
            'subnetwork': context.properties['control_subnet']
        }
    }, {
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
        # probe for kube-apiserver
        'name': context.properties['infra_id'] + '-api-internal-health-check',
        'type': 'compute.v1.healthCheck',
        'properties': {

```

```

        'httpsHealthCheck': {
            'port': 6443,
            'requestPath': '/readyz'
        },
        'type': "HTTPS"
    }
}, {
    'name': context.properties['infra_id'] + '-api-internal-backend-service',
    'type': 'compute.v1.regionBackendService',
    'properties': {
        'backends': backends,
        'healthChecks': ['$$(ref.' + context.properties['infra_id'] + '-api-internal-health-
check.selfLink)'],
        'loadBalancingScheme': 'INTERNAL',
        'region': context.properties['region'],
        'protocol': 'TCP',
        'timeoutSec': 120
    }
}, {
    'name': context.properties['infra_id'] + '-api-internal-forwarding-rule',
    'type': 'compute.v1.forwardingRule',
    'properties': {
        'backendService': '$(ref.' + context.properties['infra_id'] + '-api-internal-backend-
service.selfLink)',
        'IPAddress': '$(ref.' + context.properties['infra_id'] + '-cluster-ip.selfLink)',
        'loadBalancingScheme': 'INTERNAL',
        'ports': ['6443','22623'],
        'region': context.properties['region'],
        'subnetwork': context.properties['control_subnet']
    }
}
]]

for zone in context.properties['zones']:
    resources.append({
        'name': context.properties['infra_id'] + '-master-' + zone + '-instance-group',
        'type': 'compute.v1.instanceGroup',
        'properties': {
            'namedPorts': [
                {
                    'name': 'ignition',
                    'port': 22623
                }, {
                    'name': 'https',
                    'port': 6443
                }
            ],
            'network': context.properties['cluster_network'],
            'zone': zone
        }
    })

return {'resources': resources}

```

You will need this template in addition to the **02_lb_ext.py** template when you create an external cluster.

6.11.10. Creating a private DNS zone in GCP

You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the private DNS** section of this topic and save it as **02_dns.py** on your computer. This template describes the private DNS objects that your cluster requires.
2. Create a **02_dns.yaml** resource definition file:

```
$ cat <<EOF >02_dns.yaml
imports:
- path: 02_dns.py

resources:
- name: cluster-dns
  type: 02_dns.py
  properties:
    infra_id: '${INFRA_ID}' 1
    cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}' 2
    cluster_network: '${CLUSTER_NETWORK}' 3
EOF
```

- 1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 2 **cluster_domain** is the domain for the cluster, for example **openshift.example.com**.
- 3 **cluster_network** is the **selfLink** URL to the cluster network.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
```

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:
 - a. Add the internal DNS entries:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone --project
${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-
int.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone --project
${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
```

- b. For an external cluster, also add the external DNS entries:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns
record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns
record-sets transaction add ${CLUSTER_PUBLIC_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone
${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns
record-sets transaction execute --zone ${BASE_DOMAIN_ZONE_NAME}
```

6.11.10.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

Example 6.13. `02_dns.py` Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-private-zone',
        'type': 'dns.v1.managedZone',
        'properties': {
            'description': '',
            'dnsName': context.properties['cluster_domain'] + '.',
            'visibility': 'private',
            'privateVisibilityConfig': {
                'networks': [{
                    'networkUrl': context.properties['cluster_network']
                }]
            }
        }
    }]

    return {'resources': resources}
```

6.11.11. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for firewall rules** section of this topic and save it as **03_firewall.py** on your computer. This template describes the security groups that your cluster requires.
2. Create a **03_firewall.yaml** resource definition file:

```
$ cat <<EOF >03_firewall.yaml
imports:
- path: 03_firewall.py

resources:
- name: cluster-firewall
  type: 03_firewall.py
  properties:
    allowed_external_cidr: '0.0.0.0/0' 1
    infra_id: '${INFRA_ID}' 2
    cluster_network: '${CLUSTER_NETWORK}' 3
    network_cidr: '${NETWORK_CIDR}' 4
EOF
```

- 1 **allowed_external_cidr** is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to **\${NETWORK_CIDR}**.
- 2 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 3 **cluster_network** is the **selfLink** URL to the cluster network.
- 4 **network_cidr** is the CIDR of the VPC network, for example **10.0.0.0/16**.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-firewall --config
03_firewall.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
```

6.11.11.1. Deployment Manager template for firewall rules

You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

Example 6.14. 03_firewall.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['22']
            }],
            'sourceRanges': [context.properties['allowed_external_cidr']],
            'targetTags': [context.properties['infra_id'] + '-bootstrap']
        }
    }, {
        'name': context.properties['infra_id'] + '-api',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['6443']
            }],
            'sourceRanges': [context.properties['allowed_external_cidr']],
            'targetTags': [context.properties['infra_id'] + '-master']
        }
    }, {
        'name': context.properties['infra_id'] + '-health-checks',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['6080', '6443', '22624']
            }],
            'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22'],
            'targetTags': [context.properties['infra_id'] + '-master']
        }
    }, {
        'name': context.properties['infra_id'] + '-etcd',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
```

```

        'ports': ['2379-2380']
    }},
    'sourceTags': [context.properties['infra_id'] + '-master'],
    'targetTags': [context.properties['infra_id'] + '-master']
  }
}, {
  'name': context.properties['infra_id'] + '-control-plane',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [{
      'IPProtocol': 'tcp',
      'ports': ['10257']
    }, {
      'IPProtocol': 'tcp',
      'ports': ['10259']
    }, {
      'IPProtocol': 'tcp',
      'ports': ['22623']
    }
  ],
  'sourceTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ],
  'targetTags': [context.properties['infra_id'] + '-master']
}
}, {
  'name': context.properties['infra_id'] + '-internal-network',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [{
      'IPProtocol': 'icmp'
    }, {
      'IPProtocol': 'tcp',
      'ports': ['22']
    }
  ],
  'sourceRanges': [context.properties['network_cidr']],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
}
}, {
  'name': context.properties['infra_id'] + '-internal-cluster',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [{
      'IPProtocol': 'udp',
      'ports': ['4789', '6081']
    }, {
      'IPProtocol': 'udp',
      'ports': ['500', '4500']
    }, {
      'IPProtocol': 'esp',

```

```

    },{
      'IPProtocol': 'tcp',
      'ports': ['9000-9999']
    },{
      'IPProtocol': 'udp',
      'ports': ['9000-9999']
    },{
      'IPProtocol': 'tcp',
      'ports': ['10250']
    },{
      'IPProtocol': 'tcp',
      'ports': ['30000-32767']
    },{
      'IPProtocol': 'udp',
      'ports': ['30000-32767']
    }
  ],
  'sourceTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
}
]]
return {'resources': resources}

```

6.11.12. Creating IAM roles in GCP

You must create IAM roles in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for IAM roles** section of this topic and save it as **03_iam.py** on your computer. This template describes the IAM roles that your cluster requires.
2. Create a **03_iam.yaml** resource definition file:

```
$ cat <<EOF >03_iam.yaml
imports:
- path: 03_iam.py
resources:
- name: cluster-iam
  type: 03_iam.py
  properties:
    infra_id: '${INFRA_ID}' 1
EOF
```

1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-iam --config 03_iam.yaml
```

4. Export the variable for the master service account:

```
$ export MASTER_SERVICE_ACCOUNT=$(`gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-m@${PROJECT_NAME}." --format json | jq -r '[0].email`)
```

5. Export the variable for the worker service account:

```
$ export WORKER_SERVICE_ACCOUNT=$(`gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '[0].email`)
```

6. Assign the permissions that the installation program requires to the service accounts for the subnets that host the control plane and compute subnets:

- a. Grant the **networkViewer** role of the project that hosts your shared VPC to the master service account:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
projects add-iam-policy-binding ${HOST_PROJECT} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role
"roles/compute.networkViewer"
```

- b. Grant the **networkUser** role to the master service account for the control plane subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
compute networks subnets add-iam-policy-binding
"${HOST_PROJECT_CONTROL_SUBNET}" --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkUser"
--region ${REGION}
```

- c. Grant the **networkUser** role to the worker service account for the control plane subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
compute networks subnets add-iam-policy-binding
"${HOST_PROJECT_CONTROL_SUBNET}" --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role
"roles/compute.networkUser" --region ${REGION}
```

- d. Grant the **networkUser** role to the master service account for the compute subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
compute networks subnets add-iam-policy-binding
"${HOST_PROJECT_COMPUTE_SUBNET}" --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkUser"
--region ${REGION}
```

- e. Grant the **networkUser** role to the worker service account for the compute subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
compute networks subnets add-iam-policy-binding
"${HOST_PROJECT_COMPUTE_SUBNET}" --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role
"roles/compute.networkUser" --region ${REGION}
```

7. The templates do not create the policy bindings due to limitations of Deployment Manager, so you must create them manually:

```
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.instanceAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.securityAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/storage.admin"

$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/compute.viewer"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
"serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/storage.admin"
```

8. Create a service account key and store it locally for later use:

```
$ gcloud iam service-accounts keys create service-account-key.json --iam-
account=${MASTER_SERVICE_ACCOUNT}
```

6.11.12.1. Deployment Manager template for IAM roles

You can use the following Deployment Manager template to deploy the IAM roles that you need for your OpenShift Container Platform cluster:

Example 6.15. 03_iam.py Deployment Manager template

```
def GenerateConfig(context):
```

```

resources = [{
  'name': context.properties['infra_id'] + '-master-node-sa',
  'type': 'iam.v1.serviceAccount',
  'properties': {
    'accountId': context.properties['infra_id'] + '-m',
    'displayName': context.properties['infra_id'] + '-master-node'
  }
}, {
  'name': context.properties['infra_id'] + '-worker-node-sa',
  'type': 'iam.v1.serviceAccount',
  'properties': {
    'accountId': context.properties['infra_id'] + '-w',
    'displayName': context.properties['infra_id'] + '-worker-node'
  }
}]

return {'resources': resources}

```

6.11.13. Creating the RHCOS cluster image for the GCP infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Google Cloud Platform (GCP) for your OpenShift Container Platform nodes.

Procedure

1. Obtain the RHCOS image from the [RHCOS image mirror](#) page.

IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must download an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

The file name contains the OpenShift Container Platform version number in the format **rhcos-
<version>-<arch>-gcp.<arch>.tar.gz**.

2. Create the Google storage bucket:

```
$ gsutil mb gs://<bucket_name>
```

3. Upload the RHCOS image to the Google storage bucket:

```
$ gsutil cp <downloaded_image_file_path>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz  
gs://<bucket_name>
```

4. Export the uploaded RHCOS image location as a variable:

```
$ export IMAGE_SOURCE="gs://<bucket_name>/rhcos-<version>-x86_64-
gcp.x86_64.tar.gz"
```

5. Create the cluster image:

```
$ gcloud compute images create "${INFRA_ID}-rhcos-image" \
--source-uri="${IMAGE_SOURCE}"
```

6.11.14. Creating the bootstrap machine in GCP

You must create the bootstrap machine in Google Cloud Platform (GCP) to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Ensure pyOpenSSL is installed.

Procedure

1. Copy the template from the **Deployment Manager template for the bootstrap machine** section of this topic and save it as **04_bootstrap.py** on your computer. This template describes the bootstrap machine that your cluster requires.
2. Export the location of the Red Hat Enterprise Linux CoreOS (RHCOS) image that the installation program requires:

```
$ export CLUSTER_IMAGE=(`gcloud compute images describe ${INFRA_ID}-rhcos-image --
format json | jq -r .selfLink`)
```

3. Create a bucket and upload the **bootstrap.ign** file:

```
$ gsutil mb gs://${INFRA_ID}-bootstrap-ignition
$ gsutil cp <installation_directory>/bootstrap.ign gs://${INFRA_ID}-bootstrap-ignition/
```

4. Create a signed URL for the bootstrap instance to use to access the Ignition config. Export the URL from the output as a variable:

```
$ export BOOTSTRAP_IGN=`gsutil signurl -d 1h service-account-key.json gs://{INFRA_ID}-bootstrap-ignition/bootstrap.ign | grep "^gs:" | awk '{print $5}'`
```

5. Create a **04_bootstrap.yaml** resource definition file:

```
$ cat <<EOF >04_bootstrap.yaml
imports:
- path: 04_bootstrap.py

resources:
- name: cluster-bootstrap
  type: 04_bootstrap.py
  properties:
    infra_id: '${INFRA_ID}' 1
    region: '${REGION}' 2
    zone: '${ZONE_0}' 3

    cluster_network: '${CLUSTER_NETWORK}' 4
    control_subnet: '${CONTROL_SUBNET}' 5
    image: '${CLUSTER_IMAGE}' 6
    machine_type: 'n1-standard-4' 7
    root_volume_size: '128' 8

    bootstrap_ign: '${BOOTSTRAP_IGN}' 9
EOF
```

- 1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 2 **region** is the region to deploy the cluster into, for example **us-central1**.
- 3 **zone** is the zone to deploy the bootstrap instance into, for example **us-central1-b**.
- 4 **cluster_network** is the **selfLink** URL to the cluster network.
- 5 **control_subnet** is the **selfLink** URL to the control subnet.
- 6 **image** is the **selfLink** URL to the RHCOS image.
- 7 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 8 **root_volume_size** is the boot disk size for the bootstrap machine.
- 9 **bootstrap_ign** is the URL output when creating a signed URL.

6. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-bootstrap --config
04_bootstrap.yaml
```

7. Add the bootstrap instance to the internal load balancer instance group:

■

```
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-bootstrap-
instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-bootstrap
```

8. Add the bootstrap instance group to the internal load balancer backend service:

```
$ gcloud compute backend-services add-backend ${INFRA_ID}-api-internal-backend-service
--region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --instance-
group-zone=${ZONE_0}
```

6.11.14.1. Deployment Manager template for the bootstrap machine

You can use the following Deployment Manager template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

Example 6.16. 04_bootstrap.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-public-ip',
        'type': 'compute.v1.address',
        'properties': {
            'region': context.properties['region']
        }
    }, {
        'name': context.properties['infra_id'] + '-bootstrap',
        'type': 'compute.v1.instance',
        'properties': {
            'disks': [{
                'autoDelete': True,
                'boot': True,
                'initializeParams': {
                    'diskSizeGb': context.properties['root_volume_size'],
                    'sourceImage': context.properties['image']
                }
            }],
            'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' +
context.properties['machine_type'],
            'metadata': {
                'items': [{
                    'key': 'user-data',
                    'value': '{"ignition":{"config":{"replace":{"source":"" + context.properties['bootstrap_ign']
+ ""},"version":"3.1.0"}}',
                }],
            }],
            'networkInterfaces': [{
                'subnetwork': context.properties['control_subnet'],
                'accessConfigs': [{
                    'natIP': '$(ref.' + context.properties['infra_id'] + '-bootstrap-public-ip.address)'
                }],
            }],
            'tags': {
                'items': [
                    context.properties['infra_id'] + '-master',
                    context.properties['infra_id'] + '-bootstrap'
```

```

    ]
  },
  'zone': context.properties['zone']
}
}, {
  'name': context.properties['infra_id'] + '-bootstrap-instance-group',
  'type': 'compute.v1.instanceGroup',
  'properties': {
    'namedPorts': [
      {
        'name': 'ignition',
        'port': 22623
      }, {
        'name': 'https',
        'port': 6443
      }
    ],
    'network': context.properties['cluster_network'],
    'zone': context.properties['zone']
  }
}
]]

return {'resources': resources}

```

6.11.15. Creating the control plane machines in GCP

You must create the control plane machines in Google Cloud Platform (GCP) for your cluster to use. One way to create these machines is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.

Procedure

1. Copy the template from the **Deployment Manager template for control plane machines** section of this topic and save it as **05_control_plane.py** on your computer. This template describes the control plane machines that your cluster requires.
2. Export the following variable required by the resource definition:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign`
```

3. Create a **05_control_plane.yaml** resource definition file:

```
$ cat <<EOF >05_control_plane.yaml
imports:
- path: 05_control_plane.py

resources:
- name: cluster-control-plane
  type: 05_control_plane.py
  properties:
    infra_id: '${INFRA_ID}' 1
    zones: 2
    - '${ZONE_0}'
    - '${ZONE_1}'
    - '${ZONE_2}'

    control_subnet: '${CONTROL_SUBNET}' 3
    image: '${CLUSTER_IMAGE}' 4
    machine_type: 'n1-standard-4' 5
    root_volume_size: '128'
    service_account_email: '${MASTER_SERVICE_ACCOUNT}' 6

    ignition: '${MASTER_IGNITION}' 7
EOF
```

- 1 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 2 **zones** are the zones to deploy the control plane instances into, for example **us-central1-a**, **us-central1-b**, and **us-central1-c**.
- 3 **control_subnet** is the **selfLink** URL to the control subnet.
- 4 **image** is the **selfLink** URL to the RHCOS image.
- 5 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 6 **service_account_email** is the email address for the master service account that you created.
- 7 **ignition** is the contents of the **master.ign** file.

4. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-control-plane --config
05_control_plane.yaml
```

5. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the control plane machines manually.

- Run the following commands to add the control plane machines to the appropriate instance groups:

```
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_0}-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-master-0
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_1}-instance-group --zone=${ZONE_1} --instances=${INFRA_ID}-master-1
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_2}-instance-group --zone=${ZONE_2} --instances=${INFRA_ID}-master-2
```

- For an external cluster, you must also run the following commands to add the control plane machines to the target pools:

```
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_0}" --instances=${INFRA_ID}-master-0
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_1}" --instances=${INFRA_ID}-master-1
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_2}" --instances=${INFRA_ID}-master-2
```

6.11.15.1. Deployment Manager template for control plane machines

You can use the following Deployment Manager template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 6.17. `05_control_plane.py` Deployment Manager template

```
def GenerateConfig(context):

resources = [{
    'name': context.properties['infra_id'] + '-master-0',
    'type': 'compute.v1.instance',
    'properties': {
        'disks': [{
            'autoDelete': True,
            'boot': True,
            'initializeParams': {
                'diskSizeGb': context.properties['root_volume_size'],
                'diskType': 'zones/' + context.properties['zones'][0] + '/diskTypes/pd-ssd',
                'sourceImage': context.properties['image']
            }
        }
    ],
    'machineType': 'zones/' + context.properties['zones'][0] + '/machineTypes/' +
context.properties['machine_type'],
    'metadata': {
        'items': [{
            'key': 'user-data',
            'value': context.properties['ignition']
        }
    ]
},
    'networkInterfaces': [{
        'subnetwork': context.properties['control_subnet']
```

```

    }],
    'serviceAccounts': [{
      'email': context.properties['service_account_email'],
      'scopes': ['https://www.googleapis.com/auth/cloud-platform']
    }],
    'tags': {
      'items': [
        context.properties['infra_id'] + '-master',
      ]
    },
    'zone': context.properties['zones'][0]
  }
}, {
  'name': context.properties['infra_id'] + '-master-1',
  'type': 'compute.v1.instance',
  'properties': {
    'disks': [{
      'autoDelete': True,
      'boot': True,
      'initializeParams': {
        'diskSizeGb': context.properties['root_volume_size'],
        'diskType': 'zones/' + context.properties['zones'][1] + '/diskTypes/pd-ssd',
        'sourceImage': context.properties['image']
      }
    }
  ],
  'machineType': 'zones/' + context.properties['zones'][1] + '/machineTypes/' +
context.properties['machine_type'],
  'metadata': {
    'items': [{
      'key': 'user-data',
      'value': context.properties['ignition']
    }
  ]
},
  'networkInterfaces': [{
    'subnetwork': context.properties['control_subnet']
  }],
  'serviceAccounts': [{
    'email': context.properties['service_account_email'],
    'scopes': ['https://www.googleapis.com/auth/cloud-platform']
  }],
  'tags': {
    'items': [
      context.properties['infra_id'] + '-master',
    ]
  },
  'zone': context.properties['zones'][1]
}
}, {
  'name': context.properties['infra_id'] + '-master-2',
  'type': 'compute.v1.instance',
  'properties': {
    'disks': [{
      'autoDelete': True,
      'boot': True,
      'initializeParams': {
        'diskSizeGb': context.properties['root_volume_size'],

```

```

        'diskType': 'zones/' + context.properties['zones'][2] + '/diskTypes/pd-ssd',
        'sourceImage': context.properties['image']
    }
  ]],
  'machineType': 'zones/' + context.properties['zones'][2] + '/machineTypes/' +
context.properties['machine_type'],
  'metadata': {
    'items': [{
      'key': 'user-data',
      'value': context.properties['ignition']
    }]
  },
  'networkInterfaces': [{
    'subnetwork': context.properties['control_subnet']
  }],
  'serviceAccounts': [{
    'email': context.properties['service_account_email'],
    'scopes': ['https://www.googleapis.com/auth/cloud-platform']
  }],
  'tags': {
    'items': [
      context.properties['infra_id'] + '-master',
    ]
  },
  'zone': context.properties['zones'][2]
}
]]

return {'resources': resources}

```

6.11.16. Wait for bootstrap completion and remove bootstrap resources in GCP

After you create all of the required infrastructure in Google Cloud Platform (GCP), wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level info 2
```

1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```
$ gcloud compute backend-services remove-backend ${INFRA_ID}-api-internal-backend-
service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --
instance-group-zone=${ZONE_0}
$ gsutil rm gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign
$ gsutil rb gs://${INFRA_ID}-bootstrap-ignition
$ gcloud deployment-manager deployments delete ${INFRA_ID}-bootstrap
```

6.11.17. Creating additional worker machines in GCP

You can create worker machines in Google Cloud Platform (GCP) for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Deployment Manager template. Additional instances can be launched by including additional resources of type **06_worker.py** in the file.

NOTE

If you do not use the provided Deployment Manager template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Copy the template from the **Deployment Manager template for worker machines** section of this topic and save it as **06_worker.py** on your computer. This template describes the worker machines that your cluster requires.
2. Export the variables that the resource definition uses.

- a. Export the subnet that hosts the compute machines:

```
$ export COMPUTE_SUBNET=(`gcloud compute networks subnets describe
${HOST_PROJECT_COMPUTE_SUBNET} --region=${REGION} --project
${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT} --format json | jq -r
.selfLink`)
```

- b. Export the email address for your service account:

```
$ export WORKER_SERVICE_ACCOUNT=(`gcloud iam service-accounts list --filter
"email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email`)
```

- c. Export the location of the compute machine Ignition config file:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign`
```

3. Create a **06_worker.yaml** resource definition file:

```
$ cat <<EOF >06_worker.yaml
imports:
- path: 06_worker.py

resources:
- name: 'worker-0' 1
  type: 06_worker.py
  properties:
    infra_id: '${INFRA_ID}' 2
    zone: '${ZONE_0}' 3
    compute_subnet: '${COMPUTE_SUBNET}' 4
    image: '${CLUSTER_IMAGE}' 5
    machine_type: 'n1-standard-4' 6
    root_volume_size: '128'
    service_account_email: '${WORKER_SERVICE_ACCOUNT}' 7
    ignition: '${WORKER_IGNITION}' 8
- name: 'worker-1'
  type: 06_worker.py
  properties:
    infra_id: '${INFRA_ID}' 9
    zone: '${ZONE_1}' 10
    compute_subnet: '${COMPUTE_SUBNET}' 11
    image: '${CLUSTER_IMAGE}' 12
    machine_type: 'n1-standard-4' 13
    root_volume_size: '128'
```

```

service_account_email: '${WORKER_SERVICE_ACCOUNT}' 14
ignition: '${WORKER_IGNITION}' 15
EOF

```

- 1 **name** is the name of the worker machine, for example **worker-0**.
- 2 9 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- 3 10 **zone** is the zone to deploy the worker machine into, for example **us-central1-a**.
- 4 11 **compute_subnet** is the **selfLink** URL to the compute subnet.
- 5 12 **image** is the **selfLink** URL to the RHCOS image. ¹
- 6 13 **machine_type** is the machine type of the instance, for example **n1-standard-4**.
- 7 14 **service_account_email** is the email address for the worker service account that you created.
- 8 15 **ignition** is the contents of the **worker.ign** file.

4. Optional: If you want to launch additional instances, include additional resources of type **06_worker.py** in your **06_worker.yaml** resource definition file.
5. Create the deployment by using the **gcloud** CLI:

```

$ gcloud deployment-manager deployments create ${INFRA_ID}-worker --config
06_worker.yaml

```

1. To use a GCP Marketplace image, specify the offer to use:
 - OpenShift Container Platform:
<https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-202210040145>
 - OpenShift Platform Plus: **<https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-opp-48-x86-64-202206140145>**
 - OpenShift Kubernetes Engine:
<https://www.googleapis.com/compute/v1/projects/redhat-marketplace-public/global/images/redhat-coreos-oke-48-x86-64-202206140145>

6.11.17.1. Deployment Manager template for worker machines

You can use the following Deployment Manager template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 6.18. 06_worker.py Deployment Manager template

```

def GenerateConfig(context):

resources = [{
    'name': context.properties['infra_id'] + '-' + context.env['name'],
    'type': 'compute.v1.instance',

```

```

'properties': {
  'disks': [{
    'autoDelete': True,
    'boot': True,
    'initializeParams': {
      'diskSizeGb': context.properties['root_volume_size'],
      'sourceImage': context.properties['image']
    }
  }],
  'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' +
context.properties['machine_type'],
  'metadata': {
    'items': [{
      'key': 'user-data',
      'value': context.properties['ignition']
    }]
  },
  'networkInterfaces': [{
    'subnetwork': context.properties['compute_subnet']
  }],
  'serviceAccounts': [{
    'email': context.properties['service_account_email'],
    'scopes': ['https://www.googleapis.com/auth/cloud-platform']
  }],
  'tags': {
    'items': [
      context.properties['infra_id'] + '-worker',
    ]
  },
  'zone': context.properties['zone']
}
}]

return {'resources': resources}

```

6.11.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvzf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.8 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

6.11.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

6.11.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```
NAME      STATUS    ROLES    AGE   VERSION
master-0  Ready    master   63m   v1.21.0
master-1  Ready    master   63m   v1.21.0
master-2  Ready    master   64m   v1.21.0
```

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br  15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper  Pending
csr-8vnps  15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper  Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrap** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.21.0
master-1  Ready   master 73m  v1.21.0
master-2  Ready   master 74m  v1.21.0
worker-0  Ready   worker 11m  v1.21.0
worker-1  Ready   worker 11m  v1.21.0
```

NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

6.11.21. Adding the ingress DNS records

DNS zone configuration is removed when creating Kubernetes manifests and generating Ignition configs. You must manually create DNS records that point at the ingress load balancer. You can create either a wildcard ***.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

Prerequisites

- Configure a GCP account.
- Remove the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
- Create the worker machines.

Procedure

1. Wait for the Ingress router to create a load balancer and populate the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

Example output

```
NAME           TYPE           CLUSTER-IP   EXTERNAL-IP   PORT(S)          AGE
router-default LoadBalancer  172.30.18.154 35.233.157.184 80:32288/TCP,443:31215/TCP 98
```

2. Add the A record to your zones:

- To use A records:

- i. Export the variable for the router IP address:

```
$ export ROUTER_IP=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

- ii. Add the A record to the private zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone --project
${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${ROUTER_IP} --name
\*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
${INFRA_ID}-private-zone --project ${HOST_PROJECT} --account
${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone --
project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
```

- iii. For an external cluster, also add the A record to the public zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME} -
-project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${ROUTER_IP} --name
\*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
${BASE_DOMAIN_ZONE_NAME} --project ${HOST_PROJECT} --account
${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction execute --zone
${BASE_DOMAIN_ZONE_NAME} --project ${HOST_PROJECT} --account
${HOST_PROJECT_ACCOUNT}
```

- To add explicit domains instead of using a wildcard, create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}{end}{end}' routes
```

Example output

```

oauth-openshift.apps.your.cluster.domain.example.com
console-openshift-console.apps.your.cluster.domain.example.com
downloads-openshift-console.apps.your.cluster.domain.example.com
alertmanager-main-openshift-monitoring.apps.your.cluster.domain.example.com
grafana-openshift-monitoring.apps.your.cluster.domain.example.com
prometheus-k8s-openshift-monitoring.apps.your.cluster.domain.example.com

```

6.11.22. Adding ingress firewall rules

The cluster requires several firewall rules. If you do not use a shared VPC, these rules are created by the ingress controller via the GCP cloud provider. When you use a shared VPC, you can either create cluster-wide firewall rules for all services now or create each rule based on events, when the cluster requests access. By creating each rule when the cluster requests access, you know exactly which firewall rules are required. By creating cluster-wide firewall rules, you can apply the same rule set across multiple clusters.

If you choose to create each rule based on events, you must create firewall rules after you provision the cluster and during the life of the cluster when the console notifies you that rules are missing. Events that are similar to the following event are displayed, and you must add the firewall rules that are required:

```
$ oc get events -n openshift-ingress --field-selector="reason=LoadBalancerManualChange"
```

Example output

```

Firewall change required by security admin: `gcloud compute firewall-rules create k8s-fw-
a26e631036a3f46cba28f8df67266d55 --network example-network --description "
{"kubernetes.io/service-name":"openshift-ingress/router-default", "kubernetes.io/service-
ip":"35.237.236.234"}\` --allow tcp:443,tcp:80 --source-ranges 0.0.0.0/0 --target-tags exampl-fqzq7-
master,exampl-fqzq7-worker --project example-project`

```

If you encounter issues when creating these rule-based events, you can configure the cluster-wide firewall rules while your cluster is running.

6.11.22.1. Creating cluster-wide firewall rules for a shared VPC in GCP

You can create cluster-wide firewall rules to allow the access that the OpenShift Container Platform cluster requires.

WARNING

If you do not choose to create firewall rules based on cluster events, you must create cluster-wide firewall rules.

Prerequisites

- You exported the variables that the Deployment Manager templates require to deploy your cluster.
- You created the networking and load balancing components in GCP that your cluster requires.

Procedure

1. Add a single firewall rule to allow the Google Cloud Engine health checks to access all of the services. This rule enables the ingress load balancers to determine the health status of their instances.

```
$ gcloud compute firewall-rules create --allow='tcp:30000-32767,udp:30000-32767' --
network="${CLUSTER_NETWORK}" --source-
ranges='130.211.0.0/22,35.191.0.0/16,209.85.152.0/22,209.85.204.0/22' --target-
tags="${INFRA_ID}-master,${INFRA_ID}-worker" ${INFRA_ID}-ingress-hc --
account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
```

2. Add a single firewall rule to allow access to all cluster services:

- For an external cluster:

```
$ gcloud compute firewall-rules create --allow='tcp:80,tcp:443' --
network="${CLUSTER_NETWORK}" --source-ranges="0.0.0.0/0" --target-
tags="${INFRA_ID}-master,${INFRA_ID}-worker" ${INFRA_ID}-ingress --
account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
```

- For a private cluster:

```
$ gcloud compute firewall-rules create --allow='tcp:80,tcp:443' --
network="${CLUSTER_NETWORK}" --source-ranges=${NETWORK_CIDR} --target-
tags="${INFRA_ID}-master,${INFRA_ID}-worker" ${INFRA_ID}-ingress --
account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
```

Because this rule only allows traffic on TCP ports **80** and **443**, ensure that you add all the ports that your services use.

6.11.23. Completing a GCP installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Google Cloud Platform (GCP) user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned GCP infrastructure.
- Install the **oc** CLI and log in.

Procedure

1. Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Observe the running state of your cluster.

- a. Run the following command to view the current cluster version and status:

```
$ oc get clusterversion
```

Example output

```
NAME      VERSION  AVAILABLE  PROGRESSING  SINCE  STATUS
version   False    True        24m         Working towards 4.5.4: 99% complete
```

- b. Run the following command to view the Operators managed on the control plane by the Cluster Version Operator (CVO):

```
$ oc get clusteroperators
```

Example output

```
NAME                               VERSION  AVAILABLE  PROGRESSING  DEGRADED
SINCE
authentication                      4.5.4   True       False        False       7m56s
cloud-credential                    4.5.4   True       False        False       31m
cluster-autoscaler                  4.5.4   True       False        False       16m

```

When the current cluster version is **AVAILABLE**, the installation is complete.

6.11.24. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.11.25. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

6.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses infrastructure that you provide and an internal mirror of the installation release content.

IMPORTANT

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the GCP APIs.

The steps for performing a user-provided infrastructure install are outlined here. Several [Deployment Manager](#) templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.12.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

- You [created a registry on your mirror host](#) and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to. While you might need to grant access to more sites, you must grant access to ***.googleapis.com** and **accounts.google.com**.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

6.12.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

6.12.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

6.12.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.12.4. Configuring your GCP project

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

6.12.4.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the **api-int.<cluster_name>.<base_domain>** URL; the Premium Tier is required for internal load balancing.

6.12.4.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See [Enabling services](#) in the GCP documentation.

Table 6.42. Required API services

API service	Console service name
Compute Engine API	compute.googleapis.com
Google Cloud APIs	cloudapis.googleapis.com
Cloud Resource Manager API	cloudresourcemanager.googleapis.com
Google DNS API	dns.googleapis.com
IAM Service Account Credentials API	iamcredentials.googleapis.com
Identity and Access Management (IAM) API	iam.googleapis.com
Service Management API	servicemanagement.googleapis.com
Service Usage API	serviceusage.googleapis.com
Google Cloud Storage JSON API	storage-api.googleapis.com
Cloud Storage	storage-component.googleapis.com

6.12.4.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

NOTE

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.

3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation.
You typically have four name servers.
4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).
5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.
6. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain. This process might include a request to your company's IT department or the division that controls the root domain and DNS services for your company.

6.12.4.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default [Quotas](#) do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.43. GCP resources used in a default cluster

Service	Component	Location	Total resources required	Resources removed after bootstrap
Service account	IAM	Global	5	0
Firewall rules	Networking	Global	11	1
Forwarding rules	Compute	Global	2	0
Health checks	Compute	Global	2	0
Images	Compute	Global	1	0
Networks	Networking	Global	1	0
Routers	Networking	Global	1	0
Routes	Networking	Global	2	0
Subnetworks	Compute	Global	2	0
Target pools	Networking	Global	2	0

NOTE

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**
- **europa-north1**
- **europa-west2**
- **europa-west3**
- **europa-west6**
- **northamerica-northeast1**
- **southamerica-east1**
- **us-west2**

You can increase resource quotas from the [GCP console](#), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.12.4.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.
2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

**NOTE**

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.
The service account key is required to create a cluster.

6.12.4.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Required roles for user-provisioned GCP infrastructure

- Deployment Manager Editor
- Service Account Key Admin

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.44. GCP service account permissions

Account	Roles
Control Plane	roles/compute.instanceAdmin

Account	Roles
	roles/compute.networkAdmin
	roles/compute.securityAdmin
	roles/storage.admin
	roles/iam.serviceAccountUser
Compute	roles/compute.viewer
	roles/storage.admin

6.12.4.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)
- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europa-central2** (Warsaw, Poland)
- **europa-north1** (Hamina, Finland)
- **europa-west1** (St. Ghislain, Belgium)
- **europa-west2** (London, England, UK)
- **europa-west3** (Frankfurt, Germany)
- **europa-west4** (Eemshaven, Netherlands)
- **europa-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)

- **southamerica-east1** (São Paulo, Brazil)
- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

6.12.4.7. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.

Prerequisites

- You created a project to host your cluster.
- You created a service account and granted it the required permissions.

Procedure

1. Install the following binaries in **\$PATH**:

- **gcloud**
- **gsutil**

See [Install the latest Cloud SDK version](#) in the GCP documentation.

2. Authenticate using the **gcloud** tool with your configured service account.
See [Authorizing with a service account](#) in the GCP documentation.

6.12.5. Creating the installation files for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

6.12.5.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
```

```
99_openshift-cluster-api_master-machines-2.yaml
```

```
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
      partitions:
        - label: var
          start_mib: <partition_start_offset> 2
          size_mib: <partition_size> 3
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] 4
          with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

6.12.5.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
 - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
 - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
 - v. Select the region to deploy the cluster to.
 - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - vii. Enter a descriptive name for your cluster.
 - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
 - a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<mirror_host_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  /-----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

- c. Define the network and subnets for the VPC to install the cluster in under the parent **platform.gcp** field:

```
network: <existing_vpc>
controlPlaneSubnet: <control_plane_subnet>
computeSubnet: <compute_subnet>
```

5. **platform.gcp.network** field: If you are installing OpenShift on GCP VPC

For **platform.gcp.network**, specify the name for the existing Google VPC. For **platform.gcp.controlPlaneSubnet** and **platform.gcp.computeSubnet**, specify the existing subnets to deploy the control plane machines and compute machines, respectively.

- d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
    source: quay.example.com/openshift-release-dev/ocp-release
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
    source: registry.example.com/ocp/release
```

To complete these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.12.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines.
- The name of the custom machine type must adhere to the following syntax:
custom-<number_of_cpus>-<amount_of_memory_in_mb>

For example, **custom-6-20480**.

6.12.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

6.12.5.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

-

By removing these files, you prevent the cluster from automatically generating control plane machines.

- Optional: If you do not want the cluster to provision compute machines, remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

- Check that the **mastersSchedulable** parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:
 - Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
 - Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
 - Save and exit the file.
- Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

Additional resources

- [Optional: Adding the ingress DNS records](#)

6.12.6. Exporting common variables

6.12.6.1. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

6.12.6.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

NOTE

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Generate the Ignition config files for your cluster.
- Install the **jq** package.

Procedure

1. Export the following common variables to be used by the provided Deployment Manager templates:

```
$ export BASE_DOMAIN='<base_domain>'
$ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>'
$ export NETWORK_CIDR='10.0.0.0/16'
$ export MASTER_SUBNET_CIDR='10.0.0.0/17'
$ export WORKER_SUBNET_CIDR='10.0.128.0/17'

$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
$ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
$ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
$ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
$ export REGION=`jq -r .gcp.region <installation_directory>/metadata.json`
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

6.12.7. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.

Procedure

1. Copy the template from the **Deployment Manager template for the VPC** section of this topic and save it as **01_vpc.py** on your computer. This template describes the VPC that your cluster requires.
2. Create a **01_vpc.yaml** resource definition file:

```
$ cat <<EOF >01_vpc.yaml
imports:
- path: 01_vpc.py

resources:
- name: cluster-vpc
  type: 01_vpc.py
  properties:
    infra_id: '${INFRA_ID}' ❶
    region: '${REGION}' ❷
    master_subnet_cidr: '${MASTER_SUBNET_CIDR}' ❸
    worker_subnet_cidr: '${WORKER_SUBNET_CIDR}' ❹
EOF
```

- ❶ **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- ❷ **region** is the region to deploy the cluster into, for example **us-central1**.
- ❸ **master_subnet_cidr** is the CIDR for the master subnet, for example **10.0.0.0/17**.
- ❹ **worker_subnet_cidr** is the CIDR for the worker subnet, for example **10.0.128.0/17**.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-vpc --config 01_vpc.yaml
```

6.12.7.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

Example 6.19. 01_vpc.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-network',
        'type': 'compute.v1.network',
        'properties': {
            'region': context.properties['region'],
            'autoCreateSubnetworks': False
```

```

    }
  }, {
    'name': context.properties['infra_id'] + '-master-subnet',
    'type': 'compute.v1.subnetwork',
    'properties': {
      'region': context.properties['region'],
      'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
      'ipCidrRange': context.properties['master_subnet_cidr']
    }
  }, {
    'name': context.properties['infra_id'] + '-worker-subnet',
    'type': 'compute.v1.subnetwork',
    'properties': {
      'region': context.properties['region'],
      'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
      'ipCidrRange': context.properties['worker_subnet_cidr']
    }
  }, {
    'name': context.properties['infra_id'] + '-router',
    'type': 'compute.v1.router',
    'properties': {
      'region': context.properties['region'],
      'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
      'nats': [{
        'name': context.properties['infra_id'] + '-nat-master',
        'natIpAllocateOption': 'AUTO_ONLY',
        'minPortsPerVm': 7168,
        'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
        'subnetworks': [{
          'name': '${ref.' + context.properties['infra_id'] + '-master-subnet.selfLink}',
          'sourceIpRangesToNat': ['ALL_IP_RANGES']
        }]
      }]
    }
  }, {
    'name': context.properties['infra_id'] + '-nat-worker',
    'natIpAllocateOption': 'AUTO_ONLY',
    'minPortsPerVm': 512,
    'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
    'subnetworks': [{
      'name': '${ref.' + context.properties['infra_id'] + '-worker-subnet.selfLink}',
      'sourceIpRangesToNat': ['ALL_IP_RANGES']
    }]
  }
}
]]
return {'resources': resources}

```

6.12.8. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **initramfs** during boot to fetch their Ignition config files.

6.12.8.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, set statically through kernel arguments, or another method, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as **localhost** or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.12.8.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

Table 6.45. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	1936	Metrics
	9000-9999	Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099 .
	10250-10259	The default ports that Kubernetes reserves
	10256	openshift-sdn
UDP	4789	VXLAN and Geneve
	6081	VXLAN and Geneve
	9000-9999	Host level services, including the node exporter on ports 9100-9101 .
	500	IPsec IKE packets
	4500	IPsec NAT-T packets
TCP/UDP	30000-32767	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 6.46. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	6443	Kubernetes API

Table 6.47. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	2379-2380	etcd server and peer ports

6.12.9. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the internal load balancer** section of this topic and save it as **02_lb_int.py** on your computer. This template describes the internal load balancing objects that your cluster requires.
2. For an external cluster, also copy the template from the **Deployment Manager template for the external load balancer** section of this topic and save it as **02_lb_ext.py** on your computer. This template describes the external load balancing objects that your cluster requires.
3. Export the variables that the deployment template uses:

- a. Export the cluster network location:

```
$ export CLUSTER_NETWORK=$(gcloud compute networks describe ${INFRA_ID}-network --format json | jq -r .selfLink)
```

- b. Export the control plane subnet location:

```
$ export CONTROL_SUBNET=$(gcloud compute networks subnets describe ${INFRA_ID}-master-subnet --region=${REGION} --format json | jq -r .selfLink)
```

- c. Export the three zones that the cluster uses:

```
$ export ZONE_0=`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[0] | cut -d "/" -f9`
```

```
$ export ZONE_1=`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[1] | cut -d "/" -f9`
```

```
$ export ZONE_2=`gcloud compute regions describe ${REGION} --format=json | jq -r
.zones[2] | cut -d "/" -f9`
```

4. Create a **02_infra.yaml** resource definition file:

```
$ cat <<EOF >02_infra.yaml
imports:
- path: 02_lb_ext.py
- path: 02_lb_int.py 1
resources:
- name: cluster-lb-ext 2
  type: 02_lb_ext.py
  properties:
    infra_id: '${INFRA_ID}' 3
    region: '${REGION}' 4
- name: cluster-lb-int
  type: 02_lb_int.py
  properties:
    cluster_network: '${CLUSTER_NETWORK}'
    control_subnet: '${CONTROL_SUBNET}' 5
    infra_id: '${INFRA_ID}'
    region: '${REGION}'
    zones: 6
    - '${ZONE_0}'
    - '${ZONE_1}'
    - '${ZONE_2}'
EOF
```

1 2 Required only when deploying an external cluster.

3 **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

4 **region** is the region to deploy the cluster into, for example **us-central1**.

5 **control_subnet** is the URI to the control subnet.

6 **zones** are the zones to deploy the control plane instances into, like **us-east1-b**, **us-east1-c**, and **us-east1-d**.

5. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml
```

6. Export the cluster IP address:

```
$ export CLUSTER_IP=(`gcloud compute addresses describe ${INFRA_ID}-cluster-ip --
region=${REGION} --format json | jq -r .address`)
```

7. For an external cluster, also export the cluster public IP address:

```
$ export CLUSTER_PUBLIC_IP=(`gcloud compute addresses describe ${INFRA_ID}-cluster-
public-ip --region=${REGION} --format json | jq -r .address`)
```

6.12.9.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

Example 6.20. 02_lb_ext.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-cluster-public-ip',
        'type': 'compute.v1.address',
        'properties': {
            'region': context.properties['region']
        }
    }, {
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
        # probe for kube-apiserver
        'name': context.properties['infra_id'] + '-api-http-health-check',
        'type': 'compute.v1.httpHealthCheck',
        'properties': {
            'port': 6080,
            'requestPath': '/readyz'
        }
    }, {
        'name': context.properties['infra_id'] + '-api-target-pool',
        'type': 'compute.v1.targetPool',
        'properties': {
            'region': context.properties['region'],
            'healthChecks': ['$$(ref.' + context.properties['infra_id'] + '-api-http-health-check.selfLink)'],
            'instances': []
        }
    }, {
        'name': context.properties['infra_id'] + '-api-forwarding-rule',
        'type': 'compute.v1.forwardingRule',
        'properties': {
            'region': context.properties['region'],
            'IPAddress': '$(ref.' + context.properties['infra_id'] + '-cluster-public-ip.selfLink)',
            'target': '$(ref.' + context.properties['infra_id'] + '-api-target-pool.selfLink)',
            'portRange': '6443'
        }
    }
    ]

    return {'resources': resources}
```

6.12.9.2. Deployment Manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

Example 6.21. `02_lb_int.py` Deployment Manager template

```
def GenerateConfig(context):

    backends = []
    for zone in context.properties['zones']:
        backends.append({
            'group': '${ref.' + context.properties['infra_id'] + '-master-' + zone + '-instance-group' +
            '.selfLink}'
        })

    resources = [{
        'name': context.properties['infra_id'] + '-cluster-ip',
        'type': 'compute.v1.address',
        'properties': {
            'addressType': 'INTERNAL',
            'region': context.properties['region'],
            'subnetwork': context.properties['control_subnet']
        }
    }, {
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
        # probe for kube-apiserver
        'name': context.properties['infra_id'] + '-api-internal-health-check',
        'type': 'compute.v1.healthCheck',
        'properties': {
            'httpsHealthCheck': {
                'port': 6443,
                'requestPath': '/readyz'
            },
            'type': "HTTPS"
        }
    }, {
        'name': context.properties['infra_id'] + '-api-internal-backend-service',
        'type': 'compute.v1.regionBackendService',
        'properties': {
            'backends': backends,
            'healthChecks': [${ref.' + context.properties['infra_id'] + '-api-internal-health-
            check.selfLink')],
            'loadBalancingScheme': 'INTERNAL',
            'region': context.properties['region'],
            'protocol': 'TCP',
            'timeoutSec': 120
        }
    }, {
        'name': context.properties['infra_id'] + '-api-internal-forwarding-rule',
        'type': 'compute.v1.forwardingRule',
        'properties': {
            'backendService': ${ref.' + context.properties['infra_id'] + '-api-internal-backend-
            service.selfLink)',
            'IPAddress': ${ref.' + context.properties['infra_id'] + '-cluster-ip.selfLink)',
            'loadBalancingScheme': 'INTERNAL',
```

```

        'ports': ['6443', '22623'],
        'region': context.properties['region'],
        'subnetwork': context.properties['control_subnet']
    }
}

for zone in context.properties['zones']:
    resources.append({
        'name': context.properties['infra_id'] + '-master-' + zone + '-instance-group',
        'type': 'compute.v1.instanceGroup',
        'properties': {
            'namedPorts': [
                {
                    'name': 'ignition',
                    'port': 22623
                }, {
                    'name': 'https',
                    'port': 6443
                }
            ],
            'network': context.properties['cluster_network'],
            'zone': zone
        }
    })

return {'resources': resources}

```

You will need this template in addition to the **02_lb_ext.py** template when you create an external cluster.

6.12.10. Creating a private DNS zone in GCP

You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for the private DNS** section of this topic and save it as **02_dns.py** on your computer. This template describes the private DNS objects that your cluster requires.
2. Create a **02_dns.yaml** resource definition file:

```
$ cat <<EOF >02_dns.yaml
imports:
- path: 02_dns.py

resources:
- name: cluster-dns
  type: 02_dns.py
  properties:
    infra_id: '${INFRA_ID}' ❶
    cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}' ❷
    cluster_network: '${CLUSTER_NETWORK}' ❸
EOF
```

- ❶ **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- ❷ **cluster_domain** is the domain for the cluster, for example **openshift.example.com**.
- ❸ **cluster_network** is the **selfLink** URL to the cluster network.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml
```

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:
 - a. Add the internal DNS entries:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-
int.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-
private-zone
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone
```

- b. For an external cluster, also add the external DNS entries:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction add ${CLUSTER_PUBLIC_IP} --name
api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone
${BASE_DOMAIN_ZONE_NAME}
$ gcloud dns record-sets transaction execute --zone ${BASE_DOMAIN_ZONE_NAME}
```

6.12.10.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

Example 6.22. `02_dns.py` Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-private-zone',
        'type': 'dns.v1.managedZone',
        'properties': {
            'description': "",
            'dnsName': context.properties['cluster_domain'] + '.',
            'visibility': 'private',
            'privateVisibilityConfig': {
                'networks': [{
                    'networkUrl': context.properties['cluster_network']
                }]
            }
        }
    }]

    return {'resources': resources}
```

6.12.11. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the **Deployment Manager template for firewall rules** section of this topic and save it as **03_firewall.py** on your computer. This template describes the security groups that your cluster requires.

2. Create a **03_firewall.yaml** resource definition file:

```
$ cat <<EOF >03_firewall.yaml
imports:
- path: 03_firewall.py

resources:
- name: cluster-firewall
  type: 03_firewall.py
  properties:
    allowed_external_cidr: '0.0.0.0/0' ❶
    infra_id: '${INFRA_ID}' ❷
    cluster_network: '${CLUSTER_NETWORK}' ❸
    network_cidr: '${NETWORK_CIDR}' ❹
EOF
```

- ❶ **allowed_external_cidr** is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to **\${NETWORK_CIDR}**.
- ❷ **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.
- ❸ **cluster_network** is the **selfLink** URL to the cluster network.
- ❹ **network_cidr** is the CIDR of the VPC network, for example **10.0.0.0/16**.

3. Create the deployment by using the **gcloud** CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-firewall --config
03_firewall.yaml
```

6.12.11.1. Deployment Manager template for firewall rules

You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

Example 6.23. 03_firewall.py Deployment Manager template

```
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
        'type': 'compute.v1.firewall',
        'properties': {
            'network': context.properties['cluster_network'],
            'allowed': [{
                'IPProtocol': 'tcp',
                'ports': ['22']
            }],
            'sourceRanges': [context.properties['allowed_external_cidr']],
            'targetTags': [context.properties['infra_id'] + '-bootstrap']
        }
    ], {
        'name': context.properties['infra_id'] + '-api',
```

```

    'type': 'compute.v1.firewall',
    'properties': {
      'network': context.properties[cluster_network],
      'allowed': [{
        'IPProtocol': 'tcp',
        'ports': ['6443']
      }],
      'sourceRanges': [context.properties[allowed_external_cidr]],
      'targetTags': [context.properties[infra_id] + '-master']
    }
  }, {
    'name': context.properties[infra_id] + '-health-checks',
    'type': 'compute.v1.firewall',
    'properties': {
      'network': context.properties[cluster_network],
      'allowed': [{
        'IPProtocol': 'tcp',
        'ports': ['6080', '6443', '22624']
      }],
      'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22'],
      'targetTags': [context.properties[infra_id] + '-master']
    }
  }, {
    'name': context.properties[infra_id] + '-etcd',
    'type': 'compute.v1.firewall',
    'properties': {
      'network': context.properties[cluster_network],
      'allowed': [{
        'IPProtocol': 'tcp',
        'ports': ['2379-2380']
      }],
      'sourceTags': [context.properties[infra_id] + '-master'],
      'targetTags': [context.properties[infra_id] + '-master']
    }
  }, {
    'name': context.properties[infra_id] + '-control-plane',
    'type': 'compute.v1.firewall',
    'properties': {
      'network': context.properties[cluster_network],
      'allowed': [{
        'IPProtocol': 'tcp',
        'ports': ['10257']
      }],
      'sourceTags': [
        context.properties[infra_id] + '-master',
        context.properties[infra_id] + '-worker'
      ],
      'targetTags': [context.properties[infra_id] + '-master']
    }
  }, {

```

```

'name': context.properties['infra_id'] + '-internal-network',
'type': 'compute.v1.firewall',
'properties': {
  'network': context.properties['cluster_network'],
  'allowed': [{
    'IPProtocol': 'icmp'
  },{
    'IPProtocol': 'tcp',
    'ports': ['22']
  }],
  'sourceRanges': [context.properties['network_cidr']],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
}
}, {
'name': context.properties['infra_id'] + '-internal-cluster',
