Abstract

This guide provides a detailed overview on logging and monitoring a Red Hat OpenStack Platform environment, and how to solve problems.

Table of Contents

CHAPTER 1. ABOUT THIS GUIDE	3
CHAPTER 2. LOGGING	4
2.1. LOG FILES FOR OPENSTACK SERVICES	4
2.1.1. Bare Metal Provisioning (ironic) Log Files	4

CHAPTER 1. ABOUT THIS GUIDE

WARNING

Red Hat is currently reviewing the information and procedures provided in this guide for this release.

This document is based on the Red Hat OpenStack Platform 10 document, available at https://access.redhat.com/documentation/en-us/red_hat_openstack_platform/?version=10.

If you require assistance for Red Hat OpenStack Platform 11, please contact Red Hat support.

This document provides an overview of the logging and monitoring capabilities that are available in a Red Hat OpenStack Platform environment, and how to troubleshoot possible issues.

CHAPTER 2. LOGGING

Red Hat OpenStack Platform writes informational messages to specific log files; you can use these messages for troubleshooting and monitoring system events.

NOTE

You need not attach the individual log files to your support cases manually. All the required information will be gathered automatically by the **sosreport** utility, which is described in [Chapter 4, Troubleshooting](#).

2.1. LOG FILES FOR OPENSTACK SERVICES

Each OpenStack component has a separate logging directory containing files specific to a running service.

2.1.1. Bare Metal Provisioning (ironic) Log Files

Service	Service Name	Log Path
OpenStack Ironic API	openstack-ironic-api.service	/var/log/ironic/ironic-api.log
OpenStack Ironic Conductor	openstack-ironic-conductor.service	/var/log/ironic/ironic-conductor.log

2.1.2. Block Storage (cinder) Log Files

Service	Service Name	Log Path
Block Storage API	openstack-cinder-api.service	/var/log/cinder/api.log
Block Storage Backup	openstack-cinder-backup.service	/var/log/cinder/backup.log
Informational messages	The cinder-manage command	/var/log/cinder/cinder-manage.log
Block Storage Scheduler	openstack-cinder-scheduler.service	/var/log/cinder/scheduler.log
Block Storage Volume	openstack-cinder-volume.service	/var/log/cinder/volume.log

2.1.3. Compute (nova) Log Files

Service	Service Name	Log Path
OpenStack Compute API service	openstack-nova-api.service	/var/log/nova/nova-api.log

Service	Service Name	Log Path
OpenStack Compute certificate server	openstack-nova-cert.service	/var/log/nova/nova-cert.log
OpenStack Compute service	openstack-nova-compute.service	/var/log/nova/nova-compute.log
OpenStack Compute Conductor service	openstack-nova-conductor.service	/var/log/nova/nova-conductor.log
OpenStack Compute VNC console authentication server	openstack-nova-consoleauth.service	/var/log/nova/nova-consoleauth.log
Informational messages	nova-manage command	/var/log/nova/nova-manage.log
OpenStack Compute NoVNC Proxy service	openstack-nova-novncproxy.service	/var/log/nova/nova-novncproxy.log
OpenStack Compute Scheduler service	openstack-nova-scheduler.service	/var/log/nova/nova-scheduler.log

2.1.4. Dashboard (horizon) Log Files

Service	Service Name	Log Path
Log of certain user interactions	Dashboard interface	/var/log/horizon/horizon.log

The Apache HTTP server uses several additional log files for the Dashboard web interface, which can be accessed using a web browser or command-line clients (keystone, nova). The following log files can be helpful in tracking the usage of the Dashboard and diagnosing faults:

Purpose	Log Path
All processed HTTP requests	/var/log/httpd/horizon_access.log
HTTP errors	/var/log/httpd/horizon_error.log
Admin-role API requests	/var/log/httpd/keystone_wsgi_admin_access.log
Admin-role API errors	/var/log/httpd/keystone_wsgi_admin_error.log
Member-role API requests	/var/log/httpd/keystone_wsgi_main_access.log
Member-role API errors	/var/log/httpd/keystone_wsgi_main_error.log

**NOTE**

There is also `/var/log/httpd/default_error.log`, which stores errors reported by other web services running on the same host.

2.1.5. Data Processing (sahara) Log Files

Service	Service Name	Log Path
Sahara API Server	openstack-sahara-all.service openstack-sahara-api.service	/var/log/sahara/sahara-all.log /var/log/messages
Sahara Engine Server	openstack-sahara-engine.service	/var/log/messages

2.1.6. Database as a Service (trove) Log Files

Service	Service Name	Log Path
OpenStack Trove API Service	openstack-trove-api.service	/var/log/trove/trove-api.log
OpenStack Trove Conductor Service	openstack-trove-conductor.service	/var/log/trove/trove-conductor.log
OpenStack Trove guestagent Service	openstack-trove-guestagent.service	/var/log/trove/logfile.txt
OpenStack Trove taskmanager Service	openstack-trove-taskmanager.service	/var/log/trove/trove-taskmanager.log

2.1.7. Identity Service (keystone) Log Files

Service	Service Name	Log Path
OpenStack Identity Service	openstack-keystone.service	/var/log/keystone/keystone.log

2.1.8. Image Service (glance) Log Files

Service	Service Name	Log Path
OpenStack Image Service API server	openstack-glance-api.service	/var/log/glance/api.log
OpenStack Image Service Registry server	openstack-glance-registry.service	/var/log/glance/registry.log

2.1.9. Networking (neutron) Log Files

Service	Service Name	Log Path
OpenStack Neutron DHCP Agent	neutron-dhcp-agent.service	/var/log/neutron/dhcp-agent.log
OpenStack Networking Layer 3 Agent	neutron-l3-agent.service	/var/log/neutron/l3-agent.log
Metadata agent service	neutron-metadata-agent.service	/var/log/neutron/metadata-agent.log
Metadata namespace proxy	n/a	/var/log/neutron/neutron-ns-metadata-proxy- <i>UUID</i> .log
Open vSwitch agent	neutron-openvswitch-agent.service	/var/log/neutron/openvswitch-agent.log
OpenStack Networking service	neutron-server.service	/var/log/neutron/server.log

2.1.10. Object Storage (swift) Log Files

OpenStack Object Storage sends logs to the system logging facility only.

NOTE

By default, all Object Storage log files to /var/log/swift/swift.log, using the local0, local1, and local2 syslog facilities.

The log messages of Object Storage are classified into two broad categories: those by REST API services and those by background daemons. The API service messages contain one line per API request, in a manner similar to popular HTTP servers; both the frontend (Proxy) and backend (Account, Container, Object) services post such messages. The daemon messages are less structured and typically contain human-readable information about daemons performing their periodic tasks. However, regardless of which part of Object Storage produces the message, the source identity is always at the beginning of the line.

An example of a proxy message:

```
Apr 20 15:20:34 rhv-a24c-01 proxy-server: 127.0.0.1 127.0.0.1
20/Apr/2015/19/20/34 GET
/v1/AUTH_zaitcev%3Fformat%3Djson%26marker%3Dtestcont HTTP/1.0 200 -
python-swiftclient-2.1.0 AUTH_tk737d6... - 2 - txc454fa8ea4844d909820a-
0055355182 - 0.0162 - - 1429557634.806570053 1429557634.822791100
```

An example of ad-hoc messages from background daemons:

```
Apr 27 17:08:15 rhv-a24c-02 object-auditor: Object audit (ZBF). Since Mon
Apr 27 21:08:15 2015: Locally: 1 passed, 0 quarantined, 0 errors
files/sec: 4.34 , bytes/sec: 0.00, Total time: 0.23, Auditing time: 0.00,
Rate: 0.00
```

```

Apr 27 17:08:16 rhev-a24c-02 object-auditor: Object audit (ZBF) "forever"
mode completed: 0.56s. Total quarantined: 0, Total errors: 0, Total
files/sec: 14.31, Total bytes/sec: 0.00, Auditing time: 0.02, Rate: 0.04
Apr 27 17:08:16 rhev-a24c-02 account-replicator: Beginning replication run
Apr 27 17:08:16 rhev-a24c-02 account-replicator: Replication run OVER
Apr 27 17:08:16 rhev-a24c-02 account-replicator: Attempted to replicate 5
dbs in 0.12589 seconds (39.71876/s)
Apr 27 17:08:16 rhev-a24c-02 account-replicator: Removed 0 dbs
Apr 27 17:08:16 rhev-a24c-02 account-replicator: 10 successes, 0 failures

```

2.1.11. Orchestration (heat) Log Files

Service	Service Name	Log Path
OpenStack Heat API Service	openstack-heat-api.service	/var/log/heat/heat-api.log
Openstack Heat Engine Service	openstack-heat-engine.service	/var/log/heat/heat-engine.log
Orchestration service events	n/a	/var/log/heat/heat-manage.log

2.1.12. Shared Filesystem Service (manila) Log Files

Service	Service Name	Log Path
OpenStack Manila API Server	openstack-manila-api.service	/var/log/manila/api.log
OpenStack Manila Scheduler	openstack-manila-scheduler.service	/var/log/manila/scheduler.log
OpenStack Manila Share Service	openstack-manila-share.service	/var/log/manila/share.log

NOTE

Some information from the Manila Python library can also be logged in `/var/log/manila/manila-manage.log`.

2.1.13. Telemetry (ceilometer) Log Files

Service	Service Name	Log Path
OpenStack ceilometer notification agent	openstack-ceilometer-notification.service	/var/log/ceilometer/agent-notification.log
OpenStack ceilometer alarm evaluation	openstack-ceilometer-alarm-evaluator.service	/var/log/ceilometer/alarm-evaluator.log

Service	Service Name	Log Path
OpenStack ceilometer alarm notification	openstack-ceilometer-alarm-notifier.service	/var/log/ceilometer/alarm-notifier.log
OpenStack ceilometer API	httpd.service	/var/log/ceilometer/api.log
Informational messages	MongoDB integration	/var/log/ceilometer/ceilometer-dbsync.log
OpenStack ceilometer central agent	openstack-ceilometer-central.service	/var/log/ceilometer/central.log
OpenStack ceilometer collection	openstack-ceilometer-collector.service	/var/log/ceilometer/collector.log
OpenStack ceilometer compute agent	openstack-ceilometer-compute.service	/var/log/ceilometer/compute.log

2.1.14. Log Files for Supporting Services

The following services are used by the core OpenStack components and have their own log directories and files.

Service	Service Name	Log Path
Message broker (RabbitMQ)	rabbitmq-server.service	/var/log/rabbitmq/rabbit@short_hostname.log /var/log/rabbitmq/rabbit@short_hostname-sasl.log (for Simple Authentication and Security Layer related log messages)
Database server (MariaDB)	mariadb.service	/var/log/mariadb/mariadb.log
Document-oriented database (MongoDB)	mongod.service	/var/log/mongodb/mongodb.log
Virtual network switch (Open vSwitch)	openvswitch-nonetwork.service	/var/log/openvswitch/ovsdb-server.log /var/log/openvswitch/ovs-vswitchd.log

2.2. CONFIGURE LOGGING OPTIONS

Each component maintains its own separate logging configuration in its respective configuration file. For example, in Compute, these options are set in `/etc/nova/nova.conf`:

- Increase the level of informational logging by enabling debugging. This option greatly increases the amount of information captured, so you may want to consider using it only temporarily, or first reviewing your log rotation settings.

```
debug=True
```

- Enable verbose logging:

```
verbose=True
```

- Change the log file path:

```
log_dir=/var/log/nova
```

- Send your logs to a central syslog server:

```
use_syslog=True  
syslog_log_facility=LOG_USER
```

**NOTE**

Options are also available for timestamp configuration and log formatting, among others. Review the component's configuration file for additional logging options.

2.3. REMOTE LOGGING INSTALLATION AND CONFIGURATION

All OpenStack services generate and update log files. These log files record actions, errors, warnings, and other events. In a distributed environment like OpenStack, collecting these logs in a central location simplifies debugging and administration.

For more information about centralized logging, see the [Monitoring Tools Configuration guide](#).

CHAPTER 3. CAPACITY METERING USING THE TELEMETRY SERVICE

The Openstack Telemetry service provides usage metrics that can be leveraged for billing, charge-back, and show-back purposes. Such metrics data can also be used by third-party applications to plan for capacity on the cluster and can also be leveraged for auto-scaling virtual instances using Openstack Heat. For more information, see [Auto Scaling for Compute](#).

The combination of ceilometer and gnocchi can be used for monitoring and alarms. This is supported on small-size clusters and with known limitations. For real-time monitoring, Red Hat Openstack Platform ships with agents that provide metrics data, and can be consumed by separate monitoring infrastructure and applications. For more information, see [Monitoring Tools Configuration](#).

3.1. VIEW EXISTING ALARMS

To list the existing Telemetry alarms, use the **aodh** command. For example:

```
# aodh alarm list
+-----+-----+-----+-----+
| alarm_id | type | state | severity | enabled |
+-----+-----+-----+-----+
| 922f899c-27c8-4c7d-a2cf-107be51ca90a | gnocchi_aggregation_by_resources_threshold | iops-monitor-read-requests | insufficient data | low | True |
```

To list the meters assigned to a resource, specify the *UUID* of the resource (an instance, image, or volume, among others). For example:

```
# gnocchi resource show 5e3fcbe2-7aab-475d-b42c-a440aa42e5ad
```

3.2. CREATE AN ALARM

You can use **aodh** to create an alarm that activates when a threshold value is reached. In this example, the alarm activates and adds a log entry when the average CPU utilization for an individual instance exceeds 80%. A query is used to isolate the specific instance's id (**94619081-abf5-4f1f-81c7-9cedaa872403**) for monitoring purposes:

```
# aodh alarm create --type gnocchi_aggregation_by_resources_threshold --
name cpu_usage_high --metric cpu_util --threshold 80 --aggregation-method
sum --resource-type instance --query '{"=": {"id": "94619081-abf5-4f1f-
81c7-9cedaa872403"}}' --alarm-action 'log://'
+-----+-----+-----+-----+
| Field | Value |
```

```

+-----+-----+
-----+
| aggregation_method      | sum
|
| alarm_actions           | [u'log://']
|
| alarm_id                | b794adc7-ed4f-4edb-ace4-88cbe4674a94
|
| comparison_operator    | eq
|
| description            | gnocchi_aggregation_by_resources_threshold
alarm rule |
| enabled                | True
|
| evaluation_periods     | 1
|
| granularity            | 60
|
| insufficient_data_actions | []
|
| metric                 | cpu_util
|
| name                   | cpu_usage_high
|
| ok_actions             | []
|
| project_id             | 13c52c41e0e543d9841a3e761f981c20
|
| query                  | {"=": {"id": "94619081-abf5-4f1f-81c7-
9cedaa872403"}} |
| repeat_actions        | False
|
| resource_type          | instance
|
| severity               | low
|
| state                  | insufficient data
|
| state_timestamp        | 2016-12-09T05:18:53.326000
|
| threshold              | 80.0
|
| time_constraints       | []
|
| timestamp              | 2016-12-09T05:18:53.326000
|
| type                   | gnocchi_aggregation_by_resources_threshold
|
| user_id                | 32d3f2c9a234423cb52fb69d3741dbbc
|
+-----+-----+
-----+

```

To edit an existing threshold alarm, use the **aodh alarm update** command. For example, to increase the alarm threshold to 75%:

```
# aodh alarm update --name cpu_usage_high --threshold 75
```

3.3. DISABLE OR DELETE AN ALARM

To disable an alarm:

```
# aodh alarm update --name cpu_usage_high --enabled=false
```

To delete an alarm:

```
# aodh alarm delete --name cpu_usage_high
```

3.4. VIEW MEASURES

To list all the measures for a particular resource:

```
# gnocchi measures show --resource-id UUID METER_NAME
```

To list only measures for a particular resource, within a range of timestamps:

```
# gnocchi measures show --aggregation mean --start START_TIME --end  
STOP_TIME --resource-id UUID METER_NAME
```

Where *START_TIME* and *END_TIME* are in the form *iso-dateThh:mm:ss*.

3.5. CREATE NEW MEASURES

You can use measures to send data to the Telemetry service, and they do not need to correspond to a previously-defined meter. For example:

```
# gnocchi measures add -m 2015-01-12T17:56:23@42 --resource-id UUID  
METER_NAME
```

3.6. VIEW CLOUD USAGE MEASURES

This example shows the average memory usage of all instances for each project.

```
gnocchi measures aggregation --resource-type instance --groupby project_id  
-m memory
```

3.7. VIEW L3 CACHE USAGE

If your Intel hardware and libvirt version supports *Cache Monitoring Technology* (CMT), you can use the `cpu_l3_cache` meter to monitor the amount of L3 cache used by an instance.

3.8. MONITOR THE DISK ACTIVITY OF INSTANCES

The following example demonstrates how to use an aodh alarm to monitor the cumulative disk activity for all the instances contained within a particular project.

1. Review the existing projects, and select the appropriate UUID of the project you need to monitor. This example uses the **admin** tenant:

```
$ openstack project list
+-----+-----+
| ID                | Name      |
+-----+-----+
| 745d33000ac74d30a77539f8920555e7 | admin     |
| 983739bb834a42ddb48124a38def8538 | services  |
| be9e767afd4c4b7ead1417c6dfedde2b | demo      |
+-----+-----+
```

2. Use the project's UUID to create an alarm that analyses the **sum()** of all read requests generated by the instances in the **admin** tenant (the query can be further restrained with the **--query** parameter).

```
# aodh alarm create --type gnocchi_aggregation_by_resources_threshold --
name iops-monitor-read-requests --metric disk.read.requests.rate --
threshold 42000 --aggregation-method sum --resource-type instance --query
'{"=": {"project_id": "745d33000ac74d30a77539f8920555e7"}}'
+-----+-----+
-----+
| Field                | Value
|
+-----+-----+
-----+
| aggregation_method   | sum
|
| alarm_actions        | []
|
| alarm_id             | 192aba27-d823-4ede-a404-7f6b3cc12469
|
| comparison_operator  | eq
|
| description          | gnocchi_aggregation_by_resources_threshold
alarm rule |
| enabled              | True
|
| evaluation_periods   | 1
|
| granularity          | 60
|
| insufficient_data_actions | []
|
| metric               | disk.read.requests.rate
|
| name                 | iops-monitor-read-requests
|
| ok_actions           | []
|
| project_id           | 745d33000ac74d30a77539f8920555e7
|
| query                | {"=": {"project_id":
"745d33000ac74d30a77539f8920555e7"}} |
| repeat_actions       | False
|
```

```

| resource_type          | instance
|
| severity               | low
|
| state                  | insufficient data
|
| state_timestamp       | 2016-11-08T23:41:22.919000
|
| threshold              | 42000.0
|
| time_constraints       | []
|
| timestamp              | 2016-11-08T23:41:22.919000
|
| type                   | gnocchi_aggregation_by_resources_threshold
|
| user_id                | 8c4aea738d774967b4ef388eb41fef5e
|
+-----+-----+
-----+

```

3.9. MANAGE RESOURCE TYPES

Telemetry resource types that were previously hardcoded can now be managed by the *gnocchi* client. You can use the *gnocchi* client to create, view, and delete resource types, and you can use the *gnocchi* API to update or delete attributes.

1. Create a new *resource-type*:

```

$ gnocchi resource-type create testResource01 -a
bla:string:True:min_length=123
+-----+-----+
-----+
| Field          | Value
|
+-----+-----+
-----+
| attributes/bla | max_length=255, min_length=123, required=True,
type=string |
| name           | testResource01
|
| state          | active
|
+-----+-----+
-----+

```

2. Review the configuration of the *resource-type*:

```

$ gnocchi resource-type show testResource01
+-----+-----+
-----+
| Field          | Value
|
+-----+-----+
-----+

```

```
| attributes/bla | max_length=255, min_length=123, required=True,
type=string |
| name          | testResource01
|
| state        | active
|
+-----+-----+
-----+
```

3. Delete the *resource-type*:

```
$ gnocchi resource-type delete testResource01
```

NOTE

You cannot delete a resource type if a resource is using it.

3.10. USING THE TIME-SERIES-DATABASE-AS-A-SERVICE

Time-Series-Database-as-a-Service (gnocchi) is a multi-tenant, metrics and resource database. It is designed to store metrics at a very large scale while providing access to metrics and resources information to operators and users.

Currently, the TSDaaS uses the Identity service for authentication, and Ceph, Object Storage to store data.

TDSaaS provides the **statsd** daemon that is compatible with the **statsd** protocol and can listen to the metrics sent over the network, named **gnocchi-statsd**. In order to enable **statsd** support in TDSaaS, you need to configure the **[statsd]** option in the configuration file. The resource ID parameter is used as the main generic resource where all the metrics are attached, a user and project ID that are associated with the resource and metrics, and an archive policy name that is used to create the metrics.

All the metrics will be created dynamically as the metrics are sent to **gnocchi-statsd**, and attached with the provided name to the resource ID you configured. For more information on installing and configuring TSDaaS, see the **Install Time-Series-Database-as-a-Service** chapter in the **Manual Installation Procedures** available at: <https://access.redhat.com/documentation/en/red-hat-enterprise-linux-openstack-platform/>

3.10.1. Running Time-Series-Database-as-a-Service

Run Time-Series-Database-as-a-Service (TSDaaS) by running the HTTP server and metric daemon:

```
# gnocchi-api
# gnocchi-metricd
```

3.10.2. Running As A WSGI Application

You can run the TSDaaS through a WSGI service such as **mod_wsgi** or any other WSGI application. The file **gnocchi/rest/app.wsgi** provided with TSDaaS allows you to enable Gnocchi as a WSGI application.

The TSDaaS API tier runs using WSGI. This means it can be run using Apache **httpd** and **mod_wsgi**,

or another HTTP daemon such as **uwsgi**. You should configure the number of processes and threads according to the number of CPUs you have, usually around **1.5 × number of CPUs**. If one server is not enough, you can spawn any number of new API servers to scale Gnocchi out, even on different machines.

3.10.3. **metricd Workers**

By default, the **gnocchi-metricd** daemon spans all your CPU power in order to maximize CPU utilisation when computing metric aggregation. You can use the **gnocchi status** command to query the HTTP API and get the cluster status for metric processing. This command displays the number of metrics to process, known as the processing backlog for the **gnocchi-metricd**. As long as this backlog is not continuously increasing, that means that **gnocchi-metricd** is able to cope with the amount of metric that are being sent. If the number of measure to process is continuously increasing, you will need to (maybe temporarily) increase the number of the **gnocchi-metricd** daemons. You can run any number of **metricd** daemons on any number of servers.

3.10.4. **Monitoring the Time-Series-Database-as-a-Service**

The **/v1/status** endpoint of the HTTP API returns various information, such as the number of measures to process (measures backlog), which you can easily monitor. Making sure that the HTTP server and the **gnocchi-metricd** daemon are running and are not writing anything alarming in their logs is a sign of good health of the overall system.

3.10.5. **Backing up and Restoring Time-Series-Database-as-a-Service**

In order to be able to recover from an unfortunate event, you need to backup both the index and the storage. That means creating a database dump (PostgreSQL or MySQL) and doing snapshots or copies of your data storage (Ceph, Swift or your file system). The procedure to restore is: restore your index and storage backups, reinstall TSDaaS if necessary, and restart it.

CHAPTER 4. TROUBLESHOOTING

This chapter contains logging and support information to assist with troubleshooting your Red Hat OpenStack Platform deployment.

4.1. SUPPORT

If client commands fail or you run into other issues, contact Red Hat Technical Support with a description of what happened, the full console output, all log files referenced in the console output, and an **sosreport** from the node that is (or might be) in trouble. For example, if you encounter a problem on the compute level, run **sosreport** on the Nova node, or if it is a networking issue, run the utility on the Neutron node. For general deployment issues, it is best to run **sosreport** on the cloud controller.

For information about the **sosreport** command (**sos** package), refer to [What is a sosreport and how to create one in Red Hat Enterprise Linux 4.6 and later](#).

Check also the `/var/log/messages` file for any hints.

4.2. TROUBLESHOOT IDENTITY CLIENT (KEYSTONE) CONNECTIVITY PROBLEMS

When the Identity client (**keystone**) is unable to contact the Identity service it returns an error:

```
Unable to communicate with identity service: [Errno 113] No route to host.  
(HTTP 400)
```

To debug the issue check for these common causes:

Identity service is down

Identity Service now runs within `httpd.service`. On the system hosting the Identity service, check the service status:

```
# systemctl status httpd.service
```

If the service is not active then log in as the root user and start it.

```
# systemctl start httpd.service
```

Firewall is not configured properly

The firewall might not be configured to allow TCP traffic on ports **5000** and **35357**. If so, see *Configure the Firewall to Allow Identity Service Traffic* in the Manual Installation Procedures for instructions on how to correct this.

Service Endpoints not defined correctly

On the system hosting the Identity service check that the endpoints are defined correctly.

1. Obtain the administration token:

```
# grep admin_token /etc/keystone/keystone.conf  
admin_token = 91f0866234a64fc299db8f26f8729488
```

2. Determine the correct administration endpoint for the Identity service:

```
http://IP:35357/VERSION
```

Replace *IP* with the IP address or host name of the system hosting the Identity service. Replace *VERSION* with the API version (**v2.0**, or **v3**) that is in use.

- Unset any pre-defined Identity service related environment variables:

```
# unset OS_USERNAME OS_TENANT_NAME OS_PASSWORD OS_AUTH_URL
```

- Use the administration token and endpoint to authenticate with the Identity service. Confirm that the Identity service endpoint is correct. For example:

```
# openstack endpoint list --os-
token=91f0556234a64fc299db8f26f8729488 --os-
url=https://osp.lab.local:35357/v3/ --os-identity-api-version 3
```

Verify that the listed **publicurl**, **internalurl**, and **adminurl** for the Identity service are correct. In particular ensure that the IP addresses and port numbers listed within each endpoint are correct and reachable over the network.

If these values are incorrect then see *Create an Administrator Account and the Identity Service Endpoint* in the Manual Installation Procedures for information on adding the correct endpoint. Once the correct endpoints have been added, remove any incorrect endpoints using the **endpoint delete** action of the **openstack** command. For example:

```
# openstack endpoint delete 2d32fa6feecc49aab5de538bdf7aa018 --
os-token=91f0866234a64fc299db8f26f8729488 --os-
url=https://osp.lab.local:35357/v3/ --os-identity-api-version 3
```

Replace *TOKEN* and *ENDPOINT* with the values identified previously. Replace *ID* with the identity of the endpoint to remove as listed by the **endpoint-list** action.

4.3. TROUBLESHOOT OPENSTACK NETWORKING ISSUES

This section discusses the different commands you can use and procedures you can follow to troubleshoot the OpenStack Networking service issues.

Debugging Networking Device

- Use the **ip a** command to display all the physical and virtual devices.
- Use the **ovs-vsctl show** command to display the interfaces and bridges in a virtual switch.
- Use the **ovs-dpctl show** command to show datapaths on the switch.

Tracking Networking Packets

- Use the **tcpdump** command to see where packets are not getting through.

```
# tcpdump -n -i INTERFACE -e -w FILENAME
```

Replace *INTERFACE* with the name of the network interface to see where the packets are not getting through. The interface name can be the name of the bridge or host Ethernet device.

The **-e** flag ensures that the link-level header is dumped (in which the **vlan** tag will appear).

The **-w** flag is optional. You can use it only if you want to write the output to a file. If not, the output is written to the standard output (**stdout**).

For more information about **tcpdump**, refer to its manual page by running **man tcpdump**.

Debugging Network Namespaces

- Use the **ip netns list** command to list all known network namespaces.
- Use the **ip netns exec** command to show routing tables inside specific namespaces.

```
# ip netns exec NAMESPACE_ID bash
# route -n
```

Start the **ip netns exec** command in a bash shell so that subsequent commands can be invoked without the **ip netns exec** command.

4.4. TROUBLESHOOT NETWORKS AND ROUTES TAB DISPLAY ISSUES IN THE DASHBOARD

The *Networks* and *Routers* tabs only appear in the dashboard when the environment is configured to use OpenStack Networking. In particular note that by default the PackStack utility currently deploys Nova Networking and as such in environments deployed in this manner the tab will not be visible.

If OpenStack Networking is deployed in the environment but the tabs still do not appear ensure that the service endpoints are defined correctly in the Identity service, that the firewall is allowing access to the endpoints, and that the services are running.

4.5. TROUBLESHOOT INSTANCE LAUNCHING ERRORS IN THE DASHBOARD

When using the dashboard to launch instances if the operation fails, a generic **ERROR** message is displayed. Determining the actual cause of the failure requires the use of the command line tools.

Use the **nova list** command to locate the unique identifier of the instance. Then use this identifier as an argument to the **nova show** command. One of the items returned will be the error condition. The most common value is **NoValidHost**.

This error indicates that no valid host was found with enough available resources to host the instance. To work around this issue, consider choosing a smaller instance size or increasing the overcommit allowances for your environment.

**NOTE**

To host a given instance, the compute node must have not only available CPU and RAM resources but also enough disk space for the ephemeral storage associated with the instance.

4.6. TROUBLESHOOT KEYSTONE V3 DASHBOARD AUTHENTICATION

`django_openstack_auth` is a pluggable Django authentication back end, that works with Django's `contrib.auth` framework, to authenticate a user against the OpenStack Identity service API.

`django_openstack_auth` uses the token object to encapsulate user and Keystone related information. The dashboard uses the token object to rebuild the Django user object.

The token object currently stores:

- Keystone token
- User information
- Scope
- Roles
- Service catalog

The dashboard uses Django's sessions framework for handling user session data. The following is a list of numerous session back ends available, which are controlled through the `SESSION_ENGINE` setting in your `local_settings.py` file:

- Local Memory Cache
- Memcached
- Database
- Cached Database
- Cookies

In some cases, particularly when a signed cookie session back end is used and, when having many or all services enabled all at once, the size of cookies can reach its limit and the dashboard can fail to log in. One of the reasons for the growth of cookie size is the service catalog. As more services are registered, the bigger the size of the service catalog would be.

In such scenarios, to improve the session token management, include the following configuration settings for logging in to the dashboard, especially when using Keystone v3 authentication.

1. In `/usr/share/openstack-dashboard/openstack_dashboard/settings.py` add the following configuration:

```
DATABASES =
{
  'default':
  {
    'ENGINE': 'django.db.backends.mysql',
    'NAME': 'horizondb',
    'USER': 'User Name',
```

```
'PASSWORD': 'Password',  
'HOST': 'localhost',  
}  
}
```

2. In the same file, change `SESSION_ENGINE` to:

```
SESSION_ENGINE = 'django.contrib.sessions.backends.cached_db'
```

3. Connect to the database service using the `mysql` command, replacing `USER` with the user name by which to connect. The `USER` must be a root user (or at least as a user with the correct permission: create db).

```
# mysql -u USER -p
```

4. Create the Horizon database.

```
mysql > create database horizonsdb;
```

5. Exit the `mysql` client.

```
mysql > exit
```

6. Change to the `openstack_dashboard` directory and sync the database using:

```
# cd /usr/share/openstack-dashboard/openstack_dashboard  
$ ./manage.py syncdb
```

You do not need to create a superuser, so answer 'n' to the question.

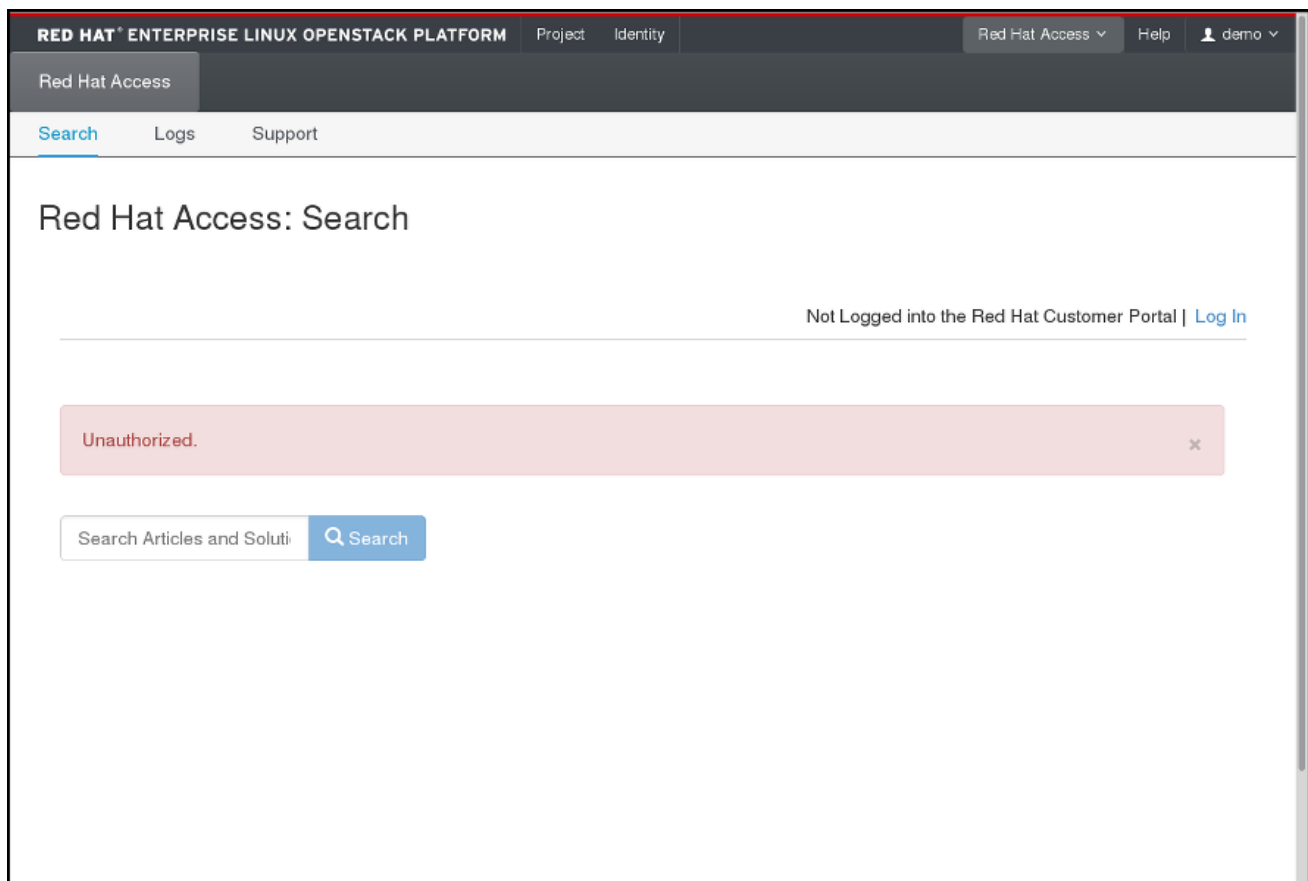

7. Restart Apache http server. For Red Hat Enterprise Linux:

```
#service httpd restart
```

4.7. OPENSTACK DASHBOARD - RED HAT ACCESS TAB

The *Red Hat Access* tab, which is part of the OpenStack dashboard, allows you to search for and read articles or solutions from the Red Hat Customer Portal, view logs from your instances and diagnose them, and work with your customer support cases.

Figure 4.1. Red Hat Access Tab.

IMPORTANT

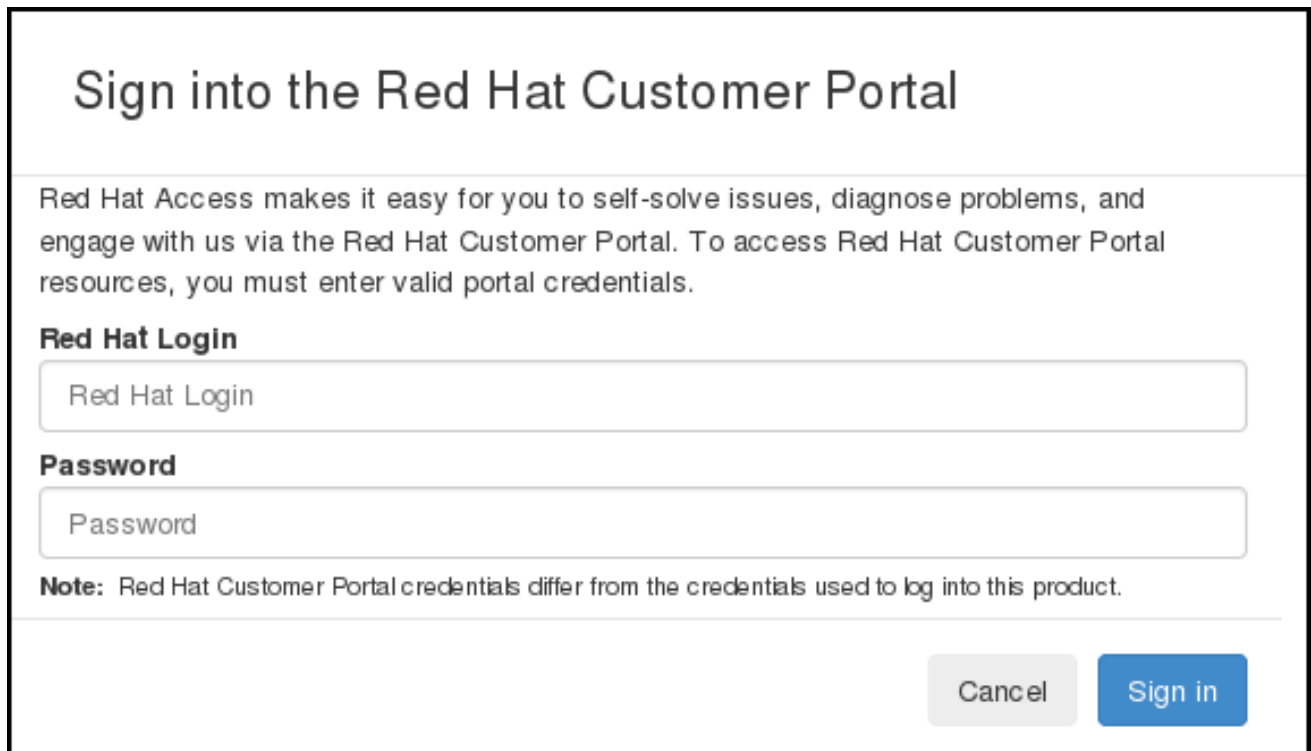

You must be logged in to the Red Hat Customer Portal in the browser in order to be able to use the functions provided by the Red Hat Access tab.

If you are not logged in, you can do so now:

1. Click *Log In*.
2. Enter your Red Hat login.
3. Enter your Red Hat password.
4. Click *Sign in*.

This is how the form looks:

Figure 4.2. Logging in to the Red Hat Customer Portal.

The screenshot shows a login form titled "Sign into the Red Hat Customer Portal". Below the title is a paragraph of text: "Red Hat Access makes it easy for you to self-solve issues, diagnose problems, and engage with us via the Red Hat Customer Portal. To access Red Hat Customer Portal resources, you must enter valid portal credentials." Below this text are two input fields: "Red Hat Login" and "Password". Below the input fields is a note: "Note: Red Hat Customer Portal credentials differ from the credentials used to log into this product." At the bottom right of the form are two buttons: "Cancel" and "Sign in".

Sign into the Red Hat Customer Portal

Red Hat Access makes it easy for you to self-solve issues, diagnose problems, and engage with us via the Red Hat Customer Portal. To access Red Hat Customer Portal resources, you must enter valid portal credentials.

Red Hat Login

Password

Note: Red Hat Customer Portal credentials differ from the credentials used to log into this product.

Cancel Sign in

If you do not log in now, you will be prompted for your Red Hat login and password when you use one of the functions that require authentication.

4.7.1. Search

You can search for articles and solutions from Red Hat Customer Portal by entering one or more search keywords. The titles of the relevant articles and solutions will then be displayed. Click on a title to view the given article or solution:

Figure 4.3. Example of Search Results on the Red Hat Access Tab.

The screenshot shows the Red Hat Access Search interface. The search query is "POODLE". The results are organized into three main sections: Recommendations, Environment, and Issue.

Recommendations:

- Poodle TLS vulnerability CVE-2014-8730
- EAP 6.2.1 JBossWeb native and POODLE
- Disabling SSLv3 For POODLE vulnerability produces errors
- Resolution for POODLE SSLv3.0 vulnerability (CVE-2014-3566) in

Environment:

- Red Hat Enterprise Linux (RHEL) 7
- Red Hat Enterprise Linux (RHEL) 6
- Red Hat Enterprise Linux (RHEL) 5
- Red Hat Enterprise Linux (RHEL) 4

Issue:

Recent media publications are publishing articles indicating that in some cases, TLS is now also impacted by the POODLE flaw and has been tracked by Red Hat as [CVE-2014-8730](#) at [Bugzilla-CVE-2014-8730 TLS: incorrect check of padding bytes when using CBC cipher suites](#).

4.7.2. Logs

Here you can read logs from your OpenStack instances:

Figure 4.4. Instance Logs on the Red Hat Access Tab.

The screenshot shows the Red Hat Access Logs page. The "Logs" tab is selected. The page displays a table of instances with the following columns: Instance Name, Image Name, IP Address, Size, Key Pair, Status, Availability Zone, Task, Power State, Time since created, and Actions.

Instance Name	Image Name	IP Address	Size	Key Pair	Status	Availability Zone	Task	Power State	Time since created	Actions
testinstance2	cirros	192.168.0.7	m1.small	OS-Key	Error	nova	None	No State	1 week, 6 days	View Log
testinstance	cirros	192.168.0.2	m1.tiny	-	Shutoff	nova	None	Shut Down	3 weeks, 2 days	View Log

Displaying 2 items

Find the instance of your choice in the table. If you have many instances, you can filter them by name, status, image ID, or flavor ID. Click *View Log* in the *Actions* column for the instance to check.

When an instance log is displayed, you can click *Red Hat Diagnose* to get recommendations regarding its contents:

Figure 4.5. Instance Logs on the Red Hat Access Tab.

The screenshot shows the Red Hat Access interface. At the top, there's a navigation bar with 'Red Hat Access', 'Project', 'Identity', 'Red Hat Access', 'Help', and 'demo'. Below the navigation bar, there are tabs for 'Search', 'Logs', and 'Support'. The 'Logs' tab is active, displaying 'Instance Log'.

The instance log content is as follows:

```
failed 13/28: up 59.82. request failed
failed 14/28: up 65.08. request failed
failed 15/28: up 68.09. request failed
failed 16/28: up 73.36. request failed
failed 17/28: up 76.36. request failed
failed 18/28: up 81.66. request failed
failed 19/28: up 84.67. request failed
failed 20/28: up 89.94. request failed

```

On the right side, there are 'Recommendations' with several items:

- taskomatic does not start, times out waiting on the JVM 5 times before stopping on Red Hat Satellite
- System panic with message : VXFEN WARNING V-11-1-20 Could not eject node 0 from disk
- Getting error: SCSI error: return code = 0x00010000
- Why does HP server reboot or shutdown unexpectedly?
- rport-1.0-0: blocked FC remote port time out: saving binding
- device-mapper-multipath on RHEL5 experiences excessive delay in detecting a lost path from a storage failure that produces no RSCN or loop/link error
- Bonding does not work using mode 4 802.3ad(LACP)
- Network interface is unstable, tg3 driver prints "DMA Status error. Resetting chip".
- Cluster fails to create reservations on device partitions in RHEL for use with fence_scsi
- How can I best see where packets are dropping on a network interface?

Buttons for 'Red Hat Diagnose' and 'Open a New Support Case' are visible.

If none of the recommendations are useful or a genuine problem has been logged, click *Open a New Support Case* to report the searched problem to Red Hat Support.

4.7.3. Support

The last option in the Red Hat Access Tab allows you to search for your support cases at the Red Hat Customer Portal:

Figure 4.6. Search for Support Cases.

The screenshot shows the Red Hat Access interface with the 'Support' tab active. The page title is 'Red Hat Access: Support'. At the top, there's a navigation bar with 'Red Hat Access', 'Project', 'Identity', 'Red Hat Access', 'Help', and 'demo'. Below the navigation bar, there are tabs for 'Search', 'Logs', and 'Support'. The 'Support' tab is active.

The search interface includes a search bar with a 'Search' button, a dropdown menu for 'All Groups', and a dropdown menu for 'Open'. There is also a button for 'Open a New Support Case'. Below the search bar, it says 'No cases found with given filters.'

You can also open a new support case by clicking the appropriate button and filling out the form on the following page:

Figure 4.7. Open a New Support Case.

The screenshot displays the Red Hat Access Support interface. At the top, the navigation bar includes "RED HAT ENTERPRISE LINUX OPENSTACK PLATFORM", "Project", "Identity", "Red Hat Access", "Help", and "demo". Below the navigation bar, there are links for "Search", "Logs", and "Support". The main heading is "Red Hat Access: Support". On the right side, it indicates the user is logged in as "demo" with a "Log Out" link.

The form on the left side is titled "Red Hat Access: Support" and contains the following fields:

- Account:** A text input field with a "My Account" button next to it.
- Owner:** A dropdown menu showing "No match found".
- Product:** A dropdown menu showing "Red Hat OpenStack".
- Product Version:** A dropdown menu showing "6.0".
- Summary:** A text input field.
- Description:** A large text area for entering the case details.

At the bottom right of the form is a "Next" button.

On the right side of the page, there is a "Recommendations" section with three items:

- ▶ The Production Support Scope of Coverage and Production Support Service Level Agreement
- ▶ What Is The Red Hat Satellite 6 Managed Design Program (MDP) and will there be a Beta?
- ▶ Error message from subscription-manager when attempting to auto-attach shows No installed products on system. No need to attach subscriptions.
