message	string	Message regarding the last termination of the container
reason	string	(brief) reason from the last termination of the container
signal	integer	Signal from the last termination of the container
startedAt	Time	Time at which previous execution of the container started

14.12.1.333. `.status.ephemeralContainerStatuses[].lastState.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

object

Property	Type	Description
message	string	Message regarding why the container is not yet running.
reason	string	(brief) reason the container is not yet running.

14.12.1.334. .status.ephemeralContainerStatuses[].resources**Description**

ResourceRequirements describes the compute resource requirements.

Type**object**

Property	Type	Description
claims	array	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	<p>Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</p>

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.12.1.335. `.status.ephemeralContainerStatuses[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.12.1.336. `.status.ephemeralContainerStatuses[].resources.claims[]`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.12.1.337. `.status.ephemeralContainerStatuses[].state`

Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

Type

object

Property	Type	Description
running	object	ContainerStateRunning is a running state of a container.
terminated	object	ContainerStateTerminated is a terminated state of a container.
waiting	object	ContainerStateWaiting is a waiting state of a container.

14.12.1.338. .status.ephemeralContainerStatuses[].state.running

Description

ContainerStateRunning is a running state of a container.

Type

object

Property	Type	Description
startedAt	Time	Time at which the container was last (re-)started

14.12.1.339. .status.ephemeralContainerStatuses[].state.terminated

Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- **exitCode**

Property	Type	Description
containerID	string	Container's ID in the format '<type>://<container_id>'
exitCode	integer	Exit status from the last termination of the container

Property	Type	Description
finishedAt	Time	Time at which the container last terminated
message	string	Message regarding the last termination of the container
reason	string	(brief) reason from the last termination of the container
signal	integer	Signal from the last termination of the container
startedAt	Time	Time at which previous execution of the container started

14.12.1.340. `.status.ephemeralContainerStatuses[].state.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

object

Property	Type	Description
message	string	Message regarding why the container is not yet running.
reason	string	(brief) reason the container is not yet running.

14.12.1.341. `.status.initContainerStatuses`

Description

The list has one entry per init container in the manifest. The most recent successful init container will have `ready = true`, the most recently started container will have `startTime` set. More info:

<https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status>

Type

array

14.12.1.342. `.status.initContainerStatuses[]`

Description

ContainerStatus contains details for the current status of this container.

Type

object

Required

- **name**
- **ready**
- **restartCount**
- **image**
- **imageID**

Property	Type	Description
allocatedResources	object (Quantity)	AllocatedResources represents the compute resources allocated for this container by the node. Kubelet sets this value to Container.Resources.Requests upon successful pod admission and after successfully admitting desired pod resize.
containerID	string	ContainerID is the ID of the container in the format ' <code><type>://<container_id></code> '. Where <code>type</code> is a container runtime identifier, returned from Version call of CRI API (for example "containerd").
image	string	Image is the name of container image that the container is running. The container image may not match the image used in the PodSpec, as it may have been resolved by the runtime. More info: https://kubernetes.io/docs/concepts/containers/images .
imageID	string	ImageID is the image ID of the container's image. The image ID may not match the image ID of the image used in the PodSpec, as it may have been resolved by the runtime.

Property	Type	Description
lastState	object	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.
name	string	Name is a DNS_LABEL representing the unique name of the container. Each container in a pod must have a unique name across all container types. Cannot be updated.
ready	boolean	Ready specifies whether the container is currently passing its readiness check. The value will change as readiness probes keep executing. If no readiness probes are specified, this field defaults to true once the container is fully started (see Started field). The value is typically used to determine whether a container is ready to accept traffic.
resources	object	ResourceRequirements describes the compute resource requirements.
restartCount	integer	RestartCount holds the number of times the container has been restarted. Kubelet makes an effort to always increment the value, but there are cases when the state may be lost due to node restarts and then the value may be reset to 0. The value is never negative.

Property	Type	Description
started	boolean	Started indicates whether the container has finished its postStart lifecycle hook and passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. In both cases, startup probes will run again. Is always true when no startupProbe is defined and container is running and has passed the postStart lifecycle hook. The null value must be treated the same as false.
state	object	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

14.12.1.343. `.status.initContainerStatuses[].lastState`

Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

Type

object

Property	Type	Description
running	object	ContainerStateRunning is a running state of a container.
terminated	object	ContainerStateTerminated is a terminated state of a container.
waiting	object	ContainerStateWaiting is a waiting state of a container.

14.12.1.344. `.status.initContainerStatuses[].lastState.running`

Description

ContainerStateRunning is a running state of a container.

Type
object

Property	Type	Description
startedAt	Time	Time at which the container was last (re-)started

14.12.1.345. `.status.initContainerStatuses[].lastState.terminated`

Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- **exitCode**

Property	Type	Description
containerID	string	Container's ID in the format ' <code><type>://<container_id></code> '
exitCode	integer	Exit status from the last termination of the container
finishedAt	Time	Time at which the container last terminated
message	string	Message regarding the last termination of the container
reason	string	(brief) reason from the last termination of the container
signal	integer	Signal from the last termination of the container
startedAt	Time	Time at which previous execution of the container started

14.12.1.346. `.status.initContainerStatuses[].lastState.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

object

Property	Type	Description
message	string	Message regarding why the container is not yet running.
reason	string	(brief) reason the container is not yet running.

14.12.1.347. .status.initContainerStatuses[].resources**Description**

ResourceRequirements describes the compute resource requirements.

Type**object**

Property	Type	Description
claims	array	<p>Claims lists the names of resources, defined in <code>spec.resourceClaims</code>, that are used by this container.</p> <p>This is an alpha field and requires enabling the <code>DynamicResourceAllocation</code> feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
claims[]	object	ResourceClaim references one entry in <code>PodSpec.ResourceClaims</code> .
limits	object (Quantity)	<p>Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</p>

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.12.1.348. `.status.initContainerStatuses[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.12.1.349. `.status.initContainerStatuses[].resources.claims[]`

Description

`ResourceClaim` references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.12.1.350. `.status.initContainerStatuses[].state`

Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

Type

object

Property	Type	Description
running	object	ContainerStateRunning is a running state of a container.
terminated	object	ContainerStateTerminated is a terminated state of a container.
waiting	object	ContainerStateWaiting is a waiting state of a container.

14.12.1.351. .status.initContainerStatuses[].state.running

Description

ContainerStateRunning is a running state of a container.

Type

object

Property	Type	Description
startedAt	Time	Time at which the container was last (re-)started

14.12.1.352. .status.initContainerStatuses[].state.terminated

Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- **exitCode**

Property	Type	Description
containerID	string	Container's ID in the format '<type>://<container_id>'
exitCode	integer	Exit status from the last termination of the container

Property	Type	Description
finishedAt	Time	Time at which the container last terminated
message	string	Message regarding the last termination of the container
reason	string	(brief) reason from the last termination of the container
signal	integer	Signal from the last termination of the container
startedAt	Time	Time at which previous execution of the container started

14.12.1.353. `.status.initContainerStatuses[].state.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

object

Property	Type	Description
message	string	Message regarding why the container is not yet running.
reason	string	(brief) reason the container is not yet running.

14.12.1.354. `.status.podIPs`

Description

podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

Type

array

14.12.1.355. `.status.podIPs[]`

Description

IP address information for entries in the (plural) PodIPs field. Each entry includes:

- IP: An IP address allocated to the pod. Routable at least within the cluster.

Type
object

Property	Type	Description
ip	string	ip is an IP address (IPv4 or IPv6) assigned to the pod

14.12.2. API endpoints

The following API endpoints are available:

- **/api/v1/pods**
 - **GET**: list or watch objects of kind Pod
- **/api/v1/watch/pods**
 - **GET**: watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/pods**
 - **DELETE**: delete collection of Pod
 - **GET**: list or watch objects of kind Pod
 - **POST**: create a Pod
- **/api/v1/watch/namespaces/{namespace}/pods**
 - **GET**: watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/pods/{name}**
 - **DELETE**: delete a Pod
 - **GET**: read the specified Pod
 - **PATCH**: partially update the specified Pod
 - **PUT**: replace the specified Pod
- **/api/v1/namespaces/{namespace}/pods/{name}/log**
 - **GET**: read log of the specified Pod
- **/api/v1/watch/namespaces/{namespace}/pods/{name}**
 - **GET**: watch changes to an object of kind Pod. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/pods/{name}/status**
 - **GET**: read status of the specified Pod

- **PATCH**: partially update status of the specified Pod
- **PUT**: replace status of the specified Pod
- **/api/v1/namespaces/{namespace}/pods/{name}/ephemeralcontainers**
 - **GET**: read ephemeralcontainers of the specified Pod
 - **PATCH**: partially update ephemeralcontainers of the specified Pod
 - **PUT**: replace ephemeralcontainers of the specified Pod

14.12.2.1. /api/v1/pods

Table 14.289. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method
GET

Description

list or watch objects of kind Pod

Table 14.290. HTTP responses

HTTP code	Response body
200 - OK	PodList schema
401 - Unauthorized	Empty

14.12.2.2. /api/v1/watch/pods**Table 14.291. Global query parameters**

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

GET

Description

watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.292. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

14.12.2.3. /api/v1/namespaces/{namespace}/pods

Table 14.293. Global path parameters

Parameter	Type	Description
namespace	string	object name and auth scope, such as for teams and projects

Table 14.294. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of Pod

Table 14.295. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 14.296. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 14.297. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind Pod

Table 14.298. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.299. HTTP responses

HTTP code	Response body
200 - OK	PodList schema
401 - Unauthorized	Empty

HTTP method

Description

create a Pod

Table 14.300. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP method

DELETE

Description

delete a Pod

Table 14.308. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

14.12.2.6. /api/v1/namespaces/{namespace}/pods/{name}/log

Table 14.318. Global path parameters

Parameter	Type	Description
name	string	name of the Pod
namespace	string	object name and auth scope, such as for teams and projects

Table 14.319. Global query parameters

Parameter	Type	Description
container	string	The container for which to stream logs. Defaults to only container if there is one container in the pod.
follow	boolean	Follow the log stream of the pod. Defaults to false.
insecureSkipTLSVerifyBackend	boolean	<code>insecureSkipTLSVerifyBackend</code> indicates that the apiserver should not confirm the validity of the serving certificate of the backend it is connecting to. This will make the HTTPS connection between the apiserver and the backend insecure. This means the apiserver cannot verify the log data it is receiving came from the real kubelet. If the kubelet is configured to verify the apiserver's TLS credentials, it does not mean the connection to the real kubelet is vulnerable to a man in the middle attack (e.g. an attacker could not intercept the actual log data coming from the real kubelet).
limitBytes	integer	If set, the number of bytes to read from the server before terminating the log output. This may not display a complete final line of logging, and may return slightly more or slightly less than the specified limit.
pretty	string	If 'true', then the output is pretty printed.
previous	boolean	Return previous terminated container logs. Defaults to false.
sinceSeconds	integer	A relative time in seconds before the current time from which to show logs. If this value precedes the time a pod was started, only logs since the pod start will be returned. If this value is in the future, no logs will be returned. Only one of <code>sinceSeconds</code> or <code>sinceTime</code> may be specified.
tailLines	integer	If set, the number of lines from the end of the logs to show. If not specified, logs are shown from the creation of the container or <code>sinceSeconds</code> or <code>sinceTime</code>
timestamps	boolean	If true, add an RFC3339 or RFC3339Nano timestamp at the beginning of every line of log output. Defaults to false.

HTTP method

GET

14.12.2.7. /api/v1/watch/namespaces/{namespace}/pods/{name}**Table 14.321. Global path parameters**

Parameter	Type	Description
name	string	name of the Pod
namespace	string	object name and auth scope, such as for teams and projects

Table 14.322. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Pod. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.331. Body parameters

Parameter	Type	Description
body	Pod schema	

Table 14.332. HTTP responses

HTTP code	Response body
200 - OK	Pod schema
201 - Created	Pod schema
401 - Unauthorized	Empty

14.12.2.9. /api/v1/namespaces/{namespace}/pods/{name}/ephemeralcontainers

Table 14.333. Global path parameters

Parameter	Type	Description
name	string	name of the Pod
namespace	string	object name and auth scope, such as for teams and projects

Table 14.334. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

GET

Description

read ephemeralcontainers of the specified Pod

Table 14.335. HTTP responses

HTTP code	Response body
200 - OK	Pod schema
401 - Unauthorized	Empty

HTTP method

PATCH**Description**

partially update ephemeralcontainers of the specified Pod

Table 14.336. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 14.337. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 14.338. HTTP responses

HTTP code	Response body
200 - OK	Pod schema
201 - Created	Pod schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace ephemeralcontainers of the specified Pod

Table 14.339. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.340. Body parameters

Parameter	Type	Description
body	Pod schema	

Table 14.341. HTTP responses

HTTP code	Response body
200 - OK	Pod schema
201 - Created	Pod schema
401 - Unauthorized	Empty

14.13. PODTEMPLATE [V1]

Description

PodTemplate describes a template for creating copies of a predefined pod.

Type

object

14.13.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
template	object	PodTemplateSpec describes the data a pod should have when created from a template

14.13.1.1. .template

Description

PodTemplateSpec describes the data a pod should have when created from a template

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	PodSpec is a description of a pod.

14.13.1.2. .template.spec

Description

PodSpec is a description of a pod.

Type

object

Required

- **containers**

Property	Type	Description
activeDeadlineSeconds	integer	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	object	Affinity is a group of affinity scheduling rules.
automountServiceAccountToken	boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	array	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
containers[]	object	A single application container that you want to run within a pod.

Property	Type	Description
dnsConfig	object	PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.
dnsPolicy	string	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - "ClusterFirst" indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - "ClusterFirstWithHostNet" indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - "Default" indicates that the pod should use the default (as determined by kubelet) DNS settings. - "None" indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
enableServiceLinks	boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

Property	Type	Description
ephemeralContainers	array	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's <code>ephemeralcontainers</code> subresource.
ephemeralContainers[]	object	<p>An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation.</p> <p>To add an ephemeral container, use the <code>ephemeralcontainers</code> subresource of an existing Pod. Ephemeral containers may not be removed or restarted.</p>
hostAliases	array	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostAliases[]	object	HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.
hostIPC	boolean	Use the host's ipc namespace. Optional: Default to false.

Property	Type	Description
hostNetwork	boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	boolean	Use the host's pid namespace. Optional: Default to false.
hostUsers	boolean	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with CAP_SYS_MODULE. When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the UserNamespacesSupport feature.
hostname	string	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	array	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
imagePullSecrets[]	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Property	Type	Description
initContainers	array	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
initContainers[]	object	A single application container that you want to run within a pod.
nodeName	string	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	object (string)	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

Property	Type	Description
os	object	PodOS defines the OS parameters of a pod.
overhead	object (Quantity)	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md
preemptionPolicy	string	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. Possible enum values: - "Never" means that pod never preempts other pods with lower priority. - "PreemptLowerPriority" means that pod can preempt other pods with lower priority.
priority	integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
priorityClassName	string	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	array	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates
readinessGates[]	object	PodReadinessGate contains the reference to a pod condition
resourceClaims	array	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable.
resourceClaims[]	object	PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Property	Type	Description
restartPolicy	string	<p>Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</p> <p>Possible enum values: - "Always" - "Never" - "OnFailure"</p>
runtimeClassName	string	<p>RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</p>
schedulerName	string	<p>If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.</p>
schedulingGates	array	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>

Property	Type	Description
schedulingGates[]	object	PodSchedulingGate is associated to a Pod to guard its scheduling.
securityContext	object	PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.
serviceAccount	string	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	string	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

Property	Type	Description
setHostnameAsFQDN	boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	string	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	array	If specified, the pod's tolerations.
tolerations[]	object	The pod this Tolerant is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.
topologySpreadConstraints	array	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
topologySpreadConstraints[]	object	TopologySpreadConstraint specifies how to spread matching pods among the given topology.
volumes	array	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes
volumes[]	object	Volume represents a named volume in a pod that may be accessed by any container in the pod.

14.13.1.3. .template.spec.affinity

Description

Affinity is a group of affinity scheduling rules.

Type

object

Property	Type	Description
nodeAffinity	object	Node affinity is a group of node affinity scheduling rules.
podAffinity	object	Pod affinity is a group of inter pod affinity scheduling rules.
podAntiAffinity	object	Pod anti affinity is a group of inter pod anti affinity scheduling rules.

14.13.1.4. .template.spec.affinity.nodeAffinity

Description

Node affinity is a group of node affinity scheduling rules.

Type

object

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution[]	object	An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).
requiredDuringSchedulingIgnoredDuringExecution	object	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

14.13.1.5. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding `matchExpressions`; the node(s) with the highest sum are the most preferred.

Type

array

14.13.1.6. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

Type

object

Required

- **weight**
- **preference**

Property	Type	Description
----------	------	-------------

Property	Type	Description
preference	object	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.
weight	integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

14.13.1.7. .template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu

Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.
matchExpressions[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
matchFields	array	A list of node selector requirements by node's fields.
matchFields[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

14.13.1.8. .template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu

Description

A list of node selector requirements by node's labels.

Type

array

14.13.1.9. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.13.1.10. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

Description

A list of node selector requirements by node's fields.

Type

array

14.13.1.11. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.13.1.12. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

Type

object

Required

- **nodeSelectorTerms**

Property	Type	Description
nodeSelectorTerms	array	Required. A list of node selector terms. The terms are ORed.
nodeSelectorTerms[]	object	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

14.13.1.13. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

Description

Required. A list of node selector terms. The terms are ORed.

Type

array

14.13.1.14. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.
matchExpressions[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
matchFields	array	A list of node selector requirements by node's fields.
matchFields[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

14.13.1.15. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

Description

A list of node selector requirements by node's labels.

Type

array

14.13.1.16. `.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.13.1.17. `.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu`

Description

A list of node selector requirements by node's fields.

Type

array

14.13.1.18. `.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.13.1.19. `.template.spec.affinity.podAffinity`

Description

Pod affinity is a group of inter pod affinity scheduling rules.

Type

object

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
preferredDuringSchedulingIgnoredDuringExecution[]	object	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
requiredDuringSchedulingIgnoredDuringExecution	array	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
requiredDuringSchedulingIgnoredDuringExecution[]	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

14.13.1.20. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution

Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Type

array

14.13.1.21. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution

Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

Type

object

Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
podAffinityTerm	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
weight	integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

14.13.1.22. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecu

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.

Property	Type	Description
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.13.1.23. `.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecut`

Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Type

array

14.13.1.24. `.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecut`

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.13.1.25. .template.spec.affinity.podAntiAffinity

Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
preferredDuringSchedulingIgnoredDuringExecution[]	object	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
requiredDuringSchedulingIgnoredDuringExecution	array	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
requiredDuringSchedulingIgnoredDuringExecution[]	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

14.13.1.26. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

Description

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Type

array

14.13.1.27. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

Type

object

Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
podAffinityTerm	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
weight	integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

14.13.1.28. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.

Property	Type	Description
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.13.1.29. `.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringEx`

Description

If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Type

array

14.13.1.30. `.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringEx`

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.13.1.31. .template.spec.containers

Description

List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

Type

array

14.13.1.32. .template.spec.containers[]

Description

A single application container that you want to run within a pod.

Type

object

Required

- **name**

Property	Type	Description
args	array (string)	Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$</code> are reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. " <code>\$(VAR_NAME)</code> " will produce the string literal " <code>\$(VAR_NAME)</code> ". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

Property	Type	Description
command	array (string)	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	array	List of environment variables to set in the container. Cannot be updated.
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps

Property	Type	Description
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	string	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
lifecycle	object	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
livenessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
name	string	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	array	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See https://github.com/kubernetes/kubernetes/issues/108255 . Cannot be updated.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Property	Type	Description
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	string	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.13.1.33. .template.spec.containers[].env

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.13.1.34. .template.spec.containers[].env[]

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.13.1.35. `.template.spec.containers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (<code>cpu</code> , <code>memory</code>) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.13.1.36. `.template.spec.containers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a `ConfigMap`.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.13.1.37. `.template.spec.containers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.13.1.38. `.template.spec.containers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.13.1.39. .template.spec.containers[].env[].valueFrom.secretKeyRef

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.13.1.40. .template.spec.containers[].envFrom

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.13.1.41. .template.spec.containers[].envFrom[]

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
prefix	string	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	object	SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

14.13.1.42. .template.spec.containers[].envFrom[].configMapRef

Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap must be defined

14.13.1.43. .template.spec.containers[].envFrom[].secretRef

Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.13.1.44. .template.spec.containers[].lifecycle

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.13.1.45. .template.spec.containers[].lifecycle.postStart

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.46. .template.spec.containers[].lifecycle.postStart.exec**Description**

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.47. .template.spec.containers[].lifecycle.postStart.httpGet**Description**

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.48. .template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.49. .template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.50. .template.spec.containers[].lifecycle.postStart.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.51. .template.spec.containers[].lifecycle.preStop

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.52. .template.spec.containers[].lifecycle.preStop.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.53. .template.spec.containers[].lifecycle.preStop.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.54. .template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.55. .template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.56. .template.spec.containers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.57. .template.spec.containers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.58. .template.spec.containers[].livenessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.59. .template.spec.containers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.60. .template.spec.containers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.61. `.template.spec.containers[].livenessProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.62. `.template.spec.containers[].livenessProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.63. `.template.spec.containers[].livenessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.64. `.template.spec.containers[].ports`

Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

Type

array

14.13.1.65. `.template.spec.containers[].ports[]`

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - " SCTP " is the SCTP protocol. - " TCP " is the TCP protocol. - " UDP " is the UDP protocol.

14.13.1.66. .template.spec.containers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.67. .template.spec.containers[].readinessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.68. .template.spec.containers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.69. .template.spec.containers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.70. `.template.spec.containers[].readinessProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.71. `.template.spec.containers[].readinessProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.72. `.template.spec.containers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.73. `.template.spec.containers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.13.1.74. `.template.spec.containers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.13.1.75. .template.spec.containers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.13.1.76. `.template.spec.containers[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.13.1.77. `.template.spec.containers[].resources.claims[]`

Description

`ResourceClaim` references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.13.1.78. `.template.spec.containers[].securityContext`

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type

object

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.13.1.79. .template.spec.containers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.13.1.80. `.template.spec.containers[].securityContext.seLinuxOptions`

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.13.1.81. `.template.spec.containers[].securityContext.seccompProfile`

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.13.1.82. .template.spec.containers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.13.1.83. .template.spec.containers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.84. .template.spec.containers[].startupProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.85. .template.spec.containers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.86. .template.spec.containers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.87. `.template.spec.containers[].startupProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.88. `.template.spec.containers[].startupProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.89. .template.spec.containers[].startupProbe.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.90. .template.spec.containers[].volumeDevices

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.13.1.91. .template.spec.containers[].volumeDevices[]

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.13.1.92. .template.spec.containers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

Type

array

14.13.1.93. .template.spec.containers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.13.1.94. .template.spec.dnsConfig

Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

Type

object

Property	Type	Description
nameservers	array (string)	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	array	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
options[]	object	PodDNSConfigOption defines DNS resolver options of a pod.
searches	array (string)	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

14.13.1.95. .template.spec.dnsConfig.options

Description

A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Type

array

14.13.1.96. .template.spec.dnsConfig.options[]**Description**

PodDNSConfigOption defines DNS resolver options of a pod.

Type

object

Property	Type	Description
name	string	Required.
value	string	

14.13.1.97. .template.spec.ephemeralContainers**Description**

List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.

Type

array

14.13.1.98. .template.spec.ephemeralContainers[]**Description**

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

Type

object

Required

- **name**

Property	Type	Description
args	array (string)	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
command	array (string)	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
env	array	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	string	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present

Property	Type	Description
lifecycle	object	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
livenessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
name	string	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	array	Ports are not allowed for ephemeral containers.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Property	Type	Description
targetContainerName	string	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
terminationMessagePath	string	<p>Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to <code>/dev/termination-log</code>. Cannot be updated.</p>

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.13.1.99. .template.spec.ephemeralContainers[].env

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.13.1.100. .template.spec.ephemeralContainers[].env[]

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.13.1.101. `.template.spec.ephemeralContainers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (<code>cpu</code> , <code>memory</code>) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.13.1.102. `.template.spec.ephemeralContainers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a `ConfigMap`.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.13.1.103. `.template.spec.ephemeralContainers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.13.1.104. `.template.spec.ephemeralContainers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.13.1.105. .template.spec.ephemeralContainers[].env[].valueFrom.secretKeyRef

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.13.1.106. .template.spec.ephemeralContainers[].envFrom

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.13.1.107. .template.spec.ephemeralContainers[].envFrom[]

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
prefix	string	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	object	SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

14.13.1.108. .template.spec.ephemeralContainers[].envFrom[].configMapRef

Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap must be defined

14.13.1.109. .template.spec.ephemeralContainers[].envFrom[].secretRef

Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.13.1.110. .template.spec.ephemeralContainers[].lifecycle

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.13.1.111. .template.spec.ephemeralContainers[].lifecycle.postStart

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.112. .template.spec.ephemeralContainers[].lifecycle.postStart.exec**Description**

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.113. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet**Description**

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.114. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.115. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.116. `.template.spec.ephemeralContainers[].lifecycle.postStart.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.117. `.template.spec.ephemeralContainers[].lifecycle.preStop`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCP socket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.118. .template.spec.ephemeralContainers[].lifecycle.preStop.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.119. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.120. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.121. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.122. .template.spec.ephemeralContainers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.123. .template.spec.ephemeralContainers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.124. `.template.spec.ephemeralContainers[].livenessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.125. .template.spec.ephemeralContainers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.126. .template.spec.ephemeralContainers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.127. .template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.128. .template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.129. `.template.spec.ephemeralContainers[].livenessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.130. `.template.spec.ephemeralContainers[].ports`

Description

Ports are not allowed for ephemeral containers.

Type

array

14.13.1.131. `.template.spec.ephemeralContainers[].ports[]`

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.

14.13.1.132. .template.spec.ephemeralContainers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type**object**

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.133. `.template.spec.ephemeralContainers[].readinessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.134. .template.spec.ephemeralContainers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.135. .template.spec.ephemeralContainers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.136. .template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.137. .template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.138. `.template.spec.ephemeralContainers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.139. `.template.spec.ephemeralContainers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.13.1.140. `.template.spec.ephemeralContainers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.13.1.141. .template.spec.ephemeralContainers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.13.1.142. `.template.spec.ephemeralContainers[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.13.1.143. `.template.spec.ephemeralContainers[].resources.claims[]`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.13.1.144. `.template.spec.ephemeralContainers[].securityContext`

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type

object

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.13.1.145. .template.spec.ephemeralContainers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.13.1.146. .template.spec.ephemeralContainers[].securityContext.seLinuxOptions

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.13.1.147. .template.spec.ephemeralContainers[].securityContext.seccompProfile

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.13.1.148. .template.spec.ephemeralContainers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.13.1.149. .template.spec.ephemeralContainers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.150. .template.spec.ephemeralContainers[].startupProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.151. .template.spec.ephemeralContainers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.152. .template.spec.ephemeralContainers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.153. `.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.154. `.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.155. `.template.spec.ephemeralContainers[].startupProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.156. `.template.spec.ephemeralContainers[].volumeDevices`

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.13.1.157. `.template.spec.ephemeralContainers[].volumeDevices[]`

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.13.1.158. .template.spec.ephemeralContainers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Type

array

14.13.1.159. .template.spec.ephemeralContainers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain ':

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.13.1.160. .template.spec.hostAliases

Description

HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

Type

array

14.13.1.161. .template.spec.hostAliases[]

Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

Type

object

Property	Type	Description
hostnames	array (string)	Hostnames for the above IP address.
ip	string	IP address of the host file entry.

14.13.1.162. .template.spec.imagePullSecrets

Description

ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info:

<https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod>

Type

array

14.13.1.163. .template.spec.imagePullSecrets[]

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.164. .template.spec.initContainers

Description

List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <https://kubernetes.io/docs/concepts/workloads/pods/init-containers/>

Type

array

14.13.1.165. .template.spec.initContainers[]

Description

A single application container that you want to run within a pod.

Type

object

Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
args	array (string)	<p>Arguments to the endpoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
command	array (string)	<p>Endpoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
env	array	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

Property	Type	Description
imagePullPolicy	string	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images</p> <p>Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>
lifecycle	object	<p>Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.</p>
livenessProbe	object	<p>Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.</p>
name	string	<p>Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.</p>

Property	Type	Description
ports	array	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See https://github.com/kubernetes/kubernetes/issues/108255 . Cannot be updated.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	string	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.13.1.166. .template.spec.initContainers[].env

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.13.1.167. .template.spec.initContainers[].env[]

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.13.1.168. `.template.spec.initContainers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (cpu, memory) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.13.1.169. `.template.spec.initContainers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a ConfigMap.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.13.1.170. .template.spec.initContainers[].env[].valueFrom.fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.13.1.171. .template.spec.initContainers[].env[].valueFrom.resourceFieldRef

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.13.1.172. `.template.spec.initContainers[].env[].valueFrom.secretKeyRef`

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.13.1.173. `.template.spec.initContainers[].envFrom`

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.13.1.174. `.template.spec.initContainers[].envFrom[]`

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	<p>ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.</p> <p>The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.</p>
prefix	string	<p>An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.</p>
secretRef	object	<p>SecretEnvSource selects a Secret to populate the environment variables with.</p> <p>The contents of the target Secret's Data field will represent the key-value pairs as environment variables.</p>

14.13.1.175. .template.spec.initContainers[].envFrom[].configMapRef**Description**

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	<p>Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</p>
optional	boolean	<p>Specify whether the ConfigMap must be defined</p>

14.13.1.176. .template.spec.initContainers[].envFrom[].secretRef

Description

SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.13.1.177. .template.spec.initContainers[].lifecycle

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.13.1.178. .template.spec.initContainers[].lifecycle.postStart

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type
object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.179. .template.spec.initContainers[].lifecycle.postStart.exec

Description

ExecAction describes a "run in container" action.

Type
object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.180. .template.spec.initContainers[].lifecycle.postStart.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type
object

Required

- port

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.181. .template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.182. .template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.183. `.template.spec.initContainers[].lifecycle.postStart.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.184. `.template.spec.initContainers[].lifecycle.preStop`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.13.1.185. .template.spec.initContainers[].lifecycle.preStop.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.186. .template.spec.initContainers[].lifecycle.preStop.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.187. .template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.188. .template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.189. .template.spec.initContainers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.190. .template.spec.initContainers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.191. .template.spec.initContainers[].livenessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.192. .template.spec.initContainers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.193. .template.spec.initContainers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.194. .template.spec.initContainers[].livenessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.195. .template.spec.initContainers[].livenessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.196. .template.spec.initContainers[].livenessProbe.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.197. .template.spec.initContainers[].ports

Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

Type

array

14.13.1.198. .template.spec.initContainers[].ports[]

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - " SCTP " is the SCTP protocol. - " TCP " is the TCP protocol. - " UDP " is the UDP protocol.

14.13.1.199. .template.spec.initContainers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.200. `.template.spec.initContainers[].readinessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.201. .template.spec.initContainers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.202. .template.spec.initContainers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.203. .template.spec.initContainers[].readinessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.204. .template.spec.initContainers[].readinessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.205. `.template.spec.initContainers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.206. `.template.spec.initContainers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.13.1.207. `.template.spec.initContainers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.13.1.208. .template.spec.initContainers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.13.1.209. .template.spec.initContainers[].resources.claims

Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.13.1.210. .template.spec.initContainers[].resources.claims[]

Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

14.13.1.211. .template.spec.initContainers[].securityContext

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type**object**

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.13.1.212. .template.spec.initContainers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.13.1.213. `.template.spec.initContainers[].securityContext.seLinuxOptions`

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.13.1.214. `.template.spec.initContainers[].securityContext.seccompProfile`

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.13.1.215. .template.spec.initContainers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.13.1.216. .template.spec.initContainers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.13.1.217. `.template.spec.initContainers[].startupProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.13.1.218. .template.spec.initContainers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.13.1.219. .template.spec.initContainers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.13.1.220. .template.spec.initContainers[].startupProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.13.1.221. .template.spec.initContainers[].startupProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.13.1.222. `.template.spec.initContainers[].startupProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.13.1.223. `.template.spec.initContainers[].volumeDevices`

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.13.1.224. `.template.spec.initContainers[].volumeDevices[]`

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.13.1.225. .template.spec.initContainers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

Type

array

14.13.1.226. .template.spec.initContainers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.13.1.227. .template.spec.os

Description

PodOS defines the OS parameters of a pod.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration Clients should expect to handle additional values and treat unrecognized values in this field as os: null

14.13.1.228. .template.spec.readinessGates

Description

If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True"
More info: <https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates>

Type

array

14.13.1.229. .template.spec.readinessGates[]

Description

PodReadinessGate contains the reference to a pod condition

Type

object

Required

- **conditionType**

Property	Type	Description
conditionType	string	ConditionType refers to a condition in the pod's condition list with matching type.

14.13.1.230. .template.spec.resourceClaims

Description

ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.

This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable.

Type

array

14.13.1.231. .template.spec.resourceClaims[]

Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.

Property	Type	Description
source	object	<p>ClaimSource describes a reference to a ResourceClaim.</p> <p>Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.</p>

14.13.1.232. .template.spec.resourceClaims[].source

Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

Type

object

Property	Type	Description
resourceClaimName	string	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
resourceClaimTemplateName	string	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be <pod name>-<resource name>, where <resource name> is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

14.13.1.233. .template.spec.schedulingGates

Description

SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.

SchedulingGates can only be set at pod creation time, and be removed only afterwards.

This is a beta feature enabled by the PodSchedulingReadiness feature gate.

Type

array

14.13.1.234. .template.spec.schedulingGates[]

Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the scheduling gate. Each scheduling gate must have a unique name field.

14.13.1.235. .template.spec.securityContext

Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

Type

object

Property	Type	Description
fsGroup	integer	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> 1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
fsGroupChangePolicy	string	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Always" indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. - "OnRootMismatch" indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>
runAsGroup	integer	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
supplementalGroups	array (integer)	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
sysctls	array	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
sysctls[]	object	Sysctl defines a kernel parameter to be set
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.13.1.236. .template.spec.securityContext.seLinuxOptions

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.13.1.237. .template.spec.securityContext.seccompProfile

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.13.1.238. .template.spec.securityContext.sysctls

Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

Type

array

14.13.1.239. .template.spec.securityContext.sysctls[]

Description

Sysctl defines a kernel parameter to be set

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	Name of a property to set
value	string	Value of a property to set

14.13.1.240. .template.spec.securityContext.windowsOptions**Description**

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.13.1.241. .template.spec.tolerations

Description

If specified, the pod's tolerations.

Type

array

14.13.1.242. .template.spec.tolerations[]

Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

Type

object

Property	Type	Description
effect	string	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: - "NoExecute" Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. - "NoSchedule" Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. - "PreferNoSchedule" Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
key	string	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
operator	string	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - "Equal" - "Exists"</p>

Property	Type	Description
tolerationSeconds	integer	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	string	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

14.13.1.243. .template.spec.topologySpreadConstraints

Description

TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

Type

array

14.13.1.244. .template.spec.topologySpreadConstraints[]

Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

Type

object

Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

Property	Type	Description
----------	------	-------------

Property	Type	Description
labelSelector	LabelSelector	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.
matchLabelKeys	array (string)	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
maxSkew	integer	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When whenUnsatisfiable=DoNotSchedule, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1. zone1 zone2 zone3 P P P P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When whenUnsatisfiable=ScheduleAnyway, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
minDomains	integer	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2: zone1 zone2 zone3 P P P P P P The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
nodeAffinityPolicy	string	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - "Honor" means use this scheduling directive when calculating pod topology spread skew. - "Ignore" means ignore this scheduling directive when calculating pod topology spread skew.</p>
nodeTaintsPolicy	string	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - "Honor" means use this scheduling directive when calculating pod topology spread skew. - "Ignore" means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
topologyKey	string	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
whenUnsatisfiable	string	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it more imbalanced. It's a required field.</p> <p>Possible enum values: - "DoNotSchedule" instructs the scheduler not to schedule the pod when constraints are not satisfied. - "ScheduleAnyway" instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

14.13.1.245. .template.spec.volumes

Description

List of volumes that can be mounted by containers belonging to the pod. More info: <https://kubernetes.io/docs/concepts/storage/volumes>

Type

array

14.13.1.246. .template.spec.volumes[]

Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

Type

object

Required

- **name**

Property	Type	Description
awsElasticBlockStore	object	<p>Represents a Persistent Disk resource in AWS.</p> <p>An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.</p>
azureDisk	object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	object	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
cinder	object	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Property	Type	Description
configMap	object	<p>Adapts a ConfigMap into a volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.</p>
csi	object	Represents a source location of a volume to mount, managed by an external CSI driver
downwardAPI	object	DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.
emptyDir	object	Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.
ephemeral	object	Represents an ephemeral volume that is handled by a normal storage driver.
fc	object	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
flexVolume	object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
flocker	object	Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.
gcePersistentDisk	object	Represents a Persistent Disk resource in Google Compute Engine. A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
gitRepo	object	Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	object	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
hostPath	object	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
iscsi	object	Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
name	string	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	object	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
persistentVolumeClaim	object	PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).
photonPersistentDisk	object	Represents a Photon Controller persistent disk resource.
portworxVolume	object	PortworxVolumeSource represents a Portworx volume resource.
projected	object	Represents a projected volume source
quobyte	object	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
rbd	object	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
scaleIO	object	ScaleIOVolumeSource represents a persistent ScaleIO volume
secret	object	Adapts a Secret into a volume. The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.
storageos	object	Represents a StorageOS persistent volume resource.
vsphereVolume	object	Represents a vSphere volume resource.

14.13.1.247. .template.spec.volumes[].awsElasticBlockStore

Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

Type

object

Required

- **volumelD**

Property	Type	Description
----------	------	-------------

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	integer	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	boolean	readOnly value true will force the readOnly setting in VolumeMounts. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	string	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

14.13.1.248. .template.spec.volumes[].azureDisk

Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

Type

object

Required

- **diskName**
- **diskURI**

Property	Type	Description
cachingMode	string	cachingMode is the Host Caching mode: None, Read Only, Read Write. Possible enum values: - "None" - "ReadOnly" - "ReadWrite"
diskName	string	diskName is the Name of the data disk in the blob storage
diskURI	string	diskURI is the URI of data disk in the blob storage
fsType	string	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	string	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared Possible enum values: - "Dedicated" - "Managed" - "Shared"
readOnly	boolean	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

14.13.1.249. .template.spec.volumes[].azureFile

Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

Type

object

Required

- **secretName**
- **shareName**

Property	Type	Description
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	string	secretName is the name of secret that contains Azure Storage Account Name and Key
shareName	string	shareName is the azure share Name

14.13.1.250. .template.spec.volumes[].cephfs

Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **monitors**

Property	Type	Description
monitors	array (string)	monitors is Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	string	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	boolean	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

Property	Type	Description
secretFile	string	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
user	string	user is optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

14.13.1.251. .template.spec.volumes[].cephfs.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.252. .template.spec.volumes[].cinder

Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Type

object

Required

- **volumeID**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
volumeID	string	volumeID used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

14.13.1.253. .template.spec.volumes[].cinder.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.254. .template.spec.volumes[].configMap

Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

Type
object

Property	Type	Description
defaultMode	integer	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

14.13.1.255. .template.spec.volumes[].configMap.items

Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type

array

14.13.1.256. .template.spec.volumes[].configMap.items[]

Description

Maps a string key to a path within a volume.

Type

object

Required

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.13.1.257. .template.spec.volumes[].csi

Description

Represents a source location of a volume to mount, managed by an external CSI driver

Type

object

Required

- **driver**

Property	Type	Description
driver	string	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	string	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
readOnly	boolean	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	object (string)	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

14.13.1.258. .template.spec.volumes[].csi.nodePublishSecretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.259. `.template.spec.volumes[].downwardAPI`**Description**

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
defaultMode	integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	Items is a list of downward API volume file
items[]	object	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.13.1.260. `.template.spec.volumes[].downwardAPI.items`**Description**

Items is a list of downward API volume file

Type

array

14.13.1.261. `.template.spec.volumes[].downwardAPI.items[]`**Description**

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

object

Required

path

- **path**

Property	Type	Description
fieldRef	object	ObjectFieldSelector selects an APIVersioned field of an object.
mode	integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	object	ResourceFieldSelector represents container resources (cpu, memory) and their output format

14.13.1.262. .template.spec.volumes[].downwardAPI.items[].fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
fieldPath	string	Path of the field to select in the specified API version.

14.13.1.263. .template.spec.volumes[].downwardAPI.items[].resourceFieldRef

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.13.1.264. .template.spec.volumes[].emptyDir

Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
medium	string	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

Property	Type	Description
sizeLimit	Quantity	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

14.13.1.265. .template.spec.volumes[].ephemeral

Description

Represents an ephemeral volume that is handled by a normal storage driver.

Type

object

Property	Type	Description
volumeClaimTemplate	object	PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

14.13.1.266. .template.spec.volumes[].ephemeral.volumeClaimTemplate

Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

Type

object

Required

- **spec**

Property	Type	Description
----------	------	-------------

Property	Type	Description
metadata	ObjectMeta	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	object	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

14.13.1.267. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec

Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

Type

object

Property	Type	Description
accessModes	array (string)	accessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
dataSource	object	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
dataSourceRef	object	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
resources	object	ResourceRequirements describes the compute resource requirements.
selector	LabelSelector	selector is a label query over volumes to consider for binding.
storageClassName	string	storageClassName is the name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	string	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - "Block" means the volume will not be formatted with a filesystem and will remain a raw block device. - "Filesystem" means the volume will be or is formatted with a filesystem.</p>
volumeName	string	volumeName is the binding reference to the PersistentVolume backing this claim.

14.13.1.268. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSource

Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced

14.13.1.269. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef

Description

`dataSourceRef` specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a `PersistentVolumeClaim` object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the `dataSource` field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in `dataSourceRef`, both fields (`dataSource` and `dataSourceRef`) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in `dataSourceRef`, `dataSource` isn't set to the same value and must be empty. There are three important differences between `dataSource` and `dataSourceRef`: * While `dataSource` only allows two specific types of objects, `dataSourceRef` allows any non-core object, as well as `PersistentVolumeClaim` objects. * While `dataSource` ignores disallowed values (dropping them), `dataSourceRef` preserves all values, and generates an error if a disallowed value is specified. * While `dataSource` only allows local objects, `dataSourceRef` allows objects in any namespaces. (Beta) Using this field requires the `AnyVolumeDataSource` feature gate to be enabled. (Alpha) Using the namespace field of `dataSourceRef` requires the `CrossNamespaceVolumeDataSource` feature gate to be enabled.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced
namespace	string	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

14.13.1.270. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.13.1.271. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims

Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.13.1.272. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims

Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

Type

object

Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

14.13.1.273. .template.spec.volumes[].fc

Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	integer	lun is Optional: FC target lun number
readOnly	boolean	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	array (string)	targetWWNs is Optional: FC target worldwide names (WWNs)
wwids	array (string)	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

14.13.1.274. .template.spec.volumes[].flexVolume

Description

FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Type

object

Required

- **driver**

Property	Type	Description
driver	string	driver is the name of the driver to use for this volume.
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	object (string)	options is Optional: this field holds extra command options if any.
readOnly	boolean	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

14.13.1.275. .template.spec.volumes[].flexVolume.secretRef**Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.276. .template.spec.volumes[].flocker**Description**

Represents a Flocker volume mounted by the Flocker agent. One and only one of `datasetName` and `datasetUUID` should be set. Flocker volumes do not support ownership management or SELinux relabeling.

Type

object

Property	Type	Description
datasetName	string	<code>datasetName</code> is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
datasetUUID	string	<code>datasetUUID</code> is the UUID of the dataset. This is unique identifier of a Flocker dataset

14.13.1.277. `.template.spec.volumes[].gcePersistentDisk`

Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

Type

object

Required

- `pdName`

Property	Type	Description
fsType	string	<code>fsType</code> is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

Property	Type	Description
partition	integer	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	string	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

14.13.1.278. .template.spec.volumes[].gitRepo

Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

Type

object

Required

- **repository**

Property	Type	Description
----------	------	-------------

Property	Type	Description
directory	string	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	string	repository is the URL
revision	string	revision is the commit hash for the specified revision.

14.13.1.279. .template.spec.volumes[].glusterfs

Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **endpoints**
- **path**

Property	Type	Description
endpoints	string	endpoints is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	string	path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

Property	Type	Description
readOnly	boolean	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

14.13.1.280. .template.spec.volumes[].hostPath

Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **path**

Property	Type	Description
path	string	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

Property	Type	Description
type	string	<p>type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath</p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - "BlockDevice" A block device must exist at the given path - "CharDevice" A character device must exist at the given path - "Directory" A directory must exist at the given path - "DirectoryOrCreate" If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - "File" A file must exist at the given path - "FileOrCreate" If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - "Socket" A UNIX socket must exist at the given path</p>

14.13.1.281. .template.spec.volumes[].iscsi

Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

Type

object

Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
----------	------	-------------

Property	Type	Description
chapAuthDiscovery	boolean	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
chapAuthSession	boolean	chapAuthSession defines whether support iSCSI Session CHAP authentication
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	string	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
iqn	string	iqn is the target iSCSI Qualified Name.
iscsiInterface	string	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	integer	lun represents iSCSI Target Lun number.
portals	array (string)	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

Property	Type	Description
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
targetPortal	string	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

14.13.1.282. .template.spec.volumes[].iscsi.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.283. .template.spec.volumes[].nfs

Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **server**
- **path**

Property	Type	Description
path	string	path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

Property	Type	Description
readOnly	boolean	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	string	server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

14.13.1.284. .template.spec.volumes[].persistentVolumeClaim

Description

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

Type

object

Required

- **claimName**

Property	Type	Description
claimName	string	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	boolean	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

14.13.1.285. .template.spec.volumes[].photonPersistentDisk

Description

Represents a Photon Controller persistent disk resource.

Type

object

Required

- **pdID**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	string	pdID is the ID that identifies Photon Controller persistent disk

14.13.1.286. .template.spec.volumes[].portworxVolume**Description**

PortworxVolumeSource represents a Portworx volume resource.

Type

object

Required

- **volumelD**

Property	Type	Description
fsType	string	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumelD	string	volumelD uniquely identifies a Portworx volume

14.13.1.287. .template.spec.volumes[].projected**Description**

Represents a projected volume source

Type

object

Property	Type	Description
defaultMode	integer	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	array	sources is the list of volume projections
sources[]	object	Projection that may be projected along with other supported volume types

14.13.1.288. `.template.spec.volumes[].projected.sources`

Description

sources is the list of volume projections

Type

array14.13.1.289. `.template.spec.volumes[].projected.sources[]`

Description

Projection that may be projected along with other supported volume types

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
configMap	object	<p>Adapts a ConfigMap into a projected volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.</p>
downwardAPI	object	<p>Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.</p>
secret	object	<p>Adapts a secret into a projected volume.</p> <p>The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.</p>
serviceAccountToken	object	<p>ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).</p>

14.13.1.290. `.template.spec.volumes[].projected.sources[].configMap`

Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

Type

object

Property	Type	Description
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

14.13.1.291. .template.spec.volumes[].projected.sources[].configMap.items**Description**

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type**array****14.13.1.292. .template.spec.volumes[].projected.sources[].configMap.items[]****Description**

Maps a string key to a path within a volume.

Type**object****Required**

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.13.1.293. .template.spec.volumes[].projected.sources[].downwardAPI

Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

Type

object

Property	Type	Description
items	array	Items is a list of DownwardAPIVolume file
items[]	object	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.13.1.294. .template.spec.volumes[].projected.sources[].downwardAPI.items

Description

Items is a list of DownwardAPIVolume file

Type

array

14.13.1.295. .template.spec.volumes[].projected.sources[].downwardAPI.items[]

Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

object

Required

- **path**

Property	Type	Description
fieldRef	object	ObjectFieldSelector selects an APIVersioned field of an object.
mode	integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	object	ResourceFieldSelector represents container resources (cpu, memory) and their output format

14.13.1.296. .template.spec.volumes[].projected.sources[].downwardAPI.items[].fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.13.1.297. .template.spec.volumes[].projected.sources[].downwardAPI.items[].resourceField

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.13.1.298. .template.spec.volumes[].projected.sources[].secret

Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

Type

object

Property	Type	Description
items	array	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional field specify whether the Secret or its key must be defined

14.13.1.299. .template.spec.volumes[].projected.sources[].secret.items

Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type

array

14.13.1.300. .template.spec.volumes[].projected.sources[].secret.items[]

Description

Maps a string key to a path within a volume.

Type

object

Required

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.13.1.301. .template.spec.volumes[].projected.sources[].serviceAccountToken

Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

Type

object

Required

- **path**

Property	Type	Description
audience	string	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.

Property	Type	Description
expirationSeconds	integer	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	string	path is the path relative to the mount point of the file to project the token into.

14.13.1.302. .template.spec.volumes[].quobyte

Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **registry**
- **volume**

Property	Type	Description
group	string	group to map volume access to Default is no group
readOnly	boolean	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
registry	string	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	string	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	string	user to map volume access to Defaults to serviceaccount user
volume	string	volume is a string that references an already created Quobyte volume by name.

14.13.1.303. .template.spec.volumes[].rbd

Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

Type

object

Required

- **monitors**
- **image**

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd

Property	Type	Description
image	string	image is the rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	string	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	array (string)	monitors is a collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	string	pool is the rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
user	string	user is the rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

14.13.1.304. .template.spec.volumes[].rbd.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.305. .template.spec.volumes[].scaleIO

Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

Type

object

Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	string	gateway is the host address of the ScaleIO API Gateway.
protectionDomain	string	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
readOnly	boolean	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
sslEnabled	boolean	sslEnabled Flag enable/disable SSL communication with Gateway, default false

Property	Type	Description
storageMode	string	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	string	storagePool is the ScaleIO Storage Pool associated with the protection domain.
system	string	system is the name of the storage system as configured in ScaleIO.
volumeName	string	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

14.13.1.306. .template.spec.volumes[].scaleIO.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.307. .template.spec.volumes[].secret

Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
defaultMode	integer	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
optional	boolean	optional field specify whether the Secret or its keys must be defined
secretName	string	secretName is the name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

14.13.1.308. .template.spec.volumes[].secret.items

Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys

will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type**array****14.13.1.309. .template.spec.volumes[].secret.items[]****Description**

Maps a string key to a path within a volume.

Type**object****Required**

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.13.1.310. .template.spec.volumes[].storageos**Description**

Represents a StorageOS persistent volume resource.

Type**object**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
volumeName	string	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	string	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

14.13.1.311. .template.spec.volumes[].storageos.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.13.1.312. .template.spec.volumes[].vsphereVolume

Description

Represents a vSphere volume resource.

Type

object

Required

- **volumePath**

Property	Type	Description
fsType	string	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	string	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	string	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
volumePath	string	volumePath is the path that identifies vSphere volume vmdk

14.13.2. API endpoints

The following API endpoints are available:

- **/api/v1/podtemplates**
 - **GET**: list or watch objects of kind PodTemplate
- **/api/v1/watch/podtemplates**

- **GET**: watch individual changes to a list of PodTemplate. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/podtemplates**
 - **DELETE**: delete collection of PodTemplate
 - **GET**: list or watch objects of kind PodTemplate
 - **POST**: create a PodTemplate
- **/api/v1/watch/namespaces/{namespace}/podtemplates**
 - **GET**: watch individual changes to a list of PodTemplate. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/podtemplates/{name}**
 - **DELETE**: delete a PodTemplate
 - **GET**: read the specified PodTemplate
 - **PATCH**: partially update the specified PodTemplate
 - **PUT**: replace the specified PodTemplate
- **/api/v1/watch/namespaces/{namespace}/podtemplates/{name}**
 - **GET**: watch changes to an object of kind PodTemplate. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

14.13.2.1. /api/v1/podtemplates

Table 14.342. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Description

create a PodTemplate

Table 14.353. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP method

DELETE

Description

delete a PodTemplate

Table 14.361. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 14.362. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 14.363. HTTP responses

HTTP code	Response body
200 - OK	PodTemplate schema
202 - Accepted	PodTemplate schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

read the specified PodTemplate

Table 14.364. HTTP responses

HTTP code	Response body
200 - OK	PodTemplate schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified PodTemplate

Table 14.365. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 14.366. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 14.367. HTTP responses

HTTP code	Response body
200 - OK	PodTemplate schema
201 - Created	PodTemplate schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace the specified PodTemplate

Table 14.368. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
body	PodTemplate schema	

Table 14.370. HTTP responses

HTTP code	Response body
200 - OK	PodTemplate schema
201 - Created	PodTemplate schema
401 - Unauthorized	Empty

14.13.2.6. /api/v1/watch/namespaces/{namespace}/podtemplates/{name}

Table 14.371. Global path parameters

Parameter	Type	Description
name	string	name of the PodTemplate
namespace	string	object name and auth scope, such as for teams and projects

Table 14.372. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind PodTemplate. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 14.373. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

14.14. REPLICATIONCONTROLLER [V1]

Description

ReplicationController represents the configuration of a replication controller.

Type

object

14.14.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	If the Labels of a ReplicationController are empty, they are defaulted to be the same as the Pod(s) that the replication controller manages. Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

Property	Type	Description
spec	object	ReplicationControllerSpec is the specification of a replication controller.
status	object	ReplicationControllerStatus represents the current status of a replication controller.

14.14.1.1. .spec

Description

ReplicationControllerSpec is the specification of a replication controller.

Type

object

Property	Type	Description
minReadySeconds	integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
replicas	integer	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller
selector	object (string)	Selector is a label query over pods that should match the Replicas count. If Selector is empty, it is defaulted to the labels present on the Pod template. Label keys and values that must match in order to be controlled by this replication controller, if empty defaulted to labels on Pod template. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors

Property	Type	Description
template	object	PodTemplateSpec describes the data a pod should have when created from a template

14.14.1.2. .spec.template

Description

PodTemplateSpec describes the data a pod should have when created from a template

Type

object

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	PodSpec is a description of a pod.

14.14.1.3. .spec.template.spec

Description

PodSpec is a description of a pod.

Type

object

Required

- **containers**

Property	Type	Description
activeDeadlineSeconds	integer	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	object	Affinity is a group of affinity scheduling rules.

Property	Type	Description
automountServiceAccountToken	boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	array	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
containers[]	object	A single application container that you want to run within a pod.
dnsConfig	object	PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

Property	Type	Description
dnsPolicy	string	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - "ClusterFirst" indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - "ClusterFirstWithHostNet" indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - "Default" indicates that the pod should use the default (as determined by kubelet) DNS settings. - "None" indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
enableServiceLinks	boolean	<p>EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.</p>

Property	Type	Description
ephemeralContainers	array	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.
ephemeralContainers[]	object	<p>An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation.</p> <p>To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.</p>
hostAliases	array	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostAliases[]	object	HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.
hostIPC	boolean	Use the host's ipc namespace. Optional: Default to false.

Property	Type	Description
hostNetwork	boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	boolean	Use the host's pid namespace. Optional: Default to false.
hostUsers	boolean	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with CAP_SYS_MODULE. When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the UserNamespacesSupport feature.
hostname	string	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	array	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
imagePullSecrets[]	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Property	Type	Description
initContainers	array	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
initContainers[]	object	A single application container that you want to run within a pod.
nodeName	string	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	object (string)	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

Property	Type	Description
os	object	PodOS defines the OS parameters of a pod.
overhead	object (Quantity)	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md
preemptionPolicy	string	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. Possible enum values: - "Never" means that pod never preempts other pods with lower priority. - "PreemptLowerPriority" means that pod can preempt other pods with lower priority.
priority	integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
priorityClassName	string	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	array	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates
readinessGates[]	object	PodReadinessGate contains the reference to a pod condition
resourceClaims	array	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable.
resourceClaims[]	object	PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Property	Type	Description
restartPolicy	string	<p>Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</p> <p>Possible enum values: - "Always" - "Never" - "OnFailure"</p>
runtimeClassName	string	<p>RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</p>
schedulerName	string	<p>If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.</p>

Property	Type	Description
schedulingGates	array	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>
schedulingGates[]	object	PodSchedulingGate is associated to a Pod to guard its scheduling.
securityContext	object	PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.
serviceAccount	string	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	string	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

Property	Type	Description
setHostnameAsFQDN	boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	string	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	array	If specified, the pod's tolerations.
tolerations[]	object	The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.
topologySpreadConstraints	array	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
topologySpreadConstraints[]	object	TopologySpreadConstraint specifies how to spread matching pods among the given topology.
volumes	array	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes
volumes[]	object	Volume represents a named volume in a pod that may be accessed by any container in the pod.

14.14.1.4. .spec.template.spec.affinity

Description

Affinity is a group of affinity scheduling rules.

Type

object

Property	Type	Description
nodeAffinity	object	Node affinity is a group of node affinity scheduling rules.
podAffinity	object	Pod affinity is a group of inter pod affinity scheduling rules.
podAntiAffinity	object	Pod anti affinity is a group of inter pod anti affinity scheduling rules.

14.14.1.5. .spec.template.spec.affinity.nodeAffinity

Description

Node affinity is a group of node affinity scheduling rules.

Type

object

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution[]	object	An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).
requiredDuringSchedulingIgnoredDuringExecution	object	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

14.14.1.6. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding `matchExpressions`; the node(s) with the highest sum are the most preferred.

Type

array

14.14.1.7. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

Type

object

Required

- **weight**
- **preference**

Property	Type	Description
----------	------	-------------

Property	Type	Description
preference	object	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.
weight	integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

14.14.1.8. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.
matchExpressions[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
matchFields	array	A list of node selector requirements by node's fields.
matchFields[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

14.14.1.9. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

A list of node selector requirements by node's labels.

Type

array

14.14.1.10. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.14.1.11. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

A list of node selector requirements by node's fields.

Type

array

14.14.1.12. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.14.1.13. .spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE

Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

Type

object

Required

- **nodeSelectorTerms**

Property	Type	Description
nodeSelectorTerms	array	Required. A list of node selector terms. The terms are ORed.
nodeSelectorTerms[]	object	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

14.14.1.14. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

Required. A list of node selector terms. The terms are ORed.

Type

array

14.14.1.15. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.
matchExpressions[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
matchFields	array	A list of node selector requirements by node's fields.
matchFields[]	object	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

14.14.1.16. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

A list of node selector requirements by node's labels.

Type

array

14.14.1.17. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.14.1.18. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

A list of node selector requirements by node's fields.

Type

array

14.14.1.19. .spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

object

Required

- **key**
- **operator**

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Possible enum values: - "DoesNotExist" - "Exists" - "Gt" - "In" - "Lt" - "NotIn"
values	array (string)	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

14.14.1.20. .spec.template.spec.affinity.podAffinity

Description

Pod affinity is a group of inter pod affinity scheduling rules.

Type

object

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
preferredDuringSchedulingIgnoredDuringExecution[]	object	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
requiredDuringSchedulingIgnoredDuringExecution	array	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
requiredDuringSchedulingIgnoredDuringExecution[]	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

14.14.1.21. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringE

Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Type

array

14.14.1.22. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringI

Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

Type

object

Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
podAffinityTerm	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
weight	integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

14.14.1.23. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuring

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.

Property	Type	Description
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.14.1.24. `.spec.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Type

array

14.14.1.25. `.spec.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringE`

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.14.1.26. .spec.template.spec.affinity.podAntiAffinity

Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	array	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
preferredDuringSchedulingIgnoredDuringExecution[]	object	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
requiredDuringSchedulingIgnoredDuringExecution	array	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
requiredDuringSchedulingIgnoredDuringExecution[]	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

14.14.1.27. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

Description

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Type

array

14.14.1.28. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

Type

object

Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
podAffinityTerm	object	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
weight	integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

14.14.1.29. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.

Property	Type	Description
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.14.1.30. `.spec.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringExecution`

Description

If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each `podAffinityTerm` are intersected, i.e. all terms must be satisfied.

Type

array

14.14.1.31. `.spec.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringExecution`

Description

Defines a set of pods (namely those matching the `labelSelector` relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key `<topologyKey>` matches that of any node on which a pod of the set of pods is running

Type

object

Required

- **topologyKey**

Property	Type	Description
labelSelector	LabelSelector	A label query over a set of resources, in this case pods.
namespaceSelector	LabelSelector	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({}) matches all namespaces.
namespaces	array (string)	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

14.14.1.32. .spec.template.spec.containers

Description

List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

Type

array

14.14.1.33. .spec.template.spec.containers[]

Description

A single application container that you want to run within a pod.

Type

object

Required

- **name**

Property	Type	Description
args	array (string)	Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$</code> are reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. " <code>\$(VAR_NAME)</code> " will produce the string literal " <code>\$(VAR_NAME)</code> ". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

Property	Type	Description
command	array (string)	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	array	List of environment variables to set in the container. Cannot be updated.
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps

Property	Type	Description
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	string	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
lifecycle	object	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
livenessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
name	string	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	array	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See https://github.com/kubernetes/kubernetes/issues/108255 . Cannot be updated.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Property	Type	Description
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	string	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.14.1.34. .spec.template.spec.containers[].env

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.14.1.35. .spec.template.spec.containers[].env[]

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.14.1.36. `..spec.template.spec.containers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (<code>cpu</code> , <code>memory</code>) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.14.1.37. `..spec.template.spec.containers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a `ConfigMap`.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.14.1.38. `.spec.template.spec.containers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.14.1.39. `.spec.template.spec.containers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.14.1.40. .spec.template.spec.containers[].env[].valueFrom.secretKeyRef

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.14.1.41. .spec.template.spec.containers[].envFrom

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.14.1.42. .spec.template.spec.containers[].envFrom[]

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
prefix	string	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	object	SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

14.14.1.43. .spec.template.spec.containers[].envFrom[].configMapRef

Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap must be defined

14.14.1.44. .spec.template.spec.containers[].envFrom[].secretRef

Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.14.1.45. .spec.template.spec.containers[].lifecycle

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.14.1.46. .spec.template.spec.containers[].lifecycle.postStart

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.47. .spec.template.spec.containers[].lifecycle.postStart.exec**Description**

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.48. .spec.template.spec.containers[].lifecycle.postStart.httpGet**Description**

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.49. .spec.template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.50. .spec.template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.51. `.spec.template.spec.containers[].lifecycle.postStart.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.52. `.spec.template.spec.containers[].lifecycle.preStop`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.53. `..spec.template.spec.containers[].lifecycle.preStop.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.54. `..spec.template.spec.containers[].lifecycle.preStop.httpGet`

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.55. `..spec.template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.56. `..spec.template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.57. .spec.template.spec.containers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.58. .spec.template.spec.containers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.59. .spec.template.spec.containers[].livenessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.60. .spec.template.spec.containers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.61. .spec.template.spec.containers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.62. `.spec.template.spec.containers[].livenessProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.63. `.spec.template.spec.containers[].livenessProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.64. `.spec.template.spec.containers[].livenessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.65. `.spec.template.spec.containers[].ports`

Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

Type

array

14.14.1.66. `.spec.template.spec.containers[].ports[]`

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - " SCTP " is the SCTP protocol. - " TCP " is the TCP protocol. - " UDP " is the UDP protocol.

14.14.1.67. .spec.template.spec.containers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.68. .spec.template.spec.containers[].readinessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.69. .spec.template.spec.containers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.70. .spec.template.spec.containers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.71. `.spec.template.spec.containers[].readinessProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.72. `.spec.template.spec.containers[].readinessProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.73. `.spec.template.spec.containers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.74. `.spec.template.spec.containers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.14.1.75. `.spec.template.spec.containers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.14.1.76. .spec.template.spec.containers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.14.1.77. `.spec.template.spec.containers[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.14.1.78. `.spec.template.spec.containers[].resources.claims[]`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.14.1.79. `.spec.template.spec.containers[].securityContext`

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type

object

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.14.1.80. .spec.template.spec.containers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.14.1.81. `.spec.template.spec.containers[].securityContext.seLinuxOptions`

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.14.1.82. `.spec.template.spec.containers[].securityContext.seccompProfile`

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.14.1.83. .spec.template.spec.containers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.14.1.84. .spec.template.spec.containers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.85. `..spec.template.spec.containers[].startupProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.86. .spec.template.spec.containers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.87. .spec.template.spec.containers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.88. `.spec.template.spec.containers[].startupProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.89. `.spec.template.spec.containers[].startupProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.90. .spec.template.spec.containers[].startupProbe.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.91. .spec.template.spec.containers[].volumeDevices

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.14.1.92. .spec.template.spec.containers[].volumeDevices[]

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.14.1.93. .spec.template.spec.containers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

Type

array

14.14.1.94. .spec.template.spec.containers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.14.1.95. .spec.template.spec.dnsConfig

Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

Type

object

Property	Type	Description
nameservers	array (string)	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	array	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
options[]	object	PodDNSConfigOption defines DNS resolver options of a pod.
searches	array (string)	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

14.14.1.96. .spec.template.spec.dnsConfig.options

Description

A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Type

array

14.14.1.97. .spec.template.spec.dnsConfig.options[]**Description**

PodDNSConfigOption defines DNS resolver options of a pod.

Type

object

Property	Type	Description
name	string	Required.
value	string	

14.14.1.98. .spec.template.spec.ephemeralContainers**Description**

List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.

Type

array

14.14.1.99. .spec.template.spec.ephemeralContainers[]**Description**

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

Type

object

Required

- **name**

Property	Type	Description
args	array (string)	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
command	array (string)	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
env	array	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	string	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images</p> <p>Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail If the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>

Property	Type	Description
lifecycle	object	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
livenessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
name	string	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	array	Ports are not allowed for ephemeral containers.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Property	Type	Description
targetContainerName	string	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
terminationMessagePath	string	<p>Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to <code>/dev/termination-log</code>. Cannot be updated.</p>

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.14.1.100. .spec.template.spec.ephemeralContainers[].env

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.14.1.101. .spec.template.spec.ephemeralContainers[].env[]

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.14.1.102. `.spec.template.spec.ephemeralContainers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (<code>cpu</code> , <code>memory</code>) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.14.1.103. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a `ConfigMap`.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.14.1.104. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.14.1.105. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.14.1.106. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.secretKeyRef`

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.14.1.107. `.spec.template.spec.ephemeralContainers[].envFrom`

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.14.1.108. `.spec.template.spec.ephemeralContainers[].envFrom[]`

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
prefix	string	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	object	SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

14.14.1.109. .spec.template.spec.ephemeralContainers[].envFrom[].configMapRef

Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap must be defined

14.14.1.110. .spec.template.spec.ephemeralContainers[].envFrom[].secretRef

Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.14.1.111. .spec.template.spec.ephemeralContainers[].lifecycle

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.14.1.112. .spec.template.spec.ephemeralContainers[].lifecycle.postStart

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.113. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.exec**Description**

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.114. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet**Description**

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.115. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeade

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.116. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeade

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.117. `.spec.template.spec.ephemeralContainers[].lifecycle.postStart.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.118. `.spec.template.spec.ephemeralContainers[].lifecycle.preStop`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCP socket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.119. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.120. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.121. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeader:

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.122. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeader

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.123. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.124. .spec.template.spec.ephemeralContainers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.125. `.spec.template.spec.ephemeralContainers[].livenessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.126. .spec.template.spec.ephemeralContainers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.127. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.128. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.129. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.130. `.spec.template.spec.ephemeralContainers[].livenessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.131. `.spec.template.spec.ephemeralContainers[].ports`

Description

Ports are not allowed for ephemeral containers.

Type

array

14.14.1.132. `.spec.template.spec.ephemeralContainers[].ports[]`

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.

14.14.1.133. .spec.template.spec.ephemeralContainers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type**object**

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.134. .spec.template.spec.ephemeralContainers[].readinessProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.135. .spec.template.spec.ephemeralContainers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.136. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.137. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.138. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.139. `.spec.template.spec.ephemeralContainers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.140. `.spec.template.spec.ephemeralContainers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.14.1.141. `.spec.template.spec.ephemeralContainers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.14.1.142. .spec.template.spec.ephemeralContainers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.14.1.143. `.spec.template.spec.ephemeralContainers[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.14.1.144. `.spec.template.spec.ephemeralContainers[].resources.claims[]`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.14.1.145. `.spec.template.spec.ephemeralContainers[].securityContext`

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type**object**

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.14.1.146. .spec.template.spec.ephemeralContainers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.14.1.147. `.spec.template.spec.ephemeralContainers[].securityContext.seLinuxOptions`

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.14.1.148. `.spec.template.spec.ephemeralContainers[].securityContext.seccompProfile`

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.14.1.149. .spec.template.spec.ephemeralContainers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.14.1.150. .spec.template.spec.ephemeralContainers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.151. .spec.template.spec.ephemeralContainers[].startupProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.152. .spec.template.spec.ephemeralContainers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.153. .spec.template.spec.ephemeralContainers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.154. `.spec.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.155. `.spec.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.156. `.spec.template.spec.ephemeralContainers[].startupProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.157. `.spec.template.spec.ephemeralContainers[].volumeDevices`

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.14.1.158. `.spec.template.spec.ephemeralContainers[].volumeDevices[]`

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.14.1.159. .spec.template.spec.ephemeralContainers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Type

array

14.14.1.160. .spec.template.spec.ephemeralContainers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain ':

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.14.1.161. .spec.template.spec.hostAliases

Description

HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

Type

array

14.14.1.162. .spec.template.spec.hostAliases[]

Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

Type

object

Property	Type	Description
hostnames	array (string)	Hostnames for the above IP address.
ip	string	IP address of the host file entry.

14.14.1.163. .spec.template.spec.imagePullSecrets

Description

ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info:

<https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod>

Type

array

14.14.1.164. .spec.template.spec.imagePullSecrets[]

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.165. .spec.template.spec.initContainers

Description

List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <https://kubernetes.io/docs/concepts/workloads/pods/init-containers/>

Type

array

14.14.1.166. .spec.template.spec.initContainers[]

Description

A single application container that you want to run within a pod.

Type

object

Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
args	array (string)	<p>Arguments to the endpoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
command	array (string)	<p>Endpoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</p>
env	array	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
env[]	object	EnvVar represents an environment variable present in a Container.
envFrom	array	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
envFrom[]	object	EnvFromSource represents the source of a set of ConfigMaps
image	string	Container image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

Property	Type	Description
imagePullPolicy	string	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images</p> <p>Possible enum values: - "Always" means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - "IfNotPresent" means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - "Never" means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>
lifecycle	object	<p>Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.</p>
livenessProbe	object	<p>Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.</p>
name	string	<p>Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.</p>

Property	Type	Description
ports	array	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See https://github.com/kubernetes/kubernetes/issues/108255 . Cannot be updated.
ports[]	object	ContainerPort represents a network port in a single container.
readinessProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
resizePolicy	array	Resources resize policy for the container.
resizePolicy[]	object	ContainerResizePolicy represents resource resize policy for the container.
resources	object	ResourceRequirements describes the compute resource requirements.
securityContext	object	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
startupProbe	object	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
stdin	boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	string	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
terminationMessagePolicy	string	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - "FallbackToLogsOnError" will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - "File" is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
tty	boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	array	volumeDevices is the list of block devices to be used by the container.
volumeDevices[]	object	volumeDevice describes a mapping of a raw block device within a container.
volumeMounts	array	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
volumeMounts[]	object	VolumeMount describes a mounting of a Volume within a container.
workingDir	string	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

14.14.1.167. `.spec.template.spec.initContainers[].env`

Description

List of environment variables to set in the container. Cannot be updated.

Type

array

14.14.1.168. `.spec.template.spec.initContainers[].env[]`

Description

EnvVar represents an environment variable present in a Container.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
value	string	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
valueFrom	object	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

14.14.1.169. `.spec.template.spec.initContainers[].env[].valueFrom`

Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

Type

object

Property	Type	Description
configMapKeyRef	object	Selects a key from a <code>ConfigMap</code> .
fieldRef	object	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
resourceFieldRef	object	<code>ResourceFieldSelector</code> represents container resources (cpu, memory) and their output format
secretKeyRef	object	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

14.14.1.170. `.spec.template.spec.initContainers[].env[].valueFrom.configMapKeyRef`

Description

Selects a key from a ConfigMap.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key to select.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the ConfigMap or its key must be defined

14.14.1.171. .spec.template.spec.initContainers[].env[].valueFrom.fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.14.1.172. .spec.template.spec.initContainers[].env[].valueFrom.resourceFieldRef

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.14.1.173. `.spec.template.spec.initContainers[].env[].valueFrom.secretKeyRef`

Description

SecretKeySelector selects a key of a Secret.

Type

object

Required

- **key**

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret or its key must be defined

14.14.1.174. `.spec.template.spec.initContainers[].envFrom`

Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Type

array

14.14.1.175. `.spec.template.spec.initContainers[].envFrom[]`

Description

EnvFromSource represents the source of a set of ConfigMaps

Type

object

Property	Type	Description
configMapRef	object	<p>ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.</p> <p>The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.</p>
prefix	string	<p>An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.</p>
secretRef	object	<p>SecretEnvSource selects a Secret to populate the environment variables with.</p> <p>The contents of the target Secret's Data field will represent the key-value pairs as environment variables.</p>

14.14.1.176. .spec.template.spec.initContainers[].envFrom[].configMapRef**Description**

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	<p>Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</p>
optional	boolean	<p>Specify whether the ConfigMap must be defined</p>

14.14.1.177. `.spec.template.spec.initContainers[].envFrom[].secretRef`

Description

SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	Specify whether the Secret must be defined

14.14.1.178. `.spec.template.spec.initContainers[].lifecycle`

Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

Type

object

Property	Type	Description
postStart	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
preStop	object	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

14.14.1.179. `.spec.template.spec.initContainers[].lifecycle.postStart`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type
object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.180. `.spec.template.spec.initContainers[].lifecycle.postStart.exec`

Description

ExecAction describes a "run in container" action.

Type
object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.181. `.spec.template.spec.initContainers[].lifecycle.postStart.httpGet`

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type
object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.182. `.spec.template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.183. `.spec.template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.184. `.spec.template.spec.initContainers[].lifecycle.postStart.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.185. `.spec.template.spec.initContainers[].lifecycle.preStop`

Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

14.14.1.186. .spec.template.spec.initContainers[].lifecycle.preStop.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.187. .spec.template.spec.initContainers[].lifecycle.preStop.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.188. `.spec.template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.189. `.spec.template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.190. .spec.template.spec.initContainers[].lifecycle.preStop.tcpSocket

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.191. .spec.template.spec.initContainers[].livenessProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.

Property	Type	Description
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.192. `.spec.template.spec.initContainers[].livenessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.193. .spec.template.spec.initContainers[].livenessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.194. .spec.template.spec.initContainers[].livenessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.195. .spec.template.spec.initContainers[].livenessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.196. .spec.template.spec.initContainers[].livenessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.197. `.spec.template.spec.initContainers[].livenessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.198. `.spec.template.spec.initContainers[].ports`

Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

Type

array

14.14.1.199. `.spec.template.spec.initContainers[].ports[]`

Description

ContainerPort represents a network port in a single container.

Type

object

Required

- **containerPort**

Property	Type	Description
containerPort	integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	string	What host IP to bind the external port to.
hostPort	integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	string	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	string	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP". Possible enum values: - " SCTP " is the SCTP protocol. - " TCP " is the TCP protocol. - " UDP " is the UDP protocol.

14.14.1.200. .spec.template.spec.initContainers[].readinessProbe**Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.201. `.spec.template.spec.initContainers[].readinessProbe.exec`

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.202. .spec.template.spec.initContainers[].readinessProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.203. .spec.template.spec.initContainers[].readinessProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.204. .spec.template.spec.initContainers[].readinessProbe.httpGet.httpHeaders

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.205. .spec.template.spec.initContainers[].readinessProbe.httpGet.httpHeaders[]

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.206. `.spec.template.spec.initContainers[].readinessProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.207. `.spec.template.spec.initContainers[].resizePolicy`

Description

Resources resize policy for the container.

Type

array

14.14.1.208. `.spec.template.spec.initContainers[].resizePolicy[]`

Description

ContainerResizePolicy represents resource resize policy for the container.

Type

object

Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
resourceName	string	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
restartPolicy	string	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.14.1.209. .spec.template.spec.initContainers[].resources

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate. This field is immutable. It can only be set for containers.
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

Property	Type	Description
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.14.1.210. `.spec.template.spec.initContainers[].resources.claims`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.14.1.211. `.spec.template.spec.initContainers[].resources.claims[]`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

14.14.1.212. `.spec.template.spec.initContainers[].securityContext`

Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Type**object**

Property	Type	Description
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
capabilities	object	Adds and removes POSIX capabilities from running containers.
privileged	boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
procMount	string	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Default" uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. - "Unmasked" bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.14.1.213. .spec.template.spec.initContainers[].securityContext.capabilities

Description

Adds and removes POSIX capabilities from running containers.

Type

object

Property	Type	Description
add	array (string)	Added capabilities

Property	Type	Description
drop	array (string)	Removed capabilities

14.14.1.214. `.spec.template.spec.initContainers[].securityContext.seLinuxOptions`

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.14.1.215. `.spec.template.spec.initContainers[].securityContext.seccompProfile`

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.14.1.216. .spec.template.spec.initContainers[].securityContext.windowsOptions

Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.14.1.217. .spec.template.spec.initContainers[].startupProbe

Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Type

object

Property	Type	Description
exec	object	ExecAction describes a "run in container" action.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC port.
httpGet	object	HTTPGetAction describes an action based on HTTP Get requests.
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	object	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
terminationGracePeriodSeconds	integer	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
timeoutSeconds	integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

14.14.1.218. .spec.template.spec.initContainers[].startupProbe.exec

Description

ExecAction describes a "run in container" action.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
command	array (string)	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

14.14.1.219. .spec.template.spec.initContainers[].startupProbe.grpc

Description

GRPC specifies an action involving a GRPC port.

Type

object

Required

- **port**

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see https://github.com/grpc/grpc/blob/master/doc/health-checking.md). If this is not specified, the default behavior is defined by gRPC.

14.14.1.220. .spec.template.spec.initContainers[].startupProbe.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type

object

Required

- **port**

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
httpHeaders[]	object	HTTPHeader describes a custom header to be used in HTTP probes
path	string	Path to access on the HTTP server.
port	IntOrString	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP. Possible enum values: - "HTTP" means that the scheme used will be http:// - "HTTPS" means that the scheme used will be https://

14.14.1.221. `.spec.template.spec.initContainers[].startupProbe.httpGet.httpHeaders`

Description

Custom headers to set in the request. HTTP allows repeated headers.

Type

array

14.14.1.222. `.spec.template.spec.initContainers[].startupProbe.httpGet.httpHeaders[]`

Description

HTTPHeader describes a custom header to be used in HTTP probes

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

14.14.1.223. `.spec.template.spec.initContainers[].startupProbe.tcpSocket`

Description

TCPSocketAction describes an action based on opening a socket

Type

object

Required

- **port**

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port	IntOrString	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

14.14.1.224. `.spec.template.spec.initContainers[].volumeDevices`

Description

volumeDevices is the list of block devices to be used by the container.

Type

array

14.14.1.225. `.spec.template.spec.initContainers[].volumeDevices[]`

Description

volumeDevice describes a mapping of a raw block device within a container.

Type

object

Required

- **name**
- **devicePath**

Property	Type	Description
devicePath	string	devicePath is the path inside of the container that the device will be mapped to.
name	string	name must match the name of a persistentVolumeClaim in the pod

14.14.1.226. .spec.template.spec.initContainers[].volumeMounts

Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

Type

array

14.14.1.227. .spec.template.spec.initContainers[].volumeMounts[]

Description

VolumeMount describes a mounting of a Volume within a container.

Type

object

Required

- **name**
- **mountPath**

Property	Type	Description
mountPath	string	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
mountPropagation	string	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - "Bidirectional" means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - "HostToContainer" means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - "None" means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
name	string	This must match the Name of a Volume.
readOnly	boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	string	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
subPathExpr	string	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

14.14.1.228. .spec.template.spec.os

Description

PodOS defines the OS parameters of a pod.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration Clients should expect to handle additional values and treat unrecognized values in this field as os: null

14.14.1.229. .spec.template.spec.readinessGates

Description

If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True"
More info: <https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates>

Type

array

14.14.1.230. `.spec.template.spec.readinessGates[]`

Description

PodReadinessGate contains the reference to a pod condition

Type

object

Required

- **conditionType**

Property	Type	Description
conditionType	string	ConditionType refers to a condition in the pod's condition list with matching type.

14.14.1.231. `.spec.template.spec.resourceClaims`

Description

ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.

This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable.

Type

array

14.14.1.232. `.spec.template.spec.resourceClaims[]`

Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.

Property	Type	Description
source	object	<p>ClaimSource describes a reference to a ResourceClaim.</p> <p>Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.</p>

14.14.1.233. .spec.template.spec.resourceClaims[].source

Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

Type

object

Property	Type	Description
resourceClaimName	string	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
resourceClaimTemplateName	string	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be <pod name>-<resource name>, where <resource name> is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

14.14.1.234. .spec.template.spec.schedulingGates

Description

SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.

SchedulingGates can only be set at pod creation time, and be removed only afterwards.

This is a beta feature enabled by the PodSchedulingReadiness feature gate.

Type

array

14.14.1.235. .spec.template.spec.schedulingGates[]

Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

Type

object

Required

- **name**

Property	Type	Description
name	string	Name of the scheduling gate. Each scheduling gate must have a unique name field.

14.14.1.236. .spec.template.spec.securityContext

Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

Type

object

Property	Type	Description
fsGroup	integer	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> 1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
fsGroupChangePolicy	string	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: - "Always" indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. - "OnRootMismatch" indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>
runAsGroup	integer	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
seLinuxOptions	object	SELinuxOptions are the labels to be applied to the container
seccompProfile	object	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
supplementalGroups	array (integer)	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
sysctls	array	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
sysctls[]	object	Sysctl defines a kernel parameter to be set
windowsOptions	object	WindowsSecurityContextOptions contain Windows-specific options and credentials.

14.14.1.237. .spec.template.spec.securityContext.seLinuxOptions

Description

SELinuxOptions are the labels to be applied to the container

Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

14.14.1.238. .spec.template.spec.securityContext.seccompProfile

Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

Type

object

Required

- **type**

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	string	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: - "Localhost" indicates a profile defined in a file on the node should be used. The file's location relative to <kubelet-root-dir>/seccomp. - "RuntimeDefault" represents the default container runtime seccomp profile. - "Unconfined" indicates no seccomp profile is applied (A.K.A. unconfined).</p>

14.14.1.239. .spec.template.spec.securityContext.sysctls

Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

Type

array

14.14.1.240. .spec.template.spec.securityContext.sysctls[]

Description

Sysctl defines a kernel parameter to be set

Type

object

Required

- **name**
- **value**

Property	Type	Description
name	string	Name of a property to set
value	string	Value of a property to set

14.14.1.241. .spec.template.spec.securityContext.windowsOptions**Description**

WindowsSecurityContextOptions contain Windows-specific options and credentials.

Type

object

Property	Type	Description
gmsaCredentialSpec	string	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
gmsaCredentialSpecName	string	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
hostProcess	boolean	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
runAsUserName	string	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

14.14.1.242. .spec.template.spec.tolerations

Description

If specified, the pod's tolerations.

Type

array

14.14.1.243. .spec.template.spec.tolerations[]

Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

Type

object

Property	Type	Description
effect	string	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: - "NoExecute" Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. - "NoSchedule" Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. - "PreferNoSchedule" Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
key	string	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
operator	string	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - "Equal" - "Exists"</p>

Property	Type	Description
tolerationSeconds	integer	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	string	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

14.14.1.244. .spec.template.spec.topologySpreadConstraints

Description

TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

Type

array

14.14.1.245. .spec.template.spec.topologySpreadConstraints[]

Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

Type

object

Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

Property	Type	Description
----------	------	-------------

Property	Type	Description
labelSelector	LabelSelector	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.
matchLabelKeys	array (string)	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
maxSkew	integer	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When whenUnsatisfiable=DoNotSchedule, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1. zone1 zone2 zone3 P P P P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When whenUnsatisfiable=ScheduleAnyway, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
minDomains	integer	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2: zone1 zone2 zone3 P P P P P P The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
nodeAffinityPolicy	string	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - "Honor" means use this scheduling directive when calculating pod topology spread skew. - "Ignore" means ignore this scheduling directive when calculating pod topology spread skew.</p>
nodeTaintsPolicy	string	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - "Honor" means use this scheduling directive when calculating pod topology spread skew. - "Ignore" means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
topologyKey	string	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
whenUnsatisfiable	string	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it more imbalanced. It's a required field.</p> <p>Possible enum values: - "DoNotSchedule" instructs the scheduler not to schedule the pod when constraints are not satisfied. - "ScheduleAnyway" instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

14.14.1.246. .spec.template.spec.volumes

Description

List of volumes that can be mounted by containers belonging to the pod. More info: <https://kubernetes.io/docs/concepts/storage/volumes>

Type

array

14.14.1.247. .spec.template.spec.volumes[]

Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

Type

object

Required

- **name**

Property	Type	Description
awsElasticBlockStore	object	<p>Represents a Persistent Disk resource in AWS.</p> <p>An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.</p>
azureDisk	object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	object	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
cinder	object	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Property	Type	Description
configMap	object	<p>Adapts a ConfigMap into a volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.</p>
csi	object	Represents a source location of a volume to mount, managed by an external CSI driver
downwardAPI	object	DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.
emptyDir	object	Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.
ephemeral	object	Represents an ephemeral volume that is handled by a normal storage driver.
fc	object	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
flexVolume	object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
flocker	object	Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.
gcePersistentDisk	object	Represents a Persistent Disk resource in Google Compute Engine. A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
gitRepo	object	Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	object	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
hostPath	object	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
iscsi	object	Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
name	string	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	object	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
persistentVolumeClaim	object	PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).
photonPersistentDisk	object	Represents a Photon Controller persistent disk resource.
portworxVolume	object	PortworxVolumeSource represents a Portworx volume resource.
projected	object	Represents a projected volume source
quobyte	object	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
rbd	object	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
scaleIO	object	ScaleIOVolumeSource represents a persistent ScaleIO volume
secret	object	Adapts a Secret into a volume. The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.
storageos	object	Represents a StorageOS persistent volume resource.
vsphereVolume	object	Represents a vSphere volume resource.

14.14.1.248. .spec.template.spec.volumes[].awsElasticBlockStore

Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

Type

object

Required

- **volumelD**

Property	Type	Description
----------	------	-------------

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	integer	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	boolean	readOnly value true will force the readOnly setting in VolumeMounts. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	string	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

14.14.1.249. .spec.template.spec.volumes[].azureDisk

Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

Type

object

Required

- **diskName**
- **diskURI**

Property	Type	Description
cachingMode	string	cachingMode is the Host Caching mode: None, Read Only, Read Write. Possible enum values: - "None" - "ReadOnly" - "ReadWrite"
diskName	string	diskName is the Name of the data disk in the blob storage
diskURI	string	diskURI is the URI of data disk in the blob storage
fsType	string	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	string	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared Possible enum values: - "Dedicated" - "Managed" - "Shared"
readOnly	boolean	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

14.14.1.250. .spec.template.spec.volumes[].azureFile

Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

Type

object

Required

- **secretName**
- **shareName**

Property	Type	Description
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	string	secretName is the name of secret that contains Azure Storage Account Name and Key
shareName	string	shareName is the azure share Name

14.14.1.251. .spec.template.spec.volumes[].cephfs

Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **monitors**

Property	Type	Description
monitors	array (string)	monitors is Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	string	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	boolean	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

Property	Type	Description
secretFile	string	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
user	string	user is optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

14.14.1.252. .spec.template.spec.volumes[].cephfs.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.253. .spec.template.spec.volumes[].cinder

Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Type

object

Required

- **volumeID**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
volumeID	string	volumeID used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

14.14.1.254. .spec.template.spec.volumes[].cinder.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.255. .spec.template.spec.volumes[].configMap

Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

Type
object

Property	Type	Description
defaultMode	integer	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

14.14.1.256. .spec.template.spec.volumes[].configMap.items

Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type

array

14.14.1.257. .spec.template.spec.volumes[].configMap.items[]

Description

Maps a string key to a path within a volume.

Type

object

Required

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.14.1.258. .spec.template.spec.volumes[].csi

Description

Represents a source location of a volume to mount, managed by an external CSI driver

Type

object

Required

- **driver**

Property	Type	Description
driver	string	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	string	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
readOnly	boolean	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	object (string)	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

14.14.1.259. .spec.template.spec.volumes[.csi.nodePublishSecretRef**Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type**object**

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.260. `.spec.template.spec.volumes[].downwardAPI`**Description**

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
defaultMode	integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	Items is a list of downward API volume file
items[]	object	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.14.1.261. `.spec.template.spec.volumes[].downwardAPI.items`**Description**

Items is a list of downward API volume file

Type

array

14.14.1.262. `.spec.template.spec.volumes[].downwardAPI.items[]`**Description**

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

object

Required

path

- **path**

Property	Type	Description
fieldRef	object	ObjectFieldSelector selects an APIVersioned field of an object.
mode	integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	object	ResourceFieldSelector represents container resources (cpu, memory) and their output format

14.14.1.263. .spec.template.spec.volumes[].downwardAPI.items[].fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
fieldPath	string	Path of the field to select in the specified API version.

14.14.1.264. `.spec.template.spec.volumes[].downwardAPI.items[].resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.14.1.265. `.spec.template.spec.volumes[].emptyDir`

Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
medium	string	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

Property	Type	Description
sizeLimit	Quantity	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

14.14.1.266. .spec.template.spec.volumes[].ephemeral

Description

Represents an ephemeral volume that is handled by a normal storage driver.

Type

object

Property	Type	Description
volumeClaimTemplate	object	PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

14.14.1.267. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate

Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

Type

object

Required

- **spec**

Property	Type	Description
----------	------	-------------

Property	Type	Description
metadata	ObjectMeta	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	object	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

14.14.1.268. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec

Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

Type

object

Property	Type	Description
accessModes	array (string)	accessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
dataSource	object	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
dataSourceRef	object	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
resources	object	ResourceRequirements describes the compute resource requirements.
selector	LabelSelector	selector is a label query over volumes to consider for binding.
storageClassName	string	storageClassName is the name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	string	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec. Possible enum values: - "Block" means the volume will not be formatted with a filesystem and will remain a raw block device. - "Filesystem" means the volume will be or is formatted with a filesystem.
volumeName	string	volumeName is the binding reference to the PersistentVolume backing this claim.

14.14.1.269. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSource

Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced

14.14.1.270. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef`

Description

`dataSourceRef` specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a `PersistentVolumeClaim` object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the `dataSource` field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in `dataSourceRef`, both fields (`dataSource` and `dataSourceRef`) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in `dataSourceRef`, `dataSource` isn't set to the same value and must be empty. There are three important differences between `dataSource` and `dataSourceRef`: * While `dataSource` only allows two specific types of objects, `dataSourceRef` allows any non-core object, as well as `PersistentVolumeClaim` objects. * While `dataSource` ignores disallowed values (dropping them), `dataSourceRef` preserves all values, and generates an error if a disallowed value is specified. * While `dataSource` only allows local objects, `dataSourceRef` allows objects in any namespaces. (Beta) Using this field requires the `AnyVolumeDataSource` feature gate to be enabled. (Alpha) Using the namespace field of `dataSourceRef` requires the `CrossNamespaceVolumeDataSource` feature gate to be enabled.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced
namespace	string	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

14.14.1.271. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources`

Description

ResourceRequirements describes the compute resource requirements.

Type

object

Property	Type	Description
claims	array	<p>Claims lists the names of resources, defined in <code>spec.resourceClaims</code>, that are used by this container.</p> <p>This is an alpha field and requires enabling the <code>DynamicResourceAllocation</code> feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
claims[]	object	ResourceClaim references one entry in PodSpec.ResourceClaims.
limits	object (Quantity)	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/
requests	object (Quantity)	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/

14.14.1.272. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.c`

Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

Type

array

14.14.1.273. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.c`

Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

Type

object

Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

14.14.1.274. .spec.template.spec.volumes[].fc

Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	integer	lun is Optional: FC target lun number
readOnly	boolean	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	array (string)	targetWWNs is Optional: FC target worldwide names (WWNs)
wwids	array (string)	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

14.14.1.275. .spec.template.spec.volumes[].flexVolume

Description

FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Type

object

Required

- **driver**

Property	Type	Description
driver	string	driver is the name of the driver to use for this volume.
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	object (string)	options is Optional: this field holds extra command options if any.
readOnly	boolean	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

14.14.1.276. .spec.template.spec.volumes[].flexVolume.secretRef**Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.277. .spec.template.spec.volumes[].flocker**Description**

Represents a Flocker volume mounted by the Flocker agent. One and only one of `datasetName` and `datasetUUID` should be set. Flocker volumes do not support ownership management or SELinux relabeling.

Type

object

Property	Type	Description
datasetName	string	<code>datasetName</code> is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
datasetUUID	string	<code>datasetUUID</code> is the UUID of the dataset. This is unique identifier of a Flocker dataset

14.14.1.278. `.spec.template.spec.volumes[].gcePersistentDisk`

Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

Type

object

Required

- `pdName`

Property	Type	Description
fsType	string	<code>fsType</code> is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

Property	Type	Description
partition	integer	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	string	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

14.14.1.279. .spec.template.spec.volumes[].gitRepo

Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

Type

object

Required

- **repository**

Property	Type	Description
----------	------	-------------

Property	Type	Description
directory	string	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	string	repository is the URL
revision	string	revision is the commit hash for the specified revision.

14.14.1.280. .spec.template.spec.volumes[].glusterfs

Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **endpoints**
- **path**

Property	Type	Description
endpoints	string	endpoints is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	string	path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

Property	Type	Description
readOnly	boolean	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

14.14.1.281. .spec.template.spec.volumes[].hostPath

Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **path**

Property	Type	Description
path	string	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

Property	Type	Description
type	string	<p>type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath</p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - "BlockDevice" A block device must exist at the given path - "CharDevice" A character device must exist at the given path - "Directory" A directory must exist at the given path - "DirectoryOrCreate" If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - "File" A file must exist at the given path - "FileOrCreate" If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - "Socket" A UNIX socket must exist at the given path</p>

14.14.1.282. .spec.template.spec.volumes[].iscsi

Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

Type

object

Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
----------	------	-------------

Property	Type	Description
chapAuthDiscovery	boolean	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
chapAuthSession	boolean	chapAuthSession defines whether support iSCSI Session CHAP authentication
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	string	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
iqn	string	iqn is the target iSCSI Qualified Name.
iscsiInterface	string	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	integer	lun represents iSCSI Target Lun number.
portals	array (string)	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

Property	Type	Description
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
targetPortal	string	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

14.14.1.283. .spec.template.spec.volumes[].iscsi.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.284. .spec.template.spec.volumes[].nfs

Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **server**
- **path**

Property	Type	Description
path	string	path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

Property	Type	Description
readOnly	boolean	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	string	server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

14.14.1.285. .spec.template.spec.volumes[].persistentVolumeClaim

Description

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

Type

object

Required

- **claimName**

Property	Type	Description
claimName	string	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	boolean	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

14.14.1.286. .spec.template.spec.volumes[].photonPersistentDisk

Description

Represents a Photon Controller persistent disk resource.

Type

object

Required

- **pdID**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	string	pdID is the ID that identifies Photon Controller persistent disk

14.14.1.287. .spec.template.spec.volumes[].portworxVolume**Description**

PortworxVolumeSource represents a Portworx volume resource.

Type

object

Required

- **volumelD**

Property	Type	Description
fsType	string	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumelD	string	volumelD uniquely identifies a Portworx volume

14.14.1.288. .spec.template.spec.volumes[].projected**Description**

Represents a projected volume source

Type

object

Property	Type	Description
defaultMode	integer	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	array	sources is the list of volume projections
sources[]	object	Projection that may be projected along with other supported volume types

14.14.1.289. `.spec.template.spec.volumes[].projected.sources`

Description

sources is the list of volume projections

Type

array14.14.1.290. `.spec.template.spec.volumes[].projected.sources[]`

Description

Projection that may be projected along with other supported volume types

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
configMap	object	<p>Adapts a ConfigMap into a projected volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.</p>
downwardAPI	object	<p>Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.</p>
secret	object	<p>Adapts a secret into a projected volume.</p> <p>The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.</p>
serviceAccountToken	object	<p>ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).</p>

14.14.1.291. `.spec.template.spec.volumes[].projected.sources[].configMap`

Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

Type

object

Property	Type	Description
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

14.14.1.292. .spec.template.spec.volumes[].projected.sources[].configMap.items**Description**

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type**array****14.14.1.293. .spec.template.spec.volumes[].projected.sources[].configMap.items[]****Description**

Maps a string key to a path within a volume.

Type**object****Required**

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.14.1.294. `.spec.template.spec.volumes[].projected.sources[].downwardAPI`

Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

Type

object

Property	Type	Description
items	array	Items is a list of DownwardAPIVolume file
items[]	object	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.14.1.295. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items`

Description

Items is a list of DownwardAPIVolume file

Type

array

14.14.1.296. .spec.template.spec.volumes[],projected.sources[],downwardAPI.items[]

Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

object

Required

- **path**

Property	Type	Description
fieldRef	object	ObjectFieldSelector selects an APIVersioned field of an object.
mode	integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	object	ResourceFieldSelector represents container resources (cpu, memory) and their output format

14.14.1.297. .spec.template.spec.volumes[],projected.sources[],downwardAPI.items[],fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

object

Required

- **fieldPath**

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

14.14.1.298. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items[].resource`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

object

Required

- **resource**

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor	Quantity	Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

14.14.1.299. `.spec.template.spec.volumes[].projected.sources[].secret`

Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

Type

object

Property	Type	Description
items	array	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	boolean	optional field specify whether the Secret or its key must be defined

14.14.1.300. `.spec.template.spec.volumes[].projected.sources[].secret.items`

Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type

array

14.14.1.301. `.spec.template.spec.volumes[].projected.sources[].secret.items[]`

Description

Maps a string key to a path within a volume.

Type

object

Required

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.14.1.302. .spec.template.spec.volumes[].projected.sources[].serviceAccountToken

Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

Type

object

Required

- **path**

Property	Type	Description
audience	string	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.

Property	Type	Description
expirationSeconds	integer	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	string	path is the path relative to the mount point of the file to project the token into.

14.14.1.303. .spec.template.spec.volumes[].quobyte

Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Type

object

Required

- **registry**
- **volume**

Property	Type	Description
group	string	group to map volume access to Default is no group
readOnly	boolean	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
registry	string	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	string	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	string	user to map volume access to Defaults to serviceaccount user
volume	string	volume is a string that references an already created Quobyte volume by name.

14.14.1.304. .spec.template.spec.volumes[].rbd

Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

Type

object

Required

- **monitors**
- **image**

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd

Property	Type	Description
image	string	image is the rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	string	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	array (string)	monitors is a collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	string	pool is the rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
user	string	user is the rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

14.14.1.305. .spec.template.spec.volumes[].rbd.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.306. .spec.template.spec.volumes[].scaleIO

Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

Type

object

Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	string	gateway is the host address of the ScaleIO API Gateway.
protectionDomain	string	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
readOnly	boolean	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
sslEnabled	boolean	sslEnabled Flag enable/disable SSL communication with Gateway, default false

Property	Type	Description
storageMode	string	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	string	storagePool is the ScaleIO Storage Pool associated with the protection domain.
system	string	system is the name of the storage system as configured in ScaleIO.
volumeName	string	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

14.14.1.307. .spec.template.spec.volumes[].scaleIO.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.308. .spec.template.spec.volumes[].secret

Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

Type

object

Property	Type	Description
defaultMode	integer	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
items[]	object	Maps a string key to a path within a volume.
optional	boolean	optional field specify whether the Secret or its keys must be defined
secretName	string	secretName is the name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

14.14.1.309. .spec.template.spec.volumes[].secret.items

Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys

will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Type**array****14.14.1.310. .spec.template.spec.volumes[].secret.items[]****Description**

Maps a string key to a path within a volume.

Type**object****Required**

- **key**
- **path**

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

14.14.1.311. .spec.template.spec.volumes[].storageos**Description**

Represents a StorageOS persistent volume resource.

Type**object**

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
volumeName	string	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	string	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

14.14.1.312. .spec.template.spec.volumes[].storageos.secretRef

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.14.1.313. .spec.template.spec.volumes[].vsphereVolume

Description

Represents a vSphere volume resource.

Type

object

Required

- **volumePath**

Property	Type	Description
fsType	string	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	string	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	string	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
volumePath	string	volumePath is the path that identifies vSphere volume vmdk

14.14.1.314. .status

Description

ReplicationControllerStatus represents the current status of a replication controller.

Type

object

Required

- replicas

Property	Type	Description
availableReplicas	integer	The number of available replicas (ready for at least <code>minReadySeconds</code>) for this replication controller.
conditions	array	Represents the latest available observations of a replication controller's current state.
conditions[]	object	<code>ReplicationControllerCondition</code> describes the state of a replication controller at a certain point.
fullyLabeledReplicas	integer	The number of pods that have labels matching the labels of the pod template of the replication controller.
observedGeneration	integer	<code>ObservedGeneration</code> reflects the generation of the most recently observed replication controller.
readyReplicas	integer	The number of ready replicas for this replication controller.
replicas	integer	Replicas is the most recently observed number of replicas. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller

14.14.1.315. `.status.conditions`

Description

Represents the latest available observations of a replication controller's current state.

Type

array

14.14.1.316. `.status.conditions[]`

Description

`ReplicationControllerCondition` describes the state of a replication controller at a certain point.

Type

object

Required

- **type**
- **status**

Property	Type	Description
lastTransitionTime	Time	The last time the condition transitioned from one status to another.
message	string	A human readable message indicating details about the transition.
reason	string	The reason for the condition's last transition.
status	string	Status of the condition, one of True, False, Unknown.
type	string	Type of replication controller condition.

14.14.2. API endpoints

The following API endpoints are available:

- **/api/v1/replicationcontrollers**
 - **GET**: list or watch objects of kind ReplicationController
- **/api/v1/watch/replicationcontrollers**
 - **GET**: watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/replicationcontrollers**
 - **DELETE**: delete collection of ReplicationController
 - **GET**: list or watch objects of kind ReplicationController
 - **POST**: create a ReplicationController
- **/api/v1/watch/namespaces/{namespace}/replicationcontrollers**
 - **GET**: watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.

- **/api/v1/namespaces/{namespace}/replicationcontrollers/{name}**
 - **DELETE:** delete a ReplicationController
 - **GET:** read the specified ReplicationController
 - **PATCH:** partially update the specified ReplicationController
 - **PUT:** replace the specified ReplicationController
- **/api/v1/watch/namespaces/{namespace}/replicationcontrollers/{name}**
 - **GET:** watch changes to an object of kind ReplicationController. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/replicationcontrollers/{name}/status**
 - **GET:** read status of the specified ReplicationController
 - **PATCH:** partially update status of the specified ReplicationController
 - **PUT:** replace status of the specified ReplicationController

14.14.2.1. /api/v1/replicationcontrollers

Table 14.374. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind ReplicationController

DELETE

Description

delete collection of ReplicationController

Table 14.380. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind ReplicationController

Table 14.383. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.384. HTTP responses

HTTP code	Response body
200 - OK	ReplicationControllerList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a ReplicationController

Table 14.385. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.386. Body parameters

Parameter	Type	Description
body	ReplicationController schema	

Table 14.387. HTTP responses

HTTP code	Response body
200 - OK	ReplicationController schema

HTTP code	Response body
201 - Created	ReplicationController schema
202 - Accepted	ReplicationController schema
401 - Unauthorized	Empty

14.14.2.4. /api/v1/watch/namespaces/{namespace}/replicationcontrollers

Table 14.388. Global path parameters

Parameter	Type	Description
namespace	string	object name and auth scope, such as for teams and projects

Table 14.389. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.390. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

name	string	name of the ReplicationController
namespace	string	object name and auth scope, such as for teams and projects

Table 14.392. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a ReplicationController

Table 14.393. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified ReplicationController

Table 14.397. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

14.15. RESOURCEQUOTA [V1]

Description

ResourceQuota sets aggregate quota restrictions enforced per namespace

Type

object

14.15.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	ResourceQuotaSpec defines the desired hard limits to enforce for Quota.
status	object	ResourceQuotaStatus defines the enforced hard limits and observed use.

14.15.1.1. .spec

Description

ResourceQuotaSpec defines the desired hard limits to enforce for Quota.

Type

object

Property	Type	Description
hard	object (Quantity)	hard is the set of desired hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/
scopeSelector	object	A scope selector represents the AND of the selectors represented by the scoped-resource selector requirements.
scopes	array (string)	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

14.15.1.2. .spec.scopeSelector

Description

A scope selector represents the AND of the selectors represented by the scoped-resource selector requirements.

Type

object

Property	Type	Description
matchExpressions	array	A list of scope selector requirements by scope of the resources.
matchExpressions[]	object	A scoped-resource selector requirement is a selector that contains values, a scope name, and an operator that relates the scope name and values.

14.15.1.3. .spec.scopeSelector.matchExpressions**Description**

A list of scope selector requirements by scope of the resources.

Type

array

14.15.1.4. .spec.scopeSelector.matchExpressions[]**Description**

A scoped-resource selector requirement is a selector that contains values, a scope name, and an operator that relates the scope name and values.

Type

object

Required

- **scopeName**
- **operator**

Property	Type	Description
operator	string	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Possible enum values: - "DoesNotExist" - "Exists" - "In" - "NotIn"

Property	Type	Description
scopeName	string	<p>The name of the scope that the selector applies to.</p> <p>Possible enum values: - "BestEffort" Match all pod objects that have best effort quality of service - "CrossNamespacePodAffinity" Match all pod objects that have cross-namespace pod (anti)affinity mentioned. - "NotBestEffort" Match all pod objects that do not have best effort quality of service - "NotTerminating" Match all pod objects where spec.activeDeadlineSeconds is nil - "PriorityClass" Match all pod objects that have priority class mentioned - "Terminating" Match all pod objects where spec.activeDeadlineSeconds >=0</p>
values	array (string)	<p>An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.</p>

14.15.1.5. .status

Description

ResourceQuotaStatus defines the enforced hard limits and observed use.

Type

object

Property	Type	Description
hard	object (Quantity)	<p>Hard is the set of enforced hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/</p>

Property	Type	Description
used	object (Quantity)	Used is the current observed total usage of the resource in the namespace.

14.15.2. API endpoints

The following API endpoints are available:

- **/api/v1/resourcequotas**
 - **GET**: list or watch objects of kind ResourceQuota
- **/api/v1/watch/resourcequotas**
 - **GET**: watch individual changes to a list of ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/resourcequotas**
 - **DELETE**: delete collection of ResourceQuota
 - **GET**: list or watch objects of kind ResourceQuota
 - **POST**: create a ResourceQuota
- **/api/v1/watch/namespaces/{namespace}/resourcequotas**
 - **GET**: watch individual changes to a list of ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead.

 - **GET**: read status of the specified ResourceQuota
 - **PATCH**: partially update status of the specified ResourceQuota
 - **PUT**: replace status of the specified ResourceQuota

14.15.2.1. /api/v1/resourcequotas

Table 14.415. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. Description

create a ResourceQuota

Table 14.426. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.434. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

HTTP code	Response body
200 - OK	ResourceQuota schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified ResourceQuota

Table 14.438. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

14.15.2.6. /api/v1/watch/namespaces/{namespace}/resourcequotas/{name}

Table 14.444. Global path parameters

Parameter	Type	Description
name	string	name of the ResourceQuota
namespace	string	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 14.445. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

14.16. SECRET [V1]

Description

Secret holds secret data of a certain type. The total bytes of the values in the Data field must be less than MaxSecretSize bytes.

Type

object

14.16.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	object (string)	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4

Property	Type	Description
immutable	boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	object (string)	stringData allows specifying non-binary secret data in string form. It is provided as a write-only input field for convenience. All keys and values are merged into the data field on write, overwriting any existing values. The stringData field is never output when reading from the API.
type	string	Used to facilitate programmatic handling of secret data. More info: https://kubernetes.io/docs/concepts/configuration/secret/#secret-types

14.16.2. API endpoints

The following API endpoints are available:

- **/api/v1/secrets**
 - **GET**: list or watch objects of kind Secret

- **/api/v1/watch/secrets**
 - **GET**: watch individual changes to a list of Secret. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/secrets**
 - **DELETE**: delete collection of Secret
 - **GET**: list or watch objects of kind Secret
 - **POST**: create a Secret
- **/api/v1/watch/namespaces/{namespace}/secrets**
 - **GET**: watch individual changes to a list of Secret. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/secrets/{name}**
 - **DELETE**: delete a Secret
 - **GET**: read the specified Secret
 - **PATCH**: partially update the specified Secret
 - **PUT**: replace the specified Secret
- **/api/v1/watch/namespaces/{namespace}/secrets/{name}**
 - **GET**: watch changes to an object of kind Secret. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

14.16.2.1. /api/v1/secrets

Table 14.456. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
body	DeleteOptions schema	

Table 14.464. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind Secret

Table 14.465. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Description

create a Secret

Table 14.467. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Secret. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 14.487. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

14.17. SERVICE [V1]

Description

Service is a named abstraction of software service (for example, mysql) consisting of local port (for example 3306) that the proxy listens on, and the selector that determines which pods will answer requests sent through the proxy.

Type

object

14.17.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

Property	Type	Description
spec	object	ServiceSpec describes the attributes that a user creates on a service.
status	object	ServiceStatus represents the current status of a service.

14.17.1.1. .spec

Description

ServiceSpec describes the attributes that a user creates on a service.

Type

object

Property	Type	Description
allocateLoadBalancerNodePorts	boolean	allocateLoadBalancerNodePorts defines if NodePorts will be automatically allocated for services with type LoadBalancer. Default is "true". It may be set to "false" if the cluster load-balancer does not rely on NodePorts. If the caller requests specific NodePorts (by specifying a value), those requests will be respected, regardless of this field. This field may only be set for services with type LoadBalancer and will be cleared if the type is changed to any other type.

Property	Type	Description
clusterIP	string	<p>clusterIP is the IP address of the service and is usually assigned randomly. If an address is specified manually, is in-range (as per system configuration), and is not in use, it will be allocated to the service; otherwise creation of the service will fail. This field may not be changed through updates unless the type field is also being changed to ExternalName (which requires this field to be blank) or the type field is being changed from ExternalName (in which case this field may optionally be specified, as describe above). Valid values are "None", empty string (""), or a valid IP address. Setting this to "None" makes a "headless service" (no virtual IP), which is useful when direct endpoint connections are preferred and proxying is not required. Only applies to types ClusterIP, NodePort, and LoadBalancer. If this field is specified when creating a Service of type ExternalName, creation will fail. This field will be wiped when updating a Service to type ExternalName. More info: https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</p>

Property	Type	Description
clusterIPs	array (string)	<p>ClusterIPs is a list of IP addresses assigned to this service, and are usually assigned randomly. If an address is specified manually, is in-range (as per system configuration), and is not in use, it will be allocated to the service; otherwise creation of the service will fail. This field may not be changed through updates unless the type field is also being changed to ExternalName (which requires this field to be empty) or the type field is being changed from ExternalName (in which case this field may optionally be specified, as describe above). Valid values are "None", empty string (""), or a valid IP address. Setting this to "None" makes a "headless service" (no virtual IP), which is useful when direct endpoint connections are preferred and proxying is not required. Only applies to types ClusterIP, NodePort, and LoadBalancer. If this field is specified when creating a Service of type ExternalName, creation will fail. This field will be wiped when updating a Service to type ExternalName. If this field is not specified, it will be initialized from the clusterIP field. If this field is specified, clients must ensure that clusterIPs[0] and clusterIP have the same value.</p> <p>This field may hold a maximum of two entries (dual-stack IPs, in either order). These IPs must correspond to the values of the ipFamilies field. Both clusterIPs and ipFamilies are governed by the ipFamilyPolicy field. More info: https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</p>

Property	Type	Description
externalIPs	array (string)	externalIPs is a list of IP addresses for which nodes in the cluster will also accept traffic for this service. These IPs are not managed by Kubernetes. The user is responsible for ensuring that traffic arrives at a node with this IP. A common example is external load-balancers that are not part of the Kubernetes system.
externalName	string	externalName is the external reference that discovery mechanisms will return as an alias for this service (e.g. a DNS CNAME record). No proxying will be involved. Must be a lowercase RFC-1123 hostname (https://tools.ietf.org/html/rfc1123) and requires type to be "ExternalName".

Property	Type	Description
externalTrafficPolicy	string	<p>externalTrafficPolicy describes how nodes distribute service traffic they receive on one of the Service's "externally-facing" addresses (NodePorts, ExternalIPs, and LoadBalancer IPs). If set to "Local", the proxy will configure the service in a way that assumes that external load balancers will take care of balancing the service traffic between nodes, and so each node will deliver traffic only to the node-local endpoints of the service, without masquerading the client source IP. (Traffic mistakenly sent to a node with no endpoints will be dropped.) The default value, "Cluster", uses the standard behavior of routing to all endpoints evenly (possibly modified by topology and other features). Note that traffic sent to an External IP or LoadBalancer IP from within the cluster will always get "Cluster" semantics, but clients sending to a NodePort from within the cluster may need to take traffic policy into account when picking a node.</p> <p>Possible enum values: - "Cluster" - "Cluster" routes traffic to all endpoints. - "Local" - "Local" preserves the source IP of the traffic by routing only to endpoints on the same node as the traffic was received on (dropping the traffic if there are no local endpoints).</p>

Property	Type	Description
healthCheckNodePort	integer	<p>healthCheckNodePort specifies the healthcheck nodePort for the service. This only applies when type is set to LoadBalancer and externalTrafficPolicy is set to Local. If a value is specified, is in-range, and is not in use, it will be used. If not specified, a value will be automatically allocated. External systems (e.g. load-balancers) can use this port to determine if a given node holds endpoints for this service or not. If this field is specified when creating a Service which does not need it, creation will fail. This field will be wiped when updating a Service to no longer need it (e.g. changing type). This field cannot be updated once set.</p>
internalTrafficPolicy	string	<p>InternalTrafficPolicy describes how nodes distribute service traffic they receive on the ClusterIP. If set to "Local", the proxy will assume that pods only want to talk to endpoints of the service on the same node as the pod, dropping the traffic if there are no local endpoints. The default value, "Cluster", uses the standard behavior of routing to all endpoints evenly (possibly modified by topology and other features).</p> <p>Possible enum values: - "Cluster" routes traffic to all endpoints. - "Local" routes traffic only to endpoints on the same node as the client pod (dropping the traffic if there are no local endpoints).</p>

Property	Type	Description
ipFamilies	array (string)	<p>IPFamilies is a list of IP families (e.g. IPv4, IPv6) assigned to this service. This field is usually assigned automatically based on cluster configuration and the ipFamilyPolicy field. If this field is specified manually, the requested family is available in the cluster, and ipFamilyPolicy allows it, it will be used; otherwise creation of the service will fail. This field is conditionally mutable: it allows for adding or removing a secondary IP family, but it does not allow changing the primary IP family of the Service. Valid values are "IPv4" and "IPv6". This field only applies to Services of types ClusterIP, NodePort, and LoadBalancer, and does not apply to "headless" services. This field will be wiped when updating a Service to type ExternalName.</p> <p>This field may hold a maximum of two entries (dual-stack families, in either order). These families must correspond to the values of the clusterIPs field, if specified. Both clusterIPs and ipFamilies are governed by the ipFamilyPolicy field.</p>
ipFamilyPolicy	string	<p>IPFamilyPolicy represents the dual-stack-ness requested or required by this Service. If there is no value provided, then this field will be set to SingleStack. Services can be "SingleStack" (a single IP family), "PreferDualStack" (two IP families on dual-stack configured clusters or a single IP family on single-stack clusters), or "RequireDualStack" (two IP families on dual-stack configured clusters, otherwise fail). The ipFamilies and clusterIPs fields depend on the value of this field. This field will be wiped when updating a service to type ExternalName.</p>

Property	Type	Possible enum values: - Description
		<p>"PreferDualStack" indicates that this service prefers dual-stack when the cluster is configured for dual-stack. If the cluster is not configured for dual-stack the service will be assigned a single IPFamily. If the IPFamily is not set in service.spec.ipFamilies then the service will be assigned the default IPFamily configured on the cluster -</p> <p>"RequireDualStack" indicates that this service requires dual-stack. Using IPFamilyPolicyRequireDualStack on a single stack cluster will result in validation errors. The IPFamilies (and their order) assigned to this service is based on service.spec.ipFamilies. If service.spec.ipFamilies was not provided then it will be assigned according to how they are configured on the cluster. If service.spec.ipFamilies has only one entry then the alternative IPFamily will be added by apiserver -</p> <p>"SingleStack" indicates that this service is required to have a single IPFamily. The IPFamily assigned is based on the default IPFamily used by the cluster or as identified by service.spec.ipFamilies field</p>

Property	Type	Description
loadBalancerClass	string	<p>loadBalancerClass is the class of the load balancer implementation this Service belongs to. If specified, the value of this field must be a label-style identifier, with an optional prefix, e.g. "internal-vip" or "example.com/internal-vip". Unprefixed names are reserved for end-users. This field can only be set when the Service type is 'LoadBalancer'. If not set, the default load balancer implementation is used, today this is typically done through the cloud provider integration, but should apply for any default implementation. If set, it is assumed that a load balancer implementation is watching for Services with a matching class. Any default load balancer implementation (e.g. cloud providers) should ignore Services that set this field. This field can only be set when creating or updating a Service to type 'LoadBalancer'. Once set, it can not be changed. This field will be wiped when a service is updated to a non 'LoadBalancer' type.</p>
loadBalancerIP	string	<p>Only applies to Service Type: LoadBalancer. This feature depends on whether the underlying cloud-provider supports specifying the loadBalancerIP when a load balancer is created. This field will be ignored if the cloud-provider does not support the feature.</p> <p>Deprecated: This field was under-specified and its meaning varies across implementations, and it cannot support dual-stack. As of Kubernetes v1.24, users are encouraged to use implementation-specific annotations when available. This field may be removed in a future API version.</p>

Property	Type	Description
loadBalancerSourceRanges	array (string)	If specified and supported by the platform, this will restrict traffic through the cloud-provider load-balancer will be restricted to the specified client IPs. This field will be ignored if the cloud-provider does not support the feature." More info: https://kubernetes.io/docs/tasks/access-application-cluster/create-external-load-balancer/
ports	array	The list of ports that are exposed by this service. More info: https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies
ports[]	object	ServicePort contains information on service's port.
publishNotReadyAddresses	boolean	publishNotReadyAddresses indicates that any agent which deals with endpoints for this Service should disregard any indications of ready/not-ready. The primary use case for setting this field is for a StatefulSet's Headless Service to propagate SRV DNS records for its Pods for the purpose of peer discovery. The Kubernetes controllers that generate Endpoints and EndpointSlice resources for Services interpret this to mean that all endpoints are considered "ready" even if the Pods themselves are not. Agents which consume only Kubernetes generated endpoints through the Endpoints or EndpointSlice resources can safely assume this behavior.

Property	Type	Description
selector	object (string)	Route service traffic to pods with label keys and values matching this selector. If empty or not present, the service is assumed to have an external process managing its endpoints, which Kubernetes will not modify. Only applies to types ClusterIP, NodePort, and LoadBalancer. Ignored if type is ExternalName. More info: https://kubernetes.io/docs/concepts/services-networking/service/
sessionAffinity	string	Supports "ClientIP" and "None". Used to maintain session affinity. Enable client IP based session affinity. Must be ClientIP or None. Defaults to None. More info: https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies Possible enum values: - "ClientIP" is the Client IP based. - "None" - no session affinity.
sessionAffinityConfig	object	SessionAffinityConfig represents the configurations of session affinity.

Property	Type	Description
type	string	<p>type determines how the Service is exposed. Defaults to ClusterIP. Valid options are ExternalName, ClusterIP, NodePort, and LoadBalancer. "ClusterIP" allocates a cluster-internal IP address for load-balancing to endpoints. Endpoints are determined by the selector or if that is not specified, by manual construction of an Endpoints object or EndpointSlice objects. If clusterIP is "None", no virtual IP is allocated and the endpoints are published as a set of endpoints rather than a virtual IP.</p> <p>"NodePort" builds on ClusterIP and allocates a port on every node which routes to the same endpoints as the clusterIP.</p> <p>"LoadBalancer" builds on NodePort and creates an external load-balancer (if supported in the current cloud) which routes to the same endpoints as the clusterIP.</p> <p>"ExternalName" aliases this service to the specified externalName. Several other fields do not apply to ExternalName services. More info: https://kubernetes.io/docs/concepts/services-networking/service/#publishing-services-service-types</p> <p>Possible enum values: -</p> <ul style="list-style-type: none"> - "ClusterIP" means a service will only be accessible inside the cluster, via the cluster IP. - - "ExternalName" means a service consists of only a reference to an external name that kubedns or equivalent will return as a CNAME record, with no exposing or proxying of any pods involved. - - "LoadBalancer" means a service will be exposed via an external load balancer (if the cloud provider supports it), in addition to 'NodePort' type. - - "NodePort" means a service will

Property	Type	Description
		be exposed on one port of every node, in addition to 'ClusterIP' type.

14.17.1.2. .spec.ports

Description

The list of ports that are exposed by this service. More info:

<https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies>

Type

array

14.17.1.3. .spec.ports[]

Description

ServicePort contains information on service's port.

Type

object

Required

- **port**

Property	Type	Description
appProtocol	string	The application protocol for this port. This field follows standard Kubernetes label syntax. Un-prefixed names are reserved for IANA standard service names (as per RFC-6335 and https://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as mycompany.com/my-custom-protocol.
name	string	The name of this port within the service. This must be a DNS_LABEL. All ports within a ServiceSpec must have unique names. When considering the endpoints for a Service, this must match the 'name' field in the EndpointPort. Optional if only one ServicePort is defined on this service.

Property	Type	Description
nodePort	integer	The port on each node on which this service is exposed when type is NodePort or LoadBalancer. Usually assigned by the system. If a value is specified, in-range, and not in use it will be used, otherwise the operation will fail. If not specified, a port will be allocated if this Service requires one. If this field is specified when creating a Service which does not need it, creation will fail. This field will be wiped when updating a Service to no longer need it (e.g. changing type from NodePort to ClusterIP). More info: https://kubernetes.io/docs/concepts/services-networking/service/#type-nodeport
port	integer	The port that will be exposed by this service.
protocol	string	The IP protocol for this port. Supports "TCP", "UDP", and "SCTP". Default is TCP. Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.
targetPort	IntOrString	Number or name of the port to access on the pods targeted by the service. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME. If this is a string, it will be looked up as a named port in the target Pod's container ports. If this is not specified, the value of the 'port' field is used (an identity map). This field is ignored for services with clusterIP=None, and should be omitted or set equal to the 'port' field. More info: https://kubernetes.io/docs/concepts/services-networking/service/#defining-a-service

14.17.1.4. .spec.sessionAffinityConfig

Description

SessionAffinityConfig represents the configurations of session affinity.

Type

object

Property	Type	Description
clientIP	object	ClientIPConfig represents the configurations of Client IP based session affinity.

14.17.1.5. .spec.sessionAffinityConfig.clientIP

Description

ClientIPConfig represents the configurations of Client IP based session affinity.

Type

object

Property	Type	Description
timeoutSeconds	integer	timeoutSeconds specifies the seconds of ClientIP type session sticky time. The value must be >0 && ≤86400(for 1 day) if ServiceAffinity == "ClientIP". Default value is 10800(for 3 hours).

14.17.1.6. .status

Description

ServiceStatus represents the current status of a service.

Type

object

Property	Type	Description
conditions	array (Condition)	Current service state
loadBalancer	object	LoadBalancerStatus represents the status of a load-balancer.

14.17.1.7. .status.loadBalancer

Description

LoadBalancerStatus represents the status of a load-balancer.

Type

object

Property	Type	Description
ingress	array	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.
ingress[]	object	LoadBalancerIngress represents the status of a load-balancer ingress point: traffic intended for the service should be sent to an ingress point.

14.17.1.8. .status.loadBalancer.ingress

Description

Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

Type

array

14.17.1.9. .status.loadBalancer.ingress[]

Description

LoadBalancerIngress represents the status of a load-balancer ingress point: traffic intended for the service should be sent to an ingress point.

Type

object

Property	Type	Description
hostname	string	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	string	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

Property	Type	Description
ports	array	Ports is a list of records of service ports If used, every port defined in the service should have an entry in it
ports[]	object	

14.17.1.10. .status.loadBalancer.ingress[].ports

Description

Ports is a list of records of service ports If used, every port defined in the service should have an entry in it

Type

array

14.17.1.11. .status.loadBalancer.ingress[].ports[]

Description

Type

object

Required

- **port**
- **protocol**

Property	Type	Description
error	string	Error is to record the problem with the service port The format of the error shall comply with the following rules: - built-in error values shall be specified in this file and those shall use CamelCase names - cloud provider specific error values must have names that comply with the format foo.example.com/CamelCase.
port	integer	Port is the port number of the service port of which status is recorded here

Property	Type	Description
protocol	string	<p>Protocol is the protocol of the service port of which status is recorded here The supported values are: "TCP", "UDP", "SCTP"</p> <p>Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.</p>

14.17.2. API endpoints

The following API endpoints are available:

- **/api/v1/services**
 - **GET**: list or watch objects of kind Service
- **/api/v1/watch/services**
 - **GET**: watch individual changes to a list of Service. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/services**
 - **DELETE**: delete collection of Service
 - **GET**: list or watch objects of kind Service
 - **POST**: create a Service
- **/api/v1/watch/namespaces/{namespace}/services**
 - **GET**: watch individual changes to a list of Service. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/services/{name}**
 - **DELETE**: delete a Service
 - **GET**: read the specified Service
 - **PATCH**: partially update the specified Service
 - **PUT**: replace the specified Service
- **/api/v1/watch/namespaces/{namespace}/services/{name}**
 - **GET**: watch changes to an object of kind Service. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/services/{name}/status**
 - **GET**: read status of the specified Service

- **PATCH**: partially update status of the specified Service
- **PUT**: replace status of the specified Service

14.17.2.1. /api/v1/services

Table 14.488. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind Service

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind Service

Table 14.497. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. POST

Description

create a Service

Table 14.499. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.517. Global path parameters

Parameter	Type	Description
name	string	name of the Service
namespace	string	object name and auth scope, such as for teams and projects

Table 14.518. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Service. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

14.18. SERVICEACCOUNT [V1]

Description

ServiceAccount binds together: * a name, understood by users, and perhaps by peripheral systems, for an identity * a principal that can be authenticated and authorized * a set of secrets

Type

object

14.18.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
automountServiceAccountToken	boolean	AutomountServiceAccountToken indicates whether pods running as this service account should have an API token automatically mounted. Can be overridden at the pod level.

Property	Type	Description
imagePullSecrets	array	ImagePullSecrets is a list of references to secrets in the same namespace to use for pulling any images in pods that reference this ServiceAccount. ImagePullSecrets are distinct from Secrets because Secrets can be mounted in the pod, but ImagePullSecrets are only accessed by the kubelet. More info: https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod
imagePullSecrets[]	object	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

Property	Type	Description
secrets	array	Secrets is a list of the secrets in the same namespace that pods running using this ServiceAccount are allowed to use. Pods are only limited to this list if this service account has a "kubernetes.io/enforce-mountable-secrets" annotation set to "true". This field should not be used to find auto-generated service account token secrets for use outside of pods. Instead, tokens can be requested directly using the TokenRequest API, or service account token secrets can be manually created. More info: https://kubernetes.io/docs/concepts/configuration/secret
secrets[]	object	ObjectReference contains enough information to let you inspect or modify the referred object.

14.18.1.1. .imagePullSecrets

Description

ImagePullSecrets is a list of references to secrets in the same namespace to use for pulling any images in pods that reference this ServiceAccount. ImagePullSecrets are distinct from Secrets because Secrets can be mounted in the pod, but ImagePullSecrets are only accessed by the kubelet. More info: <https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod>

Type

array

14.18.1.2. .imagePullSecrets[]

Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Type

object

Property	Type	Description
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

14.18.1.3. .secrets

Description

Secrets is a list of the secrets in the same namespace that pods running using this ServiceAccount are allowed to use. Pods are only limited to this list if this service account has a "kubernetes.io/enforce-mountable-secrets" annotation set to "true". This field should not be used to find auto-generated service account token secrets for use outside of pods. Instead, tokens can be requested directly using the TokenRequest API, or service account token secrets can be manually created. More info: <https://kubernetes.io/docs/concepts/configuration/secret>

Type

array

14.18.1.4. .secrets[]

Description

ObjectReference contains enough information to let you inspect or modify the referred object.

Type

object

Property	Type	Description
apiVersion	string	API version of the referent.

Property	Type	Description
fieldPath	string	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	string	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	string	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	string	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	string	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

14.18.2. API endpoints

The following API endpoints are available:

- **/api/v1/serviceaccounts**
 - **GET**: list or watch objects of kind ServiceAccount
- **/api/v1/watch/serviceaccounts**
 - **GET**: watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/serviceaccounts**
 - **DELETE**: delete collection of ServiceAccount
 - **GET**: list or watch objects of kind ServiceAccount
 - **POST**: create a ServiceAccount
- **/api/v1/watch/namespaces/{namespace}/serviceaccounts**
 - **GET**: watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/serviceaccounts/{name}**
 - **DELETE**: delete a ServiceAccount
 - **GET**: read the specified ServiceAccount
 - **PATCH**: partially update the specified ServiceAccount
 - **PUT**: replace the specified ServiceAccount
- **/api/v1/watch/namespaces/{namespace}/serviceaccounts/{name}**
 - **GET**: watch changes to an object of kind ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

14.18.2.1. /api/v1/serviceaccounts

Table 14.529. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind ServiceAccount

Table 14.530. HTTP responses

DELETE

Description

delete collection of ServiceAccount

Table 14.535. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.539. HTTP responses

HTTP code	Response body
200 - OK	ServiceAccountList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a ServiceAccount

Table 14.540. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP code	Response body
201 - Created	ServiceAccount schema
202 - Accepted	ServiceAccount schema
401 - Unauthorized	Empty

14.18.2.4. /api/v1/watch/namespaces/{namespace}/serviceaccounts

Table 14.543. Global path parameters

Parameter	Type	Description
namespace	string	object name and auth scope, such as for teams and projects

Table 14.544. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.545. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

Table 14.547. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a ServiceAccount

Table 14.548. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

partially update the specified ServiceAccount

Table 14.552. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

CHAPTER 15. DISCOVERY APIS

15.1. DISCOVERY APIS

15.1.1. EndpointSlice [discovery.k8s.io/v1]

Description

EndpointSlice represents a subset of the endpoints that implement a service. For a given service there may be multiple EndpointSlice objects, selected by labels, which must be joined to produce the full set of endpoints.

Type

object

15.2. ENDPPOINTSICE [DISCOVERY.K8S.IO/V1]

Description

EndpointSlice represents a subset of the endpoints that implement a service. For a given service there may be multiple EndpointSlice objects, selected by labels, which must be joined to produce the full set of endpoints.

Type

object

Required

- **addressType**
- **endpoints**

15.2.1. Specification

Property	Type	Description
addressType	string	<p>addressType specifies the type of address carried by this EndpointSlice. All addresses in this slice must be the same type. This field is immutable after creation. The following address types are currently supported: * IPv4: Represents an IPv4 Address. * IPv6: Represents an IPv6 Address. * FQDN: Represents a Fully Qualified Domain Name.</p> <p>Possible enum values: - "FQDN" represents a FQDN. - "IPv4" represents an IPv4 Address. - "IPv6" represents an IPv6 Address.</p>

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
endpoints	array	endpoints is a list of unique endpoints in this slice. Each slice may include a maximum of 1000 endpoints.
endpoints[]	object	Endpoint represents a single logical "backend" implementing a service.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata.
ports	array	ports specifies the list of network ports exposed by each endpoint in this slice. Each port must have a unique name. When ports is empty, it indicates that there are no defined ports. When a port is defined with a nil port value, it indicates "all ports". Each slice may include a maximum of 100 ports.
ports[]	object	EndpointPort represents a Port used by an EndpointSlice

15.2.1.1. .endpoints

Description

endpoints is a list of unique endpoints in this slice. Each slice may include a maximum of 1000 endpoints.

Type

array

15.2.1.2. .endpoints[]

Description

Endpoint represents a single logical "backend" implementing a service.

Type

object

Required

- **addresses**

Property	Type	Description
addresses	array (string)	addresses of this endpoint. The contents of this field are interpreted according to the corresponding EndpointSlice addressType field. Consumers must handle different types of addresses in the context of their own capabilities. This must contain at least one address but no more than 100. These are all assumed to be fungible and clients may choose to only use the first element. Refer to: https://issue.k8s.io/106267
conditions	object	EndpointConditions represents the current condition of an endpoint.

Property	Type	Description
deprecatedTopology	object (string)	deprecatedTopology contains topology information part of the v1beta1 API. This field is deprecated, and will be removed when the v1beta1 API is removed (no sooner than kubernetes v1.24). While this field can hold values, it is not writable through the v1 API, and any attempts to write to it will be silently ignored. Topology information can be found in the zone and nodeName fields instead.
hints	object	EndpointHints provides hints describing how an endpoint should be consumed.
hostname	string	hostname of this endpoint. This field may be used by consumers of endpoints to distinguish endpoints from each other (e.g. in DNS names). Multiple endpoints which use the same hostname should be considered fungible (e.g. multiple A values in DNS). Must be lowercase and pass DNS Label (RFC 1123) validation.
nodeName	string	nodeName represents the name of the Node hosting this endpoint. This can be used to determine endpoints local to a Node.
targetRef	ObjectReference	targetRef is a reference to a Kubernetes object that represents this endpoint.
zone	string	zone is the name of the Zone this endpoint exists in.

15.2.1.3. .endpoints[].conditions

Description

EndpointConditions represents the current condition of an endpoint.

Type

object

Property	Type	Description
ready	boolean	ready indicates that this endpoint is prepared to receive traffic, according to whatever system is managing the endpoint. A nil value indicates an unknown state. In most cases consumers should interpret this unknown state as ready. For compatibility reasons, ready should never be "true" for terminating endpoints, except when the normal readiness behavior is being explicitly overridden, for example when the associated Service has set the publishNotReadyAddresses flag.
serving	boolean	serving is identical to ready except that it is set regardless of the terminating state of endpoints. This condition should be set to true for a ready endpoint that is terminating. If nil, consumers should defer to the ready condition.
terminating	boolean	terminating indicates that this endpoint is terminating. A nil value indicates an unknown state. Consumers should interpret this unknown state to mean that the endpoint is not terminating.

15.2.1.4. .endpoints[].hints

Description

EndpointHints provides hints describing how an endpoint should be consumed.

Type

object

Property	Type	Description
forZones	array	forZones indicates the zone(s) this endpoint should be consumed by to enable topology aware routing.

Property	Type	Description
forZones[]	object	ForZone provides information about which zones should consume this endpoint.

15.2.1.5. .endpoints[].hints.forZones

Description

forZones indicates the zone(s) this endpoint should be consumed by to enable topology aware routing.

Type

array

15.2.1.6. .endpoints[].hints.forZones[]

Description

ForZone provides information about which zones should consume this endpoint.

Type

object

Required

- **name**

Property	Type	Description
name	string	name represents the name of the zone.

15.2.1.7. .ports

Description

ports specifies the list of network ports exposed by each endpoint in this slice. Each port must have a unique name. When ports is empty, it indicates that there are no defined ports. When a port is defined with a nil port value, it indicates "all ports". Each slice may include a maximum of 100 ports.

Type

array

15.2.1.8. .ports[]

Description

EndpointPort represents a Port used by an EndpointSlice

Type

object

Property	Type	Description
appProtocol	string	<p>The application protocol for this port. This is used as a hint for implementations to offer richer behavior for protocols that they understand. This field follows standard Kubernetes label syntax. Valid values are either:</p> <ul style="list-style-type: none"> * Un-prefixed protocol names - reserved for IANA standard service names (as per RFC-6335 and https://www.iana.org/assignments/service-names). * Kubernetes-defined prefixed names: * 'kubernetes.io/h2c' - HTTP/2 over cleartext as described in https://www.rfc-editor.org/rfc/rfc7540 * Other protocols should use implementation-defined prefixed names such as mycompany.com/my-custom-protocol.
name	string	<p>name represents the name of this port. All ports in an EndpointSlice must have a unique name. If the EndpointSlice is derived from a Kubernetes service, this corresponds to the Service.ports[].name. Name must either be an empty string or pass DNS_LABEL validation: * must be no more than 63 characters long. * must consist of lower case alphanumeric characters or '-'. * must start and end with an alphanumeric character. Default is empty string.</p>
port	integer	<p>port represents the port number of the endpoint. If this is not specified, ports are not restricted and must be interpreted in the context of the specific consumer.</p>

Property	Type	Description
protocol	string	<p>protocol represents the IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.</p> <p>Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.</p>

15.2.2. API endpoints

The following API endpoints are available:

- **/apis/discovery.k8s.io/v1/endpointslices**
 - **GET**: list or watch objects of kind EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/endpointslices**
 - **GET**: watch individual changes to a list of EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/discovery.k8s.io/v1/namespaces/{namespace}/endpointslices**
 - **DELETE**: delete collection of EndpointSlice
 - **GET**: list or watch objects of kind EndpointSlice
 - **POST**: create an EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices**
 - **GET**: watch individual changes to a list of EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/discovery.k8s.io/v1/namespaces/{namespace}/endpointslices/{name}**
 - **DELETE**: delete an EndpointSlice
 - **GET**: read the specified EndpointSlice
 - **PATCH**: partially update the specified EndpointSlice
 - **PUT**: replace the specified EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices/{name}**
 - **GET**: watch changes to an object of kind EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

15.2.2.1. /apis/discovery.k8s.io/v1/endpointslices

Table 15.1. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind EndpointSlice

Description

create an EndpointSlice

Table 15.12. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified EndpointSlice

Table 15.24. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

15.2.2.6. /apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices/{name}

Table 15.30. Global path parameters

Parameter	Type	Description
name	string	name of the EndpointSlice
namespace	string	object name and auth scope, such as for teams and projects

Table 15.31. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

CHAPTER 16. EVENTS APIS

16.1. EVENTS APIS

16.1.1. Event [events.k8s.io/v1]

Description

Event is a report of an event somewhere in the cluster. It generally denotes some state change in the system. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

Type

object

16.2. EVENT [EVENTS.K8S.IO/V1]

Description

Event is a report of an event somewhere in the cluster. It generally denotes some state change in the system. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

Type

object

Required

- **eventTime**

16.2.1. Specification

Property	Type	Description
action	string	action is what action was taken/failed regarding to the regarding object. It is machine-readable. This field cannot be empty for new Events and it can have at most 128 characters.

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
deprecatedCount	integer	deprecatedCount is the deprecated field assuring backward compatibility with core.v1 Event type.
deprecatedFirstTimestamp	Time	deprecatedFirstTimestamp is the deprecated field assuring backward compatibility with core.v1 Event type.
deprecatedLastTimestamp	Time	deprecatedLastTimestamp is the deprecated field assuring backward compatibility with core.v1 Event type.
deprecatedSource	EventSource	deprecatedSource is the deprecated field assuring backward compatibility with core.v1 Event type.
eventTime	MicroTime	eventTime is the time when this Event was first observed. It is required.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
note	string	note is a human-readable description of the status of this operation. Maximal length of the note is 1kB, but libraries should be prepared to handle values up to 64kB.
reason	string	reason is why the action was taken. It is human-readable. This field cannot be empty for new Events and it can have at most 128 characters.
regarding	ObjectReference	regarding contains the object this Event is about. In most cases it's an Object reporting controller implements, e.g. ReplicaSetController implements ReplicaSets and this event is emitted because it acts on some changes in a ReplicaSet object.
related	ObjectReference	related is the optional secondary object for more complex actions. E.g. when regarding object triggers a creation or deletion of related object.
reportingController	string	reportingController is the name of the controller that emitted this Event, e.g. kubernetes.io/kubelet . This field cannot be empty for new Events.
reportingInstance	string	reportingInstance is the ID of the controller instance, e.g. kubelet-xyzf . This field cannot be empty for new Events and it can have at most 128 characters.

Property	Type	Description
series	object	EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time. How often to update the EventSeries is up to the event reporters. The default event reporter in "k8s.io/client-go/tools/events/event_broadcaster.go" shows how this struct is updated on heartbeats and can guide customized reporter implementations.
type	string	type is the type of this event (Normal, Warning), new types could be added in the future. It is machine-readable. This field cannot be empty for new Events.

16.2.1.1. .series

Description

EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time. How often to update the EventSeries is up to the event reporters. The default event reporter in "k8s.io/client-go/tools/events/event_broadcaster.go" shows how this struct is updated on heartbeats and can guide customized reporter implementations.

Type

object

Required

- **count**
- **lastObservedTime**

Property	Type	Description
count	integer	count is the number of occurrences in this series up to the last heartbeat time.
lastObservedTime	MicroTime	lastObservedTime is the time when last Event from the series was seen before last heartbeat.

16.2.2. API endpoints

The following API endpoints are available:

- **/apis/events.k8s.io/v1/events**
 - **GET**: list or watch objects of kind Event
- **/apis/events.k8s.io/v1/watch/events**
 - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/events.k8s.io/v1/namespaces/{namespace}/events**
 - **DELETE**: delete collection of Event
 - **GET**: list or watch objects of kind Event
 - **POST**: create an Event
- **/apis/events.k8s.io/v1/watch/namespaces/{namespace}/events**
 - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/events.k8s.io/v1/namespaces/{namespace}/events/{name}**
 - **DELETE**: delete an Event
 - **GET**: read the specified Event
 - **PATCH**: partially update the specified Event
 - **PUT**: replace the specified Event
- **/apis/events.k8s.io/v1/watch/namespaces/{namespace}/events/{name}**
 - **GET**: watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

16.2.2.1. /apis/events.k8s.io/v1/events

Table 16.1. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. delete collection of Event

Table 16.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 16.8. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 16.9. HTTP responses

HTTP code	Reponse body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind Event

Table 16.10. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 16.11. HTTP responses

HTTP code	Response body
200 - OK	EventList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create an Event

Table 16.12. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

namespace	string	object name and auth scope, such as for teams and projects

Table 16.19. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete an Event

Table 16.20. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 16.30. Global path parameters

Parameter	Type	Description
name	string	name of the Event
namespace	string	object name and auth scope, such as for teams and projects

Table 16.31. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 16.32. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

CHAPTER 17. FLOW CONTROL APIS

17.1. FLOW CONTROL APIS

17.1.1. FlowSchema [flowcontrol.apiserver.k8s.io/v1beta3]

Description

FlowSchema defines the schema of a group of flows. Note that a flow is made up of a set of inbound API requests with similar attributes and is identified by a pair of strings: the name of the FlowSchema and a "flow distinguisher".

Type

object

17.1.2. PriorityLevelConfiguration [flowcontrol.apiserver.k8s.io/v1beta3]

Description

PriorityLevelConfiguration represents the configuration of a priority level.

Type

object

17.2. FLOWSHEMA [FLOWCONTROL.APISERVER.K8S.IO/V1BETA3]

Description

FlowSchema defines the schema of a group of flows. Note that a flow is made up of a set of inbound API requests with similar attributes and is identified by a pair of strings: the name of the FlowSchema and a "flow distinguisher".

Type

object

17.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	metadata is the standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	FlowSchemaSpec describes how the FlowSchema's specification looks like.
status	object	FlowSchemaStatus represents the current state of a FlowSchema.

17.2.1.1. .spec

Description

FlowSchemaSpec describes how the FlowSchema's specification looks like.

Type

object

Required

- **priorityLevelConfiguration**

Property	Type	Description
distinguisherMethod	object	FlowDistinguisherMethod specifies the method of a flow distinguisher.

Property	Type	Description
matchingPrecedence	integer	matchingPrecedence is used to choose among the FlowSchemas that match a given request. The chosen FlowSchema is among those with the numerically lowest (which we take to be logically highest) MatchingPrecedence. Each MatchingPrecedence value must be ranged in [1,10000]. Note that if the precedence is not specified, it will be set to 1000 as default.
priorityLevelConfiguration	object	PriorityLevelConfigurationReference contains information that points to the "request-priority" being used.
rules	array	rules describes which requests will match this flow schema. This FlowSchema matches a request if and only if at least one member of rules matches the request. if it is an empty slice, there will be no requests matching the FlowSchema.
rules[]	object	PolicyRulesWithSubjects prescribes a test that applies to a request to an apiserver. The test considers the subject making the request, the verb being requested, and the resource to be acted upon. This PolicyRulesWithSubjects matches a request if and only if both (a) at least one member of subjects matches the request and (b) at least one member of resourceRules or nonResourceRules matches the request.

17.2.1.2. .spec.distinguisherMethod

Description

FlowDistinguisherMethod specifies the method of a flow distinguisher.

Type

object

Required

- **type**

Property	Type	Description
type	string	type is the type of flow distinguisher method The supported types are "ByUser" and "ByNamespace". Required.

17.2.1.3. .spec.priorityLevelConfiguration**Description**

PriorityLevelConfigurationReference contains information that points to the "request-priority" being used.

Type

object

Required

- **name**

Property	Type	Description
name	string	name is the name of the priority level configuration being referenced Required.

17.2.1.4. .spec.rules**Description**

rules describes which requests will match this flow schema. This FlowSchema matches a request if and only if at least one member of rules matches the request. if it is an empty slice, there will be no requests matching the FlowSchema.

Type

array

17.2.1.5. .spec.rules[]**Description**

PolicyRulesWithSubjects prescribes a test that applies to a request to an apiserver. The test considers the subject making the request, the verb being requested, and the resource to be acted upon. This PolicyRulesWithSubjects matches a request if and only if both (a) at least one member of subjects matches the request and (b) at least one member of resourceRules or nonResourceRules matches the request.

Type

object

Required

- **subjects**

Property	Type	Description
nonResourceRules	array	nonResourceRules is a list of NonResourcePolicyRules that identify matching requests according to their verb and the target non-resource URL.
nonResourceRules[]	object	NonResourcePolicyRule is a predicate that matches non-resource requests according to their verb and the target non-resource URL. A NonResourcePolicyRule matches a request if and only if both (a) at least one member of verbs matches the request and (b) at least one member of nonResourceURLs matches the request.
resourceRules	array	resourceRules is a slice of ResourcePolicyRules that identify matching requests according to their verb and the target resource. At least one of resourceRules and nonResourceRules has to be non-empty.

Property	Type	Description
resourceRules[]	object	ResourcePolicyRule is a predicate that matches some resource requests, testing the request's verb and the target resource. A ResourcePolicyRule matches a resource request if and only if: (a) at least one member of verbs matches the request, (b) at least one member of apiGroups matches the request, (c) at least one member of resources matches the request, and (d) either (d1) the request does not specify a namespace (i.e., Namespace="") and clusterScope is true or (d2) the request specifies a namespace and least one member of namespaces matches the request's namespace.
subjects	array	subjects is the list of normal user, serviceaccount, or group that this rule cares about. There must be at least one member in this slice. A slice that includes both the system:authenticated and system:unauthenticated user groups matches every request. Required.
subjects[]	object	Subject matches the originator of a request, as identified by the request authentication system. There are three ways of matching an originator; by user, group, or service account.

17.2.1.6. .spec.rules[].nonResourceRules

Description

nonResourceRules is a list of NonResourcePolicyRules that identify matching requests according to their verb and the target non-resource URL.

Type

array

17.2.1.7. .spec.rules[].nonResourceRules[]

Description

NonResourcePolicyRule is a predicate that matches non-resource requests according to their verb and the target non-resource URL. A NonResourcePolicyRule matches a request if and only if both (a) at least one member of verbs matches the request and (b) at least one member of nonResourceURLs matches the request.

Type

object

Required

- **verbs**
- **nonResourceURLs**

Property	Type	Description
nonResourceURLs	array (string)	nonResourceURLs is a set of url prefixes that a user should have access to and may not be empty. For example: - "/healthz" is legal - "/hea*" is illegal - "/hea" is legal but matches nothing - "/hea/" also matches nothing - "/healthz/" matches all per-component health checks. "*" matches all non-resource urls. if it is present, it must be the only entry. Required.
verbs	array (string)	verbs is a list of matching verbs and may not be empty. "*" matches all verbs. If it is present, it must be the only entry. Required.

17.2.1.8. .spec.rules[].resourceRules

Description

resourceRules is a slice of ResourcePolicyRules that identify matching requests according to their verb and the target resource. At least one of **resourceRules** and **nonResourceRules** has to be non-empty.

Type

array

17.2.1.9. .spec.rules[].resourceRules[]

Description

ResourcePolicyRule is a predicate that matches some resource requests, testing the request's verb and the target resource. A ResourcePolicyRule matches a resource request if and only if: (a) at least one member of verbs matches the request, (b) at least one member of apiGroups matches the

request, (c) at least one member of resources matches the request, and (d) either (d1) the request does not specify a namespace (i.e., **Namespace==""**) and **clusterScope** is true or (d2) the request specifies a namespace and least one member of namespaces matches the request's namespace.

Type

object

Required

- **verbs**
- **apiGroups**
- **resources**

Property	Type	Description
apiGroups	array (string)	apiGroups is a list of matching API groups and may not be empty. "*" matches all API groups and, if present, must be the only entry. Required.
clusterScope	boolean	clusterScope indicates whether to match requests that do not specify a namespace (which happens either because the resource is not namespaced or the request targets all namespaces). If this field is omitted or false then the namespaces field must contain a non-empty list.
namespaces	array (string)	namespaces is a list of target namespaces that restricts matches. A request that specifies a target namespace matches only if either (a) this list contains that target namespace or (b) this list contains "". Note that "" matches any specified namespace but does not match a request that <i>does not specify</i> a namespace (see the clusterScope field for that). This list may be empty, but only if clusterScope is true.

Property	Type	Description
resources	array (string)	resources is a list of matching resources (i.e., lowercase and plural) with, if desired, subresource. For example, ["services", "nodes/status"]. This list may not be empty. "*" matches all resources and, if present, must be the only entry. Required.
verbs	array (string)	verbs is a list of matching verbs and may not be empty. "*" matches all verbs and, if present, must be the only entry. Required.

17.2.1.10. .spec.rules[].subjects

Description

subjects is the list of normal user, serviceaccount, or group that this rule cares about. There must be at least one member in this slice. A slice that includes both the system:authenticated and system:unauthenticated user groups matches every request. Required.

Type

array

17.2.1.11. .spec.rules[].subjects[]

Description

Subject matches the originator of a request, as identified by the request authentication system. There are three ways of matching an originator; by user, group, or service account.

Type

object

Required

- **kind**

Property	Type	Description
group	object	GroupSubject holds detailed information for group-kind subject.
kind	string	kind indicates which one of the other fields is non-empty. Required

Property	Type	Description
serviceAccount	object	ServiceAccountSubject holds detailed information for service-account-kind subject.
user	object	UserSubject holds detailed information for user-kind subject.

17.2.1.12. .spec.rules[].subjects[].group

Description

GroupSubject holds detailed information for group-kind subject.

Type

object

Required

- **name**

Property	Type	Description
name	string	name is the user group that matches, or "*" to match all user groups. See https://github.com/kubernetes/apiserver/blob/master/pkg/authentication/user/user.go for some well-known group names. Required.

17.2.1.13. .spec.rules[].subjects[].serviceAccount

Description

ServiceAccountSubject holds detailed information for service-account-kind subject.

Type

object

Required

- **namespace**
- **name**

Property	Type	Description
name	string	name is the name of matching ServiceAccount objects, or "*" to match regardless of name. Required.
namespace	string	namespace is the namespace of matching ServiceAccount objects. Required.

17.2.1.14. .spec.rules[].subjects[].user

Description

UserSubject holds detailed information for user-kind subject.

Type

object

Required

- **name**

Property	Type	Description
name	string	name is the username that matches, or "*" to match all usernames. Required.

17.2.1.15. .status

Description

FlowSchemaStatus represents the current state of a FlowSchema.

Type

object

Property	Type	Description
conditions	array	conditions is a list of the current states of FlowSchema.
conditions[]	object	FlowSchemaCondition describes conditions for a FlowSchema.

17.2.1.16. .status.conditions

Description

conditions is a list of the current states of FlowSchema.

Type

array

17.2.1.17. .status.conditions[]

Description

FlowSchemaCondition describes conditions for a FlowSchema.

Type

object

Property	Type	Description
lastTransitionTime	Time	lastTransitionTime is the last time the condition transitioned from one status to another.
message	string	message is a human-readable message indicating details about last transition.
reason	string	reason is a unique, one-word, CamelCase reason for the condition's last transition.
status	string	status is the status of the condition. Can be True, False, Unknown. Required.
type	string	type is the type of the condition. Required.

17.2.2. API endpoints

The following API endpoints are available:

- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas**
 - **DELETE**: delete collection of FlowSchema
 - **GET**: list or watch objects of kind FlowSchema
 - **POST**: create a FlowSchema
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas**
 - **GET**: watch individual changes to a list of FlowSchema. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas/{name}**
 - **DELETE**: delete a FlowSchema

- **GET**: read the specified FlowSchema
- **PATCH**: partially update the specified FlowSchema
- **PUT**: replace the specified FlowSchema
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas/{name}**
 - **GET**: watch changes to an object of kind FlowSchema. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas/{name}/status**
 - **GET**: read status of the specified FlowSchema
 - **PATCH**: partially update status of the specified FlowSchema
 - **PUT**: replace status of the specified FlowSchema

17.2.2.1. /apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas

Table 17.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of FlowSchema

Table 17.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>`continue`</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 17.3. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 17.4. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind FlowSchema

Table 17.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 17.6. HTTP responses

HTTP code	Response body
200 - OK	FlowSchemaList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create a FlowSchema

Table 17.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

partially update the specified FlowSchema

Table 17.18. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 17.23. HTTP responses

HTTP code	Reponse body
200 - OK	FlowSchema schema
201 - Created	FlowSchema schema
401 - Unauthorized	Empty

17.2.2.4. /apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas/{name}

Table 17.24. Global path parameters

Parameter	Type	Description
name	string	name of the FlowSchema

Table 17.25. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind FlowSchema. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

17.3. PRIORITYLEVELCONFIGURATION [FLOWCONTROL.APISERVER.K8S.IO/V1BETA3]

Description

PriorityLevelConfiguration represents the configuration of a priority level.

Type

object

17.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	metadata is the standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	PriorityLevelConfigurationSpec specifies the configuration of a priority level.
status	object	PriorityLevelConfigurationStatus represents the current state of a "request-priority".

17.3.1.1. .spec

Description

PriorityLevelConfigurationSpec specifies the configuration of a priority level.

Type

object

Required

- **type**

Property	Type	Description
limited	object	LimitedPriorityLevelConfiguration specifies how to handle requests that are subject to limits. It addresses two issues: - How are requests for this priority level limited? - What should be done with requests that exceed the limit?

Property	Type	Description
type	string	type indicates whether this priority level is subject to limitation on request execution. A value of " Exempt " means that requests of this priority level are not subject to a limit (and thus are never queued) and do not detract from the capacity made available to other priority levels. A value of " Limited " means that (a) requests of this priority level are subject to limits and (b) some of the server's limited capacity is made available exclusively to this priority level. Required.

17.3.1.2. .spec.limited

Description

LimitedPriorityLevelConfiguration specifies how to handle requests that are subject to limits. It addresses two issues: - How are requests for this priority level limited? - What should be done with requests that exceed the limit?

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
borrowingLimitPercent	integer	<p>borrowingLimitPercent, if present, configures a limit on how many seats this priority level can borrow from other priority levels. The limit is known as this level's BorrowingConcurrencyLimit (BorrowingCL) and is a limit on the total number of seats that this level may borrow at any one time. This field holds the ratio of that limit to the level's nominal concurrency limit. When this field is non-nil, it must hold a non-negative integer and the limit is calculated as follows.</p> $\text{BorrowingCL}(i) = \text{round}(\text{NominalCL}(i) * \text{borrowingLimitPercent}(i)/100.0)$ <p>The value of this field can be more than 100, implying that this priority level can borrow a number of seats that is greater than its own nominal concurrency limit (NominalCL). When this field is left nil, the limit is effectively infinite.</p>
lendablePercent	integer	<p>lendablePercent prescribes the fraction of the level's NominalCL that can be borrowed by other priority levels. The value of this field must be between 0 and 100, inclusive, and it defaults to 0. The number of seats that other levels can borrow from this level, known as this level's LendableConcurrencyLimit (LendableCL), is defined as follows.</p> $\text{LendableCL}(i) = \text{round}(\text{NominalCL}(i) * \text{lendablePercent}(i)/100.0)$
limitResponse	object	<p>LimitResponse defines how to handle requests that can not be executed right now.</p>

Property	Type	Description
nominalConcurrencyShares	integer	<p>nominalConcurrencyShares (NCS) contributes to the computation of the NominalConcurrencyLimit (NominalCL) of this level. This is the number of execution seats available at this priority level. This is used both for requests dispatched from this priority level as well as requests dispatched from other priority levels borrowing seats from this level. The server's concurrency limit (ServerCL) is divided among the Limited priority levels in proportion to their NCS values:</p> $\text{NominalCL}(i) = \text{ceil}(\text{ServerCL} * \text{NCS}(i) / \text{sum_ncs})$ $\text{sum_ncs} = \text{sum}[\text{limited priority level } k] \text{NCS}(k)$ <p>Bigger numbers mean a larger nominal concurrency limit, at the expense of every other Limited priority level. This field has a default value of 30.</p>

17.3.1.3. .spec.limited.limitResponse

Description

LimitResponse defines how to handle requests that can not be executed right now.

Type

object

Required

- **type**

Property	Type	Description
queuing	object	QueuingConfiguration holds the configuration parameters for queuing

Property	Type	Description
type	string	type is "Queue" or "Reject". "Queue" means that requests that can not be executed upon arrival are held in a queue until they can be executed or a queuing limit is reached. "Reject" means that requests that can not be executed upon arrival are rejected. Required.

17.3.1.4. .spec.limited.limitResponse.queuing

Description

QueuingConfiguration holds the configuration parameters for queuing

Type

object

Property	Type	Description
handSize	integer	handSize is a small positive number that configures the shuffle sharding of requests into queues. When enqueueing a request at this priority level the request's flow identifier (a string pair) is hashed and the hash value is used to shuffle the list of queues and deal a hand of the size specified here. The request is put into one of the shortest queues in that hand. handSize must be no larger than queues , and should be significantly smaller (so that a few heavy flows do not saturate most of the queues). See the user-facing documentation for more extensive guidance on setting this field. This field has a default value of 8.
queueLengthLimit	integer	queueLengthLimit is the maximum number of requests allowed to be waiting in a given queue of this priority level at a time; excess requests are rejected. This value must be positive. If not specified, it will be defaulted to 50.

Property	Type	Description
queues	integer	queues is the number of queues for this priority level. The queues exist independently at each apiserver. The value must be positive. Setting it to 1 effectively precludes shuffleharding and thus makes the distinguisher method of associated flow schemas irrelevant. This field has a default value of 64.

17.3.1.5. .status

Description

PriorityLevelConfigurationStatus represents the current state of a "request-priority".

Type

object

Property	Type	Description
conditions	array	conditions is the current state of "request-priority".
conditions[]	object	PriorityLevelConfigurationCondition defines the condition of priority level.

17.3.1.6. .status.conditions

Description

conditions is the current state of "request-priority".

Type

array

17.3.1.7. .status.conditions[]

Description

PriorityLevelConfigurationCondition defines the condition of priority level.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
lastTransitionTime	Time	lastTransitionTime is the last time the condition transitioned from one status to another.
message	string	message is a human-readable message indicating details about last transition.
reason	string	reason is a unique, one-word, CamelCase reason for the condition's last transition.
status	string	status is the status of the condition. Can be True, False, Unknown. Required.
type	string	type is the type of the condition. Required.

17.3.2. API endpoints

The following API endpoints are available:

- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations**
 - **DELETE**: delete collection of PriorityLevelConfiguration
 - **GET**: list or watch objects of kind PriorityLevelConfiguration
 - **POST**: create a PriorityLevelConfiguration
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations**
 - **GET**: watch individual changes to a list of PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations/{name}**
 - **DELETE**: delete a PriorityLevelConfiguration
 - **GET**: read the specified PriorityLevelConfiguration
 - **PATCH**: partially update the specified PriorityLevelConfiguration
 - **PUT**: replace the specified PriorityLevelConfiguration
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations/{name}**

- **GET**: watch changes to an object of kind PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations/{name}/status**
 - **GET**: read status of the specified PriorityLevelConfiguration
 - **PATCH**: partially update status of the specified PriorityLevelConfiguration
 - **PUT**: replace status of the specified PriorityLevelConfiguration

17.3.2.1. /apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations

Table 17.36. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of PriorityLevelConfiguration

Table 17.37. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Parameter	Type	Description
body	DeleteOptions schema	

Table 17.39. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind PriorityLevelConfiguration

Table 17.40. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 17.41. HTTP responses

HTTP code	Response body
200 - OK	PriorityLevelConfigurationList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a PriorityLevelConfiguration

Table 17.42. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 17.44. HTTP responses

HTTP code	Response body
200 - OK	PriorityLevelConfiguration schema

HTTP code	Response body
201 - Created	PriorityLevelConfiguration schema
202 - Accepted	PriorityLevelConfiguration schema
401 - Unauthorized	Empty

17.3.2.2. /apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations

Table 17.45. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead.

HTTP method

DELETE

Description

delete a PriorityLevelConfiguration

Table 17.49. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

CHAPTER 18. NETWORKING APIS

18.1. NETWORKING APIS

18.1.1. Ingress [networking.k8s.io/v1]

Description

Ingress is a collection of rules that allow inbound connections to reach the endpoints defined by a backend. An Ingress can be configured to give services externally-reachable urls, load balance traffic, terminate SSL, offer name based virtual hosting etc.

Type

object

18.1.2. IngressClass [networking.k8s.io/v1]

Description

IngressClass represents the class of the Ingress, referenced by the Ingress Spec. The **ingressclass.kubernetes.io/is-default-class** annotation can be used to indicate that an IngressClass should be considered default. When a single IngressClass resource has this annotation set to true, new Ingress resources without a class specified will be assigned this default class.

Type

object

18.1.3. NetworkPolicy [networking.k8s.io/v1]

Description

NetworkPolicy describes what network traffic is allowed for a set of Pods

Type

object

18.2. INGRESS [NETWORKING.K8S.IO/V1]

Description

Ingress is a collection of rules that allow inbound connections to reach the endpoints defined by a backend. An Ingress can be configured to give services externally-reachable urls, load balance traffic, terminate SSL, offer name based virtual hosting etc.

Type

object

18.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	IngressSpec describes the Ingress the user wishes to exist.
status	object	IngressStatus describe the current state of the Ingress.

18.2.1.1. .spec

Description

IngressSpec describes the Ingress the user wishes to exist.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
defaultBackend	object	IngressBackend describes all endpoints for a given service and port.
ingressClassName	string	ingressClassName is the name of an IngressClass cluster resource. Ingress controller implementations use this field to know whether they should be serving this Ingress resource, by a transitive connection (controller → IngressClass → Ingress resource). Although the kubernetes.io/ingress.class annotation (simple constant name) was never formally defined, it was widely supported by Ingress controllers to create a direct binding between Ingress controller and Ingress resources. Newly created Ingress resources should prefer using the field. However, even though the annotation is officially deprecated, for backwards compatibility reasons, ingress controllers should still honor that annotation if present.
rules	array	rules is a list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
rules[]	object	IngressRule represents the rules mapping the paths under a specified host to the related backend services. Incoming requests are first evaluated for a host match, then routed to the backend associated with the matching IngressRuleValue.

Property	Type	Description
tls	array	tls represents the TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.
tls[]	object	IngressTLS describes the transport layer security associated with an ingress.

18.2.1.2. .spec.defaultBackend

Description

IngressBackend describes all endpoints for a given service and port.

Type

object

Property	Type	Description
resource	TypedLocalObjectReference	resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, a service.Name and service.Port must not be specified. This is a mutually exclusive setting with "Service".
service	object	IngressServiceBackend references a Kubernetes Service as a Backend.

18.2.1.3. .spec.defaultBackend.service

Description

IngressServiceBackend references a Kubernetes Service as a Backend.

Type

object

Required

- **name**

Property	Type	Description
name	string	name is the referenced service. The service must exist in the same namespace as the Ingress object.
port	object	ServiceBackendPort is the service port being referenced.

18.2.1.4. .spec.defaultBackend.service.port

Description

ServiceBackendPort is the service port being referenced.

Type

object

Property	Type	Description
name	string	name is the name of the port on the Service. This is a mutually exclusive setting with "Number".
number	integer	number is the numerical port number (e.g. 80) on the Service. This is a mutually exclusive setting with "Name".

18.2.1.5. .spec.rules

Description

rules is a list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.

Type

array

18.2.1.6. .spec.rules[]

Description

IngressRule represents the rules mapping the paths under a specified host to the related backend services. Incoming requests are first evaluated for a host match, then routed to the backend associated with the matching IngressRuleValue.

Type

object

Property	Type	Description
host	string	<p>host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). The wildcard character " must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If host is precise, the request matches this rule if the http host header is equal to Host. 2. If host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>

Property	Type	Description
http	object	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: <a href="http://<host>/<path>?<searchpart>">http://<host>/<path>?<searchpart> → backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

18.2.1.7. .spec.rules[].http

Description

HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: <http://<host>/<path>?<searchpart>> → backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

Type

object

Required

- **paths**

Property	Type	Description
paths	array	paths is a collection of paths that map requests to backends.
paths[]	object	HTTPIngressPath associates a path with a backend. Incoming urls matching the path are forwarded to the backend.

18.2.1.8. .spec.rules[].http.paths

Description

paths is a collection of paths that map requests to backends.

Type

array

18.2.1.9. .spec.rules[].http.paths[]

Description

HTTPIngressPath associates a path with a backend. Incoming urls matching the path are forwarded to the backend.

Type

object

Required

- **pathType**
- **backend**

Property	Type	Description
backend	object	IngressBackend describes all endpoints for a given service and port.
path	string	path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/' and must be present when using PathType with value "Exact" or "Prefix".
pathType	string	pathType determines the interpretation of the path matching. PathType can be one of the following values: <ul style="list-style-type: none"> * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers to the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). * ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types.

Property	Type	Description
		<p>Possible enum values: - "Exact" matches the URL path exactly and with case sensitivity. - "ImplementationSpecific" matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. - "Prefix" matches based on a URL path prefix split by '/'. Matching is case sensitive and done on a path element by element basis. A path element refers to the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). If multiple matching paths exist in an Ingress spec, the longest matching path is given priority. Examples: - /foo/bar does not match requests to /foo/barbaz - /foo/bar matches request to /foo/bar and /foo/bar/baz - /foo and /foo/ both match requests to /foo and /foo/. If both paths are present in an Ingress spec, the longest matching path (/foo/) is given priority.</p>

18.2.1.10. .spec.rules[].http.paths[].backend

Description

IngressBackend describes all endpoints for a given service and port.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
resource	TypedLocalObjectReference	resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, a service.Name and service.Port must not be specified. This is a mutually exclusive setting with "Service".
service	object	IngressServiceBackend references a Kubernetes Service as a Backend.

18.2.1.11. .spec.rules[].http.paths[].backend.service

Description

IngressServiceBackend references a Kubernetes Service as a Backend.

Type

object

Required

- **name**

Property	Type	Description
name	string	name is the referenced service. The service must exist in the same namespace as the Ingress object.
port	object	ServiceBackendPort is the service port being referenced.

18.2.1.12. .spec.rules[].http.paths[].backend.service.port

Description

ServiceBackendPort is the service port being referenced.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
name	string	name is the name of the port on the Service. This is a mutually exclusive setting with "Number".
number	integer	number is the numerical port number (e.g. 80) on the Service. This is a mutually exclusive setting with "Name".

18.2.1.13. .spec.tls

Description

tls represents the TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

Type

array

18.2.1.14. .spec.tls[]

Description

IngressTLS describes the transport layer security associated with an ingress.

Type

object

Property	Type	Description
hosts	array (string)	hosts is a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	string	secretName is the name of the secret used to terminate TLS traffic on port 443. Field is left optional to allow TLS routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the "Host" header is used for routing.

18.2.1.15. `.status`

Description

`IngressStatus` describe the current state of the Ingress.

Type

object

Property	Type	Description
loadBalancer	object	<code>IngressLoadBalancerStatus</code> represents the status of a load-balancer.

18.2.1.16. `.status.loadBalancer`

Description

`IngressLoadBalancerStatus` represents the status of a load-balancer.

Type

object

Property	Type	Description
ingress	array	<code>ingress</code> is a list containing ingress points for the load-balancer.
ingress[]	object	<code>IngressLoadBalancerIngress</code> represents the status of a load-balancer ingress point.

18.2.1.17. `.status.loadBalancer.ingress`

Description

`ingress` is a list containing ingress points for the load-balancer.

Type

array

18.2.1.18. `.status.loadBalancer.ingress[]`

Description

`IngressLoadBalancerIngress` represents the status of a load-balancer ingress point.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
hostname	string	hostname is set for load-balancer ingress points that are DNS based.
ip	string	ip is set for load-balancer ingress points that are IP based.
ports	array	ports provides information about the ports exposed by this LoadBalancer.
ports[]	object	IngressPortStatus represents the error condition of a service port

18.2.1.19. `.status.loadBalancer.ingress[].ports`

Description

ports provides information about the ports exposed by this LoadBalancer.

Type

array

18.2.1.20. `.status.loadBalancer.ingress[].ports[]`

Description

IngressPortStatus represents the error condition of a service port

Type

object

Required

- **port**
- **protocol**

Property	Type	Description
----------	------	-------------

Property	Type	Description
error	string	error is to record the problem with the service port The format of the error shall comply with the following rules: - built-in error values shall be specified in this file and those shall use CamelCase names - cloud provider specific error values must have names that comply with the format foo.example.com/CamelCase.
port	integer	port is the port number of the ingress port.
protocol	string	protocol is the protocol of the ingress port. The supported values are: "TCP", "UDP", "SCTP" Possible enum values: - " SCTP " is the SCTP protocol. - " TCP " is the TCP protocol. - " UDP " is the UDP protocol.

18.2.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/ingresses**
 - **GET**: list or watch objects of kind Ingress
- **/apis/networking.k8s.io/v1/watch/ingresses**
 - **GET**: watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses**
 - **DELETE**: delete collection of Ingress
 - **GET**: list or watch objects of kind Ingress
 - **POST**: create an Ingress
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses**
 - **GET**: watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name}**
 - **DELETE**: delete an Ingress

- **GET**: read the specified Ingress
- **PATCH**: partially update the specified Ingress
- **PUT**: replace the specified Ingress
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses/{name}**
 - **GET**: watch changes to an object of kind Ingress. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name}/status**
 - **GET**: read status of the specified Ingress
 - **PATCH**: partially update status of the specified Ingress
 - **PUT**: replace status of the specified Ingress

18.2.2.1. /apis/networking.k8s.io/v1/ingresses

Table 18.1. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind Ingress

DELETE

Description

delete collection of Ingress

Table 18.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind Ingress

Table 18.10. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 18.11. HTTP responses

HTTP code	Response body
200 - OK	IngressList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create an Ingress

Table 18.12. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

body	Ingress schema	

Table 18.14. HTTP responses

HTTP code	Response body
200 - OK	Ingress schema

HTTP code	Response body
201 - Created	Ingress schema
202 - Accepted	Ingress schema
401 - Unauthorized	Empty

18.2.2.4. /apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses

Table 18.15. Global path parameters

Parameter	Type	Description
namespace	string	object name and auth scope, such as for teams and projects

Table 18.16. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.

HTTP method

DELETE

Description

delete an Ingress

Table 18.20. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 18.30. Global path parameters

Parameter	Type	Description
name	string	name of the Ingress
namespace	string	object name and auth scope, such as for teams and projects

Table 18.31. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Ingress. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

18.3. INGRESSCLASS [NETWORKING.K8S.IO/V1]

Description

IngressClass represents the class of the Ingress, referenced by the Ingress Spec. The **ingressclass.kubernetes.io/is-default-class** annotation can be used to indicate that an IngressClass should be considered default. When a single IngressClass resource has this annotation set to true, new Ingress resources without a class specified will be assigned this default class.

Type

object

18.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	IngressClassSpec provides information about the class of an Ingress.

18.3.1.1. .spec

Description

IngressClassSpec provides information about the class of an Ingress.

Type

object

Property	Type	Description
controller	string	controller refers to the name of the controller that should handle this class. This allows for different "flavors" that are controlled by the same controller. For example, you may have different parameters for the same implementing controller. This should be specified as a domain-prefixed path no more than 250 characters in length, e.g. "acme.io/ingress-controller". This field is immutable.

Property	Type	Description
parameters	object	IngressClassParametersReference identifies an API object. This can be used to specify a cluster or namespace-scoped resource.

18.3.1.2. .spec.parameters

Description

IngressClassParametersReference identifies an API object. This can be used to specify a cluster or namespace-scoped resource.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
apiGroup	string	apiGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	kind is the type of resource being referenced.
name	string	name is the name of resource being referenced.
namespace	string	namespace is the namespace of the resource being referenced. This field is required when scope is set to "Namespace" and must be unset when scope is set to "Cluster".
scope	string	scope represents if this refers to a cluster or namespace scoped resource. This may be set to "Cluster" (default) or "Namespace".

18.3.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/ingressclasses**
 - **DELETE**: delete collection of IngressClass
 - **GET**: list or watch objects of kind IngressClass
 - **POST**: create an IngressClass
- **/apis/networking.k8s.io/v1/watch/ingressclasses**
 - **GET**: watch individual changes to a list of IngressClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/ingressclasses/{name}**
 - **DELETE**: delete an IngressClass
 - **GET**: read the specified IngressClass
 - **PATCH**: partially update the specified IngressClass
 - **PUT**: replace the specified IngressClass
- **/apis/networking.k8s.io/v1/watch/ingressclasses/{name}**
 - **GET**: watch changes to an object of kind IngressClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

18.3.2.1. /apis/networking.k8s.io/v1/ingressclasses

Table 18.42. Global query parameters

pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of IngressClass

Table 18.43. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 18.45. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind IngressClass

Table 18.46. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 18.47. HTTP responses

HTTP code	Response body
200 - OK	IngressClassList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create an IngressClass

Table 18.48. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

18.4. NETWORKPOLICY [NETWORKING.K8S.IO/V1]

Description

NetworkPolicy describes what network traffic is allowed for a set of Pods

Type

object

18.4.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	NetworkPolicySpec provides the specification of a NetworkPolicy

Property	Type	Description
status	object	NetworkPolicyStatus describes the current state of the NetworkPolicy.

18.4.1.1. .spec

Description

NetworkPolicySpec provides the specification of a NetworkPolicy

Type

object

Required

- **podSelector**

Property	Type	Description
egress	array	egress is a list of egress rules to be applied to the selected pods. Outgoing traffic is allowed if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic matches at least one egress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy limits all outgoing traffic (and serves solely to ensure that the pods it selects are isolated by default). This field is beta-level in 1.8
egress[]	object	NetworkPolicyEgressRule describes a particular set of traffic that is allowed out of pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and to. This type is beta-level in 1.8

Property	Type	Description
ingress	array	ingress is a list of ingress rules to be applied to the selected pods. Traffic is allowed to a pod if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic source is the pod's local node, OR if the traffic matches at least one ingress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy does not allow any traffic (and serves solely to ensure that the pods it selects are isolated by default)
ingress[]	object	NetworkPolicyIngressRule describes a particular set of traffic that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and from.
podSelector	LabelSelector	podSelector selects the pods to which this NetworkPolicy object applies. The array of ingress rules is applied to any pods selected by this field. Multiple network policies can select the same set of pods. In this case, the ingress rules for each are combined additively. This field is NOT optional and follows standard label selector semantics. An empty podSelector matches all pods in this namespace.

Property	Type	Description
policyTypes	array (string)	policyTypes is a list of rule types that the NetworkPolicy relates to. Valid options are ["Ingress"], ["Egress"], or ["Ingress", "Egress"]. If this field is not specified, it will default based on the existence of ingress or egress rules; policies that contain an egress section are assumed to affect egress, and all policies (whether or not they contain an ingress section) are assumed to affect ingress. If you want to write an egress-only policy, you must explicitly specify policyTypes ["Egress"]. Likewise, if you want to write a policy that specifies that no egress is allowed, you must specify a policyTypes value that include "Egress" (since such a policy would not include an egress section and would otherwise default to just ["Ingress"]). This field is beta-level in 1.8

18.4.1.2. .spec.egress

Description

egress is a list of egress rules to be applied to the selected pods. Outgoing traffic is allowed if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic matches at least one egress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy limits all outgoing traffic (and serves solely to ensure that the pods it selects are isolated by default). This field is beta-level in 1.8

Type

array

18.4.1.3. .spec.egress[]

Description

NetworkPolicyEgressRule describes a particular set of traffic that is allowed out of pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and to. This type is beta-level in 1.8

Type

object

Property	Type	Description
ports	array	ports is a list of destination ports for outgoing traffic. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.
ports[]	object	NetworkPolicyPort describes a port to allow traffic on
to	array	to is a list of destinations for outgoing traffic of pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all destinations (traffic not restricted by destination). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the to list.
to[]	object	NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

18.4.1.4. .spec.egress[].ports

Description

ports is a list of destination ports for outgoing traffic. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.

Type

array

18.4.1.5. .spec.egress[].ports[]

Description

NetworkPolicyPort describes a port to allow traffic on

Type

object

Property	Type	Description
endPort	integer	endPort indicates that the range of ports from port to endPort if set, inclusive, should be allowed by the policy. This field cannot be defined if the port field is not defined or if the port field is defined as a named (string) port. The endPort must be equal or greater than port.
port	IntOrString	port represents the port on the given protocol. This can either be a numerical or named port on a pod. If this field is not provided, this matches all port names and numbers. If present, only traffic on the specified protocol AND port will be matched.
protocol	string	protocol represents the protocol (TCP, UDP, or SCTP) which traffic must match. If not specified, this field defaults to TCP. Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.

18.4.1.6. .spec.egress[].to**Description**

to is a list of destinations for outgoing traffic of pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all destinations (traffic not restricted by destination). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the to list.

Type

array

18.4.1.7. .spec.egress[].to[]**Description**

NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

Type

object

Property	Type	Description
ipBlock	object	IPBlock describes a particular CIDR (Ex. "192.168.1.0/24","2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.
namespaceSelector	LabelSelector	namespaceSelector selects namespaces using cluster-scoped labels. This field follows standard label selector semantics; if present but empty, it selects all namespaces. If podSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the namespaces selected by namespaceSelector. Otherwise it selects all pods in the namespaces selected by namespaceSelector.
podSelector	LabelSelector	podSelector is a label selector which selects pods. This field follows standard label selector semantics; if present but empty, it selects all pods. If namespaceSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the Namespaces selected by NamespaceSelector. Otherwise it selects the pods matching podSelector in the policy's own namespace.

18.4.1.8. .spec.egress[].to[].ipBlock

Description

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24","2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

Type

object

Required

- **cidr**

Property	Type	Description
cidr	string	cidr is a string representing the IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64"
except	array (string)	except is a slice of CIDRs that should not be included within an IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64" Except values will be rejected if they are outside the cidr range

18.4.1.9. .spec.ingress

Description

ingress is a list of ingress rules to be applied to the selected pods. Traffic is allowed to a pod if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic source is the pod's local node, OR if the traffic matches at least one ingress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy does not allow any traffic (and serves solely to ensure that the pods it selects are isolated by default)

Type

array

18.4.1.10. .spec.ingress[]

Description

NetworkPolicyIngressRule describes a particular set of traffic that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and from.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
from	array	from is a list of sources which should be able to access the pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all sources (traffic not restricted by source). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the from list.
from[]	object	NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed
ports	array	ports is a list of ports which should be made accessible on the pods selected for this rule. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.
ports[]	object	NetworkPolicyPort describes a port to allow traffic on

18.4.1.11. .spec.ingress[].from

Description

from is a list of sources which should be able to access the pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all sources (traffic not restricted by source). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the from list.

Type

array

18.4.1.12. .spec.ingress[].from[]

Description

NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

Type

object

Property	Type	Description
ipBlock	object	IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.
namespaceSelector	LabelSelector	namespaceSelector selects namespaces using cluster-scoped labels. This field follows standard label selector semantics; if present but empty, it selects all namespaces. If podSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the namespaces selected by namespaceSelector. Otherwise it selects all pods in the namespaces selected by namespaceSelector.
podSelector	LabelSelector	podSelector is a label selector which selects pods. This field follows standard label selector semantics; if present but empty, it selects all pods. If namespaceSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the Namespaces selected by NamespaceSelector. Otherwise it selects the pods matching podSelector in the policy's own namespace.

18.4.1.13. .spec.ingress[].from[].ipBlock

Description

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

Type

object

Required

- **cidr**

Property	Type	Description
cidr	string	cidr is a string representing the IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64"
except	array (string)	except is a slice of CIDRs that should not be included within an IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64" Except values will be rejected if they are outside the cidr range

18.4.1.14. .spec.ingress[].ports

Description

ports is a list of ports which should be made accessible on the pods selected for this rule. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.

Type

array

18.4.1.15. .spec.ingress[].ports[]

Description

NetworkPolicyPort describes a port to allow traffic on

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
endPort	integer	endPort indicates that the range of ports from port to endPort if set, inclusive, should be allowed by the policy. This field cannot be defined if the port field is not defined or if the port field is defined as a named (string) port. The endPort must be equal or greater than port.
port	IntOrString	port represents the port on the given protocol. This can either be a numerical or named port on a pod. If this field is not provided, this matches all port names and numbers. If present, only traffic on the specified protocol AND port will be matched.
protocol	string	protocol represents the protocol (TCP, UDP, or SCTP) which traffic must match. If not specified, this field defaults to TCP. Possible enum values: - "SCTP" is the SCTP protocol. - "TCP" is the TCP protocol. - "UDP" is the UDP protocol.

18.4.1.16. .status

Description

NetworkPolicyStatus describes the current state of the NetworkPolicy.

Type

object

Property	Type	Description
conditions	array (Condition)	conditions holds an array of metav1.Condition that describe the state of the NetworkPolicy. Current service state

18.4.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/networkpolicies**
 - **GET:** list or watch objects of kind NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/networkpolicies**
 - **GET:** watch individual changes to a list of NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies**
 - **DELETE:** delete collection of NetworkPolicy
 - **GET:** list or watch objects of kind NetworkPolicy
 - **POST:** create a NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/networkpolicies**
 - **GET:** watch individual changes to a list of NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies/{name}**
 - **DELETE:** delete a NetworkPolicy
 - **GET:** read the specified NetworkPolicy
 - **PATCH:** partially update the specified NetworkPolicy
 - **PUT:** replace the specified NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/networkpolicies/{name}**
 - **GET:** watch changes to an object of kind NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies/{name}/status**
 - **GET:** read status of the specified NetworkPolicy
 - **PATCH:** partially update status of the specified NetworkPolicy
 - **PUT:** replace status of the specified NetworkPolicy

18.4.2.1. /apis/networking.k8s.io/v1/networkpolicies

Table 18.68. Global query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

list or watch objects of kind NetworkPolicy

Description

delete collection of NetworkPolicy

Table 18.74. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 18.75. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 18.76. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind NetworkPolicy

Table 18.77. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 18.78. HTTP responses

HTTP code	Response body
200 - OK	NetworkPolicyList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create a NetworkPolicy

Table 18.79. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP method

DELETE

Description

delete a NetworkPolicy

Table 18.87. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 18.98. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

CHAPTER 19. NODE APIS

19.1. NODE APIS

19.1.1. RuntimeClass [node.k8s.io/v1]

Description

RuntimeClass defines a class of container runtime supported in the cluster. The RuntimeClass is used to determine which container runtime is used to run all containers in a pod. RuntimeClasses are manually defined by a user or cluster provisioner, and referenced in the PodSpec. The Kubelet is responsible for resolving the RuntimeClassName reference before running the pod. For more details, see <https://kubernetes.io/docs/concepts/containers/runtime-class/>

Type

object

19.2. RUNTIMECLASS [NODE.K8S.IO/V1]

Description

RuntimeClass defines a class of container runtime supported in the cluster. The RuntimeClass is used to determine which container runtime is used to run all containers in a pod. RuntimeClasses are manually defined by a user or cluster provisioner, and referenced in the PodSpec. The Kubelet is responsible for resolving the RuntimeClassName reference before running the pod. For more details, see <https://kubernetes.io/docs/concepts/containers/runtime-class/>

Type

object

Required

- **handler**

19.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
handler	string	handler specifies the underlying runtime and configuration that the CRI implementation will use to handle pods of this class. The possible values are specific to the node & CRI configuration. It is assumed that all handlers are available on every node, and handlers of the same name are equivalent on every node. For example, a handler called "runc" might specify that the runc OCI runtime (using native Linux containers) will be used to run the containers in a pod. The Handler must be lowercase, conform to the DNS Label (RFC 1123) requirements, and is immutable.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
overhead	object	Overhead structure represents the resource overhead associated with running a pod.
scheduling	object	Scheduling specifies the scheduling constraints for nodes supporting a RuntimeClass.

19.2.1.1. .overhead

Description

Overhead structure represents the resource overhead associated with running a pod.

Type

object

Property	Type	Description
podFixed	object (Quantity)	podFixed represents the fixed resource overhead associated with running a pod.

19.2.1.2. .scheduling**Description**

Scheduling specifies the scheduling constraints for nodes supporting a RuntimeClass.

Type**object**

Property	Type	Description
nodeSelector	object (string)	nodeSelector lists labels that must be present on nodes that support this RuntimeClass. Pods using this RuntimeClass can only be scheduled to a node matched by this selector. The RuntimeClass nodeSelector is merged with a pod's existing nodeSelector. Any conflicts will cause the pod to be rejected in admission.
tolerations	array (Toleration)	tolerations are appended (excluding duplicates) to pods running with this RuntimeClass during admission, effectively unioning the set of nodes tolerated by the pod and the RuntimeClass.

19.2.2. API endpoints

The following API endpoints are available:

- **/apis/node.k8s.io/v1/runtimeclasses**
 - **DELETE**: delete collection of RuntimeClass
 - **GET**: list or watch objects of kind RuntimeClass
 - **POST**: create a RuntimeClass
- **/apis/node.k8s.io/v1/watch/runtimeclasses**

- **GET**: watch individual changes to a list of RuntimeClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/node.k8s.io/v1/runtimeclasses/{name}**
 - **DELETE**: delete a RuntimeClass
 - **GET**: read the specified RuntimeClass
 - **PATCH**: partially update the specified RuntimeClass
 - **PUT**: replace the specified RuntimeClass
- **/apis/node.k8s.io/v1/watch/runtimeclasses/{name}**
 - **GET**: watch changes to an object of kind RuntimeClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

19.2.2.1. /apis/node.k8s.io/v1/runtimeclasses

Table 19.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of RuntimeClass

Table 19.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>`continue`</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 19.3. Body parameters

Parameter	Type	Description

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind RuntimeClass

Table 19.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 19.6. HTTP responses

HTTP code	Response body
200 - OK	RuntimeClassList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create a `RuntimeClass`

Table 19.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized <code>dryRun</code> directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	<code>fieldManager</code> is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	<code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a <code>BadRequest</code> error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 19.25. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind `RuntimeClass`. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 19.26. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

CHAPTER 20. POLICY APIS

20.1. POLICY APIS

20.1.1. Eviction [policy/v1]

Description

Eviction evicts a pod from its node subject to certain policies and safety constraints. This is a subresource of Pod. A request to cause such an eviction is created by POSTing to `.../pods/<pod name>/evictions`.

Type

object

20.1.2. PodDisruptionBudget [policy/v1]

Description

PodDisruptionBudget is an object to define the max disruption that can be caused to a collection of pods

Type

object

20.2. EVICTION [POLICY/V1]

Description

Eviction evicts a pod from its node subject to certain policies and safety constraints. This is a subresource of Pod. A request to cause such an eviction is created by POSTing to `.../pods/<pod name>/evictions`.

Type

object

20.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
deleteOptions	DeleteOptions	DeleteOptions may be provided

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	ObjectMeta describes the pod that is being evicted.

20.2.2. API endpoints

The following API endpoints are available:

- **/api/v1/namespaces/{namespace}/pods/{name}/eviction**
 - **POST**: create eviction of a Pod

20.2.2.1. /api/v1/namespaces/{namespace}/pods/{name}/eviction

Table 20.1. Global path parameters

Parameter	Type	Description
name	string	name of the Eviction
namespace	string	object name and auth scope, such as for teams and projects

Table 20.2. Global query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
pretty	string	If 'true', then the output is pretty printed.

HTTP method**POST****Description**

create eviction of a Pod

Table 20.3. Body parameters

Parameter	Type	Description
body	Eviction schema	

Table 20.4. HTTP responses

HTTP code	Response body
200 - OK	Eviction schema
201 - Created	Eviction schema

HTTP code	Reponse body
202 - Accepted	Eviction schema
401 - Unauthorized	Empty

20.3. PODDISRUPTIONBUDGET [POLICY/V1]

Description

PodDisruptionBudget is an object to define the max disruption that can be caused to a collection of pods

Type

object

20.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

Property	Type	Description
spec	object	PodDisruptionBudgetSpec is a description of a PodDisruptionBudget.
status	object	PodDisruptionBudgetStatus represents information about the status of a PodDisruptionBudget. Status may trail the actual state of a system.

20.3.1.1. .spec

Description

PodDisruptionBudgetSpec is a description of a PodDisruptionBudget.

Type

object

Property	Type	Description
maxUnavailable	IntOrString	An eviction is allowed if at most "maxUnavailable" pods selected by "selector" are unavailable after the eviction, i.e. even in absence of the evicted pod. For example, one can prevent all voluntary evictions by specifying 0. This is a mutually exclusive setting with "minAvailable".
minAvailable	IntOrString	An eviction is allowed if at least "minAvailable" pods selected by "selector" will still be available after the eviction, i.e. even in the absence of the evicted pod. So for example you can prevent all voluntary evictions by specifying "100%".
selector	LabelSelector	Label query over pods whose evictions are managed by the disruption budget. A null selector will match no pods, while an empty ({}) selector will select all pods within the namespace.
unhealthyPodEvictionPolicy	string	UnhealthyPodEvictionPolicy

Property	Type	Description
		<p>defines the criteria for when unhealthy pods should be considered for eviction. Current implementation considers healthy pods, as pods that have <code>status.conditions</code> item with <code>type="Ready",status="True"</code>.</p> <p>Valid policies are <code>IfHealthyBudget</code> and <code>AlwaysAllow</code>. If no policy is specified, the default behavior will be used, which corresponds to the <code>IfHealthyBudget</code> policy.</p> <p><code>IfHealthyBudget</code> policy means that running pods (<code>status.phase="Running"</code>), but not yet healthy can be evicted only if the guarded application is not disrupted (<code>status.currentHealthy</code> is at least equal to <code>status.desiredHealthy</code>). Healthy pods will be subject to the PDB for eviction.</p> <p><code>AlwaysAllow</code> policy means that all running pods (<code>status.phase="Running"</code>), but not yet healthy are considered disrupted and can be evicted regardless of whether the criteria in a PDB is met. This means perspective running pods of a disrupted application might not get a chance to become healthy. Healthy pods will be subject to the PDB for eviction.</p> <p>Additional policies may be added in the future. Clients making eviction decisions should disallow eviction of unhealthy pods if they encounter an unrecognized policy in this field.</p> <p>This field is beta-level. The eviction API uses this field when the feature gate <code>PDBUnhealthyPodEvictionPolicy</code> is enabled (enabled by default).</p> <p>Possible enum values: - "AlwaysAllow" policy means that all running pods (<code>status.phase="Running"</code>), but not yet healthy are considered disrupted and can be evicted</p>

Property	Type	Description
		<p>regardless of whether the criteria in a PDB is met. This means perspective running pods of a disrupted application might not get a chance to become healthy. Healthy pods will be subject to the PDB for eviction. - "IfHealthyBudget" policy means that running pods (status.phase="Running"), but not yet healthy can be evicted only if the guarded application is not disrupted (status.currentHealthy is at least equal to status.desiredHealthy). Healthy pods will be subject to the PDB for eviction.</p>

20.3.1.2. .status

Description

PodDisruptionBudgetStatus represents information about the status of a PodDisruptionBudget. Status may trail the actual state of a system.

Type

object

Required

- **disruptionsAllowed**
- **currentHealthy**
- **desiredHealthy**
- **expectedPods**

Property	Type	Description
----------	------	-------------

Property	Type	Description
conditions	array (Condition)	Conditions contain conditions for PDB. The disruption controller sets the DisruptionAllowed condition. The following are known values for the reason field (additional reasons could be added in the future): - SyncFailed: The controller encountered an error and wasn't able to compute the number of allowed disruptions. Therefore no disruptions are allowed and the status of the condition will be False. - InsufficientPods: The number of pods are either at or below the number required by the PodDisruptionBudget. No disruptions are allowed and the status of the condition will be False. - SufficientPods: There are more pods than required by the PodDisruptionBudget. The condition will be True, and the number of allowed disruptions are provided by the disruptionsAllowed property.
currentHealthy	integer	current number of healthy pods
desiredHealthy	integer	minimum desired number of healthy pods

Property	Type	Description
disruptedPods	object (Time)	DisruptedPods contains information about pods whose eviction was processed by the API server eviction subresource handler but has not yet been observed by the PodDisruptionBudget controller. A pod will be in this map from the time when the API server processed the eviction request to the time when the pod is seen by PDB controller as having been marked for deletion (or after a timeout). The key in the map is the name of the pod and the value is the time when the API server processed the eviction request. If the deletion didn't occur and a pod is still there it will be removed from the list automatically by PodDisruptionBudget controller after some time. If everything goes smooth this map should be empty for the most of the time. Large number of entries in the map may indicate problems with pod deletions.
disruptionsAllowed	integer	Number of pod disruptions that are currently allowed.
expectedPods	integer	total number of pods counted by this disruption budget
observedGeneration	integer	Most recent generation observed when updating this PDB status. DisruptionsAllowed and other status information is valid only if observedGeneration equals to PDB's object generation.

20.3.2. API endpoints

The following API endpoints are available:

- **/apis/policy/v1/poddisruptionbudgets**
 - **GET**: list or watch objects of kind PodDisruptionBudget

- **/apis/policy/v1/watch/poddisruptionbudgets**
 - **GET**: watch individual changes to a list of PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets**
 - **DELETE**: delete collection of PodDisruptionBudget
 - **GET**: list or watch objects of kind PodDisruptionBudget
 - **POST**: create a PodDisruptionBudget
- **/apis/policy/v1/watch/namespaces/{namespace}/poddisruptionbudgets**
 - **GET**: watch individual changes to a list of PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets/{name}**
 - **DELETE**: delete a PodDisruptionBudget
 - **GET**: read the specified PodDisruptionBudget
 - **PATCH**: partially update the specified PodDisruptionBudget
 - **PUT**: replace the specified PodDisruptionBudget
- **/apis/policy/v1/watch/namespaces/{namespace}/poddisruptionbudgets/{name}**
 - **GET**: watch changes to an object of kind PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets/{name}/status**
 - **GET**: read status of the specified PodDisruptionBudget
 - **PATCH**: partially update status of the specified PodDisruptionBudget
 - **PUT**: replace status of the specified PodDisruptionBudget

20.3.2.1. /apis/policy/v1/poddisruptionbudgets

Table 20.5. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

delete collection of PodDisruptionBudget

Table 20.11. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 20.12. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 20.13. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind PodDisruptionBudget

Table 20.14. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

POST

Description

create a PodDisruptionBudget

Table 20.16. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP method

DELETE

Description

delete a PodDisruptionBudget

Table 20.24. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 20.35. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

CHAPTER 21. RBAC APIS

21.1. RBAC APIS

21.1.1. ClusterRole [rbac.authorization.k8s.io/v1]

Description

ClusterRole is a cluster level, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding or ClusterRoleBinding.

Type

object

21.1.2. ClusterRoleBinding [rbac.authorization.k8s.io/v1]

Description

ClusterRoleBinding references a ClusterRole, but not contain it. It can reference a ClusterRole in the global namespace, and adds who information via Subject.

Type

object

21.1.3. Role [rbac.authorization.k8s.io/v1]

Description

Role is a namespaced, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding.

Type

object

21.1.4. RoleBinding [rbac.authorization.k8s.io/v1]

Description

RoleBinding references a role, but does not contain it. It can reference a Role in the same namespace or a ClusterRole in the global namespace. It adds who information via Subjects and namespace information by which namespace it exists in. RoleBindings in a given namespace only have effect in that namespace.

Type

object

21.2. CLUSTERROLE [RBAC.AUTHORIZATION.K8S.IO/V1]

Description

ClusterRole is a cluster level, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding or ClusterRoleBinding.

Type

object

21.2.1. Specification

Property	Type	Description
aggregationRule	object	AggregationRule describes how to locate ClusterRoles to aggregate into the ClusterRole
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata.
rules	array	Rules holds all the PolicyRules for this ClusterRole
rules[]	object	PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

21.2.1.1. .aggregationRule

Description

AggregationRule describes how to locate ClusterRoles to aggregate into the ClusterRole

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
clusterRoleSelectors	array (LabelSelector)	ClusterRoleSelectors holds a list of selectors which will be used to find ClusterRoles and create the rules. If any of the selectors match, then the ClusterRole's permissions will be added

21.2.1.2. .rules

Description

Rules holds all the PolicyRules for this ClusterRole

Type

array

21.2.1.3. .rules[]

Description

PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

Type

object

Required

- **verbs**

Property	Type	Description
apiGroups	array (string)	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed. "" represents the core API group and "*" represents all API groups.

Property	Type	Description
nonResourceURLs	array (string)	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path. Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	array (string)	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	array (string)	Resources is a list of resources this rule applies to. '*' represents all resources.
verbs	array (string)	Verbs is a list of Verbs that apply to ALL the ResourceKinds contained in this rule. '*' represents all verbs.

21.2.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/clusterroles**
 - **DELETE**: delete collection of ClusterRole
 - **GET**: list or watch objects of kind ClusterRole
 - **POST**: create a ClusterRole
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterroles**
 - **GET**: watch individual changes to a list of ClusterRole. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/clusterroles/{name}**
 - **DELETE**: delete a ClusterRole
 - **GET**: read the specified ClusterRole

- **PATCH**: partially update the specified ClusterRole
- **PUT**: replace the specified ClusterRole
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterroles/{name}**
 - **GET**: watch changes to an object of kind ClusterRole. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

21.2.2.1. /apis/rbac.authorization.k8s.io/v1/clusterroles

Table 21.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of ClusterRole

Table 21.2. Query parameters

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	string	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Table 21.3. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 21.4. HTTP responses

HTTP code	Response body
200 - OK	Status schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind ClusterRole

Table 21.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 21.6. HTTP responses

HTTP code	Response body
200 - OK	ClusterRoleList schema
401 - Unauthorized	Empty

HTTP method

POST**Description**

create a ClusterRole

Table 21.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a ClusterRole

Table 21.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 21.24. Global path parameters

Parameter	Type	Description
name	string	name of the ClusterRole

Table 21.25. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind ClusterRole. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 21.26. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

21.3. CLUSTERROLEBINDING [RBAC.AUTHORIZATION.K8S.IO/V1]

Description

ClusterRoleBinding references a ClusterRole, but not contain it. It can reference a ClusterRole in the global namespace, and adds who information via Subject.

Type

object

Required

- **roleRef**

21.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata.
roleRef	object	RoleRef contains information that points to the role being used

Property	Type	Description
subjects	array	Subjects holds references to the objects the role applies to.
subjects[]	object	Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

21.3.1.1. .roleRef

Description

RoleRef contains information that points to the role being used

Type

object

Required

- **apiGroup**
- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced

21.3.1.2. .subjects

Description

Subjects holds references to the objects the role applies to.

Type

array

21.3.1.3. .subjects[]

Description

Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	string	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	string	Name of the object being referenced.
namespace	string	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

21.3.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/clusterrolebindings**
 - **DELETE**: delete collection of ClusterRoleBinding
 - **GET**: list or watch objects of kind ClusterRoleBinding
 - **POST**: create a ClusterRoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterrolebindings**
 - **GET**: watch individual changes to a list of ClusterRoleBinding. deprecated: use the 'watch' endpoint

parameter with a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/clusterrolebindings/{name}**
 - **DELETE**: delete a ClusterRoleBinding
 - **GET**: read the specified ClusterRoleBinding
 - **PATCH**: partially update the specified ClusterRoleBinding
 - **PUT**: replace the specified ClusterRoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterrolebindings/{name}**
 - **GET**: watch changes to an object of kind ClusterRoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

21.3.2.1. /apis/rbac.authorization.k8s.io/v1/clusterrolebindings

Table 21.27. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of ClusterRoleBinding

Table 21.28. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 21.29. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 21.30. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind ClusterRoleBinding

Table 21.31. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 21.32. HTTP responses

HTTP code	Response body
200 - OK	ClusterRoleBindingList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create a ClusterRoleBinding

Table 21.33. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

name	string	name of the ClusterRoleBinding

Table 21.39. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a ClusterRoleBinding

Table 21.40. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 21.48. Body parameters

Parameter	Type	Description
body	ClusterRoleBinding schema	

Table 21.49. HTTP responses

HTTP code	Response body
200 - OK	ClusterRoleBinding schema
201 - Created	ClusterRoleBinding schema
401 - Unauthorized	Empty

21.3.2.4. /apis/rbac.authorization.k8s.io/v1/watch/clusterrolebindings/{name}

Table 21.50. Global path parameters

Parameter	Type	Description
name	string	name of the ClusterRoleBinding

Table 21.51. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind ClusterRoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 21.52. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

21.4. ROLE [RBAC.AUTHORIZATION.K8S.IO/V1]

Description

Role is a namespaced, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding.

Type

object

21.4.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata.
rules	array	Rules holds all the PolicyRules for this Role

Property	Type	Description
rules[]	object	PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

21.4.1.1. .rules

Description

Rules holds all the PolicyRules for this Role

Type

array

21.4.1.2. .rules[]

Description

PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

Type

object

Required

- **verbs**

Property	Type	Description
apiGroups	array (string)	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed. "" represents the core API group and "*" represents all API groups.

Property	Type	Description
nonResourceURLs	array (string)	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path. Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	array (string)	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	array (string)	Resources is a list of resources this rule applies to. '*' represents all resources.
verbs	array (string)	Verbs is a list of Verbs that apply to ALL the ResourceKinds contained in this rule. '*' represents all verbs.

21.4.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/roles**
 - **GET**: list or watch objects of kind Role
- **/apis/rbac.authorization.k8s.io/v1/watch/roles**
 - **GET**: watch individual changes to a list of Role. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/roles**
 - **DELETE**: delete collection of Role
 - **GET**: list or watch objects of kind Role
 - **POST**: create a Role
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles**
 - **GET**: watch individual changes to a list of Role. deprecated: use the 'watch' parameter with

a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/roles/{name}**
 - **DELETE:** delete a Role
 - **GET:** read the specified Role
 - **PATCH:** partially update the specified Role
 - **PUT:** replace the specified Role
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles/{name}**
 - **GET:** watch changes to an object of kind Role. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

21.4.2.1. /apis/rbac.authorization.k8s.io/v1/roles

Table 21.53. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. list or watch objects of kind Role

Table 21.62. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 21.63. HTTP responses

HTTP code	Response body
200 - OK	RoleList schema
401 - Unauthorized	Empty

HTTP method
POST

Description

create a Role

Table 21.64. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

200 - OK	Role schema

HTTP code	Response body
201 - Created	Role schema
202 - Accepted	Role schema
401 - Unauthorized	Empty

21.4.2.4. /apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles

Table 21.67. Global path parameters

Parameter	Type	Description
namespace	string	object name and auth scope, such as for teams and projects

Table 21.68. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of Role. deprecated: use the 'watch' parameter with a list operation instead.

namespace	string	object name and auth scope, such as for teams and projects

Table 21.71. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a Role

Table 21.72. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 21.76. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind Role. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 21.84. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

21.5. ROLEBINDING [RBAC.AUTHORIZATION.K8S.IO/V1]

Description

RoleBinding references a role, but does not contain it. It can reference a Role in the same namespace or a ClusterRole in the global namespace. It adds who information via Subjects and namespace information by which namespace it exists in. RoleBindings in a given namespace only have effect in that namespace.

Type

object

Required

- **roleRef**

21.5.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata.

Property	Type	Description
roleRef	object	RoleRef contains information that points to the role being used
subjects	array	Subjects holds references to the objects the role applies to.
subjects[]	object	Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

21.5.1.1. .roleRef

Description

RoleRef contains information that points to the role being used

Type

object

Required

- **apiGroup**
- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced

21.5.1.2. .subjects

Description

Subjects holds references to the objects the role applies to.

Type

array

21.5.1.3. .subjects[]

Description

Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
apiGroup	string	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	string	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	string	Name of the object being referenced.
namespace	string	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

21.5.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/rolebindings**
 - **GET**: list or watch objects of kind RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/rolebindings**
 - **GET**: watch individual changes to a list of RoleBinding. deprecated: use the 'watch' parameter with a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings**
 - **DELETE:** delete collection of RoleBinding
 - **GET:** list or watch objects of kind RoleBinding
 - **POST:** create a RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/rolebindings**
 - **GET:** watch individual changes to a list of RoleBinding. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}**
 - **DELETE:** delete a RoleBinding
 - **GET:** read the specified RoleBinding
 - **PATCH:** partially update the specified RoleBinding
 - **PUT:** replace the specified RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/rolebindings/{name}**
 - **GET:** watch changes to an object of kind RoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

21.5.2.1. /apis/rbac.authorization.k8s.io/v1/rolebindings

Table 21.85. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

21.5.2.2. /apis/rbac.authorization.k8s.io/v1/watch/rolebindings

Table 21.87. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of RoleBinding. deprecated: use the 'watch' parameter with a list operation instead.

Table 21.96. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind RoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

CHAPTER 22. NETWORK APIS

22.1. NETWORK APIS

22.1.1. Route [route.openshift.io/v1]

Description

A route allows developers to expose services through an HTTP(S) aware load balancing and proxy layer via a public DNS entry. The route may further specify TLS options and a certificate, or specify a public CNAME that the router should also accept for HTTP and HTTPS traffic. An administrator typically configures their router to be visible outside the cluster firewall, and may also add additional security, caching, or traffic controls on the service content. Routers usually talk directly to the service endpoints. Once a route is created, the **host** field may not be changed. Generally, routers use the oldest route with a given host when resolving conflicts. Routers are subject to additional customization and may support additional controls via the annotations field. Because administrators may configure multiple routers, the route status field is used to return information to clients about the names and states of the route under each router. If a client chooses a duplicate name, for instance, the route status conditions are used to indicate the route cannot be chosen. To enable HTTP/2 ALPN on a route it requires a custom (non-wildcard) certificate. This prevents connection coalescing by clients, notably web browsers. We do not support HTTP/2 ALPN on routes that use the default certificate because of the risk of connection re-use/coalescing. Routes that do not have their own custom certificate will not be HTTP/2 ALPN-enabled on either the frontend or the backend. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

22.2. ROUTE [ROUTE.OPENSIFT.IO/V1]

Description

A route allows developers to expose services through an HTTP(S) aware load balancing and proxy layer via a public DNS entry. The route may further specify TLS options and a certificate, or specify a public CNAME that the router should also accept for HTTP and HTTPS traffic. An administrator typically configures their router to be visible outside the cluster firewall, and may also add additional security, caching, or traffic controls on the service content. Routers usually talk directly to the service endpoints. Once a route is created, the **host** field may not be changed. Generally, routers use the oldest route with a given host when resolving conflicts. Routers are subject to additional customization and may support additional controls via the annotations field. Because administrators may configure multiple routers, the route status field is used to return information to clients about the names and states of the route under each router. If a client chooses a duplicate name, for instance, the route status conditions are used to indicate the route cannot be chosen. To enable HTTP/2 ALPN on a route it requires a custom (non-wildcard) certificate. This prevents connection coalescing by clients, notably web browsers. We do not support HTTP/2 ALPN on routes that use the default certificate because of the risk of connection re-use/coalescing. Routes that do not have their own custom certificate will not be HTTP/2 ALPN-enabled on either the frontend or the backend. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

Required

- **spec**

22.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	spec is the desired state of the route
status	object	status is the current state of the route

22.2.1.1. .spec

Description

spec is the desired state of the route

Type

object

Required

- **to**

Property	Type	Description
alternateBackends	array	alternateBackends allows up to 3 additional backends to be assigned to the route. Only the Service kind is allowed, and it will be defaulted to Service. Use the weight field in RouteTargetReference object to specify relative preference.
alternateBackends[]	object	RouteTargetReference specifies the target that resolve into endpoints. Only the 'Service' kind is allowed. Use 'weight' field to emphasize one over others.
host	string	host is an alias/DNS that points to the service. Optional. If not specified a route name will typically be automatically chosen. Must follow DNS952 subdomain conventions.
path	string	path that the router watches for, to route traffic for to the service. Optional
port	object	If specified, the port to be used by the router. Most routers will use all endpoints exposed by the service by default - set this value to instruct routers which port to use.

Property	Type	Description
subdomain	string	subdomain is a DNS subdomain that is requested within the ingress controller's domain (as a subdomain). If host is set this field is ignored. An ingress controller may choose to ignore this suggested name, in which case the controller will report the assigned name in the status.ingress array or refuse to admit the route. If this value is set and the server does not support this field host will be populated automatically. Otherwise host is left empty. The field may have multiple parts separated by a dot, but not all ingress controllers may honor the request. This field may not be changed after creation except by a user with the update routes/custom-host permission. Example: subdomain frontend automatically receives the router subdomain apps.mycluster.com to have a full hostname frontend.apps.mycluster.com .
tls	object	The tls field provides the ability to configure certificates and termination for the route.
to	object	to is an object the route should use as the primary backend. Only the Service kind is allowed, and it will be defaulted to Service. If the weight field (0-256 default 100) is set to zero, no traffic will be sent to this backend.
wildcardPolicy	string	Wildcard policy if any for the route. Currently only 'Subdomain' or 'None' is allowed.

22.2.1.2. .spec.alternateBackends

Description

alternateBackends allows up to 3 additional backends to be assigned to the route. Only the Service kind is allowed, and it will be defaulted to Service. Use the weight field in RouteTargetReference object to specify relative preference.

Type

array

22.2.1.3. .spec.alternateBackends[]

Description

RouteTargetReference specifies the target that resolve into endpoints. Only the 'Service' kind is allowed. Use 'weight' field to emphasize one over others.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
kind	string	The kind of target that the route is referring to. Currently, only 'Service' is allowed
name	string	name of the service/target that is being referred to. e.g. name of the service
weight	integer	weight as an integer between 0 and 256, default 100, that specifies the target's relative weight against other target reference objects. 0 suppresses requests to this backend.

22.2.1.4. .spec.port

Description

If specified, the port to be used by the router. Most routers will use all endpoints exposed by the service by default - set this value to instruct routers which port to use.

Type

object

Required

- **targetPort**

Property	Type	Description
targetPort	integer-or-string	

22.2.1.5. .spec.tls

Description

The `tls` field provides the ability to configure certificates and termination for the route.

Type

object

Required

- **termination**

Property	Type	Description
caCertificate	string	<code>caCertificate</code> provides the cert authority certificate contents
certificate	string	<code>certificate</code> provides certificate contents. This should be a single serving certificate, not a certificate chain. Do not include a CA certificate.
destinationCACertificate	string	<code>destinationCACertificate</code> provides the contents of the ca certificate of the final destination. When using reencrypt termination this file should be provided in order to have routers use it for health checks on the secure connection. If this field is not specified, the router may provide its own destination CA and perform hostname validation using the short service name (<code>service.namespace.svc</code>), which allows infrastructure generated certificates to automatically verify.

Property	Type	Description
insecureEdgeTerminationPolicy	string	insecureEdgeTerminationPolicy indicates the desired behavior for insecure connections to a route. While each router may make its own decisions on which ports to expose, this is normally port 80. * Allow - traffic is sent to the server on the insecure port (edge/reencrypt terminations only) (default). * None - no traffic is allowed on the insecure port. * Redirect - clients are redirected to the secure port.
key	string	key provides key file contents
termination	string	termination indicates termination type. * edge - TLS termination is done by the router and http is used to communicate with the backend (default) * passthrough - Traffic is sent straight to the destination without the router providing TLS termination * reencrypt - TLS termination is done by the router and https is used to communicate with the backend

22.2.1.6. .spec.to

Description

to is an object the route should use as the primary backend. Only the Service kind is allowed, and it will be defaulted to Service. If the weight field (0-256 default 100) is set to zero, no traffic will be sent to this backend.

Type

object

Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
kind	string	The kind of target that the route is referring to. Currently, only 'Service' is allowed
name	string	name of the service/target that is being referred to. e.g. name of the service
weight	integer	weight as an integer between 0 and 256, default 100, that specifies the target's relative weight against other target reference objects. 0 suppresses requests to this backend.

22.2.1.7. .status

Description

status is the current state of the route

Type

object

Property	Type	Description
ingress	array	ingress describes the places where the route may be exposed. The list of ingress points may contain duplicate Host or RouterName values. Routes are considered live once they are Ready
ingress[]	object	RouteIngress holds information about the places where a route is exposed.

22.2.1.8. .status.ingress

Description

ingress describes the places where the route may be exposed. The list of ingress points may contain duplicate Host or RouterName values. Routes are considered live once they are **Ready**

Type

array

22.2.1.9. .status.ingress[]

Description

RouteIngress holds information about the places where a route is exposed.

Type

object

Property	Type	Description
conditions	array	Conditions is the state of the route, may be empty.
conditions[]	object	RouteIngressCondition contains details for the current condition of this route on a particular router.
host	string	Host is the host string under which the route is exposed; this value is required
routerCanonicalHostname	string	CanonicalHostname is the external host name for the router that can be used as a CNAME for the host requested for this route. This value is optional and may not be set in all cases.
routerName	string	Name is a name chosen by the router to identify itself; this value is required
wildcardPolicy	string	Wildcard policy is the wildcard policy that was allowed where this route is exposed.

22.2.1.10. .status.ingress[].conditions

Description

Conditions is the state of the route, may be empty.

Type

array

22.2.1.11. .status.ingress[].conditions[]

Description

RouteIngressCondition contains details for the current condition of this route on a particular router.

Type

object

Required

- **status**

- **type**

Property	Type	Description
lastTransitionTime	string	RFC 3339 date and time when this condition last transitioned
message	string	Human readable message indicating details about last transition.
reason	string	(brief) reason for the condition's last transition, and is usually a machine and human readable constant
status	string	Status is the status of the condition. Can be True, False, Unknown.
type	string	Type is the type of the condition. Currently only Admitted.

22.2.2. API endpoints

The following API endpoints are available:

- **/apis/route.openshift.io/v1/routes**
 - **GET**: list objects of kind Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes**
 - **DELETE**: delete collection of Route
 - **GET**: list objects of kind Route
 - **POST**: create a Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes/{name}**
 - **DELETE**: delete a Route
 - **GET**: read the specified Route
 - **PATCH**: partially update the specified Route
 - **PUT**: replace the specified Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes/{name}/status**
 - **GET**: read status of the specified Route

- **PATCH**: partially update status of the specified Route
- **PUT**: replace status of the specified Route

22.2.2.1. /apis/route.openshift.io/v1/routes

Table 22.1. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 22.8. HTTP responses

HTTP code	Response body

create a Route

Table 22.9. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 22.12. Global path parameters

Parameter	Type	Description
name	string	name of the Route
namespace	string	object name and auth scope, such as for teams and projects

Table 22.13. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a Route

Table 22.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

CHAPTER 23. SCHEDULING APIS

23.1. SCHEDULING APIS

23.1.1. PriorityClass [scheduling.k8s.io/v1]

Description

PriorityClass defines mapping from a priority class name to the priority integer value. The value can be any valid integer.

Type

object

23.2. PRIORITYCLASS [SCHEDULING.K8S.IO/V1]

Description

PriorityClass defines mapping from a priority class name to the priority integer value. The value can be any valid integer.

Type

object

Required

- **value**

23.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
description	string	description is an arbitrary string that usually provides guidelines on when this priority class should be used.

Property	Type	Description
globalDefault	boolean	globalDefault specifies whether this PriorityClass should be considered as the default priority for pods that do not have any priority class. Only one PriorityClass can be marked as globalDefault . However, if more than one PriorityClasses exists with their globalDefault field set to true, the smallest value of such global default PriorityClasses will be used as the default priority.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
preemptionPolicy	string	preemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. Possible enum values: - "Never" means that pod never preempts other pods with lower priority. - "PreemptLowerPriority" means that pod can preempt other pods with lower priority.
value	integer	value represents the integer value of this priority class. This is the actual priority that pods receive when they have the name of this class in their pod spec.

23.2.2. API endpoints

The following API endpoints are available:

- **/apis/scheduling.k8s.io/v1/priorityclasses**
 - **DELETE**: delete collection of PriorityClass
 - **GET**: list or watch objects of kind PriorityClass
 - **POST**: create a PriorityClass
- **/apis/scheduling.k8s.io/v1/watch/priorityclasses**
 - **GET**: watch individual changes to a list of PriorityClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/scheduling.k8s.io/v1/priorityclasses/{name}**
 - **DELETE**: delete a PriorityClass
 - **GET**: read the specified PriorityClass
 - **PATCH**: partially update the specified PriorityClass
 - **PUT**: replace the specified PriorityClass
- **/apis/scheduling.k8s.io/v1/watch/priorityclasses/{name}**
 - **GET**: watch changes to an object of kind PriorityClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

23.2.2.1. /apis/scheduling.k8s.io/v1/priorityclasses

Table 23.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of PriorityClass

Table 23.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 23.3. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 23.4. HTTP responses

HTTP code	Reponse body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind PriorityClass

Table 23.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 23.6. HTTP responses

HTTP code	Response body
200 - OK	PriorityClassList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a PriorityClass

Table 23.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

201 - Created	PriorityClass schema
202 - Accepted	PriorityClass schema
401 - Unauthorized	Empty

23.2.2.2. /apis/scheduling.k8s.io/v1/watch/priorityclasses

Table 23.10. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method
GET

Description

watch individual changes to a list of PriorityClass. deprecated: use the 'watch' parameter with a list operation instead.

Table 23.11. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

Table 23.12. Global path parameters

Parameter	Type	Description
name	string	name of the PriorityClass

Table 23.13. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a PriorityClass

Table 23.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

200 - OK	PriorityClass schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified PriorityClass

Table 23.18. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 23.19. Body parameters

CHAPTER 24. SECURITY APIS

24.1. SECURITY APIS

24.1.1. SecurityContextConstraints [security.openshift.io/v1]

Description

SecurityContextConstraints governs the ability to make requests that affect the SecurityContext that will be applied to a container. For historical reasons SCC was exposed under the core Kubernetes API group. That exposure is deprecated and will be removed in a future release - users should instead use the security.openshift.io group to manage SecurityContextConstraints. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

24.2. SECURITYCONTEXTCONSTRAINTS [SECURITY.OPENSIFT.IO/V1]

Description

SecurityContextConstraints governs the ability to make requests that affect the SecurityContext that will be applied to a container. For historical reasons SCC was exposed under the core Kubernetes API group. That exposure is deprecated and will be removed in a future release - users should instead use the security.openshift.io group to manage SecurityContextConstraints. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

Required

- **allowHostDirVolumePlugin**
- **allowHostIPC**
- **allowHostNetwork**
- **allowHostPID**
- **allowHostPorts**
- **allowPrivilegedContainer**
- **readOnlyRootFilesystem**

24.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
allowHostDirVolumePlugin	boolean	AllowHostDirVolumePlugin determines if the policy allow containers to use the HostDir volume plugin
allowHostIPC	boolean	AllowHostIPC determines if the policy allows host ipc in the containers.
allowHostNetwork	boolean	AllowHostNetwork determines if the policy allows the use of HostNetwork in the pod spec.
allowHostPID	boolean	AllowHostPID determines if the policy allows host pid in the containers.
allowHostPorts	boolean	AllowHostPorts determines if the policy allows host ports in the containers.
allowPrivilegeEscalation	boolean	AllowPrivilegeEscalation determines if a pod can request to allow privilege escalation. If unspecified, defaults to true.
allowPrivilegedContainer	boolean	AllowPrivilegedContainer determines if a container can request to be run as privileged.
allowedCapabilities	string	AllowedCapabilities is a list of capabilities that can be requested to add to the container. Capabilities in this field maybe added at the pod author's discretion. You must not list a capability in both AllowedCapabilities and RequiredDropCapabilities. To allow all capabilities you may use '*'.

Property	Type	Description
allowedFlexVolumes	``	AllowedFlexVolumes is a whitelist of allowed Flexvolumes. Empty or nil indicates that all Flexvolumes may be used. This parameter is effective only when the usage of the Flexvolumes is allowed in the "Volumes" field.
allowedUnsafeSysctls	``	AllowedUnsafeSysctls is a list of explicitly allowed unsafe sysctls, defaults to none. Each entry is either a plain sysctl name or ends in "" in which case it is considered as a prefix of allowed sysctls. Single * means all unsafe sysctls are allowed. Kubelet has to whitelist all allowed unsafe sysctls explicitly to avoid rejection. Examples: e.g. "foo/" allows "foo/bar", "foo/baz", etc. e.g. "foo.*" allows "foo.bar", "foo.baz", etc.
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
defaultAddCapabilities	``	DefaultAddCapabilities is the default set of capabilities that will be added to the container unless the pod spec specifically drops the capability. You may not list a capability in both DefaultAddCapabilities and RequiredDropCapabilities.
defaultAllowPrivilegeEscalation	``	DefaultAllowPrivilegeEscalation controls the default setting for whether a process can gain more privileges than its parent process.

Property	Type	Description
forbiddenSysctls	``	ForbiddenSysctls is a list of explicitly forbidden sysctls, defaults to none. Each entry is either a plain sysctl name or ends in "" in which case it is considered as a prefix of forbidden sysctls. Single * means all sysctls are forbidden. Examples: e.g. "foo/" forbids "foo/bar", "foo/baz", etc. e.g. "foo.*" forbids "foo.bar", "foo.baz", etc.
fsGroup	``	FSGroup is the strategy that will dictate what fs group is used by the SecurityContext.
groups	``	The groups that have permission to use this security context constraints
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

Property	Type	Description
priority	``	Priority influences the sort order of SCCs when evaluating which SCCs to try first for a given pod request based on access in the Users and Groups fields. The higher the int, the higher priority. An unset value is considered a 0 priority. If scores for multiple SCCs are equal they will be sorted from most restrictive to least restrictive. If both priorities and restrictions are equal the SCCs will be sorted by name.
readOnlyRootFilesystem	boolean	ReadOnlyRootFilesystem when set to true will force containers to run with a read only root file system. If the container specifically requests to run with a non-read only root file system the SCC should deny the pod. If set to false the container may run with a read only root file system if it wishes but it will not be forced to.
requiredDropCapabilities	``	RequiredDropCapabilities are the capabilities that will be dropped from the container. These are required to be dropped and cannot be added.
runAsUser	``	RunAsUser is the strategy that will dictate what RunAsUser is used in the SecurityContext.
seLinuxContext	``	SELinuxContext is the strategy that will dictate what labels will be set in the SecurityContext.
seccompProfiles	``	SeccompProfiles lists the allowed profiles that may be set for the pod or container's seccomp annotations. An unset (nil) or empty value means that no profiles may be specified by the pod or container. The wildcard '*' may be used to allow all profiles. When used to generate a value for a pod the first non-wildcard profile will be used as the default.

Property	Type	Description
supplementalGroups	``	SupplementalGroups is the strategy that will dictate what supplemental groups are used by the SecurityContext.
users	``	The users who have permissions to use this security context constraints
volumes	``	Volumes is a white list of allowed volume plugins. FSType corresponds directly with the field names of a VolumeSource (azureFile, configMap, emptyDir). To allow all volumes you may use "*". To allow no volumes, set to ["none"].

24.2.2. API endpoints

The following API endpoints are available:

- **/apis/security.openshift.io/v1/securitycontextconstraints**
 - **DELETE**: delete collection of SecurityContextConstraints
 - **GET**: list objects of kind SecurityContextConstraints
 - **POST**: create SecurityContextConstraints
- **/apis/security.openshift.io/v1/securitycontextconstraints/{name}**
 - **DELETE**: delete SecurityContextConstraints
 - **GET**: read the specified SecurityContextConstraints
 - **PATCH**: partially update the specified SecurityContextConstraints
 - **PUT**: replace the specified SecurityContextConstraints

24.2.2.1. /apis/security.openshift.io/v1/securitycontextconstraints

Table 24.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of SecurityContextConstraints

Table 24.2. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 24.5. HTTP responses

HTTP code	Reponse body
200 - OK	SecurityContextConstraintsList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create SecurityContextConstraints

Table 24.6. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 24.9. Global path parameters

Parameter	Type	Description
name	string	name of the SecurityContextConstraints

Table 24.10. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete SecurityContextConstraints

Table 24.11. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

CHAPTER 25. SECURITY-INTERNAL APIS

25.1. SECURITY INTERNAL APIS

25.1.1. RangeAllocation [security.internal.openshift.io/v1]

Description

RangeAllocation is used so we can easily expose a RangeAllocation typed for security group This is an internal API, not intended for external consumption. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

25.2. RANGEALLOCATION [SECURITY.INTERNAL.OPENSIFT.IO/V1]

Description

RangeAllocation is used so we can easily expose a RangeAllocation typed for security group This is an internal API, not intended for external consumption. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

Type

object

25.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	string	data is a byte array representing the serialized state of a range allocation. It is a bitmap with each bit set to one to represent a range is taken.

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
range	string	range is a string representing a unique label for a range of uids, "10000000000-20000000000/10000".

25.2.2. API endpoints

The following API endpoints are available:

- **/apis/security.internal.openshift.io/v1/rangeallocations**
 - **DELETE**: delete collection of RangeAllocation
 - **GET**: list objects of kind RangeAllocation
 - **POST**: create a RangeAllocation
- **/apis/security.internal.openshift.io/v1/rangeallocations/{name}**
 - **DELETE**: delete a RangeAllocation
 - **GET**: read the specified RangeAllocation
 - **PATCH**: partially update the specified RangeAllocation
 - **PUT**: replace the specified RangeAllocation

25.2.2.1. /apis/security.internal.openshift.io/v1/rangeallocations

Table 25.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of RangeAllocation

Table 25.2. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 25.17. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 25.18. HTTP responses

HTTP code	Response body
200 - OK	RangeAllocation schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace the specified RangeAllocation

Table 25.19. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 25.20. Body parameters

Parameter	Type	Description
body	RangeAllocation schema	

Table 25.21. HTTP responses

HTTP code	Response body
200 - OK	RangeAllocation schema
201 - Created	RangeAllocation schema
401 - Unauthorized	Empty

CHAPTER 26. SNAPSHOT APIS

26.1. SNAPSHOT APIS

26.1.1. VolumeSnapshot [snapshot.storage.k8s.io/v1]

Description

VolumeSnapshot is a user's request for either creating a point-in-time snapshot of a persistent volume, or binding to a pre-existing snapshot.

Type

object

26.1.2. VolumeSnapshotClass [snapshot.storage.k8s.io/v1]

Description

VolumeSnapshotClass specifies parameters that a underlying storage system uses when creating a volume snapshot. A specific VolumeSnapshotClass is used by specifying its name in a VolumeSnapshot object. VolumeSnapshotClasses are non-namespaced

Type

object

26.1.3. VolumeSnapshotContent [snapshot.storage.k8s.io/v1]

Description

VolumeSnapshotContent represents the actual "on-disk" snapshot object in the underlying storage system

Type

object

26.2. VOLUMESNAPSHOT [SNAPSHOT.STORAGE.K8S.IO/V1]

Description

VolumeSnapshot is a user's request for either creating a point-in-time snapshot of a persistent volume, or binding to a pre-existing snapshot.

Type

object

Required

- **spec**

26.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	spec defines the desired characteristics of a snapshot requested by a user. More info: https://kubernetes.io/docs/concepts/storage/volume-snapshots#volumesnapshots Required.
status	object	status represents the current information of a snapshot. Consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.

26.2.1.1. .spec

Description

spec defines the desired characteristics of a snapshot requested by a user. More info: <https://kubernetes.io/docs/concepts/storage/volume-snapshots#volumesnapshots> Required.

Type

object

Required

- **source**

Property	Type	Description
source	object	source specifies where a snapshot will be created from. This field is immutable after creation. Required.
volumeSnapshotClassName	string	VolumeSnapshotClassName is the name of the VolumeSnapshotClass requested by the VolumeSnapshot. VolumeSnapshotClassName may be left nil to indicate that the default SnapshotClass should be used. A given cluster may have multiple default Volume SnapshotClasses: one default per CSI Driver. If a VolumeSnapshot does not specify a SnapshotClass, VolumeSnapshotSource will be checked to figure out what the associated CSI Driver is, and the default VolumeSnapshotClass associated with that CSI Driver will be used. If more than one VolumeSnapshotClass exist for a given CSI Driver and more than one have been marked as default, CreateSnapshot will fail and generate an event. Empty string is not allowed for this field.

26.2.1.2. .spec.source**Description**

source specifies where a snapshot will be created from. This field is immutable after creation. Required.

Type

object

Property	Type	Description
persistentVolumeClaimName	string	persistentVolumeClaimName specifies the name of the PersistentVolumeClaim object representing the volume from which a snapshot should be created. This PVC is assumed to be in the same namespace as the VolumeSnapshot object. This field should be set if the snapshot does not exist, and needs to be created. This field is immutable.
volumeSnapshotContentName	string	volumeSnapshotContentName specifies the name of a pre-existing VolumeSnapshotContent object representing an existing volume snapshot. This field should be set if the snapshot already exists and only needs a representation in Kubernetes. This field is immutable.

26.2.1.3. .status

Description

status represents the current information of a snapshot. Consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
boundVolumeSnapshotContentName	string	boundVolumeSnapshotContentName is the name of the VolumeSnapshotContent object to which this VolumeSnapshot object intends to bind to. If not specified, it indicates that the VolumeSnapshot object has not been successfully bound to a VolumeSnapshotContent object yet. NOTE: To avoid possible security issues, consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.
creationTime	string	creationTime is the timestamp when the point-in-time snapshot is taken by the underlying storage system. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "creation_time" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "creation_time" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. If not specified, it may indicate that the creation time of the snapshot is unknown.

Property	Type	Description
error	object	error is the last observed error during snapshot creation, if any. This field could be helpful to upper level controllers(i.e., application controller) to decide whether they should continue on waiting for the snapshot to be created based on the type of error reported. The snapshot controller will keep retrying when an error occurs during the snapshot creation. Upon success, this error field will be cleared.
readyToUse	boolean	readyToUse indicates if the snapshot is ready to be used to restore a volume. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "ready_to_use" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "ready_to_use" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it, otherwise, this field will be set to "True". If not specified, it means the readiness of a snapshot is unknown.

Property	Type	Description
restoreSize	integer-or-string	restoreSize represents the minimum size of volume required to create a volume from this snapshot. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "size_bytes" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "size_bytes" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. When restoring a volume from this snapshot, the size of the volume MUST NOT be smaller than the restoreSize if it is specified, otherwise the restoration will fail. If not specified, it indicates that the size is unknown.

26.2.1.4. .status.error

Description

error is the last observed error during snapshot creation, if any. This field could be helpful to upper level controllers(i.e., application controller) to decide whether they should continue on waiting for the snapshot to be created based on the type of error reported. The snapshot controller will keep retrying when an error occurs during the snapshot creation. Upon success, this error field will be cleared.

Type

object

Property	Type	Description
message	string	message is a string detailing the encountered error during snapshot creation if specified. NOTE: message may be logged, and it should not contain sensitive information.
time	string	time is the timestamp when the error was encountered.

26.2.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshots**
 - **GET**: list objects of kind VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots**
 - **DELETE**: delete collection of VolumeSnapshot
 - **GET**: list objects of kind VolumeSnapshot
 - **POST**: create a VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots/{name}**
 - **DELETE**: delete a VolumeSnapshot
 - **GET**: read the specified VolumeSnapshot
 - **PATCH**: partially update the specified VolumeSnapshot
 - **PUT**: replace the specified VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots/{name}/status**
 - **GET**: read status of the specified VolumeSnapshot
 - **PATCH**: partially update status of the specified VolumeSnapshot
 - **PUT**: replace status of the specified VolumeSnapshot

26.2.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshots

Table 26.1. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

POST**Description**

create a VolumeSnapshot

Table 26.9. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 26.10. Body parameters

Parameter	Type	Description
body	VolumeSnapshot schema	

Table 26.11. HTTP responses

HTTP code	Response body
200 - OK	VolumeSnapshot schema
201 - Created	VolumeSnapshot schema
202 - Accepted	VolumeSnapshot schema

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a VolumeSnapshot

Table 26.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 26.19. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 26.20. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 26.21. HTTP responses

HTTP code	Response body
200 - OK	VolumeSnapshot schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace the specified VolumeSnapshot

Table 26.22. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

26.3. VOLUMESNAPSHOTCLASS [SNAPSHOT.STORAGE.K8S.IO/V1]

Description

VolumeSnapshotClass specifies parameters that a underlying storage system uses when creating a volume snapshot. A specific VolumeSnapshotClass is used by specifying its name in a VolumeSnapshot object. VolumeSnapshotClasses are non-namespaced

Type

object

Required

- **deletionPolicy**
- **driver**

26.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
deletionPolicy	string	deletionPolicy determines whether a VolumeSnapshotContent created through the VolumeSnapshotClass should be deleted when its bound VolumeSnapshot is deleted. Supported values are "Retain" and "Delete". "Retain" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are kept. "Delete" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are deleted. Required.
driver	string	driver is the name of the storage driver that handles this VolumeSnapshotClass. Required.
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
parameters	object (string)	parameters is a key-value map with storage driver specific parameters for creating snapshots. These values are opaque to Kubernetes.

26.3.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses**
 - **DELETE**: delete collection of VolumeSnapshotClass
 - **GET**: list objects of kind VolumeSnapshotClass
 - **POST**: create a VolumeSnapshotClass
- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses/{name}**
 - **DELETE**: delete a VolumeSnapshotClass
 - **GET**: read the specified VolumeSnapshotClass
 - **PATCH**: partially update the specified VolumeSnapshotClass
 - **PUT**: replace the specified VolumeSnapshotClass

26.3.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses

Table 26.35. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of VolumeSnapshotClass

Table 26.36. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

DELETE

Description

delete a VolumeSnapshotClass

Table 26.45. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

26.4. VOLUMESNAPSHOTCONTENT [SNAPSHOT.STORAGE.K8S.IO/V1]

Description

VolumeSnapshotContent represents the actual "on-disk" snapshot object in the underlying storage system

Type

object

Required

- **spec**

26.4.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	spec defines properties of a VolumeSnapshotContent created by the underlying storage system. Required.

Property	Type	Description
status	object	status represents the current information of a snapshot.

26.4.1.1. .spec

Description

spec defines properties of a VolumeSnapshotContent created by the underlying storage system.
Required.

Type

object

Required

- **deletionPolicy**
- **driver**
- **source**
- **volumeSnapshotRef**

Property	Type	Description
----------	------	-------------

Property	Type	Description
deletionPolicy	string	deletionPolicy determines whether this VolumeSnapshotContent and its physical snapshot on the underlying storage system should be deleted when its bound VolumeSnapshot is deleted. Supported values are "Retain" and "Delete". "Retain" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are kept. "Delete" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are deleted. For dynamically provisioned snapshots, this field will automatically be filled in by the CSI snapshotter sidecar with the "DeletionPolicy" field defined in the corresponding VolumeSnapshotClass. For pre-existing snapshots, users MUST specify this field when creating the VolumeSnapshotContent object. Required.
driver	string	driver is the name of the CSI driver used to create the physical snapshot on the underlying storage system. This MUST be the same as the name returned by the CSI GetPluginName() call for that driver. Required.
source	object	source specifies whether the snapshot is (or should be) dynamically provisioned or already exists, and just requires a Kubernetes object representation. This field is immutable after creation. Required.

Property	Type	Description
sourceVolumeMode	string	SourceVolumeMode is the mode of the volume whose snapshot is taken. Can be either "Filesystem" or "Block". If not specified, it indicates the source volume's mode is unknown. This field is immutable. This field is an alpha field.
volumeSnapshotClassName	string	name of the VolumeSnapshotClass from which this snapshot was (or will be) created. Note that after provisioning, the VolumeSnapshotClass may be deleted or recreated with different set of values, and as such, should not be referenced post-snapshot creation.
volumeSnapshotRef	object	volumeSnapshotRef specifies the VolumeSnapshot object to which this VolumeSnapshotContent object is bound. VolumeSnapshot.Spec.VolumeSnapshotContentName field must reference to this VolumeSnapshotContent's name for the bidirectional binding to be valid. For a pre-existing VolumeSnapshotContent object, name and namespace of the VolumeSnapshot object MUST be provided for binding to happen. This field is immutable after creation. Required.

26.4.1.2. .spec.source

Description

source specifies whether the snapshot is (or should be) dynamically provisioned or already exists, and just requires a Kubernetes object representation. This field is immutable after creation. Required.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
snapshotHandle	string	snapshotHandle specifies the CSI "snapshot_id" of a pre-existing snapshot on the underlying storage system for which a Kubernetes object representation was (or should be) created. This field is immutable.
volumeHandle	string	volumeHandle specifies the CSI "volume_id" of the volume from which a snapshot should be dynamically taken from. This field is immutable.

26.4.1.3. .spec.volumeSnapshotRef

Description

volumeSnapshotRef specifies the VolumeSnapshot object to which this VolumeSnapshotContent object is bound. VolumeSnapshot.Spec.VolumeSnapshotContentName field must reference to this VolumeSnapshotContent's name for the bidirectional binding to be valid. For a pre-existing VolumeSnapshotContent object, name and namespace of the VolumeSnapshot object **MUST** be provided for binding to happen. This field is immutable after creation. Required.

Type

object

Property	Type	Description
apiVersion	string	API version of the referent.

Property	Type	Description
fieldPath	string	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object. TODO: this design is not final and this field is subject to change in the future.
kind	string	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	string	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	string	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	string	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency

Property	Type	Description
uid	string	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

26.4.1.4. .status

Description

status represents the current information of a snapshot.

Type

object

Property	Type	Description
creationTime	integer	creationTime is the timestamp when the point-in-time snapshot is taken by the underlying storage system. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "creation_time" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "creation_time" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. If not specified, it indicates the creation time is unknown. The format of this field is a Unix nanoseconds time encoded as an int64. On Unix, the command date +%s%N returns the current time in nanoseconds since 1970-01-01 00:00:00 UTC.
error	object	error is the last observed error during snapshot creation, if any. Upon success after retry, this error field will be cleared.

Property	Type	Description
readyToUse	boolean	readyToUse indicates if a snapshot is ready to be used to restore a volume. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "ready_to_use" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "ready_to_use" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it, otherwise, this field will be set to "True". If not specified, it means the readiness of a snapshot is unknown.
restoreSize	integer	restoreSize represents the complete size of the snapshot in bytes. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "size_bytes" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "size_bytes" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. When restoring a volume from this snapshot, the size of the volume MUST NOT be smaller than the restoreSize if it is specified, otherwise the restoration will fail. If not specified, it indicates that the size is unknown.
snapshotHandle	string	snapshotHandle is the CSI "snapshot_id" of a snapshot on the underlying storage system. If not specified, it indicates that dynamic snapshot creation has either failed or it is still in progress.

26.4.1.5. .status.error

Description

error is the last observed error during snapshot creation, if any. Upon success after retry, this error field will be cleared.

Type

object

Property	Type	Description
message	string	message is a string detailing the encountered error during snapshot creation if specified. NOTE: message may be logged, and it should not contain sensitive information.
time	string	time is the timestamp when the error was encountered.

26.4.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents**
 - **DELETE**: delete collection of VolumeSnapshotContent
 - **GET**: list objects of kind VolumeSnapshotContent
 - **POST**: create a VolumeSnapshotContent
- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents/{name}**
 - **DELETE**: delete a VolumeSnapshotContent
 - **GET**: read the specified VolumeSnapshotContent
 - **PATCH**: partially update the specified VolumeSnapshotContent
 - **PUT**: replace the specified VolumeSnapshotContent
- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents/{name}/status**
 - **GET**: read status of the specified VolumeSnapshotContent
 - **PATCH**: partially update status of the specified VolumeSnapshotContent
 - **PUT**: replace status of the specified VolumeSnapshotContent

26.4.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents

Table 26.56. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of VolumeSnapshotContent

Table 26.57. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 26.58. HTTP responses

HTTP code	Response body

timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 26.60. HTTP responses

HTTP code	Response body
200 - OK	VolumeSnapshotContentList schema
401 - Unauthorized	Empty

HTTP method

POST**Description**

create a VolumeSnapshotContent

Table 26.61. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a VolumeSnapshotContent

Table 26.66. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

CHAPTER 27. STORAGE APIS

27.1. STORAGE APIS

27.1.1. CSIDriver [storage.k8s.io/v1]

Description

CSIDriver captures information about a Container Storage Interface (CSI) volume driver deployed on the cluster. Kubernetes attach detach controller uses this object to determine whether attach is required. Kubelet uses this object to determine whether pod information needs to be passed on mount. CSIDriver objects are non-namespaced.

Type

object

27.1.2. CSINode [storage.k8s.io/v1]

Description

CSINode holds information about all CSI drivers installed on a node. CSI drivers do not need to create the CSINode object directly. As long as they use the node-driver-registrar sidecar container, the kubelet will automatically populate the CSINode object for the CSI driver as part of kubelet plugin registration. CSINode has the same name as a node. If the object is missing, it means either there are no CSI Drivers available on the node, or the Kubelet version is low enough that it doesn't create this object. CSINode has an OwnerReference that points to the corresponding node object.

Type

object

27.1.3. CSIStorageCapacity [storage.k8s.io/v1]

Description

CSIStorageCapacity stores the result of one CSI GetCapacity call. For a given StorageClass, this describes the available capacity in a particular topology segment. This can be used when considering where to instantiate new PersistentVolumes.

For example this can express things like: - StorageClass "standard" has "1234 GiB" available in "topology.kubernetes.io/zone=us-east1" - StorageClass "localssd" has "10 GiB" available in "kubernetes.io/hostname=knnode-abc123"

The following three cases all imply that no capacity is available for a certain combination: - no object exists with suitable topology and storage class name - such an object exists, but the capacity is unset - such an object exists, but the capacity is zero

The producer of these objects can decide which approach is more suitable.

They are consumed by the kube-scheduler when a CSI driver opts into capacity-aware scheduling with CSIDriverSpec.StorageCapacity. The scheduler compares the MaximumVolumeSize against the requested size of pending volumes to filter out unsuitable nodes. If MaximumVolumeSize is unset, it falls back to a comparison against the less precise Capacity. If that is also unset, the scheduler assumes that capacity is insufficient and tries some other node.

Type

object

27.1.4. StorageClass [storage.k8s.io/v1]

Description

StorageClass describes the parameters for a class of storage for which PersistentVolumes can be dynamically provisioned.

StorageClasses are non-namespaced; the name of the storage class according to etcd is in ObjectMeta.Name.

Type

object

27.1.5. VolumeAttachment [storage.k8s.io/v1]

Description

VolumeAttachment captures the intent to attach or detach the specified volume to/from the specified node.

VolumeAttachment objects are non-namespaced.

Type

object

27.2. CSIDRIVER [STORAGE.K8S.IO/V1]

Description

CSIDriver captures information about a Container Storage Interface (CSI) volume driver deployed on the cluster. Kubernetes attach detach controller uses this object to determine whether attach is required. Kubelet uses this object to determine whether pod information needs to be passed on mount. CSIDriver objects are non-namespaced.

Type

object

Required

- **spec**

27.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object metadata. metadata.Name indicates the name of the CSI driver that this object refers to; it MUST be the same name returned by the CSI GetPluginName() call for that driver. The driver name must be 63 characters or less, beginning and ending with an alphanumeric character ([a-z0-9A-Z]) with dashes (-), dots (.), and alphanumerics between. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	CSIDriverSpec is the specification of a CSIDriver.

27.2.1.1. .spec

Description

CSIDriverSpec is the specification of a CSIDriver.

Type

object

Property	Type	Description
----------	------	-------------

Property	Type	Description
attachRequired	boolean	<p>attachRequired indicates this CSI volume driver requires an attach operation (because it implements the CSI ControllerPublishVolume() method), and that the Kubernetes attach detach controller should call the attach volume interface which checks the volumeattachment status and waits until the volume is attached before proceeding to mounting. The CSI external-attacher coordinates with CSI volume driver and updates the volumeattachment status when the attach operation is complete. If the CSIDriverRegistry feature gate is enabled and the value is specified to false, the attach operation will be skipped. Otherwise the attach operation will be called.</p> <p>This field is immutable.</p>
fsGroupPolicy	string	<p>fsGroupPolicy defines if the underlying volume supports changing ownership and permission of the volume before being mounted. Refer to the specific FSGroupPolicy values for additional details.</p> <p>This field is immutable.</p> <p>Defaults to ReadWriteOnceWithFSType, which will examine each volume to determine if Kubernetes should modify ownership and permissions of the volume. With the default policy the defined fsGroup will only be applied if a fstype is defined and the volume's access mode contains ReadWriteOnce.</p>

Property	Type	Description
podInfoOnMount	boolean	<p>podInfoOnMount indicates this CSI volume driver requires additional pod information (like podName, podUID, etc.) during mount operations, if set to true. If set to false, pod information will not be passed on mount. Default is false.</p> <p>The CSI driver specifies podInfoOnMount as part of driver deployment. If true, Kubelet will pass pod information as VolumeContext in the CSI NodePublishVolume() calls. The CSI driver is responsible for parsing and validating the information passed in as VolumeContext.</p> <p>The following VolumeContext will be passed if podInfoOnMount is set to true. This list might grow, but the prefix will be used.</p> <p>"csi.storage.k8s.io/pod.name": pod.Name "csi.storage.k8s.io/pod.namespace": pod.Namespace "csi.storage.k8s.io/pod.uid": string(pod.UID) "csi.storage.k8s.io/ephemeral": "true" if the volume is an ephemeral inline volume defined by a CSIVolumeSource, otherwise "false"</p> <p>"csi.storage.k8s.io/ephemeral" is a new feature in Kubernetes 1.16. It is only required for drivers which support both the "Persistent" and "Ephemeral" VolumeLifecycleMode. Other drivers can leave pod info disabled and/or ignore this field. As Kubernetes 1.15 doesn't support this field, drivers can only support one mode when deployed on such a cluster and the deployment determines which mode that is, for example via a command line parameter of the driver.</p> <p>This field is immutable.</p>

Property	Type	Description
requiresRepublish	boolean	<p>requiresRepublish indicates the CSI driver wants NodePublishVolume being periodically called to reflect any possible change in the mounted volume. This field defaults to false.</p> <p>Note: After a successful initial NodePublishVolume call, subsequent calls to NodePublishVolume should only update the contents of the volume. New mount points will not be seen by a running container.</p>
seLinuxMount	boolean	<p>seLinuxMount specifies if the CSI driver supports "-o context" mount option.</p> <p>When "true", the CSI driver must ensure that all volumes provided by this CSI driver can be mounted separately with different -o context options. This is typical for storage backends that provide volumes as filesystems on block devices or as independent shared volumes. Kubernetes will call NodeStage / NodePublish with "-o context=xyz" mount option when mounting a ReadWriteOncePod volume used in Pod that has explicitly set SELinux context. In the future, it may be expanded to other volume AccessModes. In any case, Kubernetes will ensure that the volume is mounted only with a single SELinux context.</p> <p>When "false", Kubernetes won't pass any special SELinux mount options to the driver. This is typical for volumes that represent subdirectories of a bigger shared filesystem.</p> <p>Default is "false".</p>

Property	Type	Description
storageCapacity	boolean	<p>storageCapacity indicates that the CSI volume driver wants pod scheduling to consider the storage capacity that the driver deployment will report by creating CSISStorageCapacity objects with capacity information, if set to true.</p> <p>The check can be enabled immediately when deploying a driver. In that case, provisioning new volumes with late binding will pause until the driver deployment has published some suitable CSISStorageCapacity object.</p> <p>Alternatively, the driver can be deployed with the field unset or false and it can be flipped later when storage capacity information has been published.</p> <p>This field was immutable in Kubernetes \leq 1.22 and now is mutable.</p>
tokenRequests	array	<p>tokenRequests indicates the CSI driver needs pods' service account tokens it is mounting volume for to do necessary authentication. Kubelet will pass the tokens in VolumeContext in the CSI NodePublishVolume calls. The CSI driver should parse and validate the following VolumeContext:</p> <pre>"csi.storage.k8s.io/serviceAccount.tokens": { "<audience>": { "token": <token>, "expirationTimestamp": <expiration timestamp in RFC3339>, }, ... }</pre> <p>Note: Audience in each TokenRequest should be different and at most one token is empty string. To receive a new token after expiry, RequiresRepublish can be used to trigger NodePublishVolume periodically.</p>

Property	Type	Description
tokenRequests[]	object	TokenRequest contains parameters of a service account token.
volumeLifecycleModes	array (string)	<p>volumeLifecycleModes defines what kind of volumes this CSI volume driver supports. The default if the list is empty is "Persistent", which is the usage defined by the CSI specification and implemented in Kubernetes via the usual PV/PVC mechanism.</p> <p>The other mode is "Ephemeral". In this mode, volumes are defined inline inside the pod spec with CSIVolumeSource and their lifecycle is tied to the lifecycle of that pod. A driver has to be aware of this because it is only going to get a NodePublishVolume call for such a volume.</p> <p>For more information about implementing this mode, see https://kubernetes-csi.github.io/docs/ephemeral-local-volumes.html A driver can support one or more of these modes and more modes may be added in the future.</p> <p>This field is beta. This field is immutable.</p>

27.2.1.2. .spec.tokenRequests

Description

tokenRequests indicates the CSI driver needs pods' service account tokens it is mounting volume for to do necessary authentication. Kubelet will pass the tokens in VolumeContext in the CSI NodePublishVolume calls. The CSI driver should parse and validate the following VolumeContext: "csi.storage.k8s.io/serviceAccount.tokens": { "<audience>": { "token": <token>, "expirationTimestamp": <expiration timestamp in RFC3339>, }, ... }

Note: Audience in each TokenRequest should be different and at most one token is empty string. To receive a new token after expiry, RequiresRepublish can be used to trigger NodePublishVolume periodically.

Type

array

27.2.1.3. .spec.tokenRequests[]

Description

TokenRequest contains parameters of a service account token.

Type

object

Required

- **audience**

Property	Type	Description
audience	string	audience is the intended audience of the token in "TokenRequestSpec". It will default to the audiences of kube apiserver.
expirationSeconds	integer	expirationSeconds is the duration of validity of the token in "TokenRequestSpec". It has the same default value of "ExpirationSeconds" in "TokenRequestSpec".

27.2.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csidrivers**
 - **DELETE**: delete collection of CSIDriver
 - **GET**: list or watch objects of kind CSIDriver
 - **POST**: create a CSIDriver
- **/apis/storage.k8s.io/v1/watch/csidrivers**
 - **GET**: watch individual changes to a list of CSIDriver. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/csidrivers/{name}**
 - **DELETE**: delete a CSIDriver
 - **GET**: read the specified CSIDriver
 - **PATCH**: partially update the specified CSIDriver
 - **PUT**: replace the specified CSIDriver
- **/apis/storage.k8s.io/v1/watch/csidrivers/{name}**

- **GET**: watch changes to an object of kind CSIDriver. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

27.2.2.1. /apis/storage.k8s.io/v1/csdrivers

Table 27.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of CSIDriver

Table 27.2. Query parameters

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	string	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Table 27.3. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 27.4. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind CSIDriver

Table 27.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.6. HTTP responses

HTTP code	Response body
200 - OK	CSIDriverList schema
401 - Unauthorized	Empty

HTTP method

POST**Description**

create a CSIDriver

Table 27.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

202 - Accepted	CSIDriver schema
401 - Unauthorized	Empty

27.2.2.2. /apis/storage.k8s.io/v1/watch/csidrivers

Table 27.10. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of CSIDriver. deprecated: use the 'watch' parameter with a list operation instead.

Table 27.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

body	DeleteOptions schema	

Table 27.16. HTTP responses

HTTP code	Response body
200 - OK	CSIDriver schema
202 - Accepted	CSIDriver schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

read the specified CSIDriver

Table 27.17. HTTP responses

HTTP code	Response body
200 - OK	CSIDriver schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified CSIDriver

Table 27.18. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 27.23. HTTP responses

HTTP code	Response body
200 - OK	CSIDriver schema
201 - Created	CSIDriver schema
401 - Unauthorized	Empty

27.2.2.4. /apis/storage.k8s.io/v1/watch/csidrivers/{name}

Table 27.24. Global path parameters

Parameter	Type	Description
name	string	name of the CSIDriver

Table 27.25. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind CSIDriver. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 27.26. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

27.3. CSINODE [STORAGE.K8S.IO/V1]

Description

CSINode holds information about all CSI drivers installed on a node. CSI drivers do not need to create the CSINode object directly. As long as they use the node-driver-registrar sidecar container, the kubelet will automatically populate the CSINode object for the CSI driver as part of kubelet plugin registration. CSINode has the same name as a node. If the object is missing, it means either there are no CSI Drivers available on the node, or the Kubelet version is low enough that it doesn't create this object. CSINode has an OwnerReference that points to the corresponding node object.

Type

object

Required

- **spec**

27.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. metadata.name must be the Kubernetes node name.
spec	object	CSINodeSpec holds information about the specification of all CSI drivers installed on a node

27.3.1.1. .spec

Description

CSINodeSpec holds information about the specification of all CSI drivers installed on a node

Type

object

Required

- **drivers**

Property	Type	Description
drivers	array	drivers is a list of information of all CSI Drivers existing on a node. If all drivers in the list are uninstalled, this can become empty.
drivers[]	object	CSINodeDriver holds information about the specification of one CSI driver installed on a node

27.3.1.2. .spec.drivers

Description

drivers is a list of information of all CSI Drivers existing on a node. If all drivers in the list are uninstalled, this can become empty.

Type

array

27.3.1.3. .spec.drivers[]

Description

CSINodeDriver holds information about the specification of one CSI driver installed on a node

Type

object

Required

- **name**
- **nodeID**

Property	Type	Description
allocatable	object	VolumeNodeResources is a set of resource limits for scheduling of volumes.
name	string	name represents the name of the CSI driver that this object refers to. This MUST be the same name returned by the CSI GetPluginName() call for that driver.
nodeID	string	nodeID of the node from the driver point of view. This field enables Kubernetes to communicate with storage systems that do not share the same nomenclature for nodes. For example, Kubernetes may refer to a given node as "node1", but the storage system may refer to the same node as "nodeA". When Kubernetes issues a command to the storage system to attach a volume to a specific node, it can use this field to refer to the node name using the ID that the storage system will understand, e.g. "nodeA" instead of "node1". This field is required.

Property	Type	Description
topologyKeys	array (string)	topologyKeys is the list of keys supported by the driver. When a driver is initialized on a cluster, it provides a set of topology keys that it understands (e.g. "company.com/zone", "company.com/region"). When a driver is initialized on a node, it provides the same topology keys along with values. Kubelet will expose these topology keys as labels on its own node object. When Kubernetes does topology aware provisioning, it can use this list to determine which labels it should retrieve from the node object and pass back to the driver. It is possible for different nodes to use different topology keys. This can be empty if driver does not support topology.

27.3.1.4. .spec.drivers[].allocatable

Description

VolumeNodeResources is a set of resource limits for scheduling of volumes.

Type

object

Property	Type	Description
count	integer	count indicates the maximum number of unique volumes managed by the CSI driver that can be used on a node. A volume that is both attached and mounted on a node is considered to be used once, not twice. The same rule applies for a unique volume that is shared among multiple pods on the same node. If this field is not specified, then the supported number of volumes on this node is unbounded.

27.3.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csinodes**
 - **DELETE**: delete collection of CSINode
 - **GET**: list or watch objects of kind CSINode
 - **POST**: create a CSINode
- **/apis/storage.k8s.io/v1/watch/csinodes**
 - **GET**: watch individual changes to a list of CSINode. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/csinodes/{name}**
 - **DELETE**: delete a CSINode
 - **GET**: read the specified CSINode
 - **PATCH**: partially update the specified CSINode
 - **PUT**: replace the specified CSINode
- **/apis/storage.k8s.io/v1/watch/csinodes/{name}**
 - **GET**: watch changes to an object of kind CSINode. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

27.3.2.1. /apis/storage.k8s.io/v1/csinodes

Table 27.27. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of CSINode

Table 27.28. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method
GET

Description

watch individual changes to a list of CSINode. deprecated: use the 'watch' parameter with a list operation instead.

Table 27.37. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

27.3.2.3. /apis/storage.k8s.io/v1/csinodes/{name}**Table 27.38. Global path parameters**

Parameter	Type	Description
name	string	name of the CSINode

Table 27.39. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method**DELETE****Description**

delete a CSINode

Table 27.40. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

read the specified CSINode

Table 27.43. HTTP responses

HTTP code	Reponse body
200 - OK	CSINode schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified CSINode

Table 27.44. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 27.45. Body parameters

Table 27.50. Global path parameters

Parameter	Type	Description
name	string	name of the CSINode

Table 27.51. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

27.4. CSISTORAGECAPACITY [STORAGE.K8S.IO/V1]

Description

CSISStorageCapacity stores the result of one CSI GetCapacity call. For a given StorageClass, this describes the available capacity in a particular topology segment. This can be used when considering where to instantiate new PersistentVolumes.

For example this can express things like: - StorageClass "standard" has "1234 GiB" available in "topology.kubernetes.io/zone=us-east1" - StorageClass "localssd" has "10 GiB" available in "kubernetes.io/hostname=knnode-abc123"

The following three cases all imply that no capacity is available for a certain combination: - no object exists with suitable topology and storage class name - such an object exists, but the capacity is unset - such an object exists, but the capacity is zero

The producer of these objects can decide which approach is more suitable.

They are consumed by the kube-scheduler when a CSI driver opts into capacity-aware scheduling with CSIDriverSpec.StorageCapacity. The scheduler compares the MaximumVolumeSize against the requested size of pending volumes to filter out unsuitable nodes. If MaximumVolumeSize is unset, it falls back to a comparison against the less precise Capacity. If that is also unset, the scheduler assumes that capacity is insufficient and tries some other node.

Type

object

Required

- **storageClassName**

27.4.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
capacity	Quantity	<p>capacity is the value reported by the CSI driver in its GetCapacityResponse for a GetCapacityRequest with topology and parameters that match the previous fields.</p> <p>The semantic is currently (CSI spec 1.2) defined as: The available capacity, in bytes, of the storage that can be used to provision volumes. If not set, that information is currently unavailable.</p>
kind	string	<p>Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</p>
maximumVolumeSize	Quantity	<p>maximumVolumeSize is the value reported by the CSI driver in its GetCapacityResponse for a GetCapacityRequest with topology and parameters that match the previous fields.</p> <p>This is defined since CSI spec 1.4.0 as the largest size that may be used in a CreateVolumeRequest.capacity_range.required_bytes field to create a volume with the same parameters as those in GetCapacityRequest. The corresponding value in the Kubernetes API is ResourceRequirements.Requests in a volume claim.</p>

Property	Type	Description
metadata	ObjectMeta	<p>Standard object's metadata. The name has no particular meaning. It must be a DNS subdomain (dots allowed, 253 characters). To ensure that there are no conflicts with other CSI drivers on the cluster, the recommendation is to use <code>csisc-<uuid></code>, a generated name, or a reverse-domain name which ends with the unique CSI driver name.</p> <p>Objects are namespaced.</p> <p>More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>
nodeTopology	LabelSelector	<p><code>nodeTopology</code> defines which nodes have access to the storage for which capacity was reported. If not set, the storage is not accessible from any node in the cluster. If empty, the storage is accessible from all nodes. This field is immutable.</p>
storageClassName	string	<p><code>storageClassName</code> represents the name of the <code>StorageClass</code> that the reported capacity applies to. It must meet the same requirements as the name of a <code>StorageClass</code> object (non-empty, DNS subdomain). If that object no longer exists, the <code>CSISStorageCapacity</code> object is obsolete and should be removed by its creator. This field is immutable.</p>

27.4.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csistoragecapacities**
 - **GET**: list or watch objects of kind `CSISStorageCapacity`

- **/apis/storage.k8s.io/v1/watch/csistoragecapacities**
 - **GET**: watch individual changes to a list of CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/namespaces/{namespace}/csistoragecapacities**
 - **DELETE**: delete collection of CSIStorageCapacity
 - **GET**: list or watch objects of kind CSIStorageCapacity
 - **POST**: create a CSIStorageCapacity
- **/apis/storage.k8s.io/v1/watch/namespaces/{namespace}/csistoragecapacities**
 - **GET**: watch individual changes to a list of CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/namespaces/{namespace}/csistoragecapacities/{name}**
 - **DELETE**: delete a CSIStorageCapacity
 - **GET**: read the specified CSIStorageCapacity
 - **PATCH**: partially update the specified CSIStorageCapacity
 - **PUT**: replace the specified CSIStorageCapacity
- **/apis/storage.k8s.io/v1/watch/namespaces/{namespace}/csistoragecapacities/{name}**
 - **GET**: watch changes to an object of kind CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

27.4.2.1. /apis/storage.k8s.io/v1/csistoragecapacities

Table 27.53. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch individual changes to a list of CSISStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead.

Table 27.58. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of CSISStorageCapacity

Table 27.59. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind CSIStorageCapacity

Table 27.62. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

POST

Descriptioncreate a `CSIStorageCapacity`**Table 27.64. Query parameters**

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized <code>dryRun</code> directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	<code>fieldManager</code> is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	<code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a <code>BadRequest</code> error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 27.83. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 27.84. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

27.5. STORAGECLASS [STORAGE.K8S.IO/V1]

Description

StorageClass describes the parameters for a class of storage for which PersistentVolumes can be dynamically provisioned.

StorageClasses are non-namespaced; the name of the storage class according to etcd is in ObjectMeta.Name.

Type

object

Required

- **provisioner**

27.5.1. Specification

Property	Type	Description
allowVolumeExpansion	boolean	allowVolumeExpansion shows whether the storage class allow volume expand.
allowedTopologies	array (TopologySelectorTerm)	allowedTopologies restrict the node topologies where volumes can be dynamically provisioned. Each volume plugin defines its own supported topology specifications. An empty TopologySelectorTerm list means there is no topology restriction. This field is only honored by servers that enable the VolumeScheduling feature.

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
mountOptions	array (string)	mountOptions controls the mountOptions for dynamically provisioned PersistentVolumes of this storage class. e.g. ["ro", "soft"]. Not validated - mount of the PVs will simply fail if one is invalid.
parameters	object (string)	parameters holds the parameters for the provisioner that should create volumes of this storage class.
provisioner	string	provisioner indicates the type of the provisioner.

Property	Type	Description
reclaimPolicy	string	<p>reclaimPolicy controls the reclaimPolicy for dynamically provisioned PersistentVolumes of this storage class. Defaults to Delete.</p> <p>Possible enum values: - "Delete" means the volume will be deleted from Kubernetes on release from its claim. The volume plugin must support Deletion. - "Recycle" means the volume will be recycled back into the pool of unbound persistent volumes on release from its claim. The volume plugin must support Recycling. - "Retain" means the volume will be left in its current phase (Released) for manual reclamation by the administrator. The default policy is Retain.</p>
volumeBindingMode	string	<p>volumeBindingMode indicates how PersistentVolumeClaims should be provisioned and bound. When unset, VolumeBindingImmediate is used. This field is only honored by servers that enable the VolumeScheduling feature.</p> <p>Possible enum values: - "Immediate" indicates that PersistentVolumeClaims should be immediately provisioned and bound. This is the default mode. - "WaitForFirstConsumer" indicates that PersistentVolumeClaims should not be provisioned and bound until the first Pod is created that references the PersistentVolumeClaim. The volume provisioning and binding will occur during Pod scheduling.</p>

27.5.2. API endpoints

The following API endpoints are available:

- `/apis/storage.k8s.io/v1/storageclasses`

- **DELETE**: delete collection of StorageClass
- **GET**: list or watch objects of kind StorageClass
- **POST**: create a StorageClass
- **/apis/storage.k8s.io/v1/watch/storageclasses**
 - **GET**: watch individual changes to a list of StorageClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/storageclasses/{name}**
 - **DELETE**: delete a StorageClass
 - **GET**: read the specified StorageClass
 - **PATCH**: partially update the specified StorageClass
 - **PUT**: replace the specified StorageClass
- **/apis/storage.k8s.io/v1/watch/storageclasses/{name}**
 - **GET**: watch changes to an object of kind StorageClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

27.5.2.1. /apis/storage.k8s.io/v1/storageclasses

Table 27.85. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of StorageClass

Table 27.86. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
gracePeriodSeconds	integer	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
labelSelector	string	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
propagationPolicy	string	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Table 27.87. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 27.88. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind StorageClass

Table 27.89. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.90. HTTP responses

HTTP code	Response body
200 - OK	StorageClassList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a StorageClass

Table 27.91. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

HTTP method

DELETE

Description

delete a StorageClass

Table 27.98. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 27.108. Global path parameters

Parameter	Type	Description
name	string	name of the StorageClass

Table 27.109. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind StorageClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 27.110. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

27.6. VOLUMEATTACHMENT [STORAGE.K8S.IO/V1]

Description

VolumeAttachment captures the intent to attach or detach the specified volume to/from the specified node.

VolumeAttachment objects are non-namespaced.

Type

object

Required

- **spec**

27.6.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	VolumeAttachmentSpec is the specification of a VolumeAttachment request.
status	object	VolumeAttachmentStatus is the status of a VolumeAttachment request.

27.6.1.1. .spec

Description

VolumeAttachmentSpec is the specification of a VolumeAttachment request.

Type

object

Required

- **attacher**
- **source**
- **nodeName**

Property	Type	Description
attacher	string	attacher indicates the name of the volume driver that MUST handle this request. This is the name returned by GetPluginName().
nodeName	string	nodeName represents the node that the volume should be attached to.

Property	Type	Description
source	object	VolumeAttachmentSource represents a volume that should be attached. Right now only PersistentVolumes can be attached via external attacher, in future we may allow also inline volumes in pods. Exactly one member can be set.

27.6.1.2. .spec.source

Description

VolumeAttachmentSource represents a volume that should be attached. Right now only PersistentVolumes can be attached via external attacher, in future we may allow also inline volumes in pods. Exactly one member can be set.

Type

object

Property	Type	Description
inlineVolumeSpec	PersistentVolumeSpec	inlineVolumeSpec contains all the information necessary to attach a persistent volume defined by a pod's inline VolumeSource. This field is populated only for the CSIMigration feature. It contains translated fields from a pod's inline VolumeSource to a PersistentVolumeSpec. This field is beta-level and is only honored by servers that enabled the CSIMigration feature.
persistentVolumeName	string	persistentVolumeName represents the name of the persistent volume to attach.

27.6.1.3. .status

Description

VolumeAttachmentStatus is the status of a VolumeAttachment request.

Type

object

Required

- **attached**

Property	Type	Description
attachError	object	VolumeError captures an error encountered during a volume operation.
attached	boolean	attached indicates the volume is successfully attached. This field must only be set by the entity completing the attach operation, i.e. the external-attacher.
attachmentMetadata	object (string)	attachmentMetadata is populated with any information returned by the attach operation, upon successful attach, that must be passed into subsequent WaitForAttach or Mount calls. This field must only be set by the entity completing the attach operation, i.e. the external-attacher.
detachError	object	VolumeError captures an error encountered during a volume operation.

27.6.1.4. .status.attachError

Description

VolumeError captures an error encountered during a volume operation.

Type

object

Property	Type	Description
message	string	message represents the error encountered during Attach or Detach operation. This string may be logged, so it should not contain sensitive information.
time	Time	time represents the time the error was encountered.

27.6.1.5. .status.detachError

Description

VolumeError captures an error encountered during a volume operation.

Type
object

Property	Type	Description
message	string	message represents the error encountered during Attach or Detach operation. This string may be logged, so it should not contain sensitive information.
time	Time	time represents the time the error was encountered.

27.6.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/volumeattachments**
 - **DELETE**: delete collection of VolumeAttachment
 - **GET**: list or watch objects of kind VolumeAttachment
 - **POST**: create a VolumeAttachment
- **/apis/storage.k8s.io/v1/watch/volumeattachments**
 - **GET**: watch individual changes to a list of VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/volumeattachments/{name}**
 - **DELETE**: delete a VolumeAttachment
 - **GET**: read the specified VolumeAttachment
 - **PATCH**: partially update the specified VolumeAttachment
 - **PUT**: replace the specified VolumeAttachment
- **/apis/storage.k8s.io/v1/watch/volumeattachments/{name}**
 - **GET**: watch changes to an object of kind VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/storage.k8s.io/v1/volumeattachments/{name}/status**
 - **GET**: read status of the specified VolumeAttachment
 - **PATCH**: partially update status of the specified VolumeAttachment
 - **PUT**: replace status of the specified VolumeAttachment

27.6.2.1. /apis/storage.k8s.io/v1/volumeattachments

Table 27.111. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of VolumeAttachment

Table 27.112. Query parameters

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	string	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

200 - OK	Status schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind VolumeAttachment

Table 27.115. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.116. HTTP responses

HTTP code	Response body

HTTP method

POST**Description**

create a VolumeAttachment

Table 27.117. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 27.120. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

200 - OK	VolumeAttachment schema
201 - Created	VolumeAttachment schema
401 - Unauthorized	Empty

27.6.2.4. /apis/storage.k8s.io/v1/watch/volumeattachments/{name}

Table 27.134. Global path parameters

Parameter	Type	Description
name	string	name of the VolumeAttachment

Table 27.135. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

CHAPTER 28. STORAGE VERSION MIGRATION APIS

28.1. STORAGE VERSION MIGRATION APIS

28.1.1. StorageVersionMigration [migration.k8s.io/v1alpha1]

Description

StorageVersionMigration represents a migration of stored data to the latest storage version.

Type

object

28.2. STORAGEVERSIONMIGRATION [MIGRATION.K8S.IO/V1ALPHA1]

Description

StorageVersionMigration represents a migration of stored data to the latest storage version.

Type

object

28.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	Specification of the migration.
status	object	Status of the migration.

28.2.1.1. .spec

Description

Specification of the migration.

Type

object

Required

- **resource**

Property	Type	Description
continueToken	string	The token used in the list options to get the next chunk of objects to migrate. When the <code>.status.conditions</code> indicates the migration is "Running", users can use this token to check the progress of the migration.
resource	object	The resource that is being migrated. The migrator sends requests to the endpoint serving the resource. Immutable.

28.2.1.2. .spec.resource

Description

The resource that is being migrated. The migrator sends requests to the endpoint serving the resource. Immutable.

Type

object

Property	Type	Description
group	string	The name of the group.
resource	string	The name of the resource.
version	string	The name of the version.

28.2.1.3. .status

Description

Status of the migration.

Type

object

Property	Type	Description
conditions	array	The latest available observations of the migration's current state.
conditions[]	object	Describes the state of a migration at a certain point.

28.2.1.4. .status.conditions

Description

The latest available observations of the migration's current state.

Type

array

28.2.1.5. .status.conditions[]

Description

Describes the state of a migration at a certain point.

Type

object

Required

- **status**
- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
lastUpdateTime	string	The last time this condition was updated.
message	string	A human readable message indicating details about the transition.
reason	string	The reason for the condition's last transition.
status	string	Status of the condition, one of True, False, Unknown.
type	string	Type of the condition.

28.2.2. API endpoints

The following API endpoints are available:

- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations**
 - **DELETE:** delete collection of StorageVersionMigration
 - **GET:** list objects of kind StorageVersionMigration
 - **POST:** create a StorageVersionMigration
- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations/{name}**
 - **DELETE:** delete a StorageVersionMigration
 - **GET:** read the specified StorageVersionMigration
 - **PATCH:** partially update the specified StorageVersionMigration
 - **PUT:** replace the specified StorageVersionMigration
- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations/{name}/status**
 - **GET:** read status of the specified StorageVersionMigration
 - **PATCH:** partially update status of the specified StorageVersionMigration
 - **PUT:** replace status of the specified StorageVersionMigration

28.2.2.1. /apis/migration.k8s.io/v1alpha1/storageversionmigrations

Table 28.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of StorageVersionMigration

Table 28.2. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 28.5. HTTP responses

HTTP code	Reponse body
200 - OK	StorageVersionMigrationList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a StorageVersionMigration

Table 28.6. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a StorageVersionMigration

Table 28.11. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 28.12. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 28.13. HTTP responses

HTTP code	Response body
200 - OK	Status schema
202 - Accepted	Status schema
401 - Unauthorized	Empty

HTTP method**GET****Description**

read the specified StorageVersionMigration

Table 28.14. Query parameters

Parameter	Type	Description
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Table 28.15. HTTP responses

HTTP code	Response body
200 - OK	StorageVersionMigration schema
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update the specified StorageVersionMigration

Table 28.16. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 28.17. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 28.18. HTTP responses

HTTP code	Response body
200 - OK	StorageVersionMigration schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace the specified StorageVersionMigration

Table 28.19. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

CHAPTER 29. TOPOLVM APIS

29.1. TOPOLVM APIS

29.1.1. LogicalVolume [topolvm.io/v1]

Description

LogicalVolume is the Schema for the logicalvolumes API

Type

object

29.2. LOGICALVOLUME [TOPOLVM.IO/V1]

Description

LogicalVolume is the Schema for the logicalvolumes API

Type

object

29.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
metadata	ObjectMeta	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	object	LogicalVolumeSpec defines the desired state of LogicalVolume
status	object	LogicalVolumeStatus defines the observed state of LogicalVolume

29.2.1.1. .spec

Description

LogicalVolumeSpec defines the desired state of LogicalVolume

Type

object

Required

- **name**
- **nodeName**
- **size**

Property	Type	Description
accessType	string	'accessType' specifies how the user intends to consume the snapshot logical volume. Set to "ro" when creating a snapshot and to "rw" when restoring a snapshot or creating a clone. This field is populated only when LogicalVolume has a source.
deviceClass	string	
name	string	
nodeName	string	
size	integer-or-string	

Property	Type	Description
source	string	'source' specifies the logicalvolume name of the source; if present. This field is populated only when LogicalVolume has a source.

29.2.1.2. .status

Description

LogicalVolumeStatus defines the observed state of LogicalVolume

Type

object

Property	Type	Description
code	integer	A Code is an unsigned 32-bit error code as defined in the gRPC spec.
currentSize	integer-or-string	
message	string	
volumeID	string	INSERT ADDITIONAL STATUS FIELD - define observed state of cluster Important: Run "make" to regenerate code after modifying this file

29.2.2. API endpoints

The following API endpoints are available:

- **/apis/topolvm.io/v1/logicalvolumes**
 - **DELETE:** delete collection of LogicalVolume
 - **GET:** list objects of kind LogicalVolume
 - **POST:** create a LogicalVolume
- **/apis/topolvm.io/v1/logicalvolumes/{name}**
 - **DELETE:** delete a LogicalVolume
 - **GET:** read the specified LogicalVolume

- **PATCH**: partially update the specified LogicalVolume
- **PUT**: replace the specified LogicalVolume
- **/apis/topolvm.io/v1/logicalvolumes/{name}/status**
 - **GET**: read status of the specified LogicalVolume
 - **PATCH**: partially update status of the specified LogicalVolume
 - **PUT**: replace status of the specified LogicalVolume

29.2.2.1. /apis/topolvm.io/v1/logicalvolumes

Table 29.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of LogicalVolume

Table 29.2. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 29.3. HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method

GET

Description

list objects of kind LogicalVolume

Table 29.4. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
name	string	name of the LogicalVolume

Table 29.10. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete a LogicalVolume

Table 29.11. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

201 - Created	LogicalVolume schema
401 - Unauthorized	Empty

29.2.2.3. /apis/topolvm.io/v1/logicalvolumes/{name}/status

Table 29.22. Global path parameters

Parameter	Type	Description
name	string	name of the LogicalVolume

Table 29.23. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method**GET****Description**

read status of the specified LogicalVolume

Table 29.24. Query parameters

Parameter	Type	Description
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Table 29.25. HTTP responses

HTTP code	Response body
200 - OK	LogicalVolume schema
401 - Unauthorized	Empty

HTTP method**PATCH****Description**

partially update status of the specified LogicalVolume

Table 29.26. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 29.27. Body parameters

Parameter	Type	Description
body	Patch schema	

Table 29.28. HTTP responses

HTTP code	Response body
200 - OK	LogicalVolume schema
401 - Unauthorized	Empty

HTTP method**PUT****Description**

replace status of the specified LogicalVolume

Table 29.29. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 29.30. Body parameters

CHAPTER 30. WEBHOOK APIS

30.1. WEBHOOK APIS

30.1.1. MutatingWebhookConfiguration [admissionregistration.k8s.io/v1]

Description

MutatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and may change the object.

Type

object

30.1.2. ValidatingWebhookConfiguration [admissionregistration.k8s.io/v1]

Description

ValidatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and object without changing it.

Type

object

30.2. MUTATINGWEBHOOKCONFIGURATION [ADMISSIONREGISTRATION.K8S.IO/V1]

Description

MutatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and may change the object.

Type

object

30.2.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

Property	Type	Description
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object metadata; More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata .
webhooks	array	Webhooks is a list of webhooks and the affected resources and operations.
webhooks[]	object	MutatingWebhook describes an admission webhook and the resources and operations it applies to.

30.2.1.1. .webhooks

Description

Webhooks is a list of webhooks and the affected resources and operations.

Type

array

30.2.1.2. .webhooks[]

Description

MutatingWebhook describes an admission webhook and the resources and operations it applies to.

Type

object

Required

- **name**
- **clientConfig**
- **sideEffects**

- **admissionReviewVersions**

Property	Type	Description
admissionReviewVersions	array (string)	AdmissionReviewVersions is an ordered list of preferred AdmissionReview versions the Webhook expects. API server will try to use first version in the list which it supports. If none of the versions specified in this list supported by API server, validation will fail for this object. If a persisted webhook configuration specifies allowed versions and does not include any versions known to the API Server, calls to the webhook will fail and be subject to the failure policy.
clientConfig	object	WebhookClientConfig contains the information to make a TLS connection with the webhook
failurePolicy	string	FailurePolicy defines how unrecognized errors from the admission endpoint are handled - allowed values are Ignore or Fail. Defaults to Fail. Possible enum values: - "Fail" means that an error calling the webhook causes the admission to fail. - "Ignore" means that an error calling the webhook is ignored.

Property	Type	Description
matchConditions	array	<p>MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.</p> <p>The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped</p> <p>This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.</p>
matchConditions[]	object	MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Property	Type	Description
matchPolicy	string	<p>matchPolicy defines how the "rules" list is used to match incoming requests. Allowed values are "Exact" or "Equivalent".</p> <ul style="list-style-type: none"> - Exact: match a request only if it exactly matches a specified rule. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, but "rules" only included apiGroups: ["apps"], apiVersions:["v1"], resources: ["deployments"], a request to apps/v1beta1 or extensions/v1beta1 would not be sent to the webhook. - Equivalent: match a request if modifies a resource listed in rules, even via another API group or version. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, and "rules" only included apiGroups: ["apps"], apiVersions:["v1"], resources: ["deployments"], a request to apps/v1beta1 or extensions/v1beta1 would be converted to apps/v1 and sent to the webhook. <p>Defaults to "Equivalent"</p> <p>Possible enum values: - "Equivalent" means requests should be sent to the webhook if they modify a resource listed in rules via another API group or version. - "Exact" means requests should only be sent to the webhook if they exactly match a given rule.</p>

Property	Type	Description
name	string	The name of the admission webhook. Name should be fully qualified, e.g., imagepolicy.kubernetes.io, where "imagepolicy" is the name of the webhook, and kubernetes.io is the name of the organization. Required.
namespaceSelector	LabelSelector	<p>NamespaceSelector decides whether to run the webhook on an object based on whether the namespace for that object matches the selector. If the object itself is a namespace, the matching is performed on object.metadata.labels. If the object is another cluster scoped resource, it never skips the webhook.</p> <p>For example, to run the webhook on any objects whose namespace is not associated with "runlevel" of "0" or "1"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [{ "key": "runlevel", "operator": "NotIn", "values": ["0", "1"] }] }</p> <p>If instead you want to only run the webhook on any objects whose namespace is associated with the "environment" of "prod" or "staging"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [{ "key": "environment", "operator": "In", "values": ["prod", "staging"] }] }</p> <p>See https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/ for more examples of label selectors.</p> <p>Default to the empty LabelSelector, which matches everything.</p>

Property	Type	Description
objectSelector	LabelSelector	ObjectSelector decides whether to run the webhook based on if the object has matching labels. objectSelector is evaluated against both the oldObject and newObject that would be sent to the webhook, and is considered to match if either object matches the selector. A null object (oldObject in the case of create, or newObject in the case of delete) or an object that cannot have labels (like a DeploymentRollback or a PodProxyOptions object) is not considered to match. Use the object selector only if the webhook is opt-in, because end users may skip the admission webhook by setting the labels. Default to the empty LabelSelector, which matches everything.

Property	Type	Description
reinvocationPolicy	string	<p>reinvocationPolicy indicates whether this webhook should be called multiple times as part of a single admission evaluation. Allowed values are "Never" and "IfNeeded".</p> <p>Never: the webhook will not be called more than once in a single admission evaluation.</p> <p>IfNeeded: the webhook will be called at least one additional time as part of the admission evaluation if the object being admitted is modified by other admission plugins after the initial webhook call. Webhooks that specify this option must be idempotent, able to process objects they previously admitted.</p> <p>Note: * the number of additional invocations is not guaranteed to be exactly one. * if additional invocations result in further modifications to the object, webhooks are not guaranteed to be invoked again. * webhooks that use this option may be reordered to minimize the number of additional invocations. * to validate an object after all mutations are guaranteed complete, use a validating admission webhook instead.</p> <p>Defaults to "Never".</p> <p>Possible enum values: - "IfNeeded" indicates that the webhook may be called at least one additional time as part of the admission evaluation if the object being admitted is modified by other admission plugins after the initial webhook call. - "Never" indicates that the webhook must not be called more than once in a single admission evaluation.</p>

Property	Type	Description
rules	array	Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches <i>any</i> Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.
rules[]	object	RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Property	Type	Description
sideEffects	string	<p>SideEffects states whether this webhook has side effects. Acceptable values are: None, NoneOnDryRun (webhooks created via v1beta1 may also specify Some or Unknown). Webhooks with side effects MUST implement a reconciliation system, since a request may be rejected by a future step in the admission chain and the side effects therefore need to be undone. Requests with the dryRun attribute will be auto-rejected if they match a webhook with sideEffects == Unknown or Some.</p> <p>Possible enum values: - "None" means that calling the webhook will have no side effects. - "NoneOnDryRun" means that calling the webhook will possibly have side effects, but if the request being reviewed has the dry-run attribute, the side effects will be suppressed. - "Some" means that calling the webhook will possibly have side effects. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail. - "Unknown" means that no information is known about the side effects of calling the webhook. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail.</p>
timeoutSeconds	integer	<p>TimeoutSeconds specifies the timeout for this webhook. After the timeout passes, the webhook call will be ignored or the API call will fail based on the failure policy. The timeout value must be between 1 and 30 seconds. Default to 10 seconds.</p>

30.2.1.3. .webhooks[].clientConfig

Description

WebhookClientConfig contains the information to make a TLS connection with the webhook

Type

object

Property	Type	Description
caBundle	string	caBundle is a PEM encoded CA bundle which will be used to validate the webhook's server certificate. If unspecified, system trust roots on the apiserver are used.
service	object	ServiceReference holds a reference to Service.legacy.k8s.io

Property	Type	Description
url	string	<p>url gives the location of the webhook, in standard URL form (scheme://host:port/path). Exactly one of url or service must be specified.</p> <p>The host should not refer to a service running in the cluster; use the service field instead. The host might be resolved via external DNS in some apiservers (e.g., kube-apiserver cannot resolve in-cluster DNS as that would be a layering violation). host may also be an IP address.</p> <p>Please note that using localhost or 127.0.0.1 as a host is risky unless you take great care to run this webhook on all hosts which run an apiserver which might need to make calls to this webhook. Such installs are likely to be non-portable, i.e., not easy to turn up in a new cluster.</p> <p>The scheme must be "https"; the URL must begin with "https://".</p> <p>A path is optional, and if present may be any string permissible in a URL. You may use the path to pass an arbitrary string to the webhook, for example, a cluster identifier.</p> <p>Attempting to use a user or basic auth e.g. "user:password@" is not allowed. Fragments ("#...") and query parameters ("?...") are not allowed, either.</p>

30.2.1.4. .webhooks[].clientConfig.service

Description

ServiceReference holds a reference to Service.legacy.k8s.io

Type

object

Required

- **namespace**
- **name**

Property	Type	Description
name	string	name is the name of the service. Required
namespace	string	namespace is the namespace of the service. Required
path	string	path is an optional URL path which will be sent in any request to this service.
port	integer	If specified, the port on the service that hosting webhook. Default to 443 for backward compatibility. port should be a valid port number (1-65535, inclusive).

30.2.1.5. .webhooks[].matchConditions**Description**

MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.

The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped

This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.

Type

array

30.2.1.6. .webhooks[].matchConditions[]**Description**

MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Type

object

Required

- **name**

- **name**
- **expression**

Property	Type	Description
expression	string	<p>Expression represents the expression which will be evaluated by CEL. Must evaluate to bool. CEL expressions have access to the contents of the AdmissionRequest and Authorizer, organized into CEL variables:</p> <p>'object' - The object from the incoming request. The value is null for DELETE requests.</p> <p>'oldObject' - The existing object. The value is null for CREATE requests.</p> <p>'request' - Attributes of the admission request(/pkg/apis/admission/types.go#AdmissionRequest).</p> <p>'authorizer' - A CEL Authorizer. May be used to perform authorization checks for the principal (user or service account) of the request. See https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authorizer</p> <p>'authorizer.requestResource' - A CEL ResourceCheck constructed from the 'authorizer' and configured with the request resource. Documentation on CEL: https://kubernetes.io/docs/reference/using-api/cel/</p> <p>Required.</p>

Property	Type	Description
name	string	Name is an identifier for this match condition, used for strategic merging of MatchConditions, as well as providing an identifier for logging purposes. A good name should be descriptive of the associated expression. Name must be a qualified name consisting of alphanumeric characters, '-', '_' or '.', and must start and end with an alphanumeric character (e.g. 'MyName', or 'my.name', or '123-abc', regex used for validation is '([A-Za-z0-9][-A-Za-z0-9.]*)?[A-Za-z0-9]!') with an optional DNS subdomain prefix and '/' (e.g. 'example.com/MyName')
		Required.

30.2.1.7. .webhooks[].rules

Description

Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches *any* Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.

Type

array

30.2.1.8. .webhooks[].rules[]

Description

RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Type

object

Property	Type	Description
apiGroups	array (string)	APIGroups is the API groups the resources belong to. " is all groups. If " is present, the length of the slice must be one. Required.

Property	Type	Description
apiVersions	array (string)	APIVersions is the API versions the resources belong to. " is all versions. If " is present, the length of the slice must be one. Required.
operations	array (string)	Operations is the operations the admission hook cares about - CREATE, UPDATE, DELETE, CONNECT or * for all of those operations and any future admission operations that are added. If '*' is present, the length of the slice must be one. Required.
resources	array (string)	<p>Resources is a list of resources this rule applies to.</p> <p>For example: 'pods' means pods. 'pods/log' means the log subresource of pods. " means all resources, but not subresources. 'pods/' means all subresources of pods. ./scale' means all scale subresources. './*' means all resources and their subresources.</p> <p>If wildcard is present, the validation rule will ensure resources do not overlap with each other.</p> <p>Depending on the enclosing object, subresources might not be allowed. Required.</p>

Property	Type	Description
scope	string	scope specifies the scope of this rule. Valid values are "Cluster", "Namespaced", and "" "Cluster" means that only cluster-scoped resources will match this rule. Namespace API objects are cluster-scoped. "Namespaced" means that only namespaced resources will match this rule. "" means that there are no scope restrictions. Subresources match the scope of their parent resource. Default is "*".

30.2.2. API endpoints

The following API endpoints are available:

- **/apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations**
 - **DELETE**: delete collection of MutatingWebhookConfiguration
 - **GET**: list or watch objects of kind MutatingWebhookConfiguration
 - **POST**: create a MutatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations**
 - **GET**: watch individual changes to a list of MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations/{name}**
 - **DELETE**: delete a MutatingWebhookConfiguration
 - **GET**: read the specified MutatingWebhookConfiguration
 - **PATCH**: partially update the specified MutatingWebhookConfiguration
 - **PUT**: replace the specified MutatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations/{name}**
 - **GET**: watch changes to an object of kind MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

30.2.2.1. /apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations

Table 30.1. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of MutatingWebhookConfiguration

Table 30.2. Query parameters

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
fieldSelector	string	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>

Parameter	Type	Description
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	string	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Table 30.3. Body parameters

Parameter	Type	Description
body	DeleteOptions schema	

Table 30.4. HTTP responses

HTTP code	Reponse body
200 - OK	Status schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind MutatingWebhookConfiguration

Table 30.5. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 30.6. HTTP responses

HTTP code	Response body
200 - OK	MutatingWebhookConfigurationList schema
401 - Unauthorized	Empty

HTTP method

POST**Description**

create a MutatingWebhookConfiguration

Table 30.7. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 30.8. Body parameters

Parameter	Type	Description
body	MutatingWebhookConfiguration schema	

Table 30.9. HTTP responses

HTTP code	Response body
200 - OK	MutatingWebhookConfiguration schema
201 - Created	MutatingWebhookConfiguration schema
202 - Accepted	MutatingWebhookConfiguration schema
401 - Unauthorized	Empty

30.2.2.2. /apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations

Table 30.10. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
sendInitialEvents	boolean	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

GET**Description**

watch individual changes to a list of MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.

Table 30.11. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

30.2.2.3. /apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations/{name}**Table 30.12. Global path parameters**

Parameter	Type	Description
name	string	name of the MutatingWebhookConfiguration

Table 30.13. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method**DELETE****Description**

delete a MutatingWebhookConfiguration

Table 30.14. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

HTTP method**PATCH****Description**

partially update the specified MutatingWebhookConfiguration

Table 30.18. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 30.19. Body parameters

Parameter	Type	Description

If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 30.26. HTTP responses

HTTP code	Response body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty

30.3. VALIDATINGWEBHOOKCONFIGURATION [ADMISSIONREGISTRATION.K8S.IO/V1]

Description

ValidatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and object without changing it.

Type

object

30.3.1. Specification

Property	Type	Description
apiVersion	string	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	string	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	ObjectMeta	Standard object metadata; More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata .

Property	Type	Description
webhooks	array	Webhooks is a list of webhooks and the affected resources and operations.
webhooks[]	object	ValidatingWebhook describes an admission webhook and the resources and operations it applies to.

30.3.1.1. .webhooks

Description

Webhooks is a list of webhooks and the affected resources and operations.

Type

array

30.3.1.2. .webhooks[]

Description

ValidatingWebhook describes an admission webhook and the resources and operations it applies to.

Type

object

Required

- **name**
- **clientConfig**
- **sideEffects**
- **admissionReviewVersions**

Property	Type	Description
----------	------	-------------

Property	Type	Description
admissionReviewVersions	array (string)	AdmissionReviewVersions is an ordered list of preferred AdmissionReview versions the Webhook expects. API server will try to use first version in the list which it supports. If none of the versions specified in this list supported by API server, validation will fail for this object. If a persisted webhook configuration specifies allowed versions and does not include any versions known to the API Server, calls to the webhook will fail and be subject to the failure policy.
clientConfig	object	WebhookClientConfig contains the information to make a TLS connection with the webhook
failurePolicy	string	FailurePolicy defines how unrecognized errors from the admission endpoint are handled - allowed values are Ignore or Fail. Defaults to Fail. Possible enum values: - "Fail" means that an error calling the webhook causes the admission to fail. - "Ignore" means that an error calling the webhook is ignored.

Property	Type	Description
matchConditions	array	<p>MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.</p> <p>The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped</p> <p>This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.</p>
matchConditions[]	object	MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Property	Type	Description
matchPolicy	string	<p>matchPolicy defines how the "rules" list is used to match incoming requests. Allowed values are "Exact" or "Equivalent".</p> <ul style="list-style-type: none"> - Exact: match a request only if it exactly matches a specified rule. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, but "rules" only included apiGroups: ["apps"], apiVersions: ["v1"], resources: ["deployments"], a request to apps/v1beta1 or extensions/v1beta1 would not be sent to the webhook. - Equivalent: match a request if modifies a resource listed in rules, even via another API group or version. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, and "rules" only included apiGroups: ["apps"], apiVersions: ["v1"], resources: ["deployments"], a request to apps/v1beta1 or extensions/v1beta1 would be converted to apps/v1 and sent to the webhook. <p>Defaults to "Equivalent"</p> <p>Possible enum values: - "Equivalent" means requests should be sent to the webhook if they modify a resource listed in rules via another API group or version. - "Exact" means requests should only be sent to the webhook if they exactly match a given rule.</p>
name	string	<p>The name of the admission webhook. Name should be fully qualified, e.g., imagepolicy.kubernetes.io, where "imagepolicy" is the name of the webhook, and kubernetes.io is the name of the organization. Required.</p>

Property	Type	Description
namespaceSelector	LabelSelector	<p>NamespaceSelector decides whether to run the webhook on an object based on whether the namespace for that object matches the selector. If the object itself is a namespace, the matching is performed on object.metadata.labels. If the object is another cluster scoped resource, it never skips the webhook.</p> <p>For example, to run the webhook on any objects whose namespace is not associated with "runlevel" of "0" or "1"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [{ "key": "runlevel", "operator": "NotIn", "values": ["0", "1"] }] }</p> <p>If instead you want to only run the webhook on any objects whose namespace is associated with the "environment" of "prod" or "staging"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [{ "key": "environment", "operator": "In", "values": ["prod", "staging"] }] }</p> <p>See https://kubernetes.io/docs/concepts/overview/working-with-objects/labels for more examples of label selectors.</p> <p>Default to the empty LabelSelector, which matches everything.</p>

Property	Type	Description
objectSelector	LabelSelector	ObjectSelector decides whether to run the webhook based on if the object has matching labels. objectSelector is evaluated against both the oldObject and newObject that would be sent to the webhook, and is considered to match if either object matches the selector. A null object (oldObject in the case of create, or newObject in the case of delete) or an object that cannot have labels (like a DeploymentRollback or a PodProxyOptions object) is not considered to match. Use the object selector only if the webhook is opt-in, because end users may skip the admission webhook by setting the labels. Default to the empty LabelSelector, which matches everything.
rules	array	Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches <i>any</i> Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.
rules[]	object	RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Property	Type	Description
sideEffects	string	<p>SideEffects states whether this webhook has side effects. Acceptable values are: None, NoneOnDryRun (webhooks created via v1beta1 may also specify Some or Unknown). Webhooks with side effects MUST implement a reconciliation system, since a request may be rejected by a future step in the admission chain and the side effects therefore need to be undone. Requests with the dryRun attribute will be auto-rejected if they match a webhook with sideEffects == Unknown or Some.</p> <p>Possible enum values: - "None" means that calling the webhook will have no side effects. - "NoneOnDryRun" means that calling the webhook will possibly have side effects, but if the request being reviewed has the dry-run attribute, the side effects will be suppressed. - "Some" means that calling the webhook will possibly have side effects. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail. - "Unknown" means that no information is known about the side effects of calling the webhook. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail.</p>
timeoutSeconds	integer	<p>TimeoutSeconds specifies the timeout for this webhook. After the timeout passes, the webhook call will be ignored or the API call will fail based on the failure policy. The timeout value must be between 1 and 30 seconds. Default to 10 seconds.</p>

30.3.1.3. .webhooks[].clientConfig

Description

WebhookClientConfig contains the information to make a TLS connection with the webhook

Type

object

Property	Type	Description
caBundle	string	caBundle is a PEM encoded CA bundle which will be used to validate the webhook's server certificate. If unspecified, system trust roots on the apiserver are used.
service	object	ServiceReference holds a reference to Service.legacy.k8s.io

Property	Type	Description
url	string	<p>url gives the location of the webhook, in standard URL form (scheme://host:port/path). Exactly one of url or service must be specified.</p> <p>The host should not refer to a service running in the cluster; use the service field instead. The host might be resolved via external DNS in some apiservers (e.g., kube-apiserver cannot resolve in-cluster DNS as that would be a layering violation). host may also be an IP address.</p> <p>Please note that using localhost or 127.0.0.1 as a host is risky unless you take great care to run this webhook on all hosts which run an apiserver which might need to make calls to this webhook. Such installs are likely to be non-portable, i.e., not easy to turn up in a new cluster.</p> <p>The scheme must be "https"; the URL must begin with "https://".</p> <p>A path is optional, and if present may be any string permissible in a URL. You may use the path to pass an arbitrary string to the webhook, for example, a cluster identifier.</p> <p>Attempting to use a user or basic auth e.g. "user:password@" is not allowed. Fragments ("#...") and query parameters ("?...") are not allowed, either.</p>

30.3.1.4. .webhooks[].clientConfig.service

Description

ServiceReference holds a reference to Service.legacy.k8s.io

Type

object

Required

- **namespace**
- **name**

Property	Type	Description
name	string	name is the name of the service. Required
namespace	string	namespace is the namespace of the service. Required
path	string	path is an optional URL path which will be sent in any request to this service.
port	integer	If specified, the port on the service that hosting webhook. Default to 443 for backward compatibility. port should be a valid port number (1-65535, inclusive).

30.3.1.5. .webhooks[].matchConditions**Description**

MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.

The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped

This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.

Type

array

30.3.1.6. .webhooks[].matchConditions[]**Description**

MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Type

object

Required

- **name**

- **name**
- **expression**

Property	Type	Description
expression	string	<p>Expression represents the expression which will be evaluated by CEL. Must evaluate to bool. CEL expressions have access to the contents of the AdmissionRequest and Authorizer, organized into CEL variables:</p> <p>'object' - The object from the incoming request. The value is null for DELETE requests.</p> <p>'oldObject' - The existing object. The value is null for CREATE requests.</p> <p>'request' - Attributes of the admission request(/pkg/apis/admission/types.go#AdmissionRequest).</p> <p>'authorizer' - A CEL Authorizer. May be used to perform authorization checks for the principal (user or service account) of the request. See https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authz</p> <p>'authorizer.requestResource' - A CEL ResourceCheck constructed from the 'authorizer' and configured with the request resource. Documentation on CEL: https://kubernetes.io/docs/reference/using-api/cel/</p> <p>Required.</p>

Property	Type	Description
name	string	Name is an identifier for this match condition, used for strategic merging of MatchConditions, as well as providing an identifier for logging purposes. A good name should be descriptive of the associated expression. Name must be a qualified name consisting of alphanumeric characters, '-', '_' or '.', and must start and end with an alphanumeric character (e.g. 'MyName', or 'my.name', or '123-abc', regex used for validation is '([A-Za-z0-9][-A-Za-z0-9.]*)?[A-Za-z0-9]!') with an optional DNS subdomain prefix and '/' (e.g. 'example.com/MyName')
		Required.

30.3.1.7. .webhooks[].rules

Description

Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches *any* Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.

Type

array

30.3.1.8. .webhooks[].rules[]

Description

RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Type

object

Property	Type	Description
apiGroups	array (string)	APIGroups is the API groups the resources belong to. " is all groups. If " is present, the length of the slice must be one. Required.

Property	Type	Description
apiVersions	array (string)	APIVersions is the API versions the resources belong to. " is all versions. If " is present, the length of the slice must be one. Required.
operations	array (string)	Operations is the operations the admission hook cares about - CREATE, UPDATE, DELETE, CONNECT or * for all of those operations and any future admission operations that are added. If '*' is present, the length of the slice must be one. Required.
resources	array (string)	<p>Resources is a list of resources this rule applies to.</p> <p>For example: 'pods' means pods. 'pods/log' means the log subresource of pods. " means all resources, but not subresources. 'pods/' means all subresources of pods. '/scale' means all scale subresources. '/*' means all resources and their subresources.</p> <p>If wildcard is present, the validation rule will ensure resources do not overlap with each other.</p> <p>Depending on the enclosing object, subresources might not be allowed. Required.</p>

Property	Type	Description
scope	string	scope specifies the scope of this rule. Valid values are "Cluster", "Namespaced", and "" "Cluster" means that only cluster-scoped resources will match this rule. Namespace API objects are cluster-scoped. "Namespaced" means that only namespaced resources will match this rule. "" means that there are no scope restrictions. Subresources match the scope of their parent resource. Default is "*".

30.3.2. API endpoints

The following API endpoints are available:

- **/apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations**
 - **DELETE**: delete collection of ValidatingWebhookConfiguration
 - **GET**: list or watch objects of kind ValidatingWebhookConfiguration
 - **POST**: create a ValidatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations**
 - **GET**: watch individual changes to a list of ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations/{name}**
 - **DELETE**: delete a ValidatingWebhookConfiguration
 - **GET**: read the specified ValidatingWebhookConfiguration
 - **PATCH**: partially update the specified ValidatingWebhookConfiguration
 - **PUT**: replace the specified ValidatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations/{name}**
 - **GET**: watch changes to an object of kind ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

30.3.2.1. /apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations

Table 30.27. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method

DELETE

Description

delete collection of ValidatingWebhookConfiguration

Table 30.28. Query parameters

Parameter	Type	Description
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	string	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	string	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Parameter	Type	Description
body	DeleteOptions schema	

Table 30.30. HTTP responses

HTTP code	Reponse body
200 - OK	Status schema

HTTP code	Response body
401 - Unauthorized	Empty

HTTP method**GET****Description**

list or watch objects of kind ValidatingWebhookConfiguration

Table 30.31. Query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 30.32. HTTP responses

HTTP code	Response body

401 - Unauthorized	Empty

HTTP method

POST**Description**

create a ValidatingWebhookConfiguration

Table 30.33. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
name	string	name of the ValidatingWebhookConfiguration

Table 30.39. Global query parameters

Parameter	Type	Description
pretty	string	If 'true', then the output is pretty printed.

HTTP method**DELETE****Description**

delete a ValidatingWebhookConfiguration

Table 30.40. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
orphanDependents	boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	string	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

HTTP method**PATCH****Description**

partially update the specified ValidatingWebhookConfiguration

Table 30.44. Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
force	boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	string	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .

Parameter	Type	Description
fieldValidation	string	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 30.48. Body parameters

Parameter	Type	Description
body	ValidatingWebhookConfiguration schema	

Table 30.49. HTTP responses

HTTP code	Response body
200 - OK	ValidatingWebhookConfiguration schema
201 - Created	ValidatingWebhookConfiguration schema
401 - Unauthorized	Empty

30.3.2.4. /apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations/{name}

Table 30.50. Global path parameters

Parameter	Type	Description
name	string	name of the ValidatingWebhookConfiguration

Table 30.51. Global query parameters

Parameter	Type	Description
allowWatchBookmarks	boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
continue	string	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	string	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	string	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
limit	integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	string	If 'true', then the output is pretty printed.
resourceVersion	string	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>
resourceVersionMatch	string	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
sendInitialEvents	boolean	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
timeoutSeconds	integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method**GET****Description**

watch changes to an object of kind ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 30.52. HTTP responses

HTTP code	Reponse body
200 - OK	WatchEvent schema
401 - Unauthorized	Empty
