#### Abstract

This guide provides a detailed overview on logging and monitoring a Red Hat OpenStack Platform environment, and how to solve problems.

## Table of Contents

CHAPTER 1. ABOUT THIS GUIDE	4
CHAPTER 2. LOGGING	. 5
2.1. LOG FILES FOR OPENSTACK SERVICES	5
2.1.1. Bare Metal Provisioning (ironic) Log Files	5
2.1.2. Block Storage (cinder) Log Files	5
2.1.3. Compute (nova) Log Files	5
2.1.4. Dashboard (horizon) Log Files	6
2.1.5. Database as a Service (trove) Log Files	7
2.1.6. Identity Service (keystone) Log Files	7
2.1.7. Image Service (glance) Log Files	7
2.1.8. Networking (neutron) Log Files	8
2.1.9. Object Storage (swift) Log Files	8
2.1.10. Orchestration (heat) Log Files	9
2.1.11. Shared Filesystem Service (manila) Log Files	9
2.1.12. Telemetry (ceilometer) Log Files	10
2.1.13. Log Files for Supporting Services	10
2.2. ENABLING CENTRALIZED LOGGING DURING DEPLOYMENT	11
2.3. CONFIGURING LOGGING FEATURES	11
2.3.1. Configurable parameters	11
2.4. OVERRIDING THE DEFAULT PATH FOR A LOG FILE	12
2.5. CONFIGURING LOGGING OPTIONS	12
2.6. TESTING THE CONNECTION	13
2.7. SERVER-SIDE LOGGING	13
2.8. TRACEBACKS	13
Z.O. TRACEBACKS	15
CHAPTER 3. CONFIGURING THE TIME SERIES DATABASE (GNOCCHI) FOR TELEMETRY	14
CHAPTER 3. CONFIGURING THE TIME SERIES DATABASE (GNOCCHI) FOR TELEMETRY	<b>14</b> 14
3.1. UNDERSTANDING THE TIME SERIES DATABASE	14
<ul><li>3.1. UNDERSTANDING THE TIME SERIES DATABASE</li><li>3.2. METRICS</li><li>3.3. TIME SERIES DATABASE COMPONENTS</li></ul>	14 14 15
<ul> <li>3.1. UNDERSTANDING THE TIME SERIES DATABASE</li> <li>3.2. METRICS</li> <li>3.3. TIME SERIES DATABASE COMPONENTS</li> <li>3.4. RUNNING THE TIME SERIES DATABASE</li> </ul>	14 14 15 15

5.3. TROUBLESHOOT OPENSTACK NETWORKING ISSUES	28
5.4. TROUBLESHOOT NETWORKS AND ROUTES TAB DISPLAY ISSUES IN THE DASHBOARD	29
5.5. TROUBLESHOOT INSTANCE LAUNCHING ERRORS IN THE DASHBOARD	29
5.6. TROUBLESHOOT KEYSTONE V3 DASHBOARD AUTHENTICATION	29
5.7. OPENSTACK DASHBOARD - RED HAT ACCESS TAB	31
5.7.1. Search	33
5.7.2. Logs	34
5.7.3. Support	35

## **CHAPTER 1. ABOUT THIS GUIDE**

#### WARNING

Red Hat is currently reviewing the information and procedures provided in this guide for this release.

This document is based on the Red Hat OpenStack Platform 12 document, available at https://access.redhat.com/documentation/en-us/red\_hat\_openstack\_platform/?version=12.

If you require assistance for the current Red Hat OpenStack Platform release, please contact Red Hat support.

This document provides an overview of the logging and monitoring capabilities that are available in a Red Hat OpenStack Platform environment, and how to troubleshoot possible issues.

## **CHAPTER 2. LOGGING**

Red Hat OpenStack Platform writes informational messages to specific log files; you can use these messages for troubleshooting and monitoring system events.

#### NOTE

You do not need to attach the individual log files to your support cases manually. All the required information is gathered automatically by the **sosreport** utility, which is described in Chapter 5, *Troubleshooting*.

## 2.1. LOG FILES FOR OPENSTACK SERVICES

Each OpenStack component has a separate logging directory containing files specific to a running service.

#### 2.1.1. Bare Metal Provisioning (ironic) Log Files

Service	Service Name	Log Path
OpenStack Ironic API	openstack-ironic-api.service	/var/log/containers/ironic/iro nic-api.log
OpenStack Ironic Conductor	openstack-ironic-conductor.service	/var/log/containers/ironic/iro nic-conductor.log

#### 2.1.2. Block Storage (cinder) Log Files

Service	Service Name	Log Path
Block Storage API	openstack-cinder-api.service	/var/log/containers/cinder- api.log
Block Storage Backup	openstack-cinder-backup.service	/var/log/containers/cinder/b ackup.log
Informational messages	The cinder-manage command	/var/log/containers/cinder/ci nder-manage.log
Block Storage Scheduler	openstack-cinder-scheduler.service	/var/log/containers/cinder/sc heduler.log
Block Storage Volume	openstack-cinder-volume.service	/var/log/containers/cinder/v olume.log

#### 2.1.3. Compute (nova) Log Files

Service	Service Name	Log Path
OpenStack Compute API service	openstack-nova-api.service	/var/log/containers/nova/nov a-api.log
OpenStack Compute certificate server	openstack-nova-cert.service	/var/log/containers/nova/nov a-cert.log
OpenStack Compute service	openstack-nova- compute.service	/var/log/containers/nova/nov a-compute.log
OpenStack Compute Conductor service	openstack-nova- conductor.service	/var/log/containers/nova/nov a-conductor.log
OpenStack Compute VNC console authentication server	openstack-nova- consoleauth.service	/var/log/containers/nova/nov a-consoleauth.log
Informational messages	nova-manage command	/var/log/containers/nova/nov a-manage.log
OpenStack Compute NoVNC Proxy service	openstack-nova- novncproxy.service	/var/log/containers/nova/nov a-novncproxy.log
OpenStack Compute Scheduler service	openstack-nova- scheduler.service	/var/log/containers/nova/nov a-scheduler.log

#### 2.1.4. Dashboard (horizon) Log Files

Service	Service Name	Log Path
Log of certain user interactions	Dashboard interface	/var/log/containers/horizon/ horizon.log

The Apache HTTP server uses several additional log files for the Dashboard web interface, which can be accessed using a web browser or command-line clients (keystone, nova). The following log files can be helpful in tracking the usage of the Dashboard and diagnosing faults:

Purpose	Log Path
All processed HTTP requests	/var/log/containers/httpd/horizon_access.log
HTTP errors	/var/log/containers/httpd/horizon_error.log
Admin-role API requests	/var/log/containers/httpd/keystone_wsgi_admin_ac cess.log

Purpose	Log Path
Admin-role API errors	/var/log/containers/httpd/keystone_wsgi_admin_err or.log
Member-role API requests	/var/log/containers/httpd/keystone_wsgi_main_acc ess.log
Member-role API errors	/var/log/containers/httpd/keystone_wsgi_main_erro r.log

#### NOTE

There is also /**var/log/containers/httpd/default\_error.log**, which stores errors reported by other web services running on the same host.

#### 2.1.5. Database as a Service (trove) Log Files

Service	Service Name	Log Path
OpenStack Trove API Service	openstack-trove-api.service	/var/log/containers/trove/tro ve-api.log
OpenStack Trove Conductor Service	openstack-trove- conductor.service	/var/log/containers/trove/tro ve-conductor.log
OpenStack Trove guestagent Service	openstack-trove- guestagent.service	/var/log/containers/trove/log file.txt
OpenStack Trove taskmanager Service	openstack-trove- taskmanager.service	/var/log/containers/trove/tro ve-taskmanager.log

#### 2.1.6. Identity Service (keystone) Log Files

Service	Service Name	Log Path
OpenStack Identity Service	openstack-keystone.service	/var/log/containers/keystone /keystone.log

#### 2.1.7. Image Service (glance) Log Files

Service	Service Name	Log Path
OpenStack Image Service API server	openstack-glance-api.service	/var/log/containers/glance/a pi.log

Service	Service Name	Log Path
OpenStack Image Service Registry server	openstack-glance- registry.service	/var/log/containers/glance/r egistry.log

#### 2.1.8. Networking (neutron) Log Files

Service	Service Name	Log Path
OpenStack Neutron DHCP Agent	neutron-dhcp-agent.service	/var/log/containers/neutron/ dhcp-agent.log
OpenStack Networking Layer 3 Agent	neutron-I3-agent.service	/var/log/containers/neutron/l 3-agent.log
Metadata agent service	neutron-metadata- agent.service	/var/log/containers/neutron/ metadata-agent.log
Metadata namespace proxy	n/a	/var/log/containers/neutron/ neutron-ns-metadata- proxy- <i>UUID</i> .log
Open vSwitch agent	neutron-openvswitch- agent.service	/var/log/containers/neutron/ openvswitch-agent.log
OpenStack Networking service	neutron-server.service	/var/log/containers/neutron/ server.log

#### 2.1.9. Object Storage (swift) Log Files

OpenStack Object Storage sends logs to the system logging facility only.

#### NOTE

By default, all Object Storage log files to /var/log/containers/swift/swift.log, using the local0, local1, and local2 syslog facilities.

The log messages of Object Storage are classified into two broad categories: those by REST API services and those by background daemons. The API service messages contain one line per API request, in a manner similar to popular HTTP servers; both the frontend (Proxy) and backend (Account, Container, Object) services post such messages. The daemon messages are less structured and typically contain human-readable information about daemons performing their periodic tasks. However, regardless of which part of Object Storage produces the message, the source identity is always at the beginning of the line.

An example of a proxy message:

Apr 20 15:20:34 rhev-a24c-01 proxy-server: 127.0.0.1 127.0.0.1 20/Apr/2015/19/20/34 GET

/v1/AUTH\_zaitcev%3Fformat%3Djson%26marker%3Dtestcont HTTP/1.0 200 - python-swiftclient-2.1.0 AUTH\_tk737d6... - 2 - txc454fa8ea4844d909820a-0055355182 - 0.0162 - -1429557634.806570053 1429557634.822791100

An example of ad-hoc messages from background daemons:

Apr 27 17:08:15 rhev-a24c-02 object-auditor: Object audit (ZBF). Since Mon Apr 27 21:08:15 2015: Locally: 1 passed, 0 quarantined, 0 errors files/sec: 4.34, bytes/sec: 0.00, Total time: 0.23, Auditing time: 0.00, Rate: 0.00 Apr 27 17:08:16 rhev-a24c-02 object-auditor: Object audit (ZBF) "forever" mode completed: 0.56s. Total quarantined: 0, Total errors: 0, Total files/sec: 14.31, Total bytes/sec: 0.00, Auditing time: 0.02, Rate: 0.04 Apr 27 17:08:16 rhev-a24c-02 account-replicator: Beginning replication run Apr 27 17:08:16 rhev-a24c-02 account-replicator: Replication run OVER Apr 27 17:08:16 rhev-a24c-02 account-replicator: Attempted to replicate 5 dbs in 0.12589 seconds (39.71876/s) Apr 27 17:08:16 rhev-a24c-02 account-replicator: Removed 0 dbs

Apr 27 17:08:16 rhev-a24c-02 account-replicator: 10 successes, 0 failures

#### 2.1.10. Orchestration (heat) Log Files

Service	Service Name	Log Path
OpenStack Heat API Service	openstack-heat-api.service	/var/log/containers/heat/hea t-api.log
OpenStack Heat Engine Service	openstack-heat- engine.service	/var/log/containers/heat/hea t-engine.log
Orchestration service events	n/a	/var/log/containers/heat/hea t-manage.log

#### 2.1.11. Shared Filesystem Service (manila) Log Files

Service	Service Name	Log Path
OpenStack Manila API Server	openstack-manila-api.service	/var/log/containers/manila/a pi.log
OpenStack Manila Scheduler	openstack-manila- scheduler.service	/var/log/containers/manila/s cheduler.log
OpenStack Manila Share Service	openstack-manila- share.service	/var/log/containers/manila/s hare.log

#### NOTE

Some information from the Manila Python library can also be logged in /var/log/containers/manila/manila-manage.log.

## 2.1.12. Telemetry (ceilometer) Log Files

Service	Service Name	Log Path
OpenStack ceilometer notification agent	openstack-ceilometer- notification.service	/var/log/containers/ceilomet er/agent-notification.log
OpenStack ceilometer alarm evaluation	openstack-ceilometer-alarm- evaluator.service	/var/log/containers/ceilomet er/alarm-evaluator.log
OpenStack ceilometer alarm notification	openstack-ceilometer-alarm- notifier.service	/var/log/containers/ceilomet er/alarm-notifier.log
OpenStack ceilometer API	httpd.service	/var/log/containers/ceilomet er/api.log
Informational messages	MongoDB integration	/var/log/containers/ceilomet er/ceilometer-dbsync.log
OpenStack ceilometer central agent	openstack-ceilometer-central.service	/var/log/containers/ceilomet er/central.log
OpenStack ceilometer collection	openstack-ceilometer-collector.service	/var/log/containers/ceilomet er/collector.log
OpenStack ceilometer compute agent	openstack-ceilometer-compute.service	/var/log/containers/ceilomet er/compute.log

## 2.1.13. Log Files for Supporting Services

The following services are used by the core OpenStack components and have their own log directories and files.

Service	Service Name	Log Path
Message broker (RabbitMQ)	rabbitmq-server.service	/var/log/rabbitmq/rabbit@short_hostname.log /var/log/rabbitmq/rabbit@short_hostname- sasl.log (for Simple Authentication and Security Layer related log messages)
Database server (MariaDB)	mariadb.service	/var/log/mariadb/mariadb.log
Document-oriented database (MongoDB)	mongod.service	/var/log/mongodb/mongodb.log
Virtual network switch (Open vSwitch)	openvswitch- nonetwork.service	/var/log/openvswitch/ovsdb-server.log /var/log/openvswitch/ovs-vswitchd.log

## 2.2. ENABLING CENTRALIZED LOGGING DURING DEPLOYMENT

To enable centralized logging, specify the implementation of the **OS::TripleO::Services::Rsyslog** composable service. Add the file path of the logging environment file to the overcloud deployment command, as shown in the following example:

openstack overcloud deploy <other arguments> -e /usr/share/openstack-tripleo-heat-templates/environments/logging-environment-rsyslog.yaml

## 2.3. CONFIGURING LOGGING FEATURES

To configure logging features, modify the **RsyslogElasticsearchSetting** parameter in the **logging-environment-rsyslog.yaml** file:

- 1. Copy the **tripleo-heat-templates/environments/logging-environment-rsyslog.yaml** file to your home directory.
- 2. Create entries in the **RsyslogElasticsearchSetting** parameter to suit your environment. The following snippet is an example configuration of the **RsyslogElasticsearchSetting** parameter:

parameter\_defaults: RsyslogElasticsearchSetting: server: "exampleip:9200" usehttps: "on"

#### NOTE

You can configure the **RsyslogElasticsearchTls** parameters to enable secure data transfer. For more information, see Section 2.3.1, "Configurable parameters".

#### 2.3.1. Configurable parameters

The following table contains descriptions of the parameters that you can configure. You can find these parameters in the **tripleo-heat-templates/deployment/logging/rsyslog-container-puppet.yaml** file.

Parameter	Description
RsyslogElasticsearchSett ing	Configuration for <b>rsyslog-elasticsearch</b> plug-in. For more information, see https://www.rsyslog.com/doc/v8-stable/configuration/modules/omelasticsearch.html.
RsyslogElasticsearchTls CACert	Contains content of the CA cert for the CA that issued Elasticsearch server cert.
RsyslogElasticsearchTls ClientCert	Contains content of the client cert for doing client cert auth against Elasticsearch.
RsyslogElasticsearchTls ClientKey	Contains content of the private key corresponding to the cert <b>RsyslogElasticsearchTIsClientCert</b> .

## 2.4. OVERRIDING THE DEFAULT PATH FOR A LOG FILE

If you modify the default containers and the modification includes the path to the service log file, you must also modify the default log file path. Every composable service has a default log file path parameter with the naming convention format: <service\_name>LoggingSource. For example, the parameter for nova-compute service is **NovaComputeLoggingSource**. To override the default path for the nova-compute service, add the path to the **NovaComputeLoggingSource** parameter in your configuration file.

NovaComputeLoggingSource: tag: openstack.nova.compute file: /some/other/path/nova-compute.log

The tag and path attributes are mandatory elements of the <service\_name>LoggingSource parameter. On each service, the tag and the path are defined and the rest of the values are derived by default. The following snippet is another example of overriding the default log file path:

ServiceLoggingSource: tag: openstack.Service file: /another/path/service/service.log startmsg.regex: "^[a-zA-Z]{3} [0-9]{2} [:0-9]{8}"

## 2.5. CONFIGURING LOGGING OPTIONS

Each component maintains distinct logging configuration in the component configuration file. For example, in Compute, these options are set in /**etc/nova/nova.conf**:

• To increase the level of informational logging, enable debugging. This option increases the amount of information captured, so consider using it temporarily or first reviewing your log rotation settings.

debug=True

• Enable verbose logging:

verbose=True

• Change the log file path:

log\_dir=/var/log/containers/nova

• Send your logs to a central syslog server:

use\_syslog=True syslog\_log\_facility=LOG\_USER

#### NOTE

You can also configure the timestamp and format of the logs. Review the configuration file of the component for additional logging options.

## 2.6. TESTING THE CONNECTION

On the client side, to verify communication between Rsyslog and Elasticsearch, complete the following step:

 Navigate to the Elasticsearch connection log file, /var/log/rsyslog/omelasticsearch.log in the Rsyslog container or /var/log/containers/rsyslog/omelasticsearch.log on the host. If this log file does not exist or if the log file exists but does not contain logs, there is no connection problem. If the log file is present and contains logs, Rsyslog has not connected successfully.

#### NOTE

To test the connection from the server side, view the Elasticsearch logs for connection issues.

## 2.7. SERVER-SIDE LOGGING

If you have an Elasticsearch cluster running, configure the **RsyslogElasticsearchSetting** parameter in the **logging-environment-rsyslog.yaml** file to connect Rsyslog that is running on overcloud nodes. To configure the **RsyslogElasticsearchSetting** parameter, see https://www.rsyslog.com/doc/v8-stable/configuration/modules/omelasticsearch.html.

## 2.8. TRACEBACKS

When you encounter an issue and you start troubleshooting, you can use a traceback log to diagnose the issue. In log files, tracebacks usually have several lines of information, all relating to the same issue. Rsyslog provides a regular expression to define how a log record starts. Each log record usually starts with a timestamp and the first line of the traceback is the only line that contains this information. Rsyslog bundles the indented records with the first line and sends them as one log record. For that behaviour configuration option **startmsg.regex** in <Service>LoggingSource is used. The following regular expression is the default value for all <service>LoggingSource parameters in the director:

startmsg.regex='^[0-9]{4}-[0-9]{2}-[0-9]{2}:[0-9

When this default does not match log records of your added or modified **LoggingSource**, you must change **startmsg.regex** accordingly.

## CHAPTER 3. CONFIGURING THE TIME SERIES DATABASE (GNOCCHI) FOR TELEMETRY

Time series database (Gnocchi) is a multi-project, metrics, and resource database. It is designed to store metrics at a very large scale while providing access to metrics and resources information to operators and users.

## **3.1. UNDERSTANDING THE TIME SERIES DATABASE**

This section defines the commonly used terms for the Time series database (Gnocchi)features.

#### Aggregation method

A function used to aggregate multiple measures into an aggregate. For example, the **min** aggregation method aggregates the values of different measures to the minimum value of all the measures in the time range.

#### Aggregate

A data point tuple generated from several measures according to the archive policy. An aggregate is composed of a time stamp and a value.

#### Archive policy

An aggregate storage policy attached to a metric. An archive policy determines how long aggregates are kept in a metric and how aggregates are aggregated (the aggregation method).

#### Granularity

The time between two aggregates in an aggregated time series of a metric.

#### Measure

An incoming data point tuple sent to the Time series database by the API. A measure is composed of a time stamp and a value.

#### Metric

An entity storing aggregates identified by an UUID. A metric can be attached to a resource using a name. How a metric stores its aggregates is defined by the archive policy that the metric is associated to.

#### Resource

An entity representing anything in your infrastructure that you associate a metric with. A resource is identified by a unique ID and can contain attributes.

#### Time series

A list of aggregates ordered by time.

#### Timespan

The time period for which a metric keeps its aggregates. It is used in the context of archive policy.

## 3.2. METRICS

The Time series database (Gnocchi) stores *metrics* from Telemetry that designate anything that can be measured, for example, the CPU usage of a server, the temperature of a room or the number of bytes sent by a network interface.

A metric has the following properties:

• UUID to identify the metric

- Metric name
- Archive policy used to store and aggregate the measures

The Time series database stores the following metrics by default, as defined in the **etc/ceilometer/polling.yaml** file:

[root@controller-0 ~]# podman exec -ti ceilometer\_agent\_central cat /etc/ceilometer/polling.yaml sources: - name: some\_pollsters interval: 300 meters: - cpu - memory.usage - network.incoming.bytes - network.incoming.packets - network.outgoing.bytes - network.outgoing.packets - disk.read.bytes - disk.read.requests - disk.write.bytes - disk.write.requests - hardware.cpu.util - hardware.memory.used - hardware.memory.total - hardware.memory.buffer - hardware.memory.cached - hardware.memory.swap.avail - hardware.memory.swap.total - hardware.system\_stats.io.outgoing.blocks - hardware.system stats.io.incoming.blocks - hardware.network.ip.incoming.datagrams - hardware.network.ip.outgoing.datagrams

The **polling.yaml** file also specifies the default polling interval of 300 seconds (5 minutes).

## **3.3. TIME SERIES DATABASE COMPONENTS**

Currently, Gnocchi uses the Identity service for authentication and Redis for incoming measure storage. To store the aggregated measures, Gnocchi relies on either Swift or Ceph (Object Storage). Gnocchi also leverages MySQL to store the index of resources and metrics.

The time series database provides the **statsd** deamon (**gnocchi-statsd**) that is compatible with the **statsd** protocol and can listen to the metrics sent over the network. To enable **statsd** support in Gnocchi, configure the **[statsd]** option in the configuration file. The resource ID parameter is used as the main generic resource where all the metrics are attached, a user and project ID that are associated with the resource and metrics, and an archive policy name that is used to create the metrics.

All the metrics are created dynamically as the metrics are sent to **gnocchi-statsd**, and attached with the provided name to the resource ID you configured.

## **3.4. RUNNING THE TIME SERIES DATABASE**

Run the time series database by running the HTTP server and metric daemon:

# gnocchi-api # gnocchi-metricd

## 3.5. RUNNING AS A WSGI APPLICATION

You can run Gnocchi through a WSGI service such as **mod\_wsgi** or any other WSGI application. You can use the **gnocchi/rest/app.wsgi** file, which is provided with Gnocchi, to enable Gnocchi as a WSGI application.

The Gnocchi API tier runs using WSGI. This means it can be run using Apache **httpd** and **mod\_wsgi**, or another HTTP daemon such as **uwsgi**. Configure the number of processes and threads according to the number of CPUs you have, usually around **1.5 × number of CPUs**. If one server is not enough, you can spawn any number of new API servers to scale Gnocchi out, even on different machines.

## **3.6. METRICD WORKERS**

By default, the **gnocchi-metricd** daemon spans all your CPU power to maximize CPU utilization when computing metric aggregation. You can use the **gnocchi status** command to query the HTTP API and get the cluster status for metric processing. This command displays the number of metrics to process, known as the processing backlog for the **gnocchi-metricd**. As long as this backlog is not continuously increasing, that means that **gnocchi-metricd** can cope with the amount of metric that are being sent. If the number of measure to process is continuously increasing, you might need to temporarily increase the number of the **gnocchi-metricd** daemons. You can run any number of metricd daemons on any number of servers.

For director-based deployments, you can adjust certain metric processing parameters in your environment file:

- MetricProcessingDelay Adjusts the delay period between iterations of metric processing.
- **GnocchiMetricdWorkers** Configure the number of **metricd** workers.

## 3.7. MONITORING THE TIME SERIES DATABASE

The /**v1**/**status** endpoint of the HTTP API returns various information, such as the number of measures to process (measures backlog), which you can easily monitor. To verify good health of the overall system, ensure that the HTTP server and the **gnocchi-metricd** daemon are running and are not writing errors in their log files.

## 3.8. BACKING UP AND RESTORING THE TIME SERIES DATABASE

To recover from an unfortunate event, backup both the index and the storage. You must create a database dump (PostgreSQL or MySQL), and create snapshots or copies of your data storage (Ceph, Swift or your file system). The procedure to restore is: restore your index and storage backups, re-install Gnocchi if necessary, and restart it.

## 3.9. BATCH DELETING OLD RESOURCES FROM GNOCCHI

To remove outdated measures, create the archive policy to suit your requirements. To batch delete resources, metrics and measures, use the CLI or REST API. For example, to delete resources and all their associated metrics that were terminated 30 days ago, run the following command:

openstack metric resource batch delete "ended\_at < '-30days'"

## CHAPTER 4. CAPACITY METERING USING THE TELEMETRY SERVICE

The OpenStack Telemetry service provides usage metrics that you can use for billing, charge-back, and show-back purposes. Such metrics data can also be used by third-party applications to plan for capacity on the cluster and can also be leveraged for auto-scaling virtual instances using OpenStack Heat. For more information, see Auto Scaling for Instances.

You can use the combination of Ceilometer and Gnocchi for monitoring and alarms. This is supported on small-size clusters and with known limitations. For real-time monitoring, Red Hat OpenStack Platform ships with agents that provide metrics data, and can be consumed by separate monitoring infrastructure and applications. For more information, see Monitoring Tools Configuration.

## **4.1. VIEWING MEASURES**

List all the measures for a particular resource:

# openstack metric measures show --resource-id UUID METER\_NAME

List only measures for a particular resource, within a range of timestamps:

# openstack metric measures show --aggregation mean --start <START\_TIME> --stop <STOP\_TIME> --resource-id UUID METER\_NAME

The timestamp variables <START\_TIME> and <STOP\_TIME> use the format *iso-dateThh:mm:ss*.

## 4.2. CREATING NEW MEASURES

You can use measures to send data to the Telemetry service, and they do not need to correspond to a previously-defined meter. For example:

# openstack metrics measures add -m 2015-01-12T17:56:23@42 --resource-id UUID METER\_NAME

## 4.3. EXAMPLE: VIEWING CLOUD USAGE MEASURES

This example shows the average memory usage of all instances for each project.

# openstack metric measures aggregation --resource-type instance --groupby project\_id -m memory

## 4.4. EXAMPLE: VIEWING L3 CACHE USE

If your Intel hardware and libvirt version supports *Cache Monitoring Technology* (CMT), you can use the **cpu\_I3\_cache** meter to monitor the amount of L3 cache used by an instance.

Monitoring the L3 cache requires the following:

- cmt in the LibvirtEnabledPerfEvents parameter.
- cpu\_I3\_cache in the gnocchi\_resources.yaml file.
- cpu\_l3\_cache in the Ceilometer polling.yaml file.

#### Enableing L3 cache monitoring

To enable L3 cache monitoring:

1. Create a YAML file for telemetry (for example, **ceilometer-environment.yaml**) and add **cmt** to the **LibvirtEnabledPerfEvents** parameter.

parameter\_defaults: LibvirtEnabledPerfEvents: cmt

2. Launch the overcloud with this YAML file.

#!/bin/bash
openstack overcloud deploy \
--templates \
<additional templates> \
-e /home/stack/ceilometer-environment.yaml

3. Verify that **cpu\_l3\_cache** is enabled in gnocchi on the Compute node.

\$ sudo -i
# podman exec -ti ceilometer\_agent\_compute cat /etc/ceilometer/gnocchi\_resources.yaml |
grep cpu\_l3\_cache

4. Verify that cpu\_l3\_cache is enabled for Telemetry polling.

# podman exec -ti ceilometer\_agent\_compute cat /etc/ceilometer/polling.yaml | grep cpu\_l3\_cache

5. If **cpu\_I3\_cache** is not enabled for Telemetry, enable it and restart the service.

# podman exec -ti ceilometer\_agent\_compute echo " - cpu\_l3\_cache" >>
/etc/ceilometer/polling.yaml

# podman exec -ti ceilometer\_agent\_compute pkill -HUP -f "ceilometer.\*master process"

#### NOTE

This podman change does not persist over a reboot.

After you have launched a guest instance on this compute node, you can use the **gnocchi measures show** command to monitor the CMT metrics.

(overcloud) [stack@undercloud-0 ~]\$ gnocchi measures show --resource-id a6491d92-b2c8-4f6d-94ba-edc9dfde23ac cpu\_l3\_cache

+	++-	+

2017-10-25T10:45:00+00:00	300.0   1933312.0
2017-10-25T10:50:00+00:00	300.0   2850816.0
2017-10-25T10:55:00+00:00	300.0   2359296.0
2017-10-25T11:00:00+00:00	300.0   2293760.0
++	++

## 4.5. VIEW EXISTING ALARMS

To list the existing Telemetry alarms, use the **aodh** command. For example:

# aodh alarm list				
+	+	+++	+	
++	+			
alarm_id severity   enabled	type	name	state	
+++++++	·	++++	+	
	-a2cf-107be51ca90a	gnocchi_aggregation_by_res w  True	sources_threshole	d   iops-
+	+	++	+	
+++	+			

To list the meters assigned to a resource, specify the *UUID* of the resource (an instance, image, or volume, among others). For example:

# gnocchi resource show 5e3fcbe2-7aab-475d-b42c-a440aa42e5ad

## 4.6. CREATE AN ALARM

You can use **aodh** to create an alarm that activates when a threshold value is reached. In this example, the alarm activates and adds a log entry when the average CPU utilization for an individual instance exceeds 80%. A query is used to isolate the specific instance's id (**94619081-abf5-4f1f-81c7-9cedaa872403**) for monitoring purposes:

# aodh alarm create --type gnocchi\_aggregation\_by\_resources\_threshold --name cpu\_usage\_high -metric cpu\_util --threshold 80 --aggregation-method sum --resource-type instance --query '{"=": {"id": "94619081-abf5-4f1f-81c7-9cedaa872403"}}' --alarm-action 'log://'

Field	Value	
+   aggregation   alarm actior		++   
alarm_id   comparison_	1	lb-ace4-88cbe4674a94

description         gnocchi_aggregation_by_resources_threshold alarm rul           enabled         True           evaluation_periods         1           granularity         60	le
evaluation_periods   1	
granularity 60	
insufficient_data_actions   []	
metric   cpu_util	
name   cpu_usage_high	
ok_actions	
project_id   13c52c41e0e543d9841a3e761f981c20	
query   {"=": {"id": "94619081-abf5-4f1f-81c7-9cedaa872403"}}	
repeat_actions   False	
resource_type instance	
severity	
state insufficient data	
state_timestamp   2016-12-09T05:18:53.326000	
threshold   80.0	
time constraints	
timestamp   2016-12-09T05:18:53.326000	
type   gnocchi_aggregation_by_resources_threshold	
user_id   32d3f2c9a234423cb52fb69d3741dbbc	
++	

To edit an existing threshold alarm, use the **aodh alarm update** command. For example, to increase the alarm threshold to 75%:

# aodh alarm update --name cpu\_usage\_high --threshold 75

### 4.7. DISABLE OR DELETE AN ALARM

To disable an alarm:

# aodh alarm update --name cpu\_usage\_high --enabled=false

To delete an alarm:

# aodh alarm delete --name cpu\_usage\_high

## 4.8. EXAMPLE: MONITOR THE DISK ACTIVITY OF INSTANCES

The following example demonstrates how to use an Aodh alarm to monitor the cumulative disk activity for all the instances contained within a particular project.

**1.** Review the existing projects, and select the appropriate UUID of the project you need to monitor. This example uses the **admin** project:

\$ openstack project list +-----+ | ID | Name | +-----+ | 745d33000ac74d30a77539f8920555e7 | admin | | 983739bb834a42ddb48124a38def8538 | services | | be9e767afd4c4b7ead1417c6dfedde2b | demo | +-----+ **2.** Use the project's UUID to create an alarm that analyses the **sum()** of all read requests generated by the instances in the **admin** project (the query can be further restrained with the **--query** parameter).

# aodh alarm create --type gnocchi\_aggregation\_by\_resources\_threshold --name iops-monitor-readrequests --metric disk.read.requests.rate --threshold 42000 --aggregation-method sum --resourcetype instance --query '{"=": {"project\_id": "745d33000ac74d30a77539f8920555e7"}}' +-----+ | Field | Value +----aggregation method | sum | alarm\_actions | [] | 192aba27-d823-4ede-a404-7f6b3cc12469 | alarm id | comparison operator | eq | gnocchi aggregation by resources threshold alarm rule | description | enabled | True | evaluation\_periods | 1 granularity | 60 | insufficient data actions | [] l metric | disk.read.requests.rate Iname | iops-monitor-read-requests ok\_actions | [] project\_id | 745d33000ac74d30a77539f8920555e7 | {"=": {"project\_id": "745d33000ac74d30a77539f8920555e7"}} | | query | False | repeat\_actions | instance | resource\_type | severity | low | state | insufficient data | 2016-11-08T23:41:22.919000 state timestamp | threshold | 42000.0 | time\_constraints | [] | timestamp | 2016-11-08T23:41:22.919000 | gnocchi\_aggregation\_by\_resources\_threshold | type user\_id | 8c4aea738d774967b4ef388eb41fef5e -----+

## 4.9. EXAMPLE: MONITOR CPU USAGE

If you want to monitor an instance's performance, you would start by examining the gnocchi database to identify which metrics you can monitor, such as memory or CPU usage. For example, run **gnocchi resource show** against an instance to identify which metrics can be monitored:

1. Query the available metrics for a particular instance UUID:

\$ gnocchi resource	e showtype instance d71cdf9a-51dc-4bba-		
Field   '	Value		
created_by_proje	-+	89	
c24fa60e46d14f8c   display_name	847fca90531b43db:44adccdc32614688ae7   test-instance	65ed4e484f389   	
ended_at   flavor_id   flavor_name	None   14c7c918-df24-481c-b498-0d3ec57d2e51   m1.tiny		

image_ref	overcloud-compute-0     d71cdf9a-51dc-4bba-8170-9cd95edd3f66     e75dff7b-3408-45c2-9a02-61fbfbf054d7

user_id	1dbf5787b2ee46cf9fa6a1dfea9c9996

In this result, the **metrics** value lists the components you can monitor using Aodh alarms, for example **cpu\_util**.

2. To monitor CPU usage, you will need the **cpu\_util** metric. To see more information on this metric:

\$ gnocchi me	tric showresource d71cdf9a-5	1dc-4bba-8170-9cd95edd3f66 cpu_util
+	++	+
Field	Value	
+	++	+

| archive\_policy/aggregation\_methods | std, count, min, max, sum, mean | archive\_policy/back\_window | 0 | archive\_policy/definition - points: 8640, granularity: 0:05:00, timespan: 30 days, 0:00:00 | archive\_policy/name | low created by project id 44adccdc32614688ae765ed4e484f389 | created\_by\_user\_id | c24fa60e46d14f8d847fca90531b43db | creator c24fa60e46d14f8d847fca90531b43db:44adccdc32614688ae765ed4e484f389 | l id | b148c392-37d6-4c8f-8609-e15fc15a4728 | name | cpu util | resource/created\_by\_project\_id | 44adccdc32614688ae765ed4e484f389 | resource/created\_by\_user\_id | c24fa60e46d14f8d847fca90531b43db | resource/creator c24fa60e46d14f8d847fca90531b43db:44adccdc32614688ae765ed4e484f389 | | resource/ended at | None | d71cdf9a-51dc-4bba-8170-9cd95edd3f66 | resource/id | resource/original\_resource\_id | d71cdf9a-51dc-4bba-8170-9cd95edd3f66 | resource/project id | 3cee262b907b4040b26b678d7180566b | resource/revision end | None | resource/revision\_start | 2017-11-17T00:05:27.516421+00:00 | 2017-11-16T01:09:20.668344+00:00 | resource/started\_at | resource/type | instance | resource/user id | 1dbf5787b2ee46cf9fa6a1dfea9c9996 | unit | None

- **archive\_policy** Defines the aggregation interval for calculating the **std**, **count**, **min**, **max**, **sum**, **mean** values.
- 3. Use Aodh to create a monitoring task that queries **cpu\_util**. This task will trigger events based on the settings you specify. For example, to raise a log entry when an instance's CPU spikes over 80% for an extended duration:

```
aodh alarm create \
 --project-id 3cee262b907b4040b26b678d7180566b \
--name high-cpu \
--type gnocchi resources threshold \
--description 'High CPU usage' \
--metric cpu util \
--threshold 80.0 \
--comparison-operator ge \
--aggregation-method mean \
--granularity 300 \
--evaluation-periods 1 \
--alarm-action 'log://' \
--ok-action 'log://' \
--resource-type instance \
 --resource-id d71cdf9a-51dc-4bba-8170-9cd95edd3f66
| Field
                 | Value
```

aggregation_metl	
alarm_actions	[u'log://']
alarm_id	1625015c-49b8-4e3f-9427-3c312a8615dd

•	gnocchi_resources_threshold
	1dbf5787b2ee46cf9fa6a1dfea9c9996

- **comparison-operator** The **ge** operator defines that the alarm will trigger if the CPU usage is greater than (or equal to) 80%.
- **granularity** Metrics have an archive policy associated with them; the policy can have various granularities (for example, 5 minutes aggregation for 1 hour + 1 hour aggregation over a month). The **granularity** value must match the duration described in the archive policy.
- **evaluation-periods** Number of **granularity** periods that need to pass before the alarm will trigger. For example, setting this value to **2** will mean that the CPU usage will need to be over 80% for two polling periods before the alarm will trigger.
- **[u'log:**//'] This value will log events to your Aodh log file.

$\otimes$	
$\otimes$	
$\otimes$	
$\sim \times$	

#### NOTE

You can define different actions to run when an alarm is triggered (**alarm\_actions**), and when it returns to a normal state (**ok\_actions**), such as a webhook URL.

4. To check if your alarm has been triggered, query the alarm's history:

2		49b8-4e3f-9427-3c312a8615	
+			
+			F
timestamp	l type	detail	

event_id

	+++++

## 4.10. MANAGE RESOURCE TYPES

Telemetry resource types that were previously hardcoded can now be managed by the *gnocchi* client. You can use the gnocchi client to create, view, and delete resource types, and you can use the gnocchi API to update or delete attributes.

**1.** Create a new resource-type:

\$ gnocchi resource-type create testResource01 -a bla:string:True:min\_length=123
+----+
| Field | Value |
+----+
attributes/bla	max\_length=255, min\_length=123, required=True, type=string
name	testResource01
state	active
+-----+

2. Review the configuration of the *resource-type*:

	esource-type show testResource01	
Field	Value	
attributes/	/bla   max_length=255, min_length=123	
name   state	testResource01   active	
+	+	+

3. Delete the resource-type:

\$ gnocchi resource-type delete testResource01

#### NOTE

You cannot delete a resource type if a resource is using it.

## **CHAPTER 5. TROUBLESHOOTING**

This chapter contains logging and support information to assist with troubleshooting your Red Hat OpenStack Platform deployment.

## 5.1. SUPPORT

If client commands fail or you run into other issues, contact Red Hat Technical Support with a description of what happened, the full console output, all log files referenced in the console output, and an **sosreport** from the node that is (or might be) in trouble. For example, if you encounter a problem on the compute level, run **sosreport** on the Nova node, or if it is a networking issue, run the utility on the Neutron node. For general deployment issues, it is best to run **sosreport** on the cloud controller.

For information about the **sosreport** command (**sos** package), refer to What is a sosreport and how to create one in Red Hat Enterprise Linux 4.6 and later.

Check also the /var/log/messages file for any hints.

## 5.2. TROUBLESHOOT IDENTITY CLIENT (KEYSTONE) CONNECTIVITY PROBLEMS

When the Identity client (keystone) is unable to contact the Identity service it returns an error:

Unable to communicate with identity service: [Errno 113] No route to host. (HTTP 400)

To debug the issue check for these common causes:

#### Identity service is down

Identity Service now runs within *httpd.service*. On the system hosting the Identity service, check the service status:

# systemctl status httpd.service

If the service is not active then log in as the root user and start it.

# systemctl start httpd.service

#### Firewall is not configured properly

The firewall might not be configured to allow TCP traffic on ports **5000** and **35357**. If so, see *Managing the Overcloud Firewall* in the Advanced Overcloud Customization guide for instructions on checking your firewall settings and defining custom rules.

#### Service Endpoints not defined correctly

On the system hosting the Identity service check that the endpoints are defined correctly.

1. Obtain the administration token:

# grep admin\_token /etc/keystone/keystone.conf admin\_token = 91f0866234a64fc299db8f26f8729488

2. Determine the correct administration endpoint for the Identity service:

#### http://IP:35357/VERSION

Replace *IP* with the IP address or host name of the system hosting the Identity service. Replace *VERSION* with the API version (**v2.0**, or **v3**) that is in use.

3. Unset any pre-defined Identity service related environment variables:

# unset OS\_USERNAME OS\_TENANT\_NAME OS\_PASSWORD OS\_AUTH\_URL

4. Use the administration token and endpoint to authenticate with the Identity service. Confirm that the Identity service endpoint is correct. For example:

# openstack endpoint list --os-token=91f0556234a64fc299db8f26f8729488 --osurl=https://osp.lab.local:35357/v3/ --os-identity-api-version 3

Verify that the listed **publicurl**, **internalurl**, and **adminurl** for the Identity service are correct. In particular ensure that the IP addresses and port numbers listed within each endpoint are correct and reachable over the network.

If these values are incorrect, add the correct endpoint and remove any incorrect endpoints using the **endpoint delete** action of the **openstack** command. For example:

# openstack endpoint delete 2d32fa6feecc49aab5de538bdf7aa018 --ostoken=91f0866234a64fc299db8f26f8729488 --os-url=https://osp.lab.local:35357/v3/ --osidentity-api-version 3

Replace *TOKEN* and *ENDPOINT* with the values identified previously. Replace *ID* with the identity of the endpoint to remove as listed by the **endpoint-list** action.

## 5.3. TROUBLESHOOT OPENSTACK NETWORKING ISSUES

This section discusses the different commands you can use and procedures you can follow to troubleshoot the OpenStack Networking service issues.

#### **Debugging Networking Device**

- Use the **ip a** command to display all the physical and virtual devices.
- Use the **ovs-vsctl show** command to display the interfaces and bridges in a virtual switch.
- Use the **ovs-dpctl show** command to show datapaths on the switch.

#### **Tracking Networking Packets**

• Use the **tcpdump** command to see where packets are not getting through.

# tcpdump -n -i INTERFACE -e -w FILENAME

Replace *INTERFACE* with the name of the network interface to see where the packets are not getting through. The interface name can be the name of the bridge or host Ethernet device.

The **-e** flag ensures that the link-level header is dumped (in which the **vlan** tag will appear).

The **-w** flag is optional. You can use it only if you want to write the output to a file. If not, the output is written to the standard output (**stdout**).

For more information about **tcpdump**, refer to its manual page by running **man tcpdump**.

#### **Debugging Network Namespaces**

- Use the **ip netns list** command to list all known network namespaces.
- Use the **ip netns exec** command to show routing tables inside specific namespaces.

# ip netns exec NAMESPACE\_ID bash
# route -n

Start the **ip netns exec** command in a bash shell so that subsequent commands can be invoked without the **ip netns exec** command.

## 5.4. TROUBLESHOOT NETWORKS AND ROUTES TAB DISPLAY ISSUES IN THE DASHBOARD

The *Networks* and *Routers* tabs only appear in the dashboard when the environment is configured to use OpenStack Networking. In particular note that by default the PackStack utility currently deploys Nova Networking and as such in environments deployed in this manner the tab will not be visible.

If OpenStack Networking is deployed in the environment but the tabs still do not appear ensure that the service endpoints are defined correctly in the Identity service, that the firewall is allowing access to the endpoints, and that the services are running.

## 5.5. TROUBLESHOOT INSTANCE LAUNCHING ERRORS IN THE DASHBOARD

When using the dashboard to launch instances if the operation fails, a generic **ERROR** message is displayed. Determining the actual cause of the failure requires the use of the command line tools.

Use the **nova list** command to locate the unique identifier of the instance. Then use this identifier as an argument to the **nova show** command. One of the items returned will be the error condition. The most common value is **NoValidHost**.

This error indicates that no valid host was found with enough available resources to host the instance. To work around this issue, consider choosing a smaller instance size or increasing the overcommit allowances for your environment.

#### NOTE

To host a given instance, the compute node must have not only available CPU and RAM resources but also enough disk space for the ephemeral storage associated with the instance.

#### 5.6. TROUBLESHOOT KEYSTONE V3 DASHBOARD AUTHENTICATION

django\_openstack\_auth is a pluggable Django authentication back end, that works with Django's contrib.auth framework, to authenticate a user against the OpenStack Identity service API.

Django\_openstack\_auth uses the token object to encapsulate user and Keystone related information. The dashboard uses the token object to rebuild the Django user object.

The token object currently stores:

- Keystone token
- User information
- Scope
- Roles
- Service catalog

The dashboard uses Django's sessions framework for handling user session data. The following is a list of numerous session back ends available, which are controlled through the SESSION\_ENGINE setting in your local\_settings.py file:

- Local Memory Cache
- Memcached
- Database
- Cached Database
- Cookies

In some cases, particularly when a signed cookie session back end is used and, when having many or all services enabled all at once, the size of cookies can reach its limit and the dashboard can fail to log in. One of the reasons for the growth of cookie size is the service catalog. As more services are registered, the bigger the size of the service catalog would be.

In such scenarios, to improve the session token management, include the following configuration settings for logging in to the dashboard, especially when using Keystone v3 authentication.

1. In /usr/share/openstack-dashboard/openstack\_dashboard/settings.py add the following configuration:

```
DATABASES =
{
    'default':
    {
        'ENGINE': 'django.db.backends.mysql',
        'NAME': 'horizondb',
        'USER': 'User Name',
        'PASSWORD': 'Password',
        'HOST': 'localhost',
    }
}
```

2. In the same file, change SESSION\_ENGINE to:

SESSION\_ENGINE = 'django.contrib.sessions.backends.cached\_db'

3. Connect to the database service using the mysql command, replacing USER with the user name by which to connect. The USER must be a root user (or at least as a user with the correct permission: create db).

# mysql -u USER -p

4. Create the Horizon database.

mysql > create database horizondb;

5. Exit the mysql client.

mysql > exit

6. Change to the openstack\_dashboard directory and sync the database using:

# cd /usr/share/openstack-dashboard/openstack\_dashboard
\$ ./manage.py syncdb

You do not need to create a superuser, so answer 'n' to the question.

7. Restart Apache http server. For Red Hat Enterprise Linux:

# systemctl restart httpd

### 5.7. OPENSTACK DASHBOARD - RED HAT ACCESS TAB

The *Red Hat Access* tab, which is part of the OpenStack dashboard, allows you to search for and read articles or solutions from the Red Hat Customer Portal, view logs from your instances and diagnose them, and work with your customer support cases.

#### Figure 5.1. Red Hat Access Tab.

RED HAT ENTERPRISE LINUX OPENSTACK PLATFORM	Project Identity	Red Hat Access 🗸 Help 👤 demo 🗸
Red Hat Access		
Search Logs Support		
Red Hat Access: Search		
		Not Logged into the Red Hat Customer Portal   Log In

Search Articles and Soluti Q Search		

#### IMPORTANT

You must be logged in to the Red Hat Customer Portal in the browser in order to be able to use the functions provided by the Red Hat Access tab.

If you are not logged in, you can do so now:

- 1. Click Log In.
- 2. Enter your Red Hat login.
- 3. Enter your Red Hat password.
- 4. Click Sign in.

This is how the form looks:

#### Figure 5.2. Logging in to the Red Hat Customer Portal.

Sign into the Red Hat Customer Portal
Red Hat Access makes it easy for you to self-solve issues, diagnose problems, and engage with us via the Red Hat Customer Portal. To access Red Hat Customer Portal resources, you must enter valid portal credentials.
Red Hat Login
Red Hat Login
Password
Password
Note: Red Hat Customer Portal credentials differ from the credentials used to log into this product.
Cancel Sign in

If you do not log in now, you will be prompted for your Red Hat login and password when you use one of the functions that require authentication.

#### 5.7.1. Search

You can search for articles and solutions from Red Hat Customer Portal by entering one or more search keywords. The titles of the relevant articles and solutions will then be displayed. Click on a title to view the given article or solution:

#### Figure 5.3. Example of Search Results on the Red Hat Access Tab.

	testinstance2	cirros	192.168.0.7	m1.small	OS-Key	Error	nova	None	No State	1 week, 6 days	View Lo	g	
	testinstance	cirros	192.168.0.2	m1.tiny		Shutoff	nova	None	Shut Down	3 weeks, 2 days	View Lo	g	
Displa	ying 2 items												

Find the instance of your choice in the table. If you have many instances, you can filter them by name, status, image ID, or flavor ID. Click *View Log* in the *Actions* column for the instance to check.

When an instance log is displayed, you can click *Red Hat Diagnose* to get recommendations regarding its contents:

If none of the recommendations are useful or a genuine problem has been logged, click *Open a New Support Case* to report the problem to Red Hat Support.

#### 5.7.3. Support

The last option in the Red Hat Access Tab allows you to search for your support cases at the Red Hat Customer Portal:

Figure 5.6. Search for Support Cases.
