<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.133. .spec.ephemeralContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.134. .spec.ephemeralContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.12.1.135. .spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.12.1.136. .spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.137. .spec.ephemeralContainers[].readinessProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.138. .spec.ephemeralContainers[].resizePolicy

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.12.1.139. .spec.ephemeralContainers[].resizePolicy[]

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.12.1.140. .spec.ephemeralContainers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.141. `.spec.ephemeralContainers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.142. `.spec.ephemeralContainers[].resources.claims[]`

##### Description

`ResourceClaim` references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.143. `.spec.ephemeralContainers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.12.1.144. .spec.ephemeralContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.12.1.145. `.spec.ephemeralContainers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.12.1.146. `.spec.ephemeralContainers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.12.1.147. .spec.ephemeralContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.12.1.148. .spec.ephemeralContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.149. .spec.ephemeralContainers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.150. .spec.ephemeralContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.151. .spec.ephemeralContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.12.1.152. `.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.12.1.153. `.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.154. `.spec.ephemeralContainers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.155. `.spec.ephemeralContainers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.12.1.156. `.spec.ephemeralContainers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.12.1.157. .spec.ephemeralContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

## Type

**array**

**14.12.1.158. .spec.ephemeralContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '.'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). -  <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.12.1.159. .spec.hostAliases

##### Description

HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

##### Type

**array**

#### 14.12.1.160. .spec.hostAliases[]

##### Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

##### Type

**object**

Property	Type	Description
<b>hostnames</b>	<b>array (string)</b>	Hostnames for the above IP address.
<b>ip</b>	<b>string</b>	IP address of the host file entry.

#### 14.12.1.161. .spec.imagePullSecrets

##### Description

ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info:

<https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod>

##### Type

**array**

#### 14.12.1.162. .spec.imagePullSecrets[]

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 14.12.1.163. .spec.initContainers

## Description

List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <https://kubernetes.io/docs/concepts/workloads/pods/init-containers/>

## Type

**array**

### 14.12.1.164. .spec.initContainers[]

## Description

A single application container that you want to run within a pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$\$</code> are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal <code>\$(VAR_NAME)</code>. Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$\$</code> are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal <code>\$(VAR_NAME)</code>. Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	List of environment variables to set in the container. Cannot be updated.

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

Property	Type	Description
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>
<b>lifecycle</b>	<b>object</b>	<p>Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.</p>
<b>livenessProbe</b>	<b>object</b>	<p>Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.</p>
<b>name</b>	<b>string</b>	<p>Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.</p>

Property	Type	Description
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.12.1.165. .spec.initContainers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.12.1.166. .spec.initContainers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.12.1.167. `.spec.initContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources (cpu, memory) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.12.1.168. `.spec.initContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a ConfigMap.

#### Type

**object**

#### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.12.1.169. .spec.initContainers[].env[].valueFrom.fieldRef

#### Description

ObjectFieldSelector selects an APIVersioned field of an object.

#### Type

**object**

#### Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.12.1.170. .spec.initContainers[].env[].valueFrom.resourceFieldRef

#### Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### Type

**object**

#### Required

- **resource**

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.12.1.171. `.spec.initContainers[].env[].valueFrom.secretKeyRef`

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.12.1.172. `.spec.initContainers[].envFrom`

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.12.1.173. `.spec.initContainers[].envFrom[]`

**Description**

EnvFromSource represents the source of a set of ConfigMaps

**Type**

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	<p>ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.</p> <p>The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.</p>
<b>prefix</b>	<b>string</b>	<p>An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.</p>
<b>secretRef</b>	<b>object</b>	<p>SecretEnvSource selects a Secret to populate the environment variables with.</p> <p>The contents of the target Secret's Data field will represent the key-value pairs as environment variables.</p>

**14.12.1.174. .spec.initContainers[].envFrom[].configMapRef****Description**

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	<p>Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a></p>
<b>optional</b>	<b>boolean</b>	<p>Specify whether the ConfigMap must be defined</p>

### 14.12.1.175. .spec.initContainers[].envFrom[].secretRef

#### Description

SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.12.1.176. .spec.initContainers[].lifecycle

#### Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

#### Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.12.1.177. .spec.initContainers[].lifecycle.postStart

#### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type  
object

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.12.1.178. .spec.initContainers[].lifecycle.postStart.exec

Description

ExecAction describes a "run in container" action.

Type  
object

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.179. .spec.initContainers[].lifecycle.postStart.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type  
object

Required

- port

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.180. .spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.181. .spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.182. `.spec.initContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.183. `.spec.initContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPsocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.12.1.184. .spec.initContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.185. .spec.initContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.186. .spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.187. .spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.188. .spec.initContainers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.189. .spec.initContainers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.190. .spec.initContainers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.191. .spec.initContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.192. .spec.initContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.12.1.193. .spec.initContainers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.12.1.194. .spec.initContainers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.195. .spec.initContainers[].livenessProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.196. .spec.initContainers[].ports

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.12.1.197. .spec.initContainers[].ports[]

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.12.1.198. .spec.initContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.199. .spec.initContainers[].readinessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.200. .spec.initContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.201. .spec.initContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.12.1.202. .spec.initContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.12.1.203. .spec.initContainers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.204. `.spec.initContainers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.205. `.spec.initContainers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.12.1.206. `.spec.initContainers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.12.1.207. .spec.initContainers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.208. .spec.initContainers[].resources.claims

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.209. .spec.initContainers[].resources.claims[]

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.210. .spec.initContainers[].securityContext

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.12.1.211. .spec.initContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.12.1.212. `.spec.initContainers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.12.1.213. `.spec.initContainers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.12.1.214. .spec.initContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.12.1.215. .spec.initContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.216. .spec.initContainers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.217. .spec.initContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.218. .spec.initContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.12.1.219. `.spec.initContainers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.12.1.220. `.spec.initContainers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.221. .spec.initContainers[].startupProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.222. .spec.initContainers[].volumeDevices

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.12.1.223. .spec.initContainers[].volumeDevices[]

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.12.1.224. .spec.initContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.12.1.225. .spec.initContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.12.1.226. .spec.os

##### Description

PodOS defines the OS parameters of a pod.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: <a href="https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration">https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration</a> Clients should expect to handle additional values and treat unrecognized values in this field as os: null

#### 14.12.1.227. .spec.readinessGates

##### Description

If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True"  
More info: <https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates>

##### Type

**array**

### 14.12.1.228. .spec.readinessGates[]

#### Description

PodReadinessGate contains the reference to a pod condition

#### Type

**object**

#### Required

- **conditionType**

Property	Type	Description
<b>conditionType</b>	<b>string</b>	ConditionType refers to a condition in the pod's condition list with matching type.

### 14.12.1.229. .spec.resourceClaims

#### Description

ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.

This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable.

#### Type

**array**

### 14.12.1.230. .spec.resourceClaims[]

#### Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.

Property	Type	Description
<b>source</b>	<b>object</b>	ClaimSource describes a reference to a ResourceClaim.  Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

#### 14.12.1.231. .spec.resourceClaims[].source

##### Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

##### Type

**object**

Property	Type	Description
<b>resourceClaimName</b>	<b>string</b>	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
<b>resourceClaimTemplateName</b>	<b>string</b>	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be &lt;pod name&gt;-&lt;resource name&gt;, where &lt;resource name&gt; is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

#### 14.12.1.232. .spec.schedulingGates

##### Description

SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.

SchedulingGates can only be set at pod creation time, and be removed only afterwards.

This is a beta feature enabled by the PodSchedulingReadiness feature gate.

##### Type

**array**

#### 14.12.1.233. .spec.schedulingGates[]

##### Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the scheduling gate. Each scheduling gate must have a unique name field.

### 14.12.1.234. .spec.securityContext

#### Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

#### Type

**object**

Property	Type	Description
<b>fsGroup</b>	<b>integer</b>	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>fsGroupChangePolicy</b>	<b>string</b>	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Always"</b> indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. -  <b>"OnRootMismatch"</b> indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>
<b>runAsGroup</b>	<b>integer</b>	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>supplementalGroups</b>	<b>array (integer)</b>	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>sysctls</b>	<b>array</b>	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
<b>sysctls[]</b>	<b>object</b>	Sysctl defines a kernel parameter to be set
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.12.1.235. .spec.securityContext.seLinuxOptions

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.12.1.236. .spec.securityContext.seccompProfile

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.12.1.237. .spec.securityContext.sysctls

##### Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

##### Type

**array**

#### 14.12.1.238. .spec.securityContext.sysctls[]

##### Description

Sysctl defines a kernel parameter to be set

##### Type

**object**

**Required**

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of a property to set
<b>value</b>	<b>string</b>	Value of a property to set

**14.12.1.239. .spec.securityContext.windowsOptions****Description**

WindowsSecurityContextOptions contain Windows-specific options and credentials.

**Type**

**object**

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.12.1.240. .spec.tolerations

##### Description

If specified, the pod's tolerations.

##### Type

**array**

#### 14.12.1.241. .spec.tolerations[]

##### Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

##### Type

**object**

Property	Type	Description
<b>effect</b>	<b>string</b>	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: -  <b>"NoExecute"</b> Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. -  <b>"NoSchedule"</b> Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. -  <b>"PreferNoSchedule"</b> Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
<b>key</b>	<b>string</b>	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
<b>operator</b>	<b>string</b>	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - <b>"Equal"</b>  - <b>"Exists"</b></p>

Property	Type	Description
<b>tolerationSeconds</b>	<b>integer</b>	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
<b>value</b>	<b>string</b>	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

#### 14.12.1.242. .spec.topologySpreadConstraints

##### Description

TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

##### Type

**array**

#### 14.12.1.243. .spec.topologySpreadConstraints[]

##### Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

##### Type

**object**

##### Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.
<b>matchLabelKeys</b>	<b>array (string)</b>	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>maxSkew</b>	<b>integer</b>	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <b>whenUnsatisfiable=DoNotSchedule</b>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1.   zone1   zone2   zone3     P P   P P   P   - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <b>whenUnsatisfiable=ScheduleAnyway</b>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
<b>minDomains</b>	<b>integer</b>	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2:   zone1   zone2   zone3     P P   P P   P P   The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>nodeAffinityPolicy</b>	<b>string</b>	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>
<b>nodeTaintsPolicy</b>	<b>string</b>	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
<b>topologyKey</b>	<b>string</b>	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
<b>whenUnsatisfiable</b>	<b>string</b>	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <b>more</b> imbalanced. It's a required field.</p> <p>Possible enum values: - <b>"DoNotSchedule"</b> instructs the scheduler not to schedule the pod when constraints are not satisfied. - <b>"ScheduleAnyway"</b> instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

#### 14.12.1.244. .spec.volumes

##### Description

List of volumes that can be mounted by containers belonging to the pod. More info: <https://kubernetes.io/docs/concepts/storage/volumes>

##### Type

**array**

#### 14.12.1.245. .spec.volumes[]

##### Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
<b>awsElasticBlockStore</b>	<b>object</b>	<p>Represents a Persistent Disk resource in AWS.</p> <p>An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.</p>
<b>azureDisk</b>	<b>object</b>	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
<b>azureFile</b>	<b>object</b>	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
<b>cephfs</b>	<b>object</b>	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
<b>cinder</b>	<b>object</b>	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.</p>
<b>csi</b>	<b>object</b>	Represents a source location of a volume to mount, managed by an external CSI driver
<b>downwardAPI</b>	<b>object</b>	DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.
<b>emptyDir</b>	<b>object</b>	Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.
<b>ephemeral</b>	<b>object</b>	Represents an ephemeral volume that is handled by a normal storage driver.
<b>fc</b>	<b>object</b>	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
<b>flexVolume</b>	<b>object</b>	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
<b>flocker</b>	<b>object</b>	Represents a Flocker volume mounted by the Flocker agent. One and only one of <code>datasetName</code> and <code>datasetUUID</code> should be set. Flocker volumes do not support ownership management or SELinux relabeling.
<b>gcePersistentDisk</b>	<b>object</b>	Represents a Persistent Disk resource in Google Compute Engine.  A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
<b>gitRepo</b>	<b>object</b>	Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.  DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an <code>EmptyDir</code> into an <code>InitContainer</code> that clones the repo using <code>git</code> , then mount the <code>EmptyDir</code> into the Pod's container.
<b>glusterfs</b>	<b>object</b>	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
<b>hostPath</b>	<b>object</b>	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>iscsi</b>	<b>object</b>	Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
<b>name</b>	<b>string</b>	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>nfs</b>	<b>object</b>	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
<b>persistentVolumeClaim</b>	<b>object</b>	PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).
<b>photonPersistentDisk</b>	<b>object</b>	Represents a Photon Controller persistent disk resource.
<b>portworxVolume</b>	<b>object</b>	PortworxVolumeSource represents a Portworx volume resource.
<b>projected</b>	<b>object</b>	Represents a projected volume source
<b>quobyte</b>	<b>object</b>	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>rbd</b>	<b>object</b>	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
<b>scaleIO</b>	<b>object</b>	ScaleIOVolumeSource represents a persistent ScaleIO volume
<b>secret</b>	<b>object</b>	Adapts a Secret into a volume.  The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.
<b>storageos</b>	<b>object</b>	Represents a StorageOS persistent volume resource.
<b>vsphereVolume</b>	<b>object</b>	Represents a vSphere volume resource.

#### 14.12.1.246. .spec.volumes[].awsElasticBlockStore

##### Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumelD**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
<b>readOnly</b>	<b>boolean</b>	readOnly value true will force the readOnly setting in VolumeMounts. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>volumeID</b>	<b>string</b>	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

#### 14.12.1.247. .spec.volumes[].azureDisk

##### Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **diskName**
- **diskURI**

Property	Type	Description
<b>cachingMode</b>	<b>string</b>	cachingMode is the Host Caching mode: None, Read Only, Read Write.  Possible enum values: - <b>"None"</b> - <b>"ReadOnly"</b> - <b>"ReadWrite"</b>
<b>diskName</b>	<b>string</b>	diskName is the Name of the data disk in the blob storage
<b>diskURI</b>	<b>string</b>	diskURI is the URI of data disk in the blob storage
<b>fsType</b>	<b>string</b>	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>kind</b>	<b>string</b>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared  Possible enum values: - <b>"Dedicated"</b> - <b>"Managed"</b> - <b>"Shared"</b>
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

#### 14.12.1.248. .spec.volumes[].azureFile

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>shareName</b>	<b>string</b>	shareName is the azure share Name

#### 14.12.1.249. .spec.volumes[].cephfs

##### Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 14.12.1.250. .spec.volumes[].cephfs.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.251. .spec.volumes[].cinder

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 14.12.1.252. .spec.volumes[].cinder.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.253. .spec.volumes[].configMap

##### Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

Type  
object

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

#### 14.12.1.254. .spec.volumes[].configMap.items

##### Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

#### Type

**array**

#### 14.12.1.255. `.spec.volumes[].configMap.items[]`

#### Description

Maps a string key to a path within a volume.

#### Type

**object**

#### Required

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.12.1.256. `.spec.volumes[].csi`

#### Description

Represents a source location of a volume to mount, managed by an external CSI driver

#### Type

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
<b>fsType</b>	<b>string</b>	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
<b>nodePublishSecretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>readOnly</b>	<b>boolean</b>	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**14.12.1.257. .spec.volumes[].csi.nodePublishSecretRef****Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

14.12.1.258. `.spec.volumes[].downwardAPI`**Description**

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

**Type**

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	Items is a list of downward API volume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.12.1.259. `.spec.volumes[].downwardAPI.items`**Description**

Items is a list of downward API volume file

**Type**

**array**

14.12.1.260. `.spec.volumes[].downwardAPI.items[]`**Description**

DownwardAPIVolumeFile represents information to create the file containing the pod field

**Type**

**object**

**Required**

**path**

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.12.1.261. .spec.volumes[].downwardAPI.items[].fieldRef

##### Description

ObjectFieldSelector selects an APIVersioned field of an object.

##### Type

**object**

##### Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.12.1.262. `.spec.volumes[].downwardAPI.items[].resourceFieldRef`

##### Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

##### Type

**object**

##### Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.12.1.263. `.spec.volumes[].emptyDir`

##### Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>medium</b>	<b>string</b>	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Property	Type	Description
<b>sizeLimit</b>	<b>Quantity</b>	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

#### 14.12.1.264. .spec.volumes[].ephemeral

##### Description

Represents an ephemeral volume that is handled by a normal storage driver.

##### Type

**object**

Property	Type	Description
<b>volumeClaimTemplate</b>	<b>object</b>	PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

#### 14.12.1.265. .spec.volumes[].ephemeral.volumeClaimTemplate

##### Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

##### Type

**object**

##### Required

- **spec**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
<b>spec</b>	<b>object</b>	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

#### 14.12.1.266. .spec.volumes[].ephemeral.volumeClaimTemplate.spec

##### Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>dataSource</b>	<b>object</b>	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
<b>dataSourceRef</b>	<b>object</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

#### 14.12.1.267. .spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSource

##### Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

#### 14.12.1.268. .spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef

##### Description

dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: \* While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. \* While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. \* While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

#### 14.12.1.269. .spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.270. `.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.271. `.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.272. `.spec.volumes[].fc`

##### Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	<code>fsType</code> is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>lun</b>	<b>integer</b>	<code>lun</code> is Optional: FC target lun number
<b>readOnly</b>	<b>boolean</b>	<code>readOnly</code> is Optional: Defaults to false (read/write). <code>ReadOnly</code> here will force the <code>ReadOnly</code> setting in <code>VolumeMounts</code> .
<b>targetWWNs</b>	<b>array (string)</b>	<code>targetWWNs</code> is Optional: FC target worldwide names (WWNs)
<b>wwids</b>	<b>array (string)</b>	<code>wwids</code> Optional: FC volume world wide identifiers (wwids) Either <code>wwids</code> or combination of <code>targetWWNs</code> and <code>lun</code> must be set, but not both simultaneously.

#### 14.12.1.273. `.spec.volumes[].flexVolume`

##### Description

`FlexVolume` represents a generic volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**14.12.1.274. .spec.volumes[].flexVolume.secretRef**

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**14.12.1.275. .spec.volumes[].flocker**

## Description

Represents a Flocker volume mounted by the Flocker agent. One and only one of `datasetName` and `datasetUUID` should be set. Flocker volumes do not support ownership management or SELinux relabeling.

#### Type

**object**

Property	Type	Description
<b>datasetName</b>	<b>string</b>	<code>datasetName</code> is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
<b>datasetUUID</b>	<b>string</b>	<code>datasetUUID</code> is the UUID of the dataset. This is unique identifier of a Flocker dataset

#### 14.12.1.276. `.spec.volumes[].gcePersistentDisk`

##### Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

#### Type

**object**

#### Required

- **pdName**

Property	Type	Description
<b>fsType</b>	<b>string</b>	<code>fsType</code> is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Property	Type	Description
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>pdName</b>	<b>string</b>	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

#### 14.12.1.277. .spec.volumes[].gitRepo

##### Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

##### Type

**object**

##### Required

- **repository**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>directory</b>	<b>string</b>	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
<b>repository</b>	<b>string</b>	repository is the URL
<b>revision</b>	<b>string</b>	revision is the commit hash for the specified revision.

#### 14.12.1.278. .spec.volumes[].glusterfs

##### Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **endpoints**
- **path**

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 14.12.1.279. .spec.volumes[].hostPath

##### Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - <b>"BlockDevice"</b> A block device must exist at the given path - <b>"CharDevice"</b> A character device must exist at the given path - <b>"Directory"</b> A directory must exist at the given path - <b>"DirectoryOrCreate"</b> If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - <b>"File"</b> A file must exist at the given path - <b>"FileOrCreate"</b> If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - <b>"Socket"</b> A UNIX socket must exist at the given path</p>

#### 14.12.1.280. .spec.volumes[].iscsi

##### Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is the target iSCSI Qualified Name.
<b>iscsiInterface</b>	<b>string</b>	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<b>lun</b>	<b>integer</b>	lun represents iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

Property	Type	Description
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 14.12.1.281. .spec.volumes[].iscsi.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.282. .spec.volumes[].nfs

##### Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **server**
- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>server</b>	<b>string</b>	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

#### 14.12.1.283. .spec.volumes[].persistentVolumeClaim

##### Description

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

##### Type

**object**

##### Required

- **claimName**

Property	Type	Description
<b>claimName</b>	<b>string</b>	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>readOnly</b>	<b>boolean</b>	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

#### 14.12.1.284. .spec.volumes[].photonPersistentDisk

##### Description

Represents a Photon Controller persistent disk resource.

##### Type

**object**

**Required**

- **pdID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>pdID</b>	<b>string</b>	pdID is the ID that identifies Photon Controller persistent disk

**14.12.1.285. .spec.volumes[].portworxVolume****Description**

PortworxVolumeSource represents a Portworx volume resource.

**Type**

**object**

**Required**

- **volumelD**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>volumelD</b>	<b>string</b>	volumelD uniquely identifies a Portworx volume

**14.12.1.286. .spec.volumes[].projected****Description**

Represents a projected volume source

Type  
object

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>sources</b>	<b>array</b>	sources is the list of volume projections
<b>sources[]</b>	<b>object</b>	Projection that may be projected along with other supported volume types

#### 14.12.1.287. .spec.volumes[].projected.sources

##### Description

sources is the list of volume projections

Type  
array

#### 14.12.1.288. .spec.volumes[].projected.sources[]

##### Description

Projection that may be projected along with other supported volume types

Type  
object

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a projected volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.</p>
<b>downwardAPI</b>	<b>object</b>	<p>Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.</p>
<b>secret</b>	<b>object</b>	<p>Adapts a secret into a projected volume.</p> <p>The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.</p>
<b>serviceAccountToken</b>	<b>object</b>	<p>ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).</p>

#### 14.12.1.289. .spec.volumes[].projected.sources[].configMap

##### Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

**14.12.1.290. .spec.volumes[].projected.sources[].configMap.items****Description**

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.12.1.291. .spec.volumes[].projected.sources[].configMap.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.12.1.292. .spec.volumes[].projected.sources[].downwardAPI

##### Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	Items is a list of DownwardAPIVolume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

#### 14.12.1.293. .spec.volumes[].projected.sources[].downwardAPI.items

##### Description

Items is a list of DownwardAPIVolume file

Type

**array**

#### 14.12.1.294. `.spec.volumes[].projected.sources[].downwardAPI.items[]`

Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

**object**

Required

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the <code>..</code> path. Must be utf-8 encoded. The first item of the relative path must not start with <code>..</code>
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.12.1.295. `.spec.volumes[].projected.sources[].downwardAPI.items[].fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.12.1.296. `.spec.volumes[].projected.sources[].downwardAPI.items[].resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.12.1.297. `.spec.volumes[].projected.sources[].secret`

Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its key must be defined

#### 14.12.1.298. .spec.volumes[].projected.sources[].secret.items

##### Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

##### Type

**array**

#### 14.12.1.299. .spec.volumes[].projected.sources[].secret.items[]

##### Description

Maps a string key to a path within a volume.

##### Type

**object**

##### Required

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.12.1.300. .spec.volumes[].projected.sources[].serviceAccountToken

##### Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>audience</b>	<b>string</b>	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.

Property	Type	Description
<b>expirationSeconds</b>	<b>integer</b>	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
<b>path</b>	<b>string</b>	path is the path relative to the mount point of the file to project the token into.

#### 14.12.1.301. .spec.volumes[].quobyte

##### Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **registry**
- **volume**

Property	Type	Description
<b>group</b>	<b>string</b>	group to map volume access to Default is no group
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
<b>registry</b>	<b>string</b>	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
<b>tenant</b>	<b>string</b>	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
<b>user</b>	<b>string</b>	user to map volume access to Defaults to serviceaccount user
<b>volume</b>	<b>string</b>	volume is a string that references an already created Quobyte volume by name.

#### 14.12.1.302. .spec.volumes[].rbd

##### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**
- **image**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>

Property	Type	Description
<b>image</b>	<b>string</b>	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>keyring</b>	<b>string</b>	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>monitors</b>	<b>array (string)</b>	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>pool</b>	<b>string</b>	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

### 14.12.1.303. .spec.volumes[].rbd.secretRef

#### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.304. .spec.volumes[].scaleIO

##### Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled Flag enable/disable SSL communication with Gateway, default false

Property	Type	Description
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 14.12.1.305. .spec.volumes[].scaleIO.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.306. .spec.volumes[].secret

##### Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its keys must be defined
<b>secretName</b>	<b>string</b>	secretName is the name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

### 14.12.1.307. .spec.volumes[].secret.items

#### Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys

will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.12.1.308. .spec.volumes[].secret.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**14.12.1.309. .spec.volumes[].storageos****Description**

Represents a StorageOS persistent volume resource.

**Type****object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

#### 14.12.1.310. .spec.volumes[].storageos.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.12.1.311. .spec.volumes[].vsphereVolume

##### Description

Represents a vSphere volume resource.

##### Type

**object**

##### Required

- **volumePath**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>storagePolicyID</b>	<b>string</b>	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
<b>storagePolicyName</b>	<b>string</b>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<b>volumePath</b>	<b>string</b>	volumePath is the path that identifies vSphere volume vmdk

#### 14.12.1.312. .status

##### Description

PodStatus represents information about the status of a pod. Status may trail the actual state of a system, especially if the node that hosts the pod cannot contact the control plane.

##### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	Current service state of pod. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions</a>
<b>conditions[]</b>	<b>object</b>	PodCondition contains details for the current condition of this pod.
<b>containerStatuses</b>	<b>array</b>	The list has one entry per container in the manifest. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status</a>
<b>containerStatuses[]</b>	<b>object</b>	ContainerStatus contains details for the current status of this container.
<b>ephemeralContainerStatuses</b>	<b>array</b>	Status for any ephemeral containers that have run in this pod.
<b>ephemeralContainerStatuses []</b>	<b>object</b>	ContainerStatus contains details for the current status of this container.
<b>hostIP</b>	<b>string</b>	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
<b>initContainerStatuses</b>	<b>array</b>	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status</a>
<b>initContainerStatuses[]</b>	<b>object</b>	ContainerStatus contains details for the current status of this container.

Property	Type	Description
<b>message</b>	<b>string</b>	A human readable message indicating details about why the pod is in this condition.
<b>nominatedNodeName</b>	<b>string</b>	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
<b>phase</b>	<b>string</b>	<p>The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values:</p> <p>Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers</p>

Property	Type	Description
		<p>in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod.</p> <p>More info:  <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase</a></p> <p>Possible enum values: - <b>"Failed"</b> means that all containers in the pod have terminated, and at least one container has terminated in a failure (exited with a non-zero exit code or was stopped by the system). - <b>"Pending"</b> means the pod has been accepted by the system, but one or more of the containers has not been started. This includes time before being bound to a node, as well as time spent pulling images onto the host. - <b>"Running"</b> means the pod has been bound to a node and all of the containers have been started. At least one container is still running or is in the process of being restarted. - <b>"Succeeded"</b> means that all containers in the pod have voluntarily terminated with a container exit code of 0, and the system is not going to restart any of these containers. - <b>"Unknown"</b> means that for some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod.</p> <p>Deprecated: It isn't being set since 2015  (74da3b14b0c0f658b3bb8d2def5094686d0e9095)</p>
<b>podIP</b>	<b>string</b>	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.

Property	Type	Description
<b>podIPs</b>	<b>array</b>	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.
<b>podIPs[]</b>	<b>object</b>	IP address information for entries in the (plural) PodIPs field. Each entry includes:  IP: An IP address allocated to the pod. Routable at least within the cluster.
<b>qosClass</b>	<b>string</b>	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-qos/#quality-of-service-classes">https://kubernetes.io/docs/concepts/workloads/pods/pod-qos/#quality-of-service-classes</a>  Possible enum values: - <b>"BestEffort"</b> is the BestEffort qos class. - <b>"Burstable"</b> is the Burstable qos class. - <b>"Guaranteed"</b> is the Guaranteed qos class.
<b>reason</b>	<b>string</b>	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
<b>resize</b>	<b>string</b>	Status of resources resize desired for pod's containers. It is empty if no resources resize is pending. Any changes to container resources will automatically set this to "Proposed"
<b>startTime</b>	<b>Time</b>	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

14.12.1.313. `.status.conditions`

## Description

Current service state of pod. More info: <https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions>

## Type

**array**

14.12.1.314. `.status.conditions[]`

## Description

PodCondition contains details for the current condition of this pod.

## Type

**object**

## Required

- **type**
- **status**

Property	Type	Description
<b>lastProbeTime</b>	<b>Time</b>	Last time we probed the condition.
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	Human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	Unique, one-word, CamelCase reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status is the status of the condition. Can be True, False, Unknown. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions</a>
<b>type</b>	<b>string</b>	Type is the type of the condition. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions</a>

### 14.12.1.315. `.status.containerStatuses`

#### Description

The list has one entry per container in the manifest. More info:

<https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status>

#### Type

**array**

### 14.12.1.316. `.status.containerStatuses[]`

#### Description

ContainerStatus contains details for the current status of this container.

#### Type

**object**

#### Required

- **name**
- **ready**
- **restartCount**
- **image**
- **imageID**

Property	Type	Description
<b>allocatedResources</b>	<b>object (Quantity)</b>	AllocatedResources represents the compute resources allocated for this container by the node. Kubelet sets this value to Container.Resources.Requests upon successful pod admission and after successfully admitting desired pod resize.
<b>containerID</b>	<b>string</b>	ContainerID is the ID of the container in the format ' <code>&lt;type&gt;://&lt;container_id&gt;</code> '. Where <code>type</code> is a container runtime identifier, returned from Version call of CRI API (for example "containerd").

Property	Type	Description
<b>image</b>	<b>string</b>	Image is the name of container image that the container is running. The container image may not match the image used in the PodSpec, as it may have been resolved by the runtime. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> .
<b>imageID</b>	<b>string</b>	ImageID is the image ID of the container's image. The image ID may not match the image ID of the image used in the PodSpec, as it may have been resolved by the runtime.
<b>lastState</b>	<b>object</b>	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.
<b>name</b>	<b>string</b>	Name is a DNS_LABEL representing the unique name of the container. Each container in a pod must have a unique name across all container types. Cannot be updated.
<b>ready</b>	<b>boolean</b>	Ready specifies whether the container is currently passing its readiness check. The value will change as readiness probes keep executing. If no readiness probes are specified, this field defaults to true once the container is fully started (see Started field).  The value is typically used to determine whether a container is ready to accept traffic.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
<b>restartCount</b>	<b>integer</b>	RestartCount holds the number of times the container has been restarted. Kubelet makes an effort to always increment the value, but there are cases when the state may be lost due to node restarts and then the value may be reset to 0. The value is never negative.
<b>started</b>	<b>boolean</b>	Started indicates whether the container has finished its postStart lifecycle hook and passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. In both cases, startup probes will run again. Is always true when no startupProbe is defined and container is running and has passed the postStart lifecycle hook. The null value must be treated the same as false.
<b>state</b>	<b>object</b>	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

#### 14.12.1.317. .status.containerStatuses[].lastState

##### Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

##### Type

**object**

Property	Type	Description
<b>running</b>	<b>object</b>	ContainerStateRunning is a running state of a container.
<b>terminated</b>	<b>object</b>	ContainerStateTerminated is a terminated state of a container.

Property	Type	Description
<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.318. `.status.containerStatuses[].lastState.running`

##### Description

ContainerStateRunning is a running state of a container.

##### Type

**object**

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.319. `.status.containerStatuses[].lastState.terminated`

##### Description

ContainerStateTerminated is a terminated state of a container.

##### Type

**object**

##### Required

- **exitCode**

Property	Type	Description
<b>containerID</b>	<b>string</b>	Container's ID in the format '<type>://<container_id>'
<b>exitCode</b>	<b>integer</b>	Exit status from the last termination of the container
<b>finishedAt</b>	<b>Time</b>	Time at which the container last terminated
<b>message</b>	<b>string</b>	Message regarding the last termination of the container
<b>reason</b>	<b>string</b>	(brief) reason from the last termination of the container
<b>signal</b>	<b>integer</b>	Signal from the last termination of the container

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which previous execution of the container started

#### 14.12.1.320. .status.containerStatuses[].lastState.waiting

##### Description

ContainerStateWaiting is a waiting state of a container.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	Message regarding why the container is not yet running.
<b>reason</b>	<b>string</b>	(brief) reason the container is not yet running.

#### 14.12.1.321. .status.containerStatuses[].resources

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.

Property	Type	Description
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.322. `.status.containerStatuses[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.323. `.status.containerStatuses[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.324. `.status.containerStatuses[].state`

##### Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

##### Type

**object**

Property	Type	Description
<b>running</b>	<b>object</b>	ContainerStateRunning is a running state of a container.
<b>terminated</b>	<b>object</b>	ContainerStateTerminated is a terminated state of a container.
<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.325. `.status.containerStatuses[].state.running`

##### Description

ContainerStateRunning is a running state of a container.

##### Type

**object**

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.326. `.status.containerStatuses[].state.terminated`

##### Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- `exitCode`

Property	Type	Description
<code>containerID</code>	string	Container's ID in the format '<type>://<container_id>'
<code>exitCode</code>	integer	Exit status from the last termination of the container
<code>finishedAt</code>	Time	Time at which the container last terminated
<code>message</code>	string	Message regarding the last termination of the container
<code>reason</code>	string	(brief) reason from the last termination of the container
<code>signal</code>	integer	Signal from the last termination of the container
<code>startedAt</code>	Time	Time at which previous execution of the container started

#### 14.12.1.327. `.status.containerStatuses[].state.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

object

Property	Type	Description
<code>message</code>	string	Message regarding why the container is not yet running.
<code>reason</code>	string	(brief) reason the container is not yet running.

#### 14.12.1.328. `.status.ephemeralContainerStatuses`

Description

Status for any ephemeral containers that have run in this pod.

Type

**array**

#### 14.12.1.329. .status.ephemeralContainerStatuses[]

Description

ContainerStatus contains details for the current status of this container.

Type

**object**

Required

- **name**
- **ready**
- **restartCount**
- **image**
- **imageID**

Property	Type	Description
<b>allocatedResources</b>	<b>object (Quantity)</b>	AllocatedResources represents the compute resources allocated for this container by the node. Kubelet sets this value to Container.Resources.Requests upon successful pod admission and after successfully admitting desired pod resize.
<b>containerID</b>	<b>string</b>	ContainerID is the ID of the container in the format '<type>://<container_id>'. Where type is a container runtime identifier, returned from Version call of CRI API (for example "containerd").
<b>image</b>	<b>string</b>	Image is the name of container image that the container is running. The container image may not match the image used in the PodSpec, as it may have been resolved by the runtime. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> .

Property	Type	Description
<b>imageID</b>	<b>string</b>	ImageID is the image ID of the container's image. The image ID may not match the image ID of the image used in the PodSpec, as it may have been resolved by the runtime.
<b>lastState</b>	<b>object</b>	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.
<b>name</b>	<b>string</b>	Name is a DNS_LABEL representing the unique name of the container. Each container in a pod must have a unique name across all container types. Cannot be updated.
<b>ready</b>	<b>boolean</b>	Ready specifies whether the container is currently passing its readiness check. The value will change as readiness probes keep executing. If no readiness probes are specified, this field defaults to true once the container is fully started (see Started field).  The value is typically used to determine whether a container is ready to accept traffic.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>restartCount</b>	<b>integer</b>	RestartCount holds the number of times the container has been restarted. Kubelet makes an effort to always increment the value, but there are cases when the state may be lost due to node restarts and then the value may be reset to 0. The value is never negative.

Property	Type	Description
<b>started</b>	<b>boolean</b>	Started indicates whether the container has finished its postStart lifecycle hook and passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. In both cases, startup probes will run again. Is always true when no startupProbe is defined and container is running and has passed the postStart lifecycle hook. The null value must be treated the same as false.
<b>state</b>	<b>object</b>	ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

#### 14.12.1.330. `.status.ephemeralContainerStatuses[].lastState`

##### Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

##### Type

**object**

Property	Type	Description
<b>running</b>	<b>object</b>	ContainerStateRunning is a running state of a container.
<b>terminated</b>	<b>object</b>	ContainerStateTerminated is a terminated state of a container.
<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.331. `.status.ephemeralContainerStatuses[].lastState.running`

##### Description

ContainerStateRunning is a running state of a container.

Type  
object

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.332. `.status.ephemeralContainerStatuses[].lastState.terminated`

Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- **exitCode**

Property	Type	Description
<b>containerID</b>	<b>string</b>	Container's ID in the format ' <code>&lt;type&gt;://&lt;container_id&gt;</code> '
<b>exitCode</b>	<b>integer</b>	Exit status from the last termination of the container
<b>finishedAt</b>	<b>Time</b>	Time at which the container last terminated
<b>message</b>	<b>string</b>	Message regarding the last termination of the container
<b>reason</b>	<b>string</b>	(brief) reason from the last termination of the container
<b>signal</b>	<b>integer</b>	Signal from the last termination of the container
<b>startedAt</b>	<b>Time</b>	Time at which previous execution of the container started

#### 14.12.1.333. `.status.ephemeralContainerStatuses[].lastState.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	Message regarding why the container is not yet running.
<b>reason</b>	<b>string</b>	(brief) reason the container is not yet running.

**14.12.1.334. .status.ephemeralContainerStatuses[].resources****Description**

ResourceRequirements describes the compute resource requirements.

**Type****object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	<p>Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a></p>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.335. `.status.ephemeralContainerStatuses[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.336. `.status.ephemeralContainerStatuses[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.337. `.status.ephemeralContainerStatuses[].state`

##### Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

### Type

**object**

Property	Type	Description
<b>running</b>	<b>object</b>	ContainerStateRunning is a running state of a container.
<b>terminated</b>	<b>object</b>	ContainerStateTerminated is a terminated state of a container.
<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.338. .status.ephemeralContainerStatuses[].state.running

### Description

ContainerStateRunning is a running state of a container.

### Type

**object**

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.339. .status.ephemeralContainerStatuses[].state.terminated

### Description

ContainerStateTerminated is a terminated state of a container.

### Type

**object**

### Required

- **exitCode**

Property	Type	Description
<b>containerID</b>	<b>string</b>	Container's ID in the format '<type>://<container_id>'
<b>exitCode</b>	<b>integer</b>	Exit status from the last termination of the container

Property	Type	Description
<b>finishedAt</b>	<b>Time</b>	Time at which the container last terminated
<b>message</b>	<b>string</b>	Message regarding the last termination of the container
<b>reason</b>	<b>string</b>	(brief) reason from the last termination of the container
<b>signal</b>	<b>integer</b>	Signal from the last termination of the container
<b>startedAt</b>	<b>Time</b>	Time at which previous execution of the container started

#### 14.12.1.340. `.status.ephemeralContainerStatuses[].state.waiting`

##### Description

ContainerStateWaiting is a waiting state of a container.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	Message regarding why the container is not yet running.
<b>reason</b>	<b>string</b>	(brief) reason the container is not yet running.

#### 14.12.1.341. `.status.initContainerStatuses`

##### Description

The list has one entry per init container in the manifest. The most recent successful init container will have `ready = true`, the most recently started container will have `startTime` set. More info:

<https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status>

##### Type

**array**

#### 14.12.1.342. `.status.initContainerStatuses[]`

##### Description

ContainerStatus contains details for the current status of this container.

##### Type

**object**

## Required

- **name**
- **ready**
- **restartCount**
- **image**
- **imageID**

Property	Type	Description
<b>allocatedResources</b>	<b>object (Quantity)</b>	AllocatedResources represents the compute resources allocated for this container by the node. Kubelet sets this value to Container.Resources.Requests upon successful pod admission and after successfully admitting desired pod resize.
<b>containerID</b>	<b>string</b>	ContainerID is the ID of the container in the format '<type>://<container_id>'. Where type is a container runtime identifier, returned from Version call of CRI API (for example "containerd").

<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.344. `.status.initContainerStatuses[].lastState.running`

##### Description

ContainerStateRunning is a running state of a container.

Type  
object

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.345. `.status.initContainerStatuses[].lastState.terminated`

Description

ContainerStateTerminated is a terminated state of a container.

Type

object

Required

- **exitCode**

Property	Type	Description
<b>containerID</b>	<b>string</b>	Container's ID in the format ' <code>&lt;type&gt;://&lt;container_id&gt;</code> '
<b>exitCode</b>	<b>integer</b>	Exit status from the last termination of the container
<b>finishedAt</b>	<b>Time</b>	Time at which the container last terminated
<b>message</b>	<b>string</b>	Message regarding the last termination of the container
<b>reason</b>	<b>string</b>	(brief) reason from the last termination of the container
<b>signal</b>	<b>integer</b>	Signal from the last termination of the container
<b>startedAt</b>	<b>Time</b>	Time at which previous execution of the container started

#### 14.12.1.346. `.status.initContainerStatuses[].lastState.waiting`

Description

ContainerStateWaiting is a waiting state of a container.

Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	Message regarding why the container is not yet running.
<b>reason</b>	<b>string</b>	(brief) reason the container is not yet running.

**14.12.1.347. .status.initContainerStatuses[].resources****Description**

ResourceRequirements describes the compute resource requirements.

**Type****object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	<p>Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a></p>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.348. `.status.initContainerStatuses[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.349. `.status.initContainerStatuses[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.350. `.status.initContainerStatuses[].state`

##### Description

ContainerState holds a possible state of container. Only one of its members may be specified. If none of them is specified, the default one is ContainerStateWaiting.

### Type

**object**

Property	Type	Description
<b>running</b>	<b>object</b>	ContainerStateRunning is a running state of a container.
<b>terminated</b>	<b>object</b>	ContainerStateTerminated is a terminated state of a container.
<b>waiting</b>	<b>object</b>	ContainerStateWaiting is a waiting state of a container.

#### 14.12.1.351. .status.initContainerStatuses[].state.running

### Description

ContainerStateRunning is a running state of a container.

### Type

**object**

Property	Type	Description
<b>startedAt</b>	<b>Time</b>	Time at which the container was last (re-)started

#### 14.12.1.352. .status.initContainerStatuses[].state.terminated

### Description

ContainerStateTerminated is a terminated state of a container.

### Type

**object**

### Required

- **exitCode**

Property	Type	Description
<b>containerID</b>	<b>string</b>	Container's ID in the format '<type>://<container_id>'
<b>exitCode</b>	<b>integer</b>	Exit status from the last termination of the container

Property	Type	Description
<b>finishedAt</b>	<b>Time</b>	Time at which the container last terminated
<b>message</b>	<b>string</b>	Message regarding the last termination of the container
<b>reason</b>	<b>string</b>	(brief) reason from the last termination of the container
<b>signal</b>	<b>integer</b>	Signal from the last termination of the container
<b>startedAt</b>	<b>Time</b>	Time at which previous execution of the container started

#### 14.12.1.353. `.status.initContainerStatuses[].state.waiting`

##### Description

ContainerStateWaiting is a waiting state of a container.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	Message regarding why the container is not yet running.
<b>reason</b>	<b>string</b>	(brief) reason the container is not yet running.

#### 14.12.1.354. `.status.podIPs`

##### Description

podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

##### Type

**array**

#### 14.12.1.355. `.status.podIPs[]`

##### Description

IP address information for entries in the (plural) PodIPs field. Each entry includes:

- IP: An IP address allocated to the pod. Routable at least within the cluster.

Type  
object

Property	Type	Description
<b>ip</b>	<b>string</b>	ip is an IP address (IPv4 or IPv6) assigned to the pod

### 14.12.2. API endpoints

The following API endpoints are available:

- **/api/v1/pods**
  - **GET**: list or watch objects of kind Pod
- **/api/v1/watch/pods**
  - **GET**: watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/pods**
  - **DELETE**: delete collection of Pod
  - **GET**: list or watch objects of kind Pod
  - **POST**: create a Pod
- **/api/v1/watch/namespaces/{namespace}/pods**
  - **GET**: watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/pods/{name}**
  - **DELETE**: delete a Pod
  - **GET**: read the specified Pod
  - **PATCH**: partially update the specified Pod
  - **PUT**: replace the specified Pod
- **/api/v1/namespaces/{namespace}/pods/{name}/log**
  - **GET**: read log of the specified Pod
- **/api/v1/watch/namespaces/{namespace}/pods/{name}**
  - **GET**: watch changes to an object of kind Pod. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/pods/{name}/status**
  - **GET**: read status of the specified Pod

- **PATCH**: partially update status of the specified Pod
- **PUT**: replace status of the specified Pod
- **/api/v1/namespaces/{namespace}/pods/{name}/ephemeralcontainers**
  - **GET**: read ephemeralcontainers of the specified Pod
  - **PATCH**: partially update ephemeralcontainers of the specified Pod
  - **PUT**: replace ephemeralcontainers of the specified Pod

#### 14.12.2.1. /api/v1/pods

Table 14.289. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method  
GET

**Description**

list or watch objects of kind Pod

**Table 14.290. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">PodList</a> schema

delete collection of Pod

Table 14.295. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. create a Pod

**Table 14.300. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Pod. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.305. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.12.2.5. /api/v1/namespaces/{namespace}/pods/{name}

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Pod
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.307. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete a Pod

Table 14.308. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified Pod

**Table 14.312. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 14.12.2.6. /api/v1/namespaces/{namespace}/pods/{name}/log

Table 14.318. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Pod
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.319. Global query parameters

Parameter	Type	Description
<b>container</b>	<b>string</b>	The container for which to stream logs. Defaults to only container if there is one container in the pod.
<b>follow</b>	<b>boolean</b>	Follow the log stream of the pod. Defaults to false.
<b>insecureSkipTLSVerifyBackend</b>	<b>boolean</b>	<code>insecureSkipTLSVerifyBackend</code> indicates that the apiserver should not confirm the validity of the serving certificate of the backend it is connecting to. This will make the HTTPS connection between the apiserver and the backend insecure. This means the apiserver cannot verify the log data it is receiving came from the real kubelet. If the kubelet is configured to verify the apiserver's TLS credentials, it does not mean the connection to the real kubelet is vulnerable to a man in the middle attack (e.g. an attacker could not intercept the actual log data coming from the real kubelet).
<b>limitBytes</b>	<b>integer</b>	If set, the number of bytes to read from the server before terminating the log output. This may not display a complete final line of logging, and may return slightly more or slightly less than the specified limit.
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>previous</b>	<b>boolean</b>	Return previous terminated container logs. Defaults to false.
<b>sinceSeconds</b>	<b>integer</b>	A relative time in seconds before the current time from which to show logs. If this value precedes the time a pod was started, only logs since the pod start will be returned. If this value is in the future, no logs will be returned. Only one of <code>sinceSeconds</code> or <code>sinceTime</code> may be specified.
<b>tailLines</b>	<b>integer</b>	If set, the number of lines from the end of the logs to show. If not specified, logs are shown from the creation of the container or <code>sinceSeconds</code> or <code>sinceTime</code>
<b>timestamps</b>	<b>boolean</b>	If true, add an RFC3339 or RFC3339Nano timestamp at the beginning of every line of log output. Defaults to false.

HTTP method

GET

**Description**

read log of the specified Pod

**Table 14.320. HTTP responses**

HTTP code	Response body
200 - OK	<b>string</b>
401 - Unauthorized	Empty

**14.12.2.7. /api/v1/watch/namespaces/{namespace}/pods/{name}****Table 14.321. Global path parameters**

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Pod
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

**Table 14.322. Global query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

## 14.13. PODTEMPLATE [V1]

### Description

PodTemplate describes a template for creating copies of a predefined pod.

### Type

**object**

### 14.13.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>template</b>	<b>object</b>	PodTemplateSpec describes the data a pod should have when created from a template

----------	------	-------------

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PodSpec is a description of a pod.

#### 14.13.1.2. .template.spec

##### Description

PodSpec is a description of a pod.

##### Type

**object**

##### Required

- **containers**

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
<b>affinity</b>	<b>object</b>	Affinity is a group of affinity scheduling rules.
<b>automountServiceAccountToken</b>	<b>boolean</b>	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
<b>containers</b>	<b>array</b>	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
<b>containers[]</b>	<b>object</b>	A single application container that you want to run within a pod.

Property	Type	Description
<b>dnsConfig</b>	<b>object</b>	PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.
<b>dnsPolicy</b>	<b>string</b>	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - <b>"ClusterFirst"</b> indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"ClusterFirstWithHostNet"</b> indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"Default"</b> indicates that the pod should use the default (as determined by kubelet) DNS settings. - <b>"None"</b> indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
<b>enableServiceLinks</b>	<b>boolean</b>	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

Property	Type	Description
<b>ephemeralContainers</b>	<b>array</b>	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's <code>ephemeralcontainers</code> subresource.
<b>ephemeralContainers[]</b>	<b>object</b>	<p>An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation.</p> <p>To add an ephemeral container, use the <code>ephemeralcontainers</code> subresource of an existing Pod. Ephemeral containers may not be removed or restarted.</p>
<b>hostAliases</b>	<b>array</b>	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
<b>hostAliases[]</b>	<b>object</b>	HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.
<b>hostIPC</b>	<b>boolean</b>	Use the host's ipc namespace. Optional: Default to false.

Property	Type	Description
<b>hostNetwork</b>	<b>boolean</b>	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
<b>hostPID</b>	<b>boolean</b>	Use the host's pid namespace. Optional: Default to false.
<b>hostUsers</b>	<b>boolean</b>	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with CAP_SYS_MODULE. When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the UserNamespacesSupport feature.
<b>hostname</b>	<b>string</b>	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
<b>imagePullSecrets</b>	<b>array</b>	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
<b>imagePullSecrets[]</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Property	Type	Description
<b>initContainers</b>	<b>array</b>	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
<b>initContainers[]</b>	<b>object</b>	A single application container that you want to run within a pod.
<b>nodeName</b>	<b>string</b>	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
<b>nodeSelector</b>	<b>object (string)</b>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Property	Type	Description
<b>os</b>	<b>object</b>	PodOS defines the OS parameters of a pod.
<b>overhead</b>	<b>object (Quantity)</b>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md">https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md</a>
<b>preemptionPolicy</b>	<b>string</b>	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset.  Possible enum values: - <b>"Never"</b> means that pod never preempts other pods with lower priority. - <b>"PreemptLowerPriority"</b> means that pod can preempt other pods with lower priority.
<b>priority</b>	<b>integer</b>	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
<b>priorityClassName</b>	<b>string</b>	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
<b>readinessGates</b>	<b>array</b>	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates">https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates</a>
<b>readinessGates[]</b>	<b>object</b>	PodReadinessGate contains the reference to a pod condition
<b>resourceClaims</b>	<b>array</b>	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable.
<b>resourceClaims[]</b>	<b>object</b>	PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Property	Type	Description
<b>restartPolicy</b>	<b>string</b>	<p>Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a></p> <p>Possible enum values: - <b>"Always"</b> - <b>"Never"</b> - <b>"OnFailure"</b></p>
<b>runtimeClassName</b>	<b>string</b>	<p>RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class">https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</a></p>
<b>schedulerName</b>	<b>string</b>	<p>If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.</p>
<b>schedulingGates</b>	<b>array</b>	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>

Property	Type	Description
<b>schedulingGates[]</b>	<b>object</b>	PodSchedulingGate is associated to a Pod to guard its scheduling.
<b>securityContext</b>	<b>object</b>	PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.
<b>serviceAccount</b>	<b>string</b>	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
<b>serviceAccountName</b>	<b>string</b>	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Property	Type	Description
<b>setHostnameAsFQDN</b>	<b>boolean</b>	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
<b>shareProcessNamespace</b>	<b>boolean</b>	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
<b>subdomain</b>	<b>string</b>	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
<b>tolerations</b>	<b>array</b>	If specified, the pod's tolerations.
<b>tolerations[]</b>	<b>object</b>	The pod this Tolerant is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.
<b>topologySpreadConstraints</b>	<b>array</b>	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
<b>topologySpreadConstraints[]</b>	<b>object</b>	TopologySpreadConstraint specifies how to spread matching pods among the given topology.
<b>volumes</b>	<b>array</b>	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>
<b>volumes[]</b>	<b>object</b>	Volume represents a named volume in a pod that may be accessed by any container in the pod.

### 14.13.1.3. .template.spec.affinity

#### Description

Affinity is a group of affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>nodeAffinity</b>	<b>object</b>	Node affinity is a group of node affinity scheduling rules.
<b>podAffinity</b>	<b>object</b>	Pod affinity is a group of inter pod affinity scheduling rules.
<b>podAntiAffinity</b>	<b>object</b>	Pod anti affinity is a group of inter pod anti affinity scheduling rules.

### 14.13.1.4. .template.spec.affinity.nodeAffinity

#### Description

Node affinity is a group of node affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>object</b>	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### 14.13.1.5. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding `matchExpressions`; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.13.1.6. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

##### Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

##### Type

**object**

##### Required

- **weight**
- **preference**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preference</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.
<b>weight</b>	<b>integer</b>	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

#### 14.13.1.7. .template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.13.1.8. .template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu

##### Description

A list of node selector requirements by node's labels.

##### Type

**array**

### 14.13.1.9. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.13.1.10. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExec`

#### Description

A list of node selector requirements by node's fields.

#### Type

**array**

### 14.13.1.11. `.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecu`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.13.1.12. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

##### Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### Type

**object**

#### Required

- **nodeSelectorTerms**

Property	Type	Description
<b>nodeSelectorTerms</b>	<b>array</b>	Required. A list of node selector terms. The terms are ORed.
<b>nodeSelectorTerms[]</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

#### 14.13.1.13. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

##### Description

Required. A list of node selector terms. The terms are ORed.

##### Type

**array**

#### 14.13.1.14. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.13.1.15. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

##### Description

A list of node selector requirements by node's labels.

Type

**array**

#### 14.13.1.16. `.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu`

Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

Type

**object**

Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.13.1.17. `.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu`

Description

A list of node selector requirements by node's fields.

Type

**array**

### 14.13.1.18. .template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecu

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.13.1.19. .template.spec.affinity.podAffinity

#### Description

Pod affinity is a group of inter pod affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.13.1.20. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.13.1.21. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.13.1.22. .template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecu

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.13.1.23. `.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecut`

##### Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.13.1.24. `.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecut`

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.13.1.25. .template.spec.affinity.podAntiAffinity

##### Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.13.1.26. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.13.1.27. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.13.1.28. .template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringE

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.13.1.29. `.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringEx`

##### Description

If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.13.1.30. `.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringEx`

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.13.1.31. .template.spec.containers

##### Description

List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

##### Type

**array**

#### 14.13.1.32. .template.spec.containers[]

##### Description

A single application container that you want to run within a pod.

Type

**object**

Required

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$</code> are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
<b>env</b>	<b>array</b>	List of environment variables to set in the container. Cannot be updated.
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps

Property	Type	Description
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
<b>imagePullPolicy</b>	<b>string</b>	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>  Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Property	Type	Description
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.13.1.33. .template.spec.containers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.13.1.34. .template.spec.containers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.13.1.35. `.template.spec.containers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.13.1.36. `.template.spec.containers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.13.1.37. `.template.spec.containers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.13.1.38. `.template.spec.containers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.13.1.39. .template.spec.containers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.13.1.40. .template.spec.containers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.13.1.41. .template.spec.containers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

#### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.13.1.42. .template.spec.containers[].envFrom[].configMapRef

##### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.13.1.43. .template.spec.containers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.13.1.44. .template.spec.containers[].lifecycle

## Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.13.1.45. .template.spec.containers[].lifecycle.postStart

## Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.13.1.46. .template.spec.containers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.13.1.47. .template.spec.containers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.48. .template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.49. .template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.50. `.template.spec.containers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.51. `.template.spec.containers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.13.1.52. .template.spec.containers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.53. .template.spec.containers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.54. .template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.55. .template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.56. .template.spec.containers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.57. .template.spec.containers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.58. .template.spec.containers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.59. .template.spec.containers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.60. .template.spec.containers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.61. .template.spec.containers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.62. .template.spec.containers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.63. `.template.spec.containers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.64. `.template.spec.containers[].ports`

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.13.1.65. `.template.spec.containers[].ports[]`

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.13.1.66. .template.spec.containers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.67. .template.spec.containers[].readinessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.68. .template.spec.containers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.69. .template.spec.containers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.70. .template.spec.containers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.71. .template.spec.containers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.72. `.template.spec.containers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.73. `.template.spec.containers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.13.1.74. `.template.spec.containers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.13.1.75. .template.spec.containers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.13.1.76. .template.spec.containers[].resources.claims

##### Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.13.1.77. .template.spec.containers[].resources.claims[]

##### Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

#### 14.13.1.78. .template.spec.containers[].securityContext

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.13.1.79. .template.spec.containers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.13.1.80. .template.spec.containers[].securityContext.seLinuxOptions

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.13.1.81. .template.spec.containers[].securityContext.seccompProfile

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.13.1.82. .template.spec.containers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

### 14.13.1.83. .template.spec.containers[].startupProbe

#### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

#### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.84. .template.spec.containers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.85. .template.spec.containers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.86. .template.spec.containers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.13.1.87. `.template.spec.containers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.13.1.88. `.template.spec.containers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.89. `.template.spec.containers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.90. `.template.spec.containers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.13.1.91. `.template.spec.containers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.13.1.92. .template.spec.containers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.13.1.93. .template.spec.containers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.13.1.94. .template.spec.dnsConfig

##### Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

##### Type

**object**

Property	Type	Description
<b>nameservers</b>	<b>array (string)</b>	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
<b>options</b>	<b>array</b>	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
<b>options[]</b>	<b>object</b>	PodDNSConfigOption defines DNS resolver options of a pod.
<b>searches</b>	<b>array (string)</b>	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

#### 14.13.1.95. .template.spec.dnsConfig.options

**Description**

A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

**Type**

**array**

**14.13.1.96. .template.spec.dnsConfig.options[]****Description**

PodDNSConfigOption defines DNS resolver options of a pod.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Required.
<b>value</b>	<b>string</b>	

**14.13.1.97. .template.spec.ephemeralContainers****Description**

List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.

**Type**

**array**

**14.13.1.98. .template.spec.ephemeralContainers[]****Description**

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

**Type**

**object**

**Required**

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: -  <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>

Property	Type	Description
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>name</b>	<b>string</b>	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
<b>ports</b>	<b>array</b>	Ports are not allowed for ephemeral containers.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Property	Type	Description
<b>targetContainerName</b>	<b>string</b>	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
<b>terminationMessagePath</b>	<b>string</b>	<p>Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to <code>/dev/termination-log</code>. Cannot be updated.</p>

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.13.1.99. .template.spec.ephemeralContainers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.13.1.100. .template.spec.ephemeralContainers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.13.1.101. `.template.spec.ephemeralContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.13.1.102. `.template.spec.ephemeralContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.13.1.103. `.template.spec.ephemeralContainers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.13.1.104. `.template.spec.ephemeralContainers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.13.1.105. .template.spec.ephemeralContainers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.13.1.106. .template.spec.ephemeralContainers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.13.1.107. .template.spec.ephemeralContainers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.13.1.108. .template.spec.ephemeralContainers[].envFrom[].configMapRef

### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.13.1.109. .template.spec.ephemeralContainers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.13.1.110. .template.spec.ephemeralContainers[].lifecycle

## Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.13.1.111. .template.spec.ephemeralContainers[].lifecycle.postStart

## Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.13.1.112. .template.spec.ephemeralContainers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.13.1.113. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.114. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.115. .template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.116. `.template.spec.ephemeralContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.117. `.template.spec.ephemeralContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.13.1.118. .template.spec.ephemeralContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.119. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.120. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.121. .template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.122. .template.spec.ephemeralContainers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.123. .template.spec.ephemeralContainers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.124. `.template.spec.ephemeralContainers[].livenessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.125. .template.spec.ephemeralContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.126. .template.spec.ephemeralContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.13.1.127. `.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.13.1.128. `.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.129. `.template.spec.ephemeralContainers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.130. `.template.spec.ephemeralContainers[].ports`

##### Description

Ports are not allowed for ephemeral containers.

##### Type

**array**

#### 14.13.1.131. `.template.spec.ephemeralContainers[].ports[]`

##### Description

ContainerPort represents a network port in a single container.

##### Type

**object**

## Required

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

**14.13.1.132. .template.spec.ephemeralContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type****object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.133. `.template.spec.ephemeralContainers[].readinessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.134. .template.spec.ephemeralContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.135. .template.spec.ephemeralContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.136. .template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.137. .template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.138. `.template.spec.ephemeralContainers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.139. `.template.spec.ephemeralContainers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.13.1.140. `.template.spec.ephemeralContainers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.13.1.141. .template.spec.ephemeralContainers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.13.1.142. `.template.spec.ephemeralContainers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.13.1.143. `.template.spec.ephemeralContainers[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.13.1.144. `.template.spec.ephemeralContainers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.13.1.145. .template.spec.ephemeralContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.13.1.146. .template.spec.ephemeralContainers[].securityContext.seLinuxOptions

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.13.1.147. .template.spec.ephemeralContainers[].securityContext.seccompProfile

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.13.1.148. .template.spec.ephemeralContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.13.1.149. .template.spec.ephemeralContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.150. .template.spec.ephemeralContainers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.151. .template.spec.ephemeralContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.152. .template.spec.ephemeralContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.13.1.153. `.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.13.1.154. `.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.155. `.template.spec.ephemeralContainers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.156. `.template.spec.ephemeralContainers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.13.1.157. `.template.spec.ephemeralContainers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.13.1.158. .template.spec.ephemeralContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

## Type

**array**

**14.13.1.159. .template.spec.ephemeralContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '.'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). -  <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.13.1.160. .template.spec.hostAliases

##### Description

HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

##### Type

**array**

#### 14.13.1.161. .template.spec.hostAliases[]

##### Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

##### Type

**object**

Property	Type	Description
<b>hostnames</b>	<b>array (string)</b>	Hostnames for the above IP address.
<b>ip</b>	<b>string</b>	IP address of the host file entry.

#### 14.13.1.162. .template.spec.imagePullSecrets

##### Description

ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info:

<https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod>

##### Type

**array**

#### 14.13.1.163. .template.spec.imagePullSecrets[]

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 14.13.1.164. .template.spec.initContainers

## Description

List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <https://kubernetes.io/docs/concepts/workloads/pods/init-containers/>

## Type

**array**

### 14.13.1.165. .template.spec.initContainers[]

## Description

A single application container that you want to run within a pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code>, which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. "<code>\$(VAR_NAME)</code>" will produce the string literal "<code>\$(VAR_NAME)</code>". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

Property	Type	Description
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>
<b>lifecycle</b>	<b>object</b>	<p>Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.</p>
<b>livenessProbe</b>	<b>object</b>	<p>Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.</p>
<b>name</b>	<b>string</b>	<p>Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.</p>

Property	Type	Description
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.13.1.166. .template.spec.initContainers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.13.1.167. .template.spec.initContainers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.13.1.168. `.template.spec.initContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources (cpu, memory) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.13.1.169. `.template.spec.initContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a ConfigMap.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.13.1.170. .template.spec.initContainers[].env[].valueFrom.fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.13.1.171. .template.spec.initContainers[].env[].valueFrom.resourceFieldRef

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.13.1.172. .template.spec.initContainers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.13.1.173. .template.spec.initContainers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.13.1.174. .template.spec.initContainers[].envFrom[]

**Description**

EnvFromSource represents the source of a set of ConfigMaps

**Type**

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	<p>ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.</p> <p>The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.</p>
<b>prefix</b>	<b>string</b>	<p>An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.</p>
<b>secretRef</b>	<b>object</b>	<p>SecretEnvSource selects a Secret to populate the environment variables with.</p> <p>The contents of the target Secret's Data field will represent the key-value pairs as environment variables.</p>

**14.13.1.175. .template.spec.initContainers[].envFrom[].configMapRef****Description**

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	<p>Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a></p>
<b>optional</b>	<b>boolean</b>	<p>Specify whether the ConfigMap must be defined</p>

### 14.13.1.176. .template.spec.initContainers[].envFrom[].secretRef

#### Description

SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.13.1.177. .template.spec.initContainers[].lifecycle

#### Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

#### Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.13.1.178. .template.spec.initContainers[].lifecycle.postStart

#### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type  
object

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.13.1.179. .template.spec.initContainers[].lifecycle.postStart.exec

Description

ExecAction describes a "run in container" action.

Type  
object

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.180. .template.spec.initContainers[].lifecycle.postStart.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type  
object

Required

- port

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.181. .template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.182. .template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.183. `.template.spec.initContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.184. `.template.spec.initContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCP socket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.13.1.185. .template.spec.initContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.186. .template.spec.initContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.13.1.187. .template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.13.1.188. .template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.189. .template.spec.initContainers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.190. .template.spec.initContainers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.191. .template.spec.initContainers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.192. .template.spec.initContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.193. .template.spec.initContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.194. .template.spec.initContainers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.195. .template.spec.initContainers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.196. .template.spec.initContainers[].livenessProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.197. .template.spec.initContainers[].ports

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.13.1.198. .template.spec.initContainers[].ports[]

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.13.1.199. .template.spec.initContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.200. `.template.spec.initContainers[].readinessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.201. .template.spec.initContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.202. .template.spec.initContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.203. .template.spec.initContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.204. .template.spec.initContainers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.205. `.template.spec.initContainers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.206. `.template.spec.initContainers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.13.1.207. `.template.spec.initContainers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.13.1.208. .template.spec.initContainers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.13.1.209. .template.spec.initContainers[].resources.claims

##### Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.13.1.210. .template.spec.initContainers[].resources.claims[]

##### Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

#### 14.13.1.211. .template.spec.initContainers[].securityContext

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

## Type

**object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.13.1.212. .template.spec.initContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.13.1.213. `.template.spec.initContainers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.13.1.214. `.template.spec.initContainers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.13.1.215. .template.spec.initContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.13.1.216. .template.spec.initContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.13.1.217. `.template.spec.initContainers[].startupProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.13.1.218. .template.spec.initContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.13.1.219. .template.spec.initContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.13.1.220. .template.spec.initContainers[].startupProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.13.1.221. .template.spec.initContainers[].startupProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.13.1.222. `.template.spec.initContainers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.13.1.223. `.template.spec.initContainers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.13.1.224. `.template.spec.initContainers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.13.1.225. .template.spec.initContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.13.1.226. .template.spec.initContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

### 14.13.1.227. .template.spec.os

#### Description

PodOS defines the OS parameters of a pod.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: <a href="https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration">https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration</a> Clients should expect to handle additional values and treat unrecognized values in this field as os: null

### 14.13.1.228. .template.spec.readinessGates

#### Description

If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True"  
More info: <https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates>

#### Type

**array**

### 14.13.1.229. .template.spec.readinessGates[]

#### Description

PodReadinessGate contains the reference to a pod condition

#### Type

**object**

#### Required

- **conditionType**

Property	Type	Description
<b>conditionType</b>	<b>string</b>	ConditionType refers to a condition in the pod's condition list with matching type.

### 14.13.1.230. .template.spec.resourceClaims

#### Description

ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.

This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable.

#### Type

**array**

### 14.13.1.231. .template.spec.resourceClaims[]

#### Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.

Property	Type	Description
<b>source</b>	<b>object</b>	<p>ClaimSource describes a reference to a ResourceClaim.</p> <p>Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.</p>

#### 14.13.1.232. .template.spec.resourceClaims[].source

##### Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

##### Type

**object**

Property	Type	Description
<b>resourceClaimName</b>	<b>string</b>	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
<b>resourceClaimTemplateName</b>	<b>string</b>	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be &lt;pod name&gt;-&lt;resource name&gt;, where &lt;resource name&gt; is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

### 14.13.1.233. .template.spec.schedulingGates

#### Description

SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.

SchedulingGates can only be set at pod creation time, and be removed only afterwards.

This is a beta feature enabled by the PodSchedulingReadiness feature gate.

#### Type

**array**

### 14.13.1.234. .template.spec.schedulingGates[]

#### Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the scheduling gate. Each scheduling gate must have a unique name field.

### 14.13.1.235. .template.spec.securityContext

#### Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

#### Type

**object**

Property	Type	Description
<b>fsGroup</b>	<b>integer</b>	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>fsGroupChangePolicy</b>	<b>string</b>	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Always"</b> indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. -  <b>"OnRootMismatch"</b> indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>
<b>runAsGroup</b>	<b>integer</b>	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>supplementalGroups</b>	<b>array (integer)</b>	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>sysctls</b>	<b>array</b>	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
<b>sysctls[]</b>	<b>object</b>	Sysctl defines a kernel parameter to be set
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.13.1.236. .template.spec.securityContext.seLinuxOptions

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.13.1.237. .template.spec.securityContext.seccompProfile

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.13.1.238. .template.spec.securityContext.sysctls

##### Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

##### Type

**array**

#### 14.13.1.239. .template.spec.securityContext.sysctls[]

##### Description

Sysctl defines a kernel parameter to be set

##### Type

**object**

**Required**

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of a property to set
<b>value</b>	<b>string</b>	Value of a property to set

**14.13.1.240. .template.spec.securityContext.windowsOptions****Description**

WindowsSecurityContextOptions contain Windows-specific options and credentials.

**Type**

**object**

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.13.1.241. .template.spec.tolerations

##### Description

If specified, the pod's tolerations.

##### Type

**array**

#### 14.13.1.242. .template.spec.tolerations[]

##### Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

##### Type

**object**

Property	Type	Description
<b>effect</b>	<b>string</b>	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: -  <b>"NoExecute"</b> Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. -  <b>"NoSchedule"</b> Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. -  <b>"PreferNoSchedule"</b> Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
<b>key</b>	<b>string</b>	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
<b>operator</b>	<b>string</b>	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - <b>"Equal"</b>  - <b>"Exists"</b></p>

Property	Type	Description
<b>tolerationSeconds</b>	<b>integer</b>	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
<b>value</b>	<b>string</b>	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

#### 14.13.1.243. `.template.spec.topologySpreadConstraints`

##### Description

TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

##### Type

**array**

#### 14.13.1.244. `.template.spec.topologySpreadConstraints[]`

##### Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

##### Type

**object**

##### Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.
<b>matchLabelKeys</b>	<b>array (string)</b>	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>maxSkew</b>	<b>integer</b>	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <b>whenUnsatisfiable=DoNotSchedule</b>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1.   zone1   zone2   zone3     P P   P P   P   - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <b>whenUnsatisfiable=ScheduleAnyway</b>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
<b>minDomains</b>	<b>integer</b>	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2:   zone1   zone2   zone3     P P   P P   P P   The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>nodeAffinityPolicy</b>	<b>string</b>	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>
<b>nodeTaintsPolicy</b>	<b>string</b>	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
<b>topologyKey</b>	<b>string</b>	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
<b>whenUnsatisfiable</b>	<b>string</b>	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <b>more</b> imbalanced. It's a required field.</p> <p>Possible enum values: - <b>"DoNotSchedule"</b> instructs the scheduler not to schedule the pod when constraints are not satisfied. - <b>"ScheduleAnyway"</b> instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

#### 14.13.1.245. .template.spec.volumes

##### Description

List of volumes that can be mounted by containers belonging to the pod. More info: <https://kubernetes.io/docs/concepts/storage/volumes>

##### Type

**array**

#### 14.13.1.246. .template.spec.volumes[]

##### Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
<b>awsElasticBlockStore</b>	<b>object</b>	<p>Represents a Persistent Disk resource in AWS.</p> <p>An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.</p>
<b>azureDisk</b>	<b>object</b>	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
<b>azureFile</b>	<b>object</b>	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
<b>cephfs</b>	<b>object</b>	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
<b>cinder</b>	<b>object</b>	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.</p>
<b>csi</b>	<b>object</b>	Represents a source location of a volume to mount, managed by an external CSI driver
<b>downwardAPI</b>	<b>object</b>	DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.
<b>emptyDir</b>	<b>object</b>	Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.
<b>ephemeral</b>	<b>object</b>	Represents an ephemeral volume that is handled by a normal storage driver.
<b>fc</b>	<b>object</b>	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
<b>flexVolume</b>	<b>object</b>	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
<b>flocker</b>	<b>object</b>	Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.
<b>gcePersistentDisk</b>	<b>object</b>	Represents a Persistent Disk resource in Google Compute Engine.  A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
<b>gitRepo</b>	<b>object</b>	Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.  DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
<b>glusterfs</b>	<b>object</b>	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
<b>hostPath</b>	<b>object</b>	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>iscsi</b>	<b>object</b>	Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
<b>name</b>	<b>string</b>	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>nfs</b>	<b>object</b>	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
<b>persistentVolumeClaim</b>	<b>object</b>	PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).
<b>photonPersistentDisk</b>	<b>object</b>	Represents a Photon Controller persistent disk resource.
<b>portworxVolume</b>	<b>object</b>	PortworxVolumeSource represents a Portworx volume resource.
<b>projected</b>	<b>object</b>	Represents a projected volume source
<b>quobyte</b>	<b>object</b>	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>rbd</b>	<b>object</b>	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
<b>scaleIO</b>	<b>object</b>	ScaleIOVolumeSource represents a persistent ScaleIO volume
<b>secret</b>	<b>object</b>	Adapts a Secret into a volume.  The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.
<b>storageos</b>	<b>object</b>	Represents a StorageOS persistent volume resource.
<b>vsphereVolume</b>	<b>object</b>	Represents a vSphere volume resource.

#### 14.13.1.247. .template.spec.volumes[].awsElasticBlockStore

##### Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumelD**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
<b>readOnly</b>	<b>boolean</b>	readOnly value true will force the readOnly setting in VolumeMounts. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>volumeID</b>	<b>string</b>	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

#### 14.13.1.248. .template.spec.volumes[].azureDisk

##### Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **diskName**
- **diskURI**

Property	Type	Description
<b>cachingMode</b>	<b>string</b>	cachingMode is the Host Caching mode: None, Read Only, Read Write.  Possible enum values: - <b>"None"</b> - <b>"ReadOnly"</b> - <b>"ReadWrite"</b>
<b>diskName</b>	<b>string</b>	diskName is the Name of the data disk in the blob storage
<b>diskURI</b>	<b>string</b>	diskURI is the URI of data disk in the blob storage
<b>fsType</b>	<b>string</b>	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>kind</b>	<b>string</b>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared  Possible enum values: - <b>"Dedicated"</b> - <b>"Managed"</b> - <b>"Shared"</b>
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

#### 14.13.1.249. .template.spec.volumes[].azureFile

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>shareName</b>	<b>string</b>	shareName is the azure share Name

#### 14.13.1.250. .template.spec.volumes[].cephfs

##### Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 14.13.1.251. .template.spec.volumes[].cephfs.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.252. .template.spec.volumes[].cinder

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 14.13.1.253. .template.spec.volumes[].cinder.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.254. .template.spec.volumes[].configMap

##### Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

Type  
object

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

14.13.1.255. `.template.spec.volumes[].configMap.items`

Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

#### Type

**array**

### 14.13.1.256. .template.spec.volumes[].configMap.items[]

#### Description

Maps a string key to a path within a volume.

#### Type

**object**

#### Required

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

### 14.13.1.257. .template.spec.volumes[].csi

#### Description

Represents a source location of a volume to mount, managed by an external CSI driver

#### Type

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
<b>fsType</b>	<b>string</b>	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
<b>nodePublishSecretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>readOnly</b>	<b>boolean</b>	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**14.13.1.258. .template.spec.volumes[].csi.nodePublishSecretRef**

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 14.13.1.259. .template.spec.volumes[].downwardAPI

#### Description

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

#### Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	Items is a list of downward API volume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

### 14.13.1.260. .template.spec.volumes[].downwardAPI.items

#### Description

Items is a list of downward API volume file

#### Type

**array**

### 14.13.1.261. .template.spec.volumes[].downwardAPI.items[]

#### Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

#### Type

**object**

#### Required

**path**

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.13.1.262. .template.spec.volumes[].downwardAPI.items[].fieldRef

##### Description

ObjectFieldSelector selects an APIVersioned field of an object.

##### Type

**object**

##### Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.13.1.263. .template.spec.volumes[].downwardAPI.items[].resourceFieldRef

##### Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

##### Type

**object**

##### Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.13.1.264. .template.spec.volumes[].emptyDir

##### Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>medium</b>	<b>string</b>	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Property	Type	Description
<b>sizeLimit</b>	<b>Quantity</b>	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

#### 14.13.1.265. .template.spec.volumes[].ephemeral

##### Description

Represents an ephemeral volume that is handled by a normal storage driver.

##### Type

**object**

Property	Type	Description
<b>volumeClaimTemplate</b>	<b>object</b>	PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

#### 14.13.1.266. .template.spec.volumes[].ephemeral.volumeClaimTemplate

##### Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

##### Type

**object**

##### Required

- **spec**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
<b>spec</b>	<b>object</b>	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

#### 14.13.1.267. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec

##### Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>dataSource</b>	<b>object</b>	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
<b>dataSourceRef</b>	<b>object</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

#### 14.13.1.268. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSource

##### Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

### 14.13.1.269. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef

#### Description

`dataSourceRef` specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a `PersistentVolumeClaim` object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the `dataSource` field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in `dataSourceRef`, both fields (`dataSource` and `dataSourceRef`) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in `dataSourceRef`, `dataSource` isn't set to the same value and must be empty. There are three important differences between `dataSource` and `dataSourceRef`: \* While `dataSource` only allows two specific types of objects, `dataSourceRef` allows any non-core object, as well as `PersistentVolumeClaim` objects. \* While `dataSource` ignores disallowed values (dropping them), `dataSourceRef` preserves all values, and generates an error if a disallowed value is specified. \* While `dataSource` only allows local objects, `dataSourceRef` allows objects in any namespaces. (Beta) Using this field requires the `AnyVolumeDataSource` feature gate to be enabled. (Alpha) Using the namespace field of `dataSourceRef` requires the `CrossNamespaceVolumeDataSource` feature gate to be enabled.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

#### 14.13.1.270. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.13.1.271. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims

##### Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.13.1.272. .template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.claims

##### Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

#### 14.13.1.273. .template.spec.volumes[].fc

##### Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>lun</b>	<b>integer</b>	lun is Optional: FC target lun number
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>targetWWNs</b>	<b>array (string)</b>	targetWWNs is Optional: FC target worldwide names (WWNs)
<b>wwids</b>	<b>array (string)</b>	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

#### 14.13.1.274. .template.spec.volumes[].flexVolume

##### Description

FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**14.13.1.275. .template.spec.volumes[].flexVolume.secretRef****Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**14.13.1.276. .template.spec.volumes[].flocker****Description**

Represents a Flocker volume mounted by the Flocker agent. One and only one of `datasetName` and `datasetUUID` should be set. Flocker volumes do not support ownership management or SELinux relabeling.

#### Type

**object**

Property	Type	Description
<b>datasetName</b>	<b>string</b>	<code>datasetName</code> is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
<b>datasetUUID</b>	<b>string</b>	<code>datasetUUID</code> is the UUID of the dataset. This is unique identifier of a Flocker dataset

#### 14.13.1.277. `.template.spec.volumes[].gcePersistentDisk`

##### Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

#### Type

**object**

#### Required

- `pdName`

Property	Type	Description
<b>fsType</b>	<b>string</b>	<code>fsType</code> is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Property	Type	Description
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>pdName</b>	<b>string</b>	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

#### 14.13.1.278. .template.spec.volumes[].gitRepo

##### Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

##### Type

**object**

##### Required

- **repository**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>directory</b>	<b>string</b>	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
<b>repository</b>	<b>string</b>	repository is the URL
<b>revision</b>	<b>string</b>	revision is the commit hash for the specified revision.

#### 14.13.1.279. .template.spec.volumes[].glusterfs

##### Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **endpoints**
- **path**

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 14.13.1.280. .template.spec.volumes[].hostPath

##### Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - <b>"BlockDevice"</b> A block device must exist at the given path - <b>"CharDevice"</b> A character device must exist at the given path - <b>"Directory"</b> A directory must exist at the given path - <b>"DirectoryOrCreate"</b> If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - <b>"File"</b> A file must exist at the given path - <b>"FileOrCreate"</b> If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - <b>"Socket"</b> A UNIX socket must exist at the given path</p>

#### 14.13.1.281. .template.spec.volumes[].iscsi

##### Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is the target iSCSI Qualified Name.
<b>iscsiInterface</b>	<b>string</b>	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<b>lun</b>	<b>integer</b>	lun represents iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

Property	Type	Description
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 14.13.1.282. .template.spec.volumes[].iscsi.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.283. .template.spec.volumes[].nfs

##### Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **server**
- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>server</b>	<b>string</b>	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

#### 14.13.1.284. .template.spec.volumes[].persistentVolumeClaim

##### Description

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

##### Type

**object**

##### Required

- **claimName**

Property	Type	Description
<b>claimName</b>	<b>string</b>	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>readOnly</b>	<b>boolean</b>	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

#### 14.13.1.285. .template.spec.volumes[].photonPersistentDisk

##### Description

Represents a Photon Controller persistent disk resource.

##### Type

**object**

**Required**

- **pdID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>pdID</b>	<b>string</b>	pdID is the ID that identifies Photon Controller persistent disk

**14.13.1.286. .template.spec.volumes[].portworxVolume****Description**

PortworxVolumeSource represents a Portworx volume resource.

**Type**

**object**

**Required**

- **volumelD**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>volumelD</b>	<b>string</b>	volumelD uniquely identifies a Portworx volume

**14.13.1.287. .template.spec.volumes[].projected****Description**

Represents a projected volume source

## Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>sources</b>	<b>array</b>	sources is the list of volume projections
<b>sources[]</b>	<b>object</b>	Projection that may be projected along with other supported volume types

14.13.1.288. `.template.spec.volumes[].projected.sources`

## Description

sources is the list of volume projections

## Type

**array**14.13.1.289. `.template.spec.volumes[].projected.sources[]`

## Description

Projection that may be projected along with other supported volume types

## Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a projected volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.</p>
<b>downwardAPI</b>	<b>object</b>	<p>Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.</p>
<b>secret</b>	<b>object</b>	<p>Adapts a secret into a projected volume.</p> <p>The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.</p>
<b>serviceAccountToken</b>	<b>object</b>	<p>ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).</p>

#### 14.13.1.290. `.template.spec.volumes[].projected.sources[].configMap`

##### Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

**14.13.1.291. .template.spec.volumes[].projected.sources[].configMap.items****Description**

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.13.1.292. .template.spec.volumes[].projected.sources[].configMap.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.13.1.293. .template.spec.volumes[].projected.sources[].downwardAPI

##### Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	Items is a list of DownwardAPIVolume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

#### 14.13.1.294. .template.spec.volumes[].projected.sources[].downwardAPI.items

##### Description

Items is a list of DownwardAPIVolume file

Type

**array**

#### 14.13.1.295. .template.spec.volumes[].projected.sources[].downwardAPI.items[]

Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

**object**

Required

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.13.1.296. .template.spec.volumes[].projected.sources[].downwardAPI.items[].fieldRef

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.13.1.297. .template.spec.volumes[].projected.sources[].downwardAPI.items[].resourceField

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.13.1.298. .template.spec.volumes[].projected.sources[].secret

Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its key must be defined

#### 14.13.1.299. .template.spec.volumes[].projected.sources[].secret.items

##### Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

##### Type

**array**

#### 14.13.1.300. .template.spec.volumes[].projected.sources[].secret.items[]

##### Description

Maps a string key to a path within a volume.

##### Type

**object**

##### Required

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.13.1.301. .template.spec.volumes[].projected.sources[].serviceAccountToken

##### Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>audience</b>	<b>string</b>	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.

Property	Type	Description
<b>expirationSeconds</b>	<b>integer</b>	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
<b>path</b>	<b>string</b>	path is the path relative to the mount point of the file to project the token into.

#### 14.13.1.302. .template.spec.volumes[].quobyte

##### Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **registry**
- **volume**

Property	Type	Description
<b>group</b>	<b>string</b>	group to map volume access to Default is no group
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
<b>registry</b>	<b>string</b>	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
<b>tenant</b>	<b>string</b>	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
<b>user</b>	<b>string</b>	user to map volume access to Defaults to serviceaccount user
<b>volume</b>	<b>string</b>	volume is a string that references an already created Quobyte volume by name.

#### 14.13.1.303. .template.spec.volumes[].rbd

##### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**
- **image**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>

Property	Type	Description
<b>image</b>	<b>string</b>	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>keyring</b>	<b>string</b>	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>monitors</b>	<b>array (string)</b>	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>pool</b>	<b>string</b>	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

#### 14.13.1.304. .template.spec.volumes[].rbd.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.305. .template.spec.volumes[].scaleIO

##### Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled Flag enable/disable SSL communication with Gateway, default false

Property	Type	Description
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 14.13.1.306. .template.spec.volumes[].scaleIO.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.307. .template.spec.volumes[].secret

##### Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its keys must be defined
<b>secretName</b>	<b>string</b>	secretName is the name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

#### 14.13.1.308. .template.spec.volumes[].secret.items

##### Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys

will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.13.1.309. .template.spec.volumes[].secret.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**14.13.1.310. .template.spec.volumes[].storageos****Description**

Represents a StorageOS persistent volume resource.

**Type****object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

#### 14.13.1.311. .template.spec.volumes[].storageos.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.13.1.312. .template.spec.volumes[].vsphereVolume

##### Description

Represents a vSphere volume resource.

##### Type

**object**

##### Required

- **volumePath**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>storagePolicyID</b>	<b>string</b>	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
<b>storagePolicyName</b>	<b>string</b>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<b>volumePath</b>	<b>string</b>	volumePath is the path that identifies vSphere volume vmdk

#### 14.13.2. API endpoints

The following API endpoints are available:

- **/api/v1/podtemplates**
  - **GET**: list or watch objects of kind PodTemplate
- **/api/v1/watch/podtemplates**

- **GET**: watch individual changes to a list of PodTemplate. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/podtemplates**
  - **DELETE**: delete collection of PodTemplate
  - **GET**: list or watch objects of kind PodTemplate
  - **POST**: create a PodTemplate
- **/api/v1/watch/namespaces/{namespace}/podtemplates**
  - **GET**: watch individual changes to a list of PodTemplate. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/podtemplates/{name}**
  - **DELETE**: delete a PodTemplate
  - **GET**: read the specified PodTemplate
  - **PATCH**: partially update the specified PodTemplate
  - **PUT**: replace the specified PodTemplate
- **/api/v1/watch/namespaces/{namespace}/podtemplates/{name}**
  - **GET**: watch changes to an object of kind PodTemplate. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.13.2.1. /api/v1/podtemplates

Table 14.342. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind PodTemplate

#### **DELETE**

#### Description

delete collection of PodTemplate

Table 14.348. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. list or watch objects of kind PodTemplate

Table 14.351. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.352. HTTP responses

200 - OK	<a href="#">PodTemplateList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a PodTemplate

**Table 14.353. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### 14.13.2.4. /api/v1/watch/namespaces/{namespace}/podtemplates

Table 14.356. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.357. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of PodTemplate. deprecated: use the 'watch' parameter with a list operation instead.

#### HTTP method

##### DELETE

#### Description

delete a PodTemplate

Table 14.361. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 14.371. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PodTemplate
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.372. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PodTemplate. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 14.14. REPLICATIONCONTROLLER [V1]

### Description

ReplicationController represents the configuration of a replication controller.

### Type

**object**

### 14.14.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	If the Labels of a ReplicationController are empty, they are defaulted to be the same as the Pod(s) that the replication controller manages. Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>spec</b>	<b>object</b>	ReplicationControllerSpec is the specification of a replication controller.
<b>status</b>	<b>object</b>	ReplicationControllerStatus represents the current status of a replication controller.

#### 14.14.1.1. .spec

##### Description

ReplicationControllerSpec is the specification of a replication controller.

##### Type

**object**

Property	Type	Description
<b>minReadySeconds</b>	<b>integer</b>	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
<b>replicas</b>	<b>integer</b>	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller</a>
<b>selector</b>	<b>object (string)</b>	Selector is a label query over pods that should match the Replicas count. If Selector is empty, it is defaulted to the labels present on the Pod template. Label keys and values that must match in order to be controlled by this replication controller, if empty defaulted to labels on Pod template. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Property	Type	Description
<b>template</b>	<b>object</b>	PodTemplateSpec describes the data a pod should have when created from a template

#### 14.14.1.2. .spec.template

##### Description

PodTemplateSpec describes the data a pod should have when created from a template

##### Type

**object**

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PodSpec is a description of a pod.

#### 14.14.1.3. .spec.template.spec

##### Description

PodSpec is a description of a pod.

##### Type

**object**

##### Required

- **containers**

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
<b>affinity</b>	<b>object</b>	Affinity is a group of affinity scheduling rules.

Property	Type	Description
<b>automountServiceAccountToken</b>	<b>boolean</b>	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
<b>containers</b>	<b>array</b>	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
<b>containers[]</b>	<b>object</b>	A single application container that you want to run within a pod.
<b>dnsConfig</b>	<b>object</b>	PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

Property	Type	Description
<b>dnsPolicy</b>	<b>string</b>	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - <b>"ClusterFirst"</b> indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"ClusterFirstWithHostNet"</b> indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"Default"</b> indicates that the pod should use the default (as determined by kubelet) DNS settings. - <b>"None"</b> indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
<b>enableServiceLinks</b>	<b>boolean</b>	<p>EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.</p>

Property	Type	Description
<b>ephemeralContainers</b>	<b>array</b>	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's <code>ephemeralcontainers</code> subresource.
<b>ephemeralContainers[]</b>	<b>object</b>	<p>An <code>EphemeralContainer</code> is a temporary container that you may add to an existing <code>Pod</code> for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a <code>Pod</code> is removed or restarted. The kubelet may evict a <code>Pod</code> if an ephemeral container causes the <code>Pod</code> to exceed its resource allocation.</p> <p>To add an ephemeral container, use the <code>ephemeralcontainers</code> subresource of an existing <code>Pod</code>. Ephemeral containers may not be removed or restarted.</p>
<b>hostAliases</b>	<b>array</b>	<code>HostAliases</code> is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non- <code>hostNetwork</code> pods.
<b>hostAliases[]</b>	<b>object</b>	<code>HostAlias</code> holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.
<b>hostIPC</b>	<b>boolean</b>	Use the host's <code>ipc</code> namespace. Optional: Default to false.

Property	Type	Description
<b>hostNetwork</b>	<b>boolean</b>	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
<b>hostPID</b>	<b>boolean</b>	Use the host's pid namespace. Optional: Default to false.
<b>hostUsers</b>	<b>boolean</b>	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with CAP_SYS_MODULE. When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the UserNamespacesSupport feature.
<b>hostname</b>	<b>string</b>	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
<b>imagePullSecrets</b>	<b>array</b>	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
<b>imagePullSecrets[]</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Property	Type	Description
<b>initContainers</b>	<b>array</b>	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
<b>initContainers[]</b>	<b>object</b>	A single application container that you want to run within a pod.
<b>nodeName</b>	<b>string</b>	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
<b>nodeSelector</b>	<b>object (string)</b>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Property	Type	Description
<b>os</b>	<b>object</b>	PodOS defines the OS parameters of a pod.
<b>overhead</b>	<b>object (Quantity)</b>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md">https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md</a>
<b>preemptionPolicy</b>	<b>string</b>	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset.  Possible enum values: - <b>"Never"</b> means that pod never preempts other pods with lower priority. - <b>"PreemptLowerPriority"</b> means that pod can preempt other pods with lower priority.
<b>priority</b>	<b>integer</b>	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
<b>priorityClassName</b>	<b>string</b>	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
<b>readinessGates</b>	<b>array</b>	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates">https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates</a>
<b>readinessGates[]</b>	<b>object</b>	PodReadinessGate contains the reference to a pod condition
<b>resourceClaims</b>	<b>array</b>	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable.
<b>resourceClaims[]</b>	<b>object</b>	PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

Property	Type	Description
<b>restartPolicy</b>	<b>string</b>	<p>Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a></p> <p>Possible enum values: - <b>"Always"</b> - <b>"Never"</b> - <b>"OnFailure"</b></p>
<b>runtimeClassName</b>	<b>string</b>	<p>RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class">https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</a></p>
<b>schedulerName</b>	<b>string</b>	<p>If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.</p>

Property	Type	Description
<b>schedulingGates</b>	<b>array</b>	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>
<b>schedulingGates[]</b>	<b>object</b>	PodSchedulingGate is associated to a Pod to guard its scheduling.
<b>securityContext</b>	<b>object</b>	PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.
<b>serviceAccount</b>	<b>string</b>	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
<b>serviceAccountName</b>	<b>string</b>	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Property	Type	Description
<b>setHostnameAsFQDN</b>	<b>boolean</b>	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
<b>shareProcessNamespace</b>	<b>boolean</b>	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
<b>subdomain</b>	<b>string</b>	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
<b>tolerations</b>	<b>array</b>	If specified, the pod's tolerations.
<b>tolerations[]</b>	<b>object</b>	The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.
<b>topologySpreadConstraints</b>	<b>array</b>	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
<b>topologySpreadConstraints[]</b>	<b>object</b>	TopologySpreadConstraint specifies how to spread matching pods among the given topology.
<b>volumes</b>	<b>array</b>	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>
<b>volumes[]</b>	<b>object</b>	Volume represents a named volume in a pod that may be accessed by any container in the pod.

#### 14.14.1.4. .spec.template.spec.affinity

##### Description

Affinity is a group of affinity scheduling rules.

##### Type

**object**

Property	Type	Description
<b>nodeAffinity</b>	<b>object</b>	Node affinity is a group of node affinity scheduling rules.
<b>podAffinity</b>	<b>object</b>	Pod affinity is a group of inter pod affinity scheduling rules.
<b>podAntiAffinity</b>	<b>object</b>	Pod anti affinity is a group of inter pod anti affinity scheduling rules.

#### 14.14.1.5. .spec.template.spec.affinity.nodeAffinity

##### Description

Node affinity is a group of node affinity scheduling rules.

##### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>object</b>	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### 14.14.1.6. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding `matchExpressions`; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.14.1.7. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

##### Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

##### Type

**object**

##### Required

- **weight**
- **preference**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preference</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.
<b>weight</b>	<b>integer</b>	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

#### 14.14.1.8. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.14.1.9. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

##### Description

A list of node selector requirements by node's labels.

##### Type

**array**

### 14.14.1.10. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.14.1.11. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

#### Description

A list of node selector requirements by node's fields.

#### Type

**array**

### 14.14.1.12. `.spec.template.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuring`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.14.1.13. .spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE

#### Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### Type

**object**

#### Required

- **nodeSelectorTerms**

Property	Type	Description
<b>nodeSelectorTerms</b>	<b>array</b>	Required. A list of node selector terms. The terms are ORed.
<b>nodeSelectorTerms[]</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

#### 14.14.1.14. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

##### Description

Required. A list of node selector terms. The terms are ORed.

##### Type

**array**

#### 14.14.1.15. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.14.1.16. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

##### Description

A list of node selector requirements by node's labels.

#### Type

**array**

### 14.14.1.17. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.14.1.18. `.spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE`

#### Description

A list of node selector requirements by node's fields.

#### Type

**array**

### 14.14.1.19. .spec.template.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringE

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.14.1.20. .spec.template.spec.affinity.podAffinity

#### Description

Pod affinity is a group of inter pod affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.14.1.21. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringE

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.14.1.22. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringI

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.14.1.23. .spec.template.spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuring

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.14.1.24. `.spec.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringE`

##### Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.14.1.25. `.spec.template.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringE`

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.14.1.26. .spec.template.spec.affinity.podAntiAffinity

##### Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.14.1.27. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.14.1.28. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.14.1.29. .spec.template.spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDu

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.14.1.30. `.spec.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDur`

##### Description

If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.14.1.31. `.spec.template.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDurii`

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.14.1.32. .spec.template.spec.containers

##### Description

List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

##### Type

**array**

#### 14.14.1.33. .spec.template.spec.containers[]

##### Description

A single application container that you want to run within a pod.

Type

**object**

Required

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
<b>env</b>	<b>array</b>	List of environment variables to set in the container. Cannot be updated.
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps

Property	Type	Description
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
<b>imagePullPolicy</b>	<b>string</b>	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>  Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Property	Type	Description
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.14.1.34. .spec.template.spec.containers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.14.1.35. .spec.template.spec.containers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.14.1.36. `..spec.template.spec.containers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.14.1.37. `..spec.template.spec.containers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.14.1.38. `.spec.template.spec.containers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.14.1.39. `.spec.template.spec.containers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.14.1.40. .spec.template.spec.containers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.14.1.41. .spec.template.spec.containers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.14.1.42. .spec.template.spec.containers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.14.1.43. .spec.template.spec.containers[].envFrom[].configMapRef

### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.14.1.44. .spec.template.spec.containers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.14.1.45. .spec.template.spec.containers[].lifecycle

## Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.14.1.46. .spec.template.spec.containers[].lifecycle.postStart

## Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.14.1.47. .spec.template.spec.containers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.14.1.48. .spec.template.spec.containers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.49. .spec.template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.50. .spec.template.spec.containers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.51. `.spec.template.spec.containers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.52. `.spec.template.spec.containers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.14.1.53. `.spec.template.spec.containers[].lifecycle.preStop.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.54. `.spec.template.spec.containers[].lifecycle.preStop.httpGet`

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.55. `..spec.template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders`

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.56. `..spec.template.spec.containers[].lifecycle.preStop.httpGet.httpHeaders[]`

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.57. .spec.template.spec.containers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.58. .spec.template.spec.containers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.59. .spec.template.spec.containers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.60. .spec.template.spec.containers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.61. .spec.template.spec.containers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.14.1.62. `.spec.template.spec.containers[].livenessProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.14.1.63. `.spec.template.spec.containers[].livenessProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.64. `.spec.template.spec.containers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.65. `.spec.template.spec.containers[].ports`

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.14.1.66. `.spec.template.spec.containers[].ports[]`

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.14.1.67. .spec.template.spec.containers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.68. .spec.template.spec.containers[].readinessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.69. .spec.template.spec.containers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.70. .spec.template.spec.containers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.14.1.71. `.spec.template.spec.containers[].readinessProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.14.1.72. `.spec.template.spec.containers[].readinessProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.73. `.spec.template.spec.containers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.74. `.spec.template.spec.containers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.14.1.75. `.spec.template.spec.containers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.14.1.76. .spec.template.spec.containers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.14.1.77. `.spec.template.spec.containers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.14.1.78. `.spec.template.spec.containers[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.14.1.79. `.spec.template.spec.containers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.14.1.80. .spec.template.spec.containers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.14.1.81. `.spec.template.spec.containers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.14.1.82. `.spec.template.spec.containers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.14.1.83. .spec.template.spec.containers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.14.1.84. .spec.template.spec.containers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.85. `..spec.template.spec.containers[].startupProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.86. .spec.template.spec.containers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.87. .spec.template.spec.containers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.14.1.88. `.spec.template.spec.containers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.14.1.89. `.spec.template.spec.containers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.90. .spec.template.spec.containers[].startupProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.91. .spec.template.spec.containers[].volumeDevices

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.14.1.92. .spec.template.spec.containers[].volumeDevices[]

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.14.1.93. .spec.template.spec.containers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.14.1.94. .spec.template.spec.containers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.14.1.95. .spec.template.spec.dnsConfig

##### Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

##### Type

**object**

Property	Type	Description
<b>nameservers</b>	<b>array (string)</b>	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
<b>options</b>	<b>array</b>	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
<b>options[]</b>	<b>object</b>	PodDNSConfigOption defines DNS resolver options of a pod.
<b>searches</b>	<b>array (string)</b>	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

#### 14.14.1.96. .spec.template.spec.dnsConfig.options

**Description**

A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

**Type**

**array**

**14.14.1.97. .spec.template.spec.dnsConfig.options[]****Description**

PodDNSConfigOption defines DNS resolver options of a pod.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Required.
<b>value</b>	<b>string</b>	

**14.14.1.98. .spec.template.spec.ephemeralContainers****Description**

List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.

**Type**

**array**

**14.14.1.99. .spec.template.spec.ephemeralContainers[]****Description**

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

**Type**

**object**

**Required**

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: -  <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>

Property	Type	Description
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>name</b>	<b>string</b>	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
<b>ports</b>	<b>array</b>	Ports are not allowed for ephemeral containers.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Property	Type	Description
<b>targetContainerName</b>	<b>string</b>	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
<b>terminationMessagePath</b>	<b>string</b>	<p>Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to <code>/dev/termination-log</code>. Cannot be updated.</p>

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.14.1.100. .spec.template.spec.ephemeralContainers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.14.1.101. .spec.template.spec.ephemeralContainers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.14.1.102. `.spec.template.spec.ephemeralContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.14.1.103. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.14.1.104. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.14.1.105. `.spec.template.spec.ephemeralContainers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.14.1.106. .spec.template.spec.ephemeralContainers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.14.1.107. .spec.template.spec.ephemeralContainers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.14.1.108. .spec.template.spec.ephemeralContainers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.14.1.109. .spec.template.spec.ephemeralContainers[].envFrom[].configMapRef

### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.14.1.110. .spec.template.spec.ephemeralContainers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.14.1.111. .spec.template.spec.ephemeralContainers[].lifecycle

## Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.14.1.112. .spec.template.spec.ephemeralContainers[].lifecycle.postStart

## Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.14.1.113. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.14.1.114. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.115. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeade

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.116. .spec.template.spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeade

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.117. `.spec.template.spec.ephemeralContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.118. `.spec.template.spec.ephemeralContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPsocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.14.1.119. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.120. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.121. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeader:

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.122. .spec.template.spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeader

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.123. `.spec.template.spec.ephemeralContainers[].lifecycle.preStop.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.124. `.spec.template.spec.ephemeralContainers[].livenessProbe`

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.125. .spec.template.spec.ephemeralContainers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.126. .spec.template.spec.ephemeralContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.127. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.14.1.128. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.14.1.129. .spec.template.spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.130. `.spec.template.spec.ephemeralContainers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.131. `.spec.template.spec.ephemeralContainers[].ports`

##### Description

Ports are not allowed for ephemeral containers.

##### Type

**array**

#### 14.14.1.132. `.spec.template.spec.ephemeralContainers[].ports[]`

##### Description

ContainerPort represents a network port in a single container.

##### Type

**object**

## Required

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

**14.14.1.133. .spec.template.spec.ephemeralContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type****object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.134. .spec.template.spec.ephemeralContainers[].readinessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.135. .spec.template.spec.ephemeralContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.136. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.14.1.137. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.14.1.138. .spec.template.spec.ephemeralContainers[].readinessProbe.httpGet.httpHeaders

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.139. `.spec.template.spec.ephemeralContainers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.140. `.spec.template.spec.ephemeralContainers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.14.1.141. `.spec.template.spec.ephemeralContainers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.14.1.142. .spec.template.spec.ephemeralContainers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.14.1.143. `.spec.template.spec.ephemeralContainers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.14.1.144. `.spec.template.spec.ephemeralContainers[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.14.1.145. `.spec.template.spec.ephemeralContainers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.14.1.146. .spec.template.spec.ephemeralContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.14.1.147. `.spec.template.spec.ephemeralContainers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.14.1.148. `.spec.template.spec.ephemeralContainers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.14.1.149. .spec.template.spec.ephemeralContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.14.1.150. .spec.template.spec.ephemeralContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.151. .spec.template.spec.ephemeralContainers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.152. .spec.template.spec.ephemeralContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.153. .spec.template.spec.ephemeralContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.14.1.154. `.spec.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.14.1.155. `.spec.template.spec.ephemeralContainers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.156. `.spec.template.spec.ephemeralContainers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.157. `.spec.template.spec.ephemeralContainers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.14.1.158. `.spec.template.spec.ephemeralContainers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.14.1.159. .spec.template.spec.ephemeralContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

## Type

**array**

**14.14.1.160. .spec.template.spec.ephemeralContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '.'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: - <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.14.1.161. .spec.template.spec.hostAliases

##### Description

HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

##### Type

**array**

#### 14.14.1.162. .spec.template.spec.hostAliases[]

##### Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

##### Type

**object**

Property	Type	Description
<b>hostnames</b>	<b>array (string)</b>	Hostnames for the above IP address.
<b>ip</b>	<b>string</b>	IP address of the host file entry.

#### 14.14.1.163. .spec.template.spec.imagePullSecrets

##### Description

ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info:

<https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod>

##### Type

**array**

#### 14.14.1.164. .spec.template.spec.imagePullSecrets[]

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 14.14.1.165. .spec.template.spec.initContainers

## Description

List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <https://kubernetes.io/docs/concepts/workloads/pods/init-containers/>

## Type

**array**

### 14.14.1.166. .spec.template.spec.initContainers[]

## Description

A single application container that you want to run within a pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The container image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

Property	Type	Description
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>
<b>lifecycle</b>	<b>object</b>	<p>Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.</p>
<b>livenessProbe</b>	<b>object</b>	<p>Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.</p>
<b>name</b>	<b>string</b>	<p>Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.</p>

Property	Type	Description
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.14.1.167. `.spec.template.spec.initContainers[].env`

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.14.1.168. `.spec.template.spec.initContainers[].env[]`

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.14.1.169. `.spec.template.spec.initContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources (cpu, memory) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.14.1.170. `.spec.template.spec.initContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a ConfigMap.

#### Type

**object**

#### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.14.1.171. .spec.template.spec.initContainers[].env[].valueFrom.fieldRef

#### Description

ObjectFieldSelector selects an APIVersioned field of an object.

#### Type

**object**

#### Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.14.1.172. .spec.template.spec.initContainers[].env[].valueFrom.resourceFieldRef

#### Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### Type

**object**

#### Required

- **resource**

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.14.1.173. `.spec.template.spec.initContainers[].env[].valueFrom.secretKeyRef`

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.14.1.174. `.spec.template.spec.initContainers[].envFrom`

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.14.1.175. `.spec.template.spec.initContainers[].envFrom[]`

**Description**

EnvFromSource represents the source of a set of ConfigMaps

**Type**

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	<p>ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.</p> <p>The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.</p>
<b>prefix</b>	<b>string</b>	<p>An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.</p>
<b>secretRef</b>	<b>object</b>	<p>SecretEnvSource selects a Secret to populate the environment variables with.</p> <p>The contents of the target Secret's Data field will represent the key-value pairs as environment variables.</p>

**14.14.1.176. .spec.template.spec.initContainers[].envFrom[].configMapRef****Description**

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	<p>Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a></p>
<b>optional</b>	<b>boolean</b>	<p>Specify whether the ConfigMap must be defined</p>

### 14.14.1.177. `.spec.template.spec.initContainers[].envFrom[].secretRef`

#### Description

SecretEnvSource selects a Secret to populate the environment variables with. The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.14.1.178. `.spec.template.spec.initContainers[].lifecycle`

#### Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

#### Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.14.1.179. `.spec.template.spec.initContainers[].lifecycle.postStart`

#### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

Type  
object

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.14.1.180. .spec.template.spec.initContainers[].lifecycle.postStart.exec

Description

ExecAction describes a "run in container" action.

Type  
object

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.181. .spec.template.spec.initContainers[].lifecycle.postStart.httpGet

Description

HTTPGetAction describes an action based on HTTP Get requests.

Type  
object

Required

- port

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.182. .spec.template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.183. .spec.template.spec.initContainers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.184. `.spec.template.spec.initContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.185. `.spec.template.spec.initContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCP socket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.14.1.186. .spec.template.spec.initContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.187. .spec.template.spec.initContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.14.1.188. `.spec.template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders`

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.14.1.189. `.spec.template.spec.initContainers[].lifecycle.preStop.httpGet.httpHeaders[]`

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.190. .spec.template.spec.initContainers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.191. .spec.template.spec.initContainers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.192. `spec.template.spec.initContainers[].livenessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.193. .spec.template.spec.initContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.194. .spec.template.spec.initContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.14.1.195. .spec.template.spec.initContainers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.14.1.196. .spec.template.spec.initContainers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.197. `.spec.template.spec.initContainers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.198. `.spec.template.spec.initContainers[].ports`

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.14.1.199. `.spec.template.spec.initContainers[].ports[]`

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.14.1.200. .spec.template.spec.initContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.201. `.spec.template.spec.initContainers[].readinessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.202. .spec.template.spec.initContainers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.203. .spec.template.spec.initContainers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.14.1.204. .spec.template.spec.initContainers[].readinessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.14.1.205. .spec.template.spec.initContainers[].readinessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.206. `.spec.template.spec.initContainers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.207. `.spec.template.spec.initContainers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.14.1.208. `.spec.template.spec.initContainers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

14.14.1.209. `.spec.template.spec.initContainers[].resources`

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in <code>spec.resourceClaims</code> , that are used by this container.  This is an alpha field and requires enabling the <code>DynamicResourceAllocation</code> feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in <code>PodSpec.ResourceClaims</code> .
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.14.1.210. `.spec.template.spec.initContainers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.14.1.211. `.spec.template.spec.initContainers[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.14.1.212. `.spec.template.spec.initContainers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

## Type

**object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.14.1.213. .spec.template.spec.initContainers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.14.1.214. `.spec.template.spec.initContainers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.14.1.215. `.spec.template.spec.initContainers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.14.1.216. .spec.template.spec.initContainers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.14.1.217. .spec.template.spec.initContainers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.14.1.218. .spec.template.spec.initContainers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.14.1.219. .spec.template.spec.initContainers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.14.1.220. .spec.template.spec.initContainers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.14.1.221. `.spec.template.spec.initContainers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.14.1.222. `.spec.template.spec.initContainers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.14.1.223. `.spec.template.spec.initContainers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.14.1.224. `.spec.template.spec.initContainers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.14.1.225. `.spec.template.spec.initContainers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.14.1.226. .spec.template.spec.initContainers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.14.1.227. .spec.template.spec.initContainers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 14.14.1.228. .spec.template.spec.os

##### Description

PodOS defines the OS parameters of a pod.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: <a href="https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration">https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration</a> Clients should expect to handle additional values and treat unrecognized values in this field as os: null

#### 14.14.1.229. .spec.template.spec.readinessGates

##### Description

If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True"  
More info: <https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates>

##### Type

**array**

### 14.14.1.230. `.spec.template.spec.readinessGates[]`

#### Description

PodReadinessGate contains the reference to a pod condition

#### Type

**object**

#### Required

- **conditionType**

Property	Type	Description
<b>conditionType</b>	<b>string</b>	ConditionType refers to a condition in the pod's condition list with matching type.

### 14.14.1.231. `.spec.template.spec.resourceClaims`

#### Description

ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.

This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable.

#### Type

**array**

### 14.14.1.232. `.spec.template.spec.resourceClaims[]`

#### Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.

Property	Type	Description
<b>source</b>	<b>object</b>	<p>ClaimSource describes a reference to a ResourceClaim.</p> <p>Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.</p>

#### 14.14.1.233. .spec.template.spec.resourceClaims[].source

##### Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

##### Type

**object**

Property	Type	Description
<b>resourceClaimName</b>	<b>string</b>	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
<b>resourceClaimTemplateName</b>	<b>string</b>	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be &lt;pod name&gt;-&lt;resource name&gt;, where &lt;resource name&gt; is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

#### 14.14.1.234. .spec.template.spec.schedulingGates

##### Description

SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.

SchedulingGates can only be set at pod creation time, and be removed only afterwards.

This is a beta feature enabled by the PodSchedulingReadiness feature gate.

##### Type

**array**

#### 14.14.1.235. .spec.template.spec.schedulingGates[]

##### Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the scheduling gate. Each scheduling gate must have a unique name field.

### 14.14.1.236. .spec.template.spec.securityContext

#### Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

#### Type

**object**

Property	Type	Description
<b>fsGroup</b>	<b>integer</b>	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>fsGroupChangePolicy</b>	<b>string</b>	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Always"</b> indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. -  <b>"OnRootMismatch"</b> indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>
<b>runAsGroup</b>	<b>integer</b>	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>supplementalGroups</b>	<b>array (integer)</b>	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>sysctls</b>	<b>array</b>	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
<b>sysctls[]</b>	<b>object</b>	Sysctl defines a kernel parameter to be set
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.14.1.237. .spec.template.spec.securityContext.seLinuxOptions

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.14.1.238. .spec.template.spec.securityContext.seccompProfile

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.14.1.239. .spec.template.spec.securityContext.sysctls

##### Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

##### Type

**array**

#### 14.14.1.240. .spec.template.spec.securityContext.sysctls[]

##### Description

Sysctl defines a kernel parameter to be set

##### Type

**object**

**Required**

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of a property to set
<b>value</b>	<b>string</b>	Value of a property to set

**14.14.1.241. .spec.template.spec.securityContext.windowsOptions****Description**

WindowsSecurityContextOptions contain Windows-specific options and credentials.

**Type**

**object**

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.14.1.242. .spec.template.spec.tolerations

##### Description

If specified, the pod's tolerations.

##### Type

**array**

#### 14.14.1.243. .spec.template.spec.tolerations[]

##### Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

##### Type

**object**

Property	Type	Description
<b>effect</b>	<b>string</b>	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: -  <b>"NoExecute"</b> Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. -  <b>"NoSchedule"</b> Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. -  <b>"PreferNoSchedule"</b> Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
<b>key</b>	<b>string</b>	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
<b>operator</b>	<b>string</b>	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - <b>"Equal"</b>  - <b>"Exists"</b></p>

Property	Type	Description
<b>tolerationSeconds</b>	<b>integer</b>	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
<b>value</b>	<b>string</b>	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

#### 14.14.1.244. .spec.template.spec.topologySpreadConstraints

##### Description

TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

##### Type

**array**

#### 14.14.1.245. .spec.template.spec.topologySpreadConstraints[]

##### Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

##### Type

**object**

##### Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.
<b>matchLabelKeys</b>	<b>array (string)</b>	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>maxSkew</b>	<b>integer</b>	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <b>whenUnsatisfiable=DoNotSchedule</b>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1.   zone1   zone2   zone3     P P   P P   P   - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <b>whenUnsatisfiable=ScheduleAnyway</b>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
<b>minDomains</b>	<b>integer</b>	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2:   zone1   zone2   zone3     P P   P P   P P   The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>nodeAffinityPolicy</b>	<b>string</b>	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>
<b>nodeTaintsPolicy</b>	<b>string</b>	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
<b>topologyKey</b>	<b>string</b>	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
<b>whenUnsatisfiable</b>	<b>string</b>	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <b>more</b> imbalanced. It's a required field.</p> <p>Possible enum values: - <b>"DoNotSchedule"</b> instructs the scheduler not to schedule the pod when constraints are not satisfied. - <b>"ScheduleAnyway"</b> instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

#### 14.14.1.246. .spec.template.spec.volumes

##### Description

List of volumes that can be mounted by containers belonging to the pod. More info: <https://kubernetes.io/docs/concepts/storage/volumes>

##### Type

**array**

#### 14.14.1.247. .spec.template.spec.volumes[]

##### Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

## Type

**object**

## Required

- **name**

Property	Type	Description
<b>awsElasticBlockStore</b>	<b>object</b>	<p>Represents a Persistent Disk resource in AWS.</p> <p>An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.</p>
<b>azureDisk</b>	<b>object</b>	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
<b>azureFile</b>	<b>object</b>	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
<b>cephfs</b>	<b>object</b>	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
<b>cinder</b>	<b>object</b>	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.</p>
<b>csi</b>	<b>object</b>	Represents a source location of a volume to mount, managed by an external CSI driver
<b>downwardAPI</b>	<b>object</b>	DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.
<b>emptyDir</b>	<b>object</b>	Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.
<b>ephemeral</b>	<b>object</b>	Represents an ephemeral volume that is handled by a normal storage driver.
<b>fc</b>	<b>object</b>	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
<b>flexVolume</b>	<b>object</b>	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
<b>flocker</b>	<b>object</b>	Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.
<b>gcePersistentDisk</b>	<b>object</b>	Represents a Persistent Disk resource in Google Compute Engine.  A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
<b>gitRepo</b>	<b>object</b>	Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.  DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
<b>glusterfs</b>	<b>object</b>	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
<b>hostPath</b>	<b>object</b>	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>iscsi</b>	<b>object</b>	Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
<b>name</b>	<b>string</b>	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>nfs</b>	<b>object</b>	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
<b>persistentVolumeClaim</b>	<b>object</b>	PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).
<b>photonPersistentDisk</b>	<b>object</b>	Represents a Photon Controller persistent disk resource.
<b>portworxVolume</b>	<b>object</b>	PortworxVolumeSource represents a Portworx volume resource.
<b>projected</b>	<b>object</b>	Represents a projected volume source
<b>quobyte</b>	<b>object</b>	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

Property	Type	Description
<b>rbd</b>	<b>object</b>	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
<b>scaleIO</b>	<b>object</b>	ScaleIOVolumeSource represents a persistent ScaleIO volume
<b>secret</b>	<b>object</b>	Adapts a Secret into a volume.  The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.
<b>storageos</b>	<b>object</b>	Represents a StorageOS persistent volume resource.
<b>vsphereVolume</b>	<b>object</b>	Represents a vSphere volume resource.

#### 14.14.1.248. .spec.template.spec.volumes[].awsElasticBlockStore

##### Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumelD**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
<b>readOnly</b>	<b>boolean</b>	readOnly value true will force the readOnly setting in VolumeMounts. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>volumeID</b>	<b>string</b>	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

#### 14.14.1.249. .spec.template.spec.volumes[].azureDisk

##### Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **diskName**
- **diskURI**

Property	Type	Description
<b>cachingMode</b>	<b>string</b>	cachingMode is the Host Caching mode: None, Read Only, Read Write.  Possible enum values: - <b>"None"</b> - <b>"ReadOnly"</b> - <b>"ReadWrite"</b>
<b>diskName</b>	<b>string</b>	diskName is the Name of the data disk in the blob storage
<b>diskURI</b>	<b>string</b>	diskURI is the URI of data disk in the blob storage
<b>fsType</b>	<b>string</b>	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>kind</b>	<b>string</b>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared  Possible enum values: - <b>"Dedicated"</b> - <b>"Managed"</b> - <b>"Shared"</b>
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

#### 14.14.1.250. .spec.template.spec.volumes[].azureFile

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>shareName</b>	<b>string</b>	shareName is the azure share Name

#### 14.14.1.251. .spec.template.spec.volumes[].cephfs

##### Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 14.14.1.252. .spec.template.spec.volumes[].cephfs.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.253. .spec.template.spec.volumes[].cinder

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 14.14.1.254. .spec.template.spec.volumes[].cinder.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.255. .spec.template.spec.volumes[].configMap

##### Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

Type  
object

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

#### 14.14.1.256. .spec.template.spec.volumes[].configMap.items

##### Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.14.1.257. .spec.template.spec.volumes[].configMap.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**14.14.1.258. .spec.template.spec.volumes[].csi****Description**

Represents a source location of a volume to mount, managed by an external CSI driver

**Type**

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
<b>fsType</b>	<b>string</b>	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
<b>nodePublishSecretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>readOnly</b>	<b>boolean</b>	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**14.14.1.259. .spec.template.spec.volumes[].csi.nodePublishSecretRef**

## Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

14.14.1.260. `.spec.template.spec.volumes[].downwardAPI`**Description**

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

**Type**

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	Items is a list of downward API volume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

14.14.1.261. `.spec.template.spec.volumes[].downwardAPI.items`**Description**

Items is a list of downward API volume file

**Type**

**array**

14.14.1.262. `.spec.template.spec.volumes[].downwardAPI.items[]`**Description**

DownwardAPIVolumeFile represents information to create the file containing the pod field

**Type**

**object**

**Required**

**path**

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.14.1.263. .spec.template.spec.volumes[].downwardAPI.items[].fieldRef

##### Description

ObjectFieldSelector selects an APIVersioned field of an object.

##### Type

**object**

##### Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.14.1.264. `.spec.template.spec.volumes[].downwardAPI.items[].resourceFieldRef`

##### Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

##### Type

**object**

##### Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.14.1.265. `.spec.template.spec.volumes[].emptyDir`

##### Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>medium</b>	<b>string</b>	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Property	Type	Description
<b>sizeLimit</b>	<b>Quantity</b>	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

#### 14.14.1.266. .spec.template.spec.volumes[].ephemeral

##### Description

Represents an ephemeral volume that is handled by a normal storage driver.

##### Type

**object**

Property	Type	Description
<b>volumeClaimTemplate</b>	<b>object</b>	PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

#### 14.14.1.267. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate

##### Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

##### Type

**object**

##### Required

- **spec**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
<b>spec</b>	<b>object</b>	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

#### 14.14.1.268. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec

##### Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>dataSource</b>	<b>object</b>	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
<b>dataSourceRef</b>	<b>object</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

#### 14.14.1.269. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSource

##### Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

#### 14.14.1.270. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef`

##### Description

`dataSourceRef` specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a `PersistentVolumeClaim` object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the `dataSource` field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in `dataSourceRef`, both fields (`dataSource` and `dataSourceRef`) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in `dataSourceRef`, `dataSource` isn't set to the same value and must be empty. There are three important differences between `dataSource` and `dataSourceRef`: \* While `dataSource` only allows two specific types of objects, `dataSourceRef` allows any non-core object, as well as `PersistentVolumeClaim` objects. \* While `dataSource` ignores disallowed values (dropping them), `dataSourceRef` preserves all values, and generates an error if a disallowed value is specified. \* While `dataSource` only allows local objects, `dataSourceRef` allows objects in any namespaces. (Beta) Using this field requires the `AnyVolumeDataSource` feature gate to be enabled. (Alpha) Using the namespace field of `dataSourceRef` requires the `CrossNamespaceVolumeDataSource` feature gate to be enabled.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

#### 14.14.1.271. .spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.14.1.272. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.c`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.14.1.273. `.spec.template.spec.volumes[].ephemeral.volumeClaimTemplate.spec.resources.c`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

#### 14.14.1.274. .spec.template.spec.volumes[].fc

##### Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>lun</b>	<b>integer</b>	lun is Optional: FC target lun number
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>targetWWNs</b>	<b>array (string)</b>	targetWWNs is Optional: FC target worldwide names (WWNs)
<b>wwids</b>	<b>array (string)</b>	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

#### 14.14.1.275. .spec.template.spec.volumes[].flexVolume

##### Description

FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

## Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**14.14.1.276. .spec.template.spec.volumes[].flexVolume.secretRef****Description**

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

**Type****object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**14.14.1.277. .spec.template.spec.volumes[].flocker****Description**

Represents a Flocker volume mounted by the Flocker agent. One and only one of `datasetName` and `datasetUUID` should be set. Flocker volumes do not support ownership management or SELinux relabeling.

### Type

**object**

Property	Type	Description
<b>datasetName</b>	<b>string</b>	<code>datasetName</code> is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
<b>datasetUUID</b>	<b>string</b>	<code>datasetUUID</code> is the UUID of the dataset. This is unique identifier of a Flocker dataset

### 14.14.1.278. `.spec.template.spec.volumes[].gcePersistentDisk`

#### Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

### Type

**object**

#### Required

- `pdName`

Property	Type	Description
<b>fsType</b>	<b>string</b>	<code>fsType</code> is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Property	Type	Description
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>pdName</b>	<b>string</b>	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

#### 14.14.1.279. .spec.template.spec.volumes[].gitRepo

##### Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

##### Type

**object**

##### Required

- **repository**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>directory</b>	<b>string</b>	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
<b>repository</b>	<b>string</b>	repository is the URL
<b>revision</b>	<b>string</b>	revision is the commit hash for the specified revision.

#### 14.14.1.280. .spec.template.spec.volumes[].glusterfs

##### Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **endpoints**
- **path**

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 14.14.1.281. .spec.template.spec.volumes[].hostPath

##### Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - <b>"BlockDevice"</b> A block device must exist at the given path - <b>"CharDevice"</b> A character device must exist at the given path - <b>"Directory"</b> A directory must exist at the given path - <b>"DirectoryOrCreate"</b> If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - <b>"File"</b> A file must exist at the given path - <b>"FileOrCreate"</b> If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - <b>"Socket"</b> A UNIX socket must exist at the given path</p>

#### 14.14.1.282. .spec.template.spec.volumes[].iscsi

##### Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is the target iSCSI Qualified Name.
<b>iscsilInterface</b>	<b>string</b>	iscsilInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<b>lun</b>	<b>integer</b>	lun represents iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

Property	Type	Description
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 14.14.1.283. .spec.template.spec.volumes[].iscsi.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.284. .spec.template.spec.volumes[].nfs

##### Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **server**
- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>server</b>	<b>string</b>	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

#### 14.14.1.285. .spec.template.spec.volumes[].persistentVolumeClaim

##### Description

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

##### Type

**object**

##### Required

- **claimName**

Property	Type	Description
<b>claimName</b>	<b>string</b>	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>readOnly</b>	<b>boolean</b>	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

#### 14.14.1.286. .spec.template.spec.volumes[].photonPersistentDisk

##### Description

Represents a Photon Controller persistent disk resource.

##### Type

**object**

**Required**

- **pdID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>pdID</b>	<b>string</b>	pdID is the ID that identifies Photon Controller persistent disk

**14.14.1.287. .spec.template.spec.volumes[].portworxVolume****Description**

PortworxVolumeSource represents a Portworx volume resource.

**Type**

**object**

**Required**

- **volumelD**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>volumelD</b>	<b>string</b>	volumelD uniquely identifies a Portworx volume

**14.14.1.288. .spec.template.spec.volumes[].projected****Description**

Represents a projected volume source

## Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>sources</b>	<b>array</b>	sources is the list of volume projections
<b>sources[]</b>	<b>object</b>	Projection that may be projected along with other supported volume types

14.14.1.289. `.spec.template.spec.volumes[].projected.sources`

## Description

sources is the list of volume projections

## Type

**array**14.14.1.290. `.spec.template.spec.volumes[].projected.sources[]`

## Description

Projection that may be projected along with other supported volume types

## Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>configMap</b>	<b>object</b>	<p>Adapts a ConfigMap into a projected volume.</p> <p>The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.</p>
<b>downwardAPI</b>	<b>object</b>	<p>Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.</p>
<b>secret</b>	<b>object</b>	<p>Adapts a secret into a projected volume.</p> <p>The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.</p>
<b>serviceAccountToken</b>	<b>object</b>	<p>ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).</p>

#### 14.14.1.291. .spec.template.spec.volumes[].projected.sources[].configMap

##### Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

**14.14.1.292. .spec.template.spec.volumes[].projected.sources[].configMap.items****Description**

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.14.1.293. .spec.template.spec.volumes[].projected.sources[].configMap.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.14.1.294. `.spec.template.spec.volumes[].projected.sources[].downwardAPI`

##### Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

##### Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	Items is a list of DownwardAPIVolume file
<b>items[]</b>	<b>object</b>	DownwardAPIVolumeFile represents information to create the file containing the pod field

#### 14.14.1.295. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items`

##### Description

Items is a list of DownwardAPIVolume file

Type

**array**

#### 14.14.1.296. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items[]`

Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

**object**

Required

- **path**

Property	Type	Description
<b>fieldRef</b>	<b>object</b>	ObjectFieldSelector selects an APIVersioned field of an object.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the <code>..</code> path. Must be utf-8 encoded. The first item of the relative path must not start with <code>..</code>
<b>resourceFieldRef</b>	<b>object</b>	ResourceFieldSelector represents container resources (cpu, memory) and their output format

#### 14.14.1.297. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items[].fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.14.1.298. `.spec.template.spec.volumes[].projected.sources[].downwardAPI.items[].resource`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.14.1.299. `.spec.template.spec.volumes[].projected.sources[].secret`

Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

Type

**object**

Property	Type	Description
<b>items</b>	<b>array</b>	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its key must be defined

#### 14.14.1.300. `.spec.template.spec.volumes[].projected.sources[].secret.items`

##### Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

##### Type

**array**

#### 14.14.1.301. `.spec.template.spec.volumes[].projected.sources[].secret.items[]`

##### Description

Maps a string key to a path within a volume.

##### Type

**object**

##### Required

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 14.14.1.302. `.spec.template.spec.volumes[].projected.sources[].serviceAccountToken`

##### Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>audience</b>	<b>string</b>	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.

Property	Type	Description
<b>expirationSeconds</b>	<b>integer</b>	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
<b>path</b>	<b>string</b>	path is the path relative to the mount point of the file to project the token into.

#### 14.14.1.303. .spec.template.spec.volumes[].quobyte

##### Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **registry**
- **volume**

Property	Type	Description
<b>group</b>	<b>string</b>	group to map volume access to Default is no group
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
<b>registry</b>	<b>string</b>	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
<b>tenant</b>	<b>string</b>	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
<b>user</b>	<b>string</b>	user to map volume access to Defaults to serviceaccount user
<b>volume</b>	<b>string</b>	volume is a string that references an already created Quobyte volume by name.

#### 14.14.1.304. .spec.template.spec.volumes[].rbd

##### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**
- **image**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>

Property	Type	Description
<b>image</b>	<b>string</b>	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>keyring</b>	<b>string</b>	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>monitors</b>	<b>array (string)</b>	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>pool</b>	<b>string</b>	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

#### 14.14.1.305. .spec.template.spec.volumes[].rbd.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.306. .spec.template.spec.volumes[].scaleIO

##### Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled Flag enable/disable SSL communication with Gateway, default false

Property	Type	Description
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 14.14.1.307. .spec.template.spec.volumes[].scaleIO.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.308. .spec.template.spec.volumes[].secret

##### Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b>	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>items[]</b>	<b>object</b>	Maps a string key to a path within a volume.
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its keys must be defined
<b>secretName</b>	<b>string</b>	secretName is the name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

#### 14.14.1.309. .spec.template.spec.volumes[].secret.items

##### Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys

will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

**Type****array****14.14.1.310. .spec.template.spec.volumes[].secret.items[]****Description**

Maps a string key to a path within a volume.

**Type****object****Required**

- **key**
- **path**

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**14.14.1.311. .spec.template.spec.volumes[].storageos****Description**

Represents a StorageOS persistent volume resource.

**Type****object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

#### 14.14.1.312. .spec.template.spec.volumes[].storageos.secretRef

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 14.14.1.313. .spec.template.spec.volumes[].vsphereVolume

##### Description

Represents a vSphere volume resource.

##### Type

**object**

##### Required

- **volumePath**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>storagePolicyID</b>	<b>string</b>	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
<b>storagePolicyName</b>	<b>string</b>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<b>volumePath</b>	<b>string</b>	volumePath is the path that identifies vSphere volume vmdk

#### 14.14.1.314. .status

##### Description

ReplicationControllerStatus represents the current status of a replication controller.

##### Type

**object**

##### Required

- replicas

Property	Type	Description
<b>availableReplicas</b>	<b>integer</b>	The number of available replicas (ready for at least <code>minReadySeconds</code> ) for this replication controller.
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a replication controller's current state.
<b>conditions[]</b>	<b>object</b>	<code>ReplicationControllerCondition</code> describes the state of a replication controller at a certain point.
<b>fullyLabeledReplicas</b>	<b>integer</b>	The number of pods that have labels matching the labels of the pod template of the replication controller.
<b>observedGeneration</b>	<b>integer</b>	<code>ObservedGeneration</code> reflects the generation of the most recently observed replication controller.
<b>readyReplicas</b>	<b>integer</b>	The number of ready replicas for this replication controller.
<b>replicas</b>	<b>integer</b>	Replicas is the most recently observed number of replicas. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#what-is-a-replicationcontroller</a>

#### 14.14.1.315. `.status.conditions`

##### Description

Represents the latest available observations of a replication controller's current state.

##### Type

**array**

#### 14.14.1.316. `.status.conditions[]`

##### Description

`ReplicationControllerCondition` describes the state of a replication controller at a certain point.

## Type

object

## Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	The last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of replication controller condition.

### 14.14.2. API endpoints

The following API endpoints are available:

- **/api/v1/replicationcontrollers**
  - **GET**: list or watch objects of kind ReplicationController
- **/api/v1/watch/replicationcontrollers**
  - **GET**: watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/replicationcontrollers**
  - **DELETE**: delete collection of ReplicationController
  - **GET**: list or watch objects of kind ReplicationController
  - **POST**: create a ReplicationController
- **/api/v1/watch/namespaces/{namespace}/replicationcontrollers**
  - **GET**: watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.

- **/api/v1/namespaces/{namespace}/replicationcontrollers/{name}**
  - **DELETE:** delete a ReplicationController
  - **GET:** read the specified ReplicationController
  - **PATCH:** partially update the specified ReplicationController
  - **PUT:** replace the specified ReplicationController
- **/api/v1/watch/namespaces/{namespace}/replicationcontrollers/{name}**
  - **GET:** watch changes to an object of kind ReplicationController. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/replicationcontrollers/{name}/status**
  - **GET:** read status of the specified ReplicationController
  - **PATCH:** partially update status of the specified ReplicationController
  - **PUT:** replace status of the specified ReplicationController

#### 14.14.2.1. /api/v1/replicationcontrollers

Table 14.374. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind ReplicationController

#### HTTP method

#### **DELETE**

#### Description

delete collection of ReplicationController

Table 14.380. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. list or watch objects of kind ReplicationController

Table 14.383. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.384. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">ReplicationControllerList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a ReplicationController

**Table 14.385. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

401 - Unauthorized	Empty

#### 14.14.2.4. /api/v1/watch/namespaces/{namespace}/replicationcontrollers

Table 14.388. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.389. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ReplicationController. deprecated: use the 'watch' parameter with a list operation instead.

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete a ReplicationController

Table 14.393. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 14.404. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ReplicationController. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 14.15. RESOURCEQUOTA [V1]

### Description

ResourceQuota sets aggregate quota restrictions enforced per namespace

### Type

**object**

### 14.15.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	ResourceQuotaSpec defines the desired hard limits to enforce for Quota.
<b>status</b>	<b>object</b>	ResourceQuotaStatus defines the enforced hard limits and observed use.

#### 14.15.1.1. .spec

##### Description

ResourceQuotaSpec defines the desired hard limits to enforce for Quota.

##### Type

**object**

Property	Type	Description
<b>hard</b>	<b>object (Quantity)</b>	hard is the set of desired hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>
<b>scopeSelector</b>	<b>object</b>	A scope selector represents the AND of the selectors represented by the scoped-resource selector requirements.
<b>scopes</b>	<b>array (string)</b>	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

#### 14.15.1.2. .spec.scopeSelector

##### Description

A scope selector represents the AND of the selectors represented by the scoped-resource selector requirements.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of scope selector requirements by scope of the resources.
<b>matchExpressions[]</b>	<b>object</b>	A scoped-resource selector requirement is a selector that contains values, a scope name, and an operator that relates the scope name and values.

**14.15.1.3. .spec.scopeSelector.matchExpressions****Description**

A list of scope selector requirements by scope of the resources.

**Type**

**array**

**14.15.1.4. .spec.scopeSelector.matchExpressions[]****Description**

A scoped-resource selector requirement is a selector that contains values, a scope name, and an operator that relates the scope name and values.

**Type**

**object**

**Required**

- **scopeName**
- **operator**

Property	Type	Description
<b>operator</b>	<b>string</b>	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"In"</b> - <b>"NotIn"</b>

Property	Type	Description
<b>scopeName</b>	<b>string</b>	<p>The name of the scope that the selector applies to.</p> <p>Possible enum values: -  <b>"BestEffort"</b> Match all pod objects that have best effort quality of service -  <b>"CrossNamespacePodAffinity"</b> Match all pod objects that have cross-namespace pod (anti)affinity mentioned. -  <b>"NotBestEffort"</b> Match all pod objects that do not have best effort quality of service -  <b>"NotTerminating"</b> Match all pod objects where spec.activeDeadlineSeconds is nil -  <b>"PriorityClass"</b> Match all pod objects that have priority class mentioned -  <b>"Terminating"</b> Match all pod objects where spec.activeDeadlineSeconds &gt;=0</p>
<b>values</b>	<b>array (string)</b>	<p>An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.</p>

#### 14.15.1.5. .status

##### Description

ResourceQuotaStatus defines the enforced hard limits and observed use.

##### Type

**object**

Property	Type	Description
<b>hard</b>	<b>object (Quantity)</b>	<p>Hard is the set of enforced hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a></p>

Property	Type	Description
<b>used</b>	<b>object (Quantity)</b>	Used is the current observed total usage of the resource in the namespace.

## 14.15.2. API endpoints

The following API endpoints are available:

- **/api/v1/resourcequotas**
  - **GET**: list or watch objects of kind ResourceQuota
- **/api/v1/watch/resourcequotas**
  - **GET**: watch individual changes to a list of ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/resourcequotas**
  - **DELETE**: delete collection of ResourceQuota
  - **GET**: list or watch objects of kind ResourceQuota
  - **POST**: create a ResourceQuota
- **/api/v1/watch/namespaces/{namespace}/resourcequotas**
  - **GET**: watch individual changes to a list of ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/resourcequotas/{name}**
  - **DELETE**: delete a ResourceQuota
  - **GET**: read the specified ResourceQuota
  - **PATCH**: partially update the specified ResourceQuota
  - **PUT**: replace the specified ResourceQuota
- **/api/v1/watch/namespaces/{namespace}/resourcequotas/{name}**
  - **GET**: watch changes to an object of kind ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/resourcequotas/{name}/status**
  - **GET**: read status of the specified ResourceQuota
  - **PATCH**: partially update status of the specified ResourceQuota
  - **PUT**: replace status of the specified ResourceQuota

## 14.15.2.1. /api/v1/resourcequotas

Table 14.415. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind ResourceQuota

#### HTTP method

#### **DELETE**

#### Description

delete collection of ResourceQuota

Table 14.421. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>"k8s.io/initial-events-end": "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.425. HTTP responses

**POST**

**Description**

create a ResourceQuota

**Table 14.426. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.431. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.15.2.5. /api/v1/namespaces/{namespace}/resourcequotas/{name}

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete a ResourceQuota

Table 14.434. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

partially update the specified ResourceQuota

**Table 14.438. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Parameter	Type	Description
-----------	------	-------------

Table 14.445. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ResourceQuota. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 14.16. SECRET [V1]

### Description

Secret holds secret data of a certain type. The total bytes of the values in the Data field must be less than MaxSecretSize bytes.

### Type

**object**

### 14.16.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>data</b>	<b>object (string)</b>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>

Property	Type	Description
<b>immutable</b>	<b>boolean</b>	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>stringData</b>	<b>object (string)</b>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only input field for convenience. All keys and values are merged into the data field on write, overwriting any existing values. The stringData field is never output when reading from the API.
<b>type</b>	<b>string</b>	Used to facilitate programmatic handling of secret data. More info: <a href="https://kubernetes.io/docs/concepts/configuration/secret/#secret-types">https://kubernetes.io/docs/concepts/configuration/secret/#secret-types</a>

### 14.16.2. API endpoints

The following API endpoints are available:

- **/api/v1/secrets**
  - **GET**: list or watch objects of kind Secret

- **/api/v1/watch/secrets**
  - **GET**: watch individual changes to a list of Secret. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/secrets**
  - **DELETE**: delete collection of Secret
  - **GET**: list or watch objects of kind Secret
  - **POST**: create a Secret
- **/api/v1/watch/namespaces/{namespace}/secrets**
  - **GET**: watch individual changes to a list of Secret. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/secrets/{name}**
  - **DELETE**: delete a Secret
  - **GET**: read the specified Secret
  - **PATCH**: partially update the specified Secret
  - **PUT**: replace the specified Secret
- **/api/v1/watch/namespaces/{namespace}/secrets/{name}**
  - **GET**: watch changes to an object of kind Secret. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.16.2.1. /api/v1/secrets

Table 14.456. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind Secret

HTTP code	Response body
200 - OK	<a href="#">SecretList</a> schema

HTTP code	Response body
401 - Unauthorized	Empty

### 14.16.2.2. /api/v1/watch/secrets

Table 14.458. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**Table 14.467. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 14.479. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 14.16.2.6. /api/v1/watch/namespaces/{namespace}/secrets/{name}

Table 14.485. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Secret
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.486. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Secret. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 14.487. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## 14.17. SERVICE [V1]

### Description

Service is a named abstraction of software service (for example, mysql) consisting of local port (for example 3306) that the proxy listens on, and the selector that determines which pods will answer requests sent through the proxy.

### Type

**object**

### 14.17.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>spec</b>	<b>object</b>	ServiceSpec describes the attributes that a user creates on a service.
<b>status</b>	<b>object</b>	ServiceStatus represents the current status of a service.

#### 14.17.1.1. .spec

##### Description

ServiceSpec describes the attributes that a user creates on a service.

##### Type

**object**

Property	Type	Description
<b>allocateLoadBalancerNodePorts</b>	<b>boolean</b>	allocateLoadBalancerNodePorts defines if NodePorts will be automatically allocated for services with type LoadBalancer. Default is "true". It may be set to "false" if the cluster load-balancer does not rely on NodePorts. If the caller requests specific NodePorts (by specifying a value), those requests will be respected, regardless of this field. This field may only be set for services with type LoadBalancer and will be cleared if the type is changed to any other type.

Property	Type	Description
<b>clusterIP</b>	<b>string</b>	<p>clusterIP is the IP address of the service and is usually assigned randomly. If an address is specified manually, is in-range (as per system configuration), and is not in use, it will be allocated to the service; otherwise creation of the service will fail. This field may not be changed through updates unless the type field is also being changed to ExternalName (which requires this field to be blank) or the type field is being changed from ExternalName (in which case this field may optionally be specified, as describe above). Valid values are "None", empty string (""), or a valid IP address. Setting this to "None" makes a "headless service" (no virtual IP), which is useful when direct endpoint connections are preferred and proxying is not required. Only applies to types ClusterIP, NodePort, and LoadBalancer. If this field is specified when creating a Service of type ExternalName, creation will fail. This field will be wiped when updating a Service to type ExternalName. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies">https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</a></p>

Property	Type	Description
<b>clusterIPs</b>	<b>array (string)</b>	<p>ClusterIPs is a list of IP addresses assigned to this service, and are usually assigned randomly. If an address is specified manually, is in-range (as per system configuration), and is not in use, it will be allocated to the service; otherwise creation of the service will fail. This field may not be changed through updates unless the type field is also being changed to ExternalName (which requires this field to be empty) or the type field is being changed from ExternalName (in which case this field may optionally be specified, as describe above). Valid values are "None", empty string (""), or a valid IP address. Setting this to "None" makes a "headless service" (no virtual IP), which is useful when direct endpoint connections are preferred and proxying is not required. Only applies to types ClusterIP, NodePort, and LoadBalancer. If this field is specified when creating a Service of type ExternalName, creation will fail. This field will be wiped when updating a Service to type ExternalName. If this field is not specified, it will be initialized from the clusterIP field. If this field is specified, clients must ensure that clusterIPs[0] and clusterIP have the same value.</p> <p>This field may hold a maximum of two entries (dual-stack IPs, in either order). These IPs must correspond to the values of the ipFamilies field. Both clusterIPs and ipFamilies are governed by the ipFamilyPolicy field. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies">https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</a></p>

Property	Type	Description
<b>externalIPs</b>	<b>array (string)</b>	externalIPs is a list of IP addresses for which nodes in the cluster will also accept traffic for this service. These IPs are not managed by Kubernetes. The user is responsible for ensuring that traffic arrives at a node with this IP. A common example is external load-balancers that are not part of the Kubernetes system.
<b>externalName</b>	<b>string</b>	externalName is the external reference that discovery mechanisms will return as an alias for this service (e.g. a DNS CNAME record). No proxying will be involved. Must be a lowercase RFC-1123 hostname ( <a href="https://tools.ietf.org/html/rfc1123">https://tools.ietf.org/html/rfc1123</a> ) and requires <b>type</b> to be "ExternalName".

Property	Type	Description
<b>externalTrafficPolicy</b>	<b>string</b>	<p>externalTrafficPolicy describes how nodes distribute service traffic they receive on one of the Service's "externally-facing" addresses (NodePorts, ExternalIPs, and LoadBalancer IPs). If set to "Local", the proxy will configure the service in a way that assumes that external load balancers will take care of balancing the service traffic between nodes, and so each node will deliver traffic only to the node-local endpoints of the service, without masquerading the client source IP. (Traffic mistakenly sent to a node with no endpoints will be dropped.) The default value, "Cluster", uses the standard behavior of routing to all endpoints evenly (possibly modified by topology and other features). Note that traffic sent to an External IP or LoadBalancer IP from within the cluster will always get "Cluster" semantics, but clients sending to a NodePort from within the cluster may need to take traffic policy into account when picking a node.</p> <p>Possible enum values: - <b>"Cluster"</b> - <b>"Cluster"</b> routes traffic to all endpoints. - <b>"Local"</b> - <b>"Local"</b> preserves the source IP of the traffic by routing only to endpoints on the same node as the traffic was received on (dropping the traffic if there are no local endpoints).</p>

Property	Type	Description
<b>healthCheckNodePort</b>	<b>integer</b>	<p>healthCheckNodePort specifies the healthcheck nodePort for the service. This only applies when type is set to LoadBalancer and externalTrafficPolicy is set to Local. If a value is specified, is in-range, and is not in use, it will be used. If not specified, a value will be automatically allocated. External systems (e.g. load-balancers) can use this port to determine if a given node holds endpoints for this service or not. If this field is specified when creating a Service which does not need it, creation will fail. This field will be wiped when updating a Service to no longer need it (e.g. changing type). This field cannot be updated once set.</p>
<b>internalTrafficPolicy</b>	<b>string</b>	<p>InternalTrafficPolicy describes how nodes distribute service traffic they receive on the ClusterIP. If set to "Local", the proxy will assume that pods only want to talk to endpoints of the service on the same node as the pod, dropping the traffic if there are no local endpoints. The default value, "Cluster", uses the standard behavior of routing to all endpoints evenly (possibly modified by topology and other features).</p> <p>Possible enum values: - <b>"Cluster"</b> routes traffic to all endpoints. - <b>"Local"</b> routes traffic only to endpoints on the same node as the client pod (dropping the traffic if there are no local endpoints).</p>

Property	Type	Description
<b>ipFamilies</b>	<b>array (string)</b>	<p>IPFamilies is a list of IP families (e.g. IPv4, IPv6) assigned to this service. This field is usually assigned automatically based on cluster configuration and the ipFamilyPolicy field. If this field is specified manually, the requested family is available in the cluster, and ipFamilyPolicy allows it, it will be used; otherwise creation of the service will fail. This field is conditionally mutable: it allows for adding or removing a secondary IP family, but it does not allow changing the primary IP family of the Service. Valid values are "IPv4" and "IPv6". This field only applies to Services of types ClusterIP, NodePort, and LoadBalancer, and does apply to "headless" services. This field will be wiped when updating a Service to type ExternalName.</p> <p>This field may hold a maximum of two entries (dual-stack families, in either order). These families must correspond to the values of the clusterIPs field, if specified. Both clusterIPs and ipFamilies are governed by the ipFamilyPolicy field.</p>
<b>ipFamilyPolicy</b>	<b>string</b>	<p>IPFamilyPolicy represents the dual-stack-ness requested or required by this Service. If there is no value provided, then this field will be set to SingleStack. Services can be "SingleStack" (a single IP family), "PreferDualStack" (two IP families on dual-stack configured clusters or a single IP family on single-stack clusters), or "RequireDualStack" (two IP families on dual-stack configured clusters, otherwise fail). The ipFamilies and clusterIPs fields depend on the value of this field. This field will be wiped when updating a service to type ExternalName.</p>

Property	Type	Possible enum values: - Description
		<p>that this service prefers dual-stack when the cluster is configured for dual-stack. If the cluster is not configured for dual-stack the service will be assigned a single IPFamily. If the IPFamily is not set in service.spec.ipFamilies then the service will be assigned the default IPFamily configured on the cluster -</p> <p><b>"RequireDualStack"</b> indicates that this service requires dual-stack. Using IPFamilyPolicyRequireDualStack on a single stack cluster will result in validation errors. The IPFamilies (and their order) assigned to this service is based on service.spec.ipFamilies. If service.spec.ipFamilies was not provided then it will be assigned according to how they are configured on the cluster. If service.spec.ipFamilies has only one entry then the alternative IPFamily will be added by apiserver - <b>"SingleStack"</b> indicates that this service is required to have a single IPFamily. The IPFamily assigned is based on the default IPFamily used by the cluster or as identified by service.spec.ipFamilies field</p>

Property	Type	Description
<b>loadBalancerClass</b>	<b>string</b>	<p>loadBalancerClass is the class of the load balancer implementation this Service belongs to. If specified, the value of this field must be a label-style identifier, with an optional prefix, e.g. "internal-vip" or "example.com/internal-vip". Unprefixed names are reserved for end-users. This field can only be set when the Service type is 'LoadBalancer'. If not set, the default load balancer implementation is used, today this is typically done through the cloud provider integration, but should apply for any default implementation. If set, it is assumed that a load balancer implementation is watching for Services with a matching class. Any default load balancer implementation (e.g. cloud providers) should ignore Services that set this field. This field can only be set when creating or updating a Service to type 'LoadBalancer'. Once set, it can not be changed. This field will be wiped when a service is updated to a non 'LoadBalancer' type.</p>
<b>loadBalancerIP</b>	<b>string</b>	<p>Only applies to Service Type: LoadBalancer. This feature depends on whether the underlying cloud-provider supports specifying the loadBalancerIP when a load balancer is created. This field will be ignored if the cloud-provider does not support the feature. Deprecated: This field was under-specified and its meaning varies across implementations, and it cannot support dual-stack. As of Kubernetes v1.24, users are encouraged to use implementation-specific annotations when available. This field may be removed in a future API version.</p>

Property	Type	Description
<b>loadBalancerSourceRanges</b>	<b>array (string)</b>	If specified and supported by the platform, this will restrict traffic through the cloud-provider load-balancer will be restricted to the specified client IPs. This field will be ignored if the cloud-provider does not support the feature." More info: <a href="https://kubernetes.io/docs/tasks/access-application-cluster/create-external-load-balancer/">https://kubernetes.io/docs/tasks/access-application-cluster/create-external-load-balancer/</a>
<b>ports</b>	<b>array</b>	The list of ports that are exposed by this service. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies">https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</a>
<b>ports[]</b>	<b>object</b>	ServicePort contains information on service's port.
<b>publishNotReadyAddresses</b>	<b>boolean</b>	publishNotReadyAddresses indicates that any agent which deals with endpoints for this Service should disregard any indications of ready/not-ready. The primary use case for setting this field is for a StatefulSet's Headless Service to propagate SRV DNS records for its Pods for the purpose of peer discovery. The Kubernetes controllers that generate Endpoints and EndpointSlice resources for Services interpret this to mean that all endpoints are considered "ready" even if the Pods themselves are not. Agents which consume only Kubernetes generated endpoints through the Endpoints or EndpointSlice resources can safely assume this behavior.

Property	Type	Description
<b>selector</b>	<b>object (string)</b>	Route service traffic to pods with label keys and values matching this selector. If empty or not present, the service is assumed to have an external process managing its endpoints, which Kubernetes will not modify. Only applies to types ClusterIP, NodePort, and LoadBalancer. Ignored if type is ExternalName. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/">https://kubernetes.io/docs/concepts/services-networking/service/</a>
<b>sessionAffinity</b>	<b>string</b>	Supports "ClientIP" and "None". Used to maintain session affinity. Enable client IP based session affinity. Must be ClientIP or None. Defaults to None. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies">https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies</a>  Possible enum values: - <b>"ClientIP"</b> is the Client IP based. - <b>"None"</b> - no session affinity.
<b>sessionAffinityConfig</b>	<b>object</b>	SessionAffinityConfig represents the configurations of session affinity.

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type determines how the Service is exposed. Defaults to ClusterIP. Valid options are ExternalName, ClusterIP, NodePort, and LoadBalancer. "ClusterIP" allocates a cluster-internal IP address for load-balancing to endpoints. Endpoints are determined by the selector or if that is not specified, by manual construction of an Endpoints object or EndpointSlice objects. If clusterIP is "None", no virtual IP is allocated and the endpoints are published as a set of endpoints rather than a virtual IP. "NodePort" builds on ClusterIP and allocates a port on every node which routes to the same endpoints as the clusterIP. "LoadBalancer" builds on NodePort and creates an external load-balancer (if supported in the current cloud) which routes to the same endpoints as the clusterIP. "ExternalName" aliases this service to the specified externalName. Several other fields do not apply to ExternalName services. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#publishing-services-service-types">https://kubernetes.io/docs/concepts/services-networking/service/#publishing-services-service-types</a></p> <p>Possible enum values: -  <b>"ClusterIP"</b> means a service will only be accessible inside the cluster, via the cluster IP. -  <b>"ExternalName"</b> means a service consists of only a reference to an external name that kubedns or equivalent will return as a CNAME record, with no exposing or proxying of any pods involved. -  <b>"LoadBalancer"</b> means a service will be exposed via an external load balancer (if the cloud provider supports it), in addition to 'NodePort' type. -  <b>"NodePort"</b> means a service will</p>

Property	Type	Description
		be exposed on one port of every node, in addition to 'ClusterIP' type.

### 14.17.1.2. .spec.ports

#### Description

The list of ports that are exposed by this service. More info:

<https://kubernetes.io/docs/concepts/services-networking/service/#virtual-ips-and-service-proxies>

#### Type

**array**

### 14.17.1.3. .spec.ports[]

#### Description

ServicePort contains information on service's port.

#### Type

**object**

#### Required

- **port**

Property	Type	Description
<b>appProtocol</b>	<b>string</b>	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="https://www.iana.org/assignments/service-names">https://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as mycompany.com/my-custom-protocol.
<b>name</b>	<b>string</b>	The name of this port within the service. This must be a DNS_LABEL. All ports within a ServiceSpec must have unique names. When considering the endpoints for a Service, this must match the 'name' field in the EndpointPort. Optional if only one ServicePort is defined on this service.

Property	Type	Description
<b>nodePort</b>	<b>integer</b>	<p>The port on each node on which this service is exposed when type is NodePort or LoadBalancer. Usually assigned by the system. If a value is specified, in-range, and not in use it will be used, otherwise the operation will fail. If not specified, a port will be allocated if this Service requires one. If this field is specified when creating a Service which does not need it, creation will fail. This field will be wiped when updating a Service to no longer need it (e.g. changing type from NodePort to ClusterIP). More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#type-nodeport">https://kubernetes.io/docs/concepts/services-networking/service/#type-nodeport</a></p>
<b>port</b>	<b>integer</b>	The port that will be exposed by this service.
<b>protocol</b>	<b>string</b>	<p>The IP protocol for this port. Supports "TCP", "UDP", and "SCTP". Default is TCP.</p> <p>Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.</p>
<b>targetPort</b>	<b>IntOrString</b>	<p>Number or name of the port to access on the pods targeted by the service. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME. If this is a string, it will be looked up as a named port in the target Pod's container ports. If this is not specified, the value of the 'port' field is used (an identity map). This field is ignored for services with clusterIP=None, and should be omitted or set equal to the 'port' field. More info: <a href="https://kubernetes.io/docs/concepts/services-networking/service/#defining-a-service">https://kubernetes.io/docs/concepts/services-networking/service/#defining-a-service</a></p>

#### 14.17.1.4. .spec.sessionAffinityConfig

##### Description

SessionAffinityConfig represents the configurations of session affinity.

##### Type

**object**

Property	Type	Description
<b>clientIP</b>	<b>object</b>	ClientIPConfig represents the configurations of Client IP based session affinity.

#### 14.17.1.5. .spec.sessionAffinityConfig.clientIP

##### Description

ClientIPConfig represents the configurations of Client IP based session affinity.

##### Type

**object**

Property	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	timeoutSeconds specifies the seconds of ClientIP type session sticky time. The value must be >0 && ≤86400(for 1 day) if ServiceAffinity == "ClientIP". Default value is 10800(for 3 hours).

#### 14.17.1.6. .status

##### Description

ServiceStatus represents the current status of a service.

##### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array (Condition)</b>	Current service state
<b>loadBalancer</b>	<b>object</b>	LoadBalancerStatus represents the status of a load-balancer.

#### 14.17.1.7. .status.loadBalancer

##### Description

LoadBalancerStatus represents the status of a load-balancer.

#### Type

**object**

Property	Type	Description
<b>ingress</b>	<b>array</b>	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.
<b>ingress[]</b>	<b>object</b>	LoadBalancerIngress represents the status of a load-balancer ingress point: traffic intended for the service should be sent to an ingress point.

#### 14.17.1.8. .status.loadBalancer.ingress

##### Description

Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

##### Type

**array**

#### 14.17.1.9. .status.loadBalancer.ingress[]

##### Description

LoadBalancerIngress represents the status of a load-balancer ingress point: traffic intended for the service should be sent to an ingress point.

##### Type

**object**

Property	Type	Description
<b>hostname</b>	<b>string</b>	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
<b>ip</b>	<b>string</b>	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

Property	Type	Description
<b>ports</b>	<b>array</b>	Ports is a list of records of service ports If used, every port defined in the service should have an entry in it
<b>ports[]</b>	<b>object</b>	

#### 14.17.1.10. .status.loadBalancer.ingress[].ports

##### Description

Ports is a list of records of service ports If used, every port defined in the service should have an entry in it

##### Type

**array**

#### 14.17.1.11. .status.loadBalancer.ingress[].ports[]

##### Description

##### Type

**object**

##### Required

- **port**
- **protocol**

Property	Type	Description
<b>error</b>	<b>string</b>	Error is to record the problem with the service port The format of the error shall comply with the following rules: - built-in error values shall be specified in this file and those shall use CamelCase names - cloud provider specific error values must have names that comply with the format foo.example.com/CamelCase.
<b>port</b>	<b>integer</b>	Port is the port number of the service port of which status is recorded here

Property	Type	Description
<b>protocol</b>	<b>string</b>	<p>Protocol is the protocol of the service port of which status is recorded here The supported values are: "TCP", "UDP", "SCTP"</p> <p>Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.</p>

### 14.17.2. API endpoints

The following API endpoints are available:

- **/api/v1/services**
  - **GET**: list or watch objects of kind Service
- **/api/v1/watch/services**
  - **GET**: watch individual changes to a list of Service. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/services**
  - **DELETE**: delete collection of Service
  - **GET**: list or watch objects of kind Service
  - **POST**: create a Service
- **/api/v1/watch/namespaces/{namespace}/services**
  - **GET**: watch individual changes to a list of Service. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/services/{name}**
  - **DELETE**: delete a Service
  - **GET**: read the specified Service
  - **PATCH**: partially update the specified Service
  - **PUT**: replace the specified Service
- **/api/v1/watch/namespaces/{namespace}/services/{name}**
  - **GET**: watch changes to an object of kind Service. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/services/{name}/status**
  - **GET**: read status of the specified Service

- **PATCH**: partially update status of the specified Service
- **PUT**: replace status of the specified Service

### 14.17.2.1. /api/v1/services

Table 14.488. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

#### **DELETE**

#### Description

delete collection of Service

Table 14.494. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. create a Service

**Table 14.499. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Service. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.504. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.17.2.5. /api/v1/namespaces/{namespace}/services/{name}

Table 14.505. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Service
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.506. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete a Service

Table 14.507. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**HTTP method****PATCH****Description**

partially update the specified Service

**Table 14.511. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 14.17.2.6. /api/v1/watch/namespaces/{namespace}/services/{name}

Table 14.517. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Service
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.518. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Service. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 14.18. SERVICEACCOUNT [V1]

### Description

ServiceAccount binds together: \* a name, understood by users, and perhaps by peripheral systems, for an identity \* a principal that can be authenticated and authorized \* a set of secrets

### Type

**object**

### 14.18.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>automountServiceAccountToken</b>	<b>boolean</b>	AutomountServiceAccountToken indicates whether pods running as this service account should have an API token automatically mounted. Can be overridden at the pod level.

Property	Type	Description
<b>imagePullSecrets</b>	<b>array</b>	ImagePullSecrets is a list of references to secrets in the same namespace to use for pulling any images in pods that reference this ServiceAccount. ImagePullSecrets are distinct from Secrets because Secrets can be mounted in the pod, but ImagePullSecrets are only accessed by the kubelet. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>
<b>imagePullSecrets[]</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>secrets</b>	<b>array</b>	Secrets is a list of the secrets in the same namespace that pods running using this ServiceAccount are allowed to use. Pods are only limited to this list if this service account has a "kubernetes.io/enforce-mountable-secrets" annotation set to "true". This field should not be used to find auto-generated service account token secrets for use outside of pods. Instead, tokens can be requested directly using the TokenRequest API, or service account token secrets can be manually created. More info: <a href="https://kubernetes.io/docs/concepts/configuration/secret">https://kubernetes.io/docs/concepts/configuration/secret</a>
<b>secrets[]</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.

#### 14.18.1.1. .imagePullSecrets

##### Description

ImagePullSecrets is a list of references to secrets in the same namespace to use for pulling any images in pods that reference this ServiceAccount. ImagePullSecrets are distinct from Secrets because Secrets can be mounted in the pod, but ImagePullSecrets are only accessed by the kubelet. More info: <https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod>

##### Type

**array**

#### 14.18.1.2. .imagePullSecrets[]

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 14.18.1.3. .secrets

#### Description

Secrets is a list of the secrets in the same namespace that pods running using this ServiceAccount are allowed to use. Pods are only limited to this list if this service account has a "kubernetes.io/enforce-mountable-secrets" annotation set to "true". This field should not be used to find auto-generated service account token secrets for use outside of pods. Instead, tokens can be requested directly using the TokenRequest API, or service account token secrets can be manually created. More info: <https://kubernetes.io/docs/concepts/configuration/secret>

#### Type

**array**

### 14.18.1.4. .secrets[]

#### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

#### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

## 14.18.2. API endpoints

The following API endpoints are available:

- **/api/v1/serviceaccounts**
  - **GET**: list or watch objects of kind ServiceAccount
- **/api/v1/watch/serviceaccounts**
  - **GET**: watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/serviceaccounts**
  - **DELETE**: delete collection of ServiceAccount
  - **GET**: list or watch objects of kind ServiceAccount
  - **POST**: create a ServiceAccount
- **/api/v1/watch/namespaces/{namespace}/serviceaccounts**
  - **GET**: watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/serviceaccounts/{name}**
  - **DELETE**: delete a ServiceAccount
  - **GET**: read the specified ServiceAccount
  - **PATCH**: partially update the specified ServiceAccount
  - **PUT**: replace the specified ServiceAccount
- **/api/v1/watch/namespaces/{namespace}/serviceaccounts/{name}**
  - **GET**: watch changes to an object of kind ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 14.18.2.1. /api/v1/serviceaccounts

Table 14.529. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

delete collection of ServiceAccount

Table 14.535. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. create a ServiceAccount

**Table 14.540. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.545. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.18.2.5. /api/v1/namespaces/{namespace}/serviceaccounts/{name}

Table 14.546. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ServiceAccount
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.547. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### DELETE

#### Description

delete a ServiceAccount

Table 14.548. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified ServiceAccount

**Table 14.552. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 14.18.2.6. /api/v1/watch/namespaces/{namespace}/serviceaccounts/{name}

Table 14.558. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ServiceAccount
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 14.559. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>"k8s.io/initial-events-end": "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ServiceAccount. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## CHAPTER 15. DISCOVERY APIS

### 15.1. DISCOVERY APIS

#### 15.1.1. EndpointSlice [discovery.k8s.io/v1]

##### Description

EndpointSlice represents a subset of the endpoints that implement a service. For a given service there may be multiple EndpointSlice objects, selected by labels, which must be joined to produce the full set of endpoints.

##### Type

**object**

### 15.2. ENDPPOINTSICE [DISCOVERY.K8S.IO/V1]

##### Description

EndpointSlice represents a subset of the endpoints that implement a service. For a given service there may be multiple EndpointSlice objects, selected by labels, which must be joined to produce the full set of endpoints.

##### Type

**object**

##### Required

- **addressType**
- **endpoints**

#### 15.2.1. Specification

Property	Type	Description
<b>addressType</b>	<b>string</b>	<p>addressType specifies the type of address carried by this EndpointSlice. All addresses in this slice must be the same type. This field is immutable after creation. The following address types are currently supported: * IPv4: Represents an IPv4 Address. * IPv6: Represents an IPv6 Address. * FQDN: Represents a Fully Qualified Domain Name.</p> <p>Possible enum values: - <b>"FQDN"</b> represents a FQDN. - <b>"IPv4"</b> represents an IPv4 Address. - <b>"IPv6"</b> represents an IPv6 Address.</p>

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>endpoints</b>	<b>array</b>	endpoints is a list of unique endpoints in this slice. Each slice may include a maximum of 1000 endpoints.
<b>endpoints[]</b>	<b>object</b>	Endpoint represents a single logical "backend" implementing a service.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata.
<b>ports</b>	<b>array</b>	ports specifies the list of network ports exposed by each endpoint in this slice. Each port must have a unique name. When ports is empty, it indicates that there are no defined ports. When a port is defined with a nil port value, it indicates "all ports". Each slice may include a maximum of 100 ports.
<b>ports[]</b>	<b>object</b>	EndpointPort represents a Port used by an EndpointSlice

### 15.2.1.1. .endpoints

#### Description

endpoints is a list of unique endpoints in this slice. Each slice may include a maximum of 1000 endpoints.

#### Type

**array**

### 15.2.1.2. .endpoints[]

#### Description

Endpoint represents a single logical "backend" implementing a service.

#### Type

**object**

#### Required

- **addresses**

Property	Type	Description
<b>addresses</b>	<b>array (string)</b>	addresses of this endpoint. The contents of this field are interpreted according to the corresponding EndpointSlice addressType field. Consumers must handle different types of addresses in the context of their own capabilities. This must contain at least one address but no more than 100. These are all assumed to be fungible and clients may choose to only use the first element. Refer to: <a href="https://issue.k8s.io/106267">https://issue.k8s.io/106267</a>
<b>conditions</b>	<b>object</b>	EndpointConditions represents the current condition of an endpoint.

Property	Type	Description
<b>deprecatedTopology</b>	<b>object (string)</b>	deprecatedTopology contains topology information part of the v1beta1 API. This field is deprecated, and will be removed when the v1beta1 API is removed (no sooner than kubernetes v1.24). While this field can hold values, it is not writable through the v1 API, and any attempts to write to it will be silently ignored. Topology information can be found in the zone and nodeName fields instead.
<b>hints</b>	<b>object</b>	EndpointHints provides hints describing how an endpoint should be consumed.
<b>hostname</b>	<b>string</b>	hostname of this endpoint. This field may be used by consumers of endpoints to distinguish endpoints from each other (e.g. in DNS names). Multiple endpoints which use the same hostname should be considered fungible (e.g. multiple A values in DNS). Must be lowercase and pass DNS Label (RFC 1123) validation.
<b>nodeName</b>	<b>string</b>	nodeName represents the name of the Node hosting this endpoint. This can be used to determine endpoints local to a Node.
<b>targetRef</b>	<b>ObjectReference</b>	targetRef is a reference to a Kubernetes object that represents this endpoint.
<b>zone</b>	<b>string</b>	zone is the name of the Zone this endpoint exists in.

### 15.2.1.3. .endpoints[].conditions

#### Description

EndpointConditions represents the current condition of an endpoint.

#### Type

**object**

Property	Type	Description
<b>ready</b>	<b>boolean</b>	ready indicates that this endpoint is prepared to receive traffic, according to whatever system is managing the endpoint. A nil value indicates an unknown state. In most cases consumers should interpret this unknown state as ready. For compatibility reasons, ready should never be "true" for terminating endpoints, except when the normal readiness behavior is being explicitly overridden, for example when the associated Service has set the publishNotReadyAddresses flag.
<b>serving</b>	<b>boolean</b>	serving is identical to ready except that it is set regardless of the terminating state of endpoints. This condition should be set to true for a ready endpoint that is terminating. If nil, consumers should defer to the ready condition.
<b>terminating</b>	<b>boolean</b>	terminating indicates that this endpoint is terminating. A nil value indicates an unknown state. Consumers should interpret this unknown state to mean that the endpoint is not terminating.

#### 15.2.1.4. .endpoints[].hints

##### Description

EndpointHints provides hints describing how an endpoint should be consumed.

##### Type

**object**

Property	Type	Description
<b>forZones</b>	<b>array</b>	forZones indicates the zone(s) this endpoint should be consumed by to enable topology aware routing.

Property	Type	Description
<b>forZones[]</b>	<b>object</b>	ForZone provides information about which zones should consume this endpoint.

#### 15.2.1.5. .endpoints[].hints.forZones

##### Description

forZones indicates the zone(s) this endpoint should be consumed by to enable topology aware routing.

##### Type

**array**

#### 15.2.1.6. .endpoints[].hints.forZones[]

##### Description

ForZone provides information about which zones should consume this endpoint.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name represents the name of the zone.

#### 15.2.1.7. .ports

##### Description

ports specifies the list of network ports exposed by each endpoint in this slice. Each port must have a unique name. When ports is empty, it indicates that there are no defined ports. When a port is defined with a nil port value, it indicates "all ports". Each slice may include a maximum of 100 ports.

##### Type

**array**

#### 15.2.1.8. .ports[]

##### Description

EndpointPort represents a Port used by an EndpointSlice

##### Type

**object**

Property	Type	Description
<b>appProtocol</b>	<b>string</b>	<p>The application protocol for this port. This is used as a hint for implementations to offer richer behavior for protocols that they understand. This field follows standard Kubernetes label syntax. Valid values are either:</p> <ul style="list-style-type: none"> <li>* Un-prefixed protocol names - reserved for IANA standard service names (as per RFC-6335 and <a href="https://www.iana.org/assignments/service-names">https://www.iana.org/assignments/service-names</a>).</li> <li>* Kubernetes-defined prefixed names: * 'kubernetes.io/h2c' - HTTP/2 over cleartext as described in <a href="https://www.rfc-editor.org/rfc/rfc7540">https://www.rfc-editor.org/rfc/rfc7540</a></li> <li>* Other protocols should use implementation-defined prefixed names such as mycompany.com/my-custom-protocol.</li> </ul>
<b>name</b>	<b>string</b>	<p>name represents the name of this port. All ports in an EndpointSlice must have a unique name. If the EndpointSlice is derived from a Kubernetes service, this corresponds to the Service.ports[].name. Name must either be an empty string or pass DNS_LABEL validation: * must be no more than 63 characters long. * must consist of lower case alphanumeric characters or '-'. * must start and end with an alphanumeric character. Default is empty string.</p>
<b>port</b>	<b>integer</b>	<p>port represents the port number of the endpoint. If this is not specified, ports are not restricted and must be interpreted in the context of the specific consumer.</p>

Property	Type	Description
<b>protocol</b>	<b>string</b>	<p>protocol represents the IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.</p> <p>Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.</p>

### 15.2.2. API endpoints

The following API endpoints are available:

- **/apis/discovery.k8s.io/v1/endpointslices**
  - **GET**: list or watch objects of kind EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/endpointslices**
  - **GET**: watch individual changes to a list of EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/discovery.k8s.io/v1/namespaces/{namespace}/endpointslices**
  - **DELETE**: delete collection of EndpointSlice
  - **GET**: list or watch objects of kind EndpointSlice
  - **POST**: create an EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices**
  - **GET**: watch individual changes to a list of EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/discovery.k8s.io/v1/namespaces/{namespace}/endpointslices/{name}**
  - **DELETE**: delete an EndpointSlice
  - **GET**: read the specified EndpointSlice
  - **PATCH**: partially update the specified EndpointSlice
  - **PUT**: replace the specified EndpointSlice
- **/apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices/{name}**
  - **GET**: watch changes to an object of kind EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 15.2.2.1. /apis/discovery.k8s.io/v1/endpointslices

Table 15.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind EndpointSlice

Table 15.2. HTTP responses

HTTP code	Response body
200 - OK	<b>EndpointSliceList</b> schema
401 - Unauthorized	Empty

### 15.2.2.2. /apis/discovery.k8s.io/v1/watch/endpointlices

Table 15.3. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

create an EndpointSlice

**Table 15.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

### 15.2.2.6. /apis/discovery.k8s.io/v1/watch/namespaces/{namespace}/endpointslices/{name}

Table 15.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the EndpointSlice
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 15.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind EndpointSlice. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

## CHAPTER 16. EVENTS APIS

### 16.1. EVENTS APIS

#### 16.1.1. Event [events.k8s.io/v1]

##### Description

Event is a report of an event somewhere in the cluster. It generally denotes some state change in the system. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

##### Type

**object**

### 16.2. EVENT [EVENTS.K8S.IO/V1]

##### Description

Event is a report of an event somewhere in the cluster. It generally denotes some state change in the system. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

##### Type

**object**

##### Required

- **eventTime**

#### 16.2.1. Specification

Property	Type	Description
<b>action</b>	<b>string</b>	action is what action was taken/failed regarding to the regarding object. It is machine-readable. This field cannot be empty for new Events and it can have at most 128 characters.

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>deprecatedCount</b>	<b>integer</b>	deprecatedCount is the deprecated field assuring backward compatibility with core.v1 Event type.
<b>deprecatedFirstTimestamp</b>	<b>Time</b>	deprecatedFirstTimestamp is the deprecated field assuring backward compatibility with core.v1 Event type.
<b>deprecatedLastTimestamp</b>	<b>Time</b>	deprecatedLastTimestamp is the deprecated field assuring backward compatibility with core.v1 Event type.
<b>deprecatedSource</b>	<b>EventSource</b>	deprecatedSource is the deprecated field assuring backward compatibility with core.v1 Event type.
<b>eventTime</b>	<b>MicroTime</b>	eventTime is the time when this Event was first observed. It is required.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>note</b>	<b>string</b>	note is a human-readable description of the status of this operation. Maximal length of the note is 1kB, but libraries should be prepared to handle values up to 64kB.
<b>reason</b>	<b>string</b>	reason is why the action was taken. It is human-readable. This field cannot be empty for new Events and it can have at most 128 characters.
<b>regarding</b>	<b>ObjectReference</b>	regarding contains the object this Event is about. In most cases it's an Object reporting controller implements, e.g. ReplicaSetController implements ReplicaSets and this event is emitted because it acts on some changes in a ReplicaSet object.
<b>related</b>	<b>ObjectReference</b>	related is the optional secondary object for more complex actions. E.g. when regarding object triggers a creation or deletion of related object.
<b>reportingController</b>	<b>string</b>	reportingController is the name of the controller that emitted this Event, e.g. <b>kubernetes.io/kubelet</b> . This field cannot be empty for new Events.
<b>reportingInstance</b>	<b>string</b>	reportingInstance is the ID of the controller instance, e.g. <b>kubelet-xyzf</b> . This field cannot be empty for new Events and it can have at most 128 characters.

Property	Type	Description
<b>series</b>	<b>object</b>	EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time. How often to update the EventSeries is up to the event reporters. The default event reporter in "k8s.io/client-go/tools/events/event_broadcaster.go" shows how this struct is updated on heartbeats and can guide customized reporter implementations.
<b>type</b>	<b>string</b>	type is the type of this event (Normal, Warning), new types could be added in the future. It is machine-readable. This field cannot be empty for new Events.

### 16.2.1.1. .series

#### Description

EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time. How often to update the EventSeries is up to the event reporters. The default event reporter in "k8s.io/client-go/tools/events/event\_broadcaster.go" shows how this struct is updated on heartbeats and can guide customized reporter implementations.

#### Type

**object**

#### Required

- **count**
- **lastObservedTime**

Property	Type	Description
<b>count</b>	<b>integer</b>	count is the number of occurrences in this series up to the last heartbeat time.
<b>lastObservedTime</b>	<b>MicroTime</b>	lastObservedTime is the time when last Event from the series was seen before last heartbeat.

### 16.2.2. API endpoints

The following API endpoints are available:

- **/apis/events.k8s.io/v1/events**
  - **GET**: list or watch objects of kind Event
- **/apis/events.k8s.io/v1/watch/events**
  - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/events.k8s.io/v1/namespaces/{namespace}/events**
  - **DELETE**: delete collection of Event
  - **GET**: list or watch objects of kind Event
  - **POST**: create an Event
- **/apis/events.k8s.io/v1/watch/namespaces/{namespace}/events**
  - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/events.k8s.io/v1/namespaces/{namespace}/events/{name}**
  - **DELETE**: delete an Event
  - **GET**: read the specified Event
  - **PATCH**: partially update the specified Event
  - **PUT**: replace the specified Event
- **/apis/events.k8s.io/v1/watch/namespaces/{namespace}/events/{name}**
  - **GET**: watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 16.2.2.1. /apis/events.k8s.io/v1/events

Table 16.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 16.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 16.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Event
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 16.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

## CHAPTER 17. FLOW CONTROL APIS

### 17.1. FLOW CONTROL APIS

#### 17.1.1. FlowSchema [flowcontrol.apiserver.k8s.io/v1beta3]

##### Description

FlowSchema defines the schema of a group of flows. Note that a flow is made up of a set of inbound API requests with similar attributes and is identified by a pair of strings: the name of the FlowSchema and a "flow distinguisher".

##### Type

**object**

#### 17.1.2. PriorityLevelConfiguration [flowcontrol.apiserver.k8s.io/v1beta3]

##### Description

PriorityLevelConfiguration represents the configuration of a priority level.

##### Type

**object**

### 17.2. FLOWSHEMA [FLOWCONTROL.APISERVER.K8S.IO/V1BETA3]

##### Description

FlowSchema defines the schema of a group of flows. Note that a flow is made up of a set of inbound API requests with similar attributes and is identified by a pair of strings: the name of the FlowSchema and a "flow distinguisher".

##### Type

**object**

#### 17.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	<b>metadata</b> is the standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	FlowSchemaSpec describes how the FlowSchema's specification looks like.
<b>status</b>	<b>object</b>	FlowSchemaStatus represents the current state of a FlowSchema.

### 17.2.1.1. .spec

#### Description

FlowSchemaSpec describes how the FlowSchema's specification looks like.

#### Type

**object**

#### Required

- **priorityLevelConfiguration**

Property	Type	Description
<b>distinguisherMethod</b>	<b>object</b>	FlowDistinguisherMethod specifies the method of a flow distinguisher.

Property	Type	Description
<b>matchingPrecedence</b>	<b>integer</b>	<b>matchingPrecedence</b> is used to choose among the FlowSchemas that match a given request. The chosen FlowSchema is among those with the numerically lowest (which we take to be logically highest) MatchingPrecedence. Each MatchingPrecedence value must be ranged in [1,10000]. Note that if the precedence is not specified, it will be set to 1000 as default.
<b>priorityLevelConfiguration</b>	<b>object</b>	PriorityLevelConfigurationReference contains information that points to the "request-priority" being used.
<b>rules</b>	<b>array</b>	<b>rules</b> describes which requests will match this flow schema. This FlowSchema matches a request if and only if at least one member of rules matches the request. if it is an empty slice, there will be no requests matching the FlowSchema.
<b>rules[]</b>	<b>object</b>	PolicyRulesWithSubjects prescribes a test that applies to a request to an apiserver. The test considers the subject making the request, the verb being requested, and the resource to be acted upon. This PolicyRulesWithSubjects matches a request if and only if both (a) at least one member of subjects matches the request and (b) at least one member of resourceRules or nonResourceRules matches the request.

### 17.2.1.2. .spec.distinguisherMethod

#### Description

FlowDistinguisherMethod specifies the method of a flow distinguisher.

#### Type

**object**

**Required**

- **type**

Property	Type	Description
<b>type</b>	<b>string</b>	<b>type</b> is the type of flow distinguisher method The supported types are "ByUser" and "ByNamespace". Required.

**17.2.1.3. .spec.priorityLevelConfiguration****Description**

PriorityLevelConfigurationReference contains information that points to the "request-priority" being used.

**Type**

**object**

**Required**

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	<b>name</b> is the name of the priority level configuration being referenced Required.

**17.2.1.4. .spec.rules****Description**

**rules** describes which requests will match this flow schema. This FlowSchema matches a request if and only if at least one member of rules matches the request. if it is an empty slice, there will be no requests matching the FlowSchema.

**Type**

**array**

**17.2.1.5. .spec.rules[]****Description**

PolicyRulesWithSubjects prescribes a test that applies to a request to an apiserver. The test considers the subject making the request, the verb being requested, and the resource to be acted upon. This PolicyRulesWithSubjects matches a request if and only if both (a) at least one member of subjects matches the request and (b) at least one member of resourceRules or nonResourceRules matches the request.

**Type**

**object**

## Required

- **subjects**

Property	Type	Description
<b>nonResourceRules</b>	<b>array</b>	<b>nonResourceRules</b> is a list of NonResourcePolicyRules that identify matching requests according to their verb and the target non-resource URL.
<b>nonResourceRules[]</b>	<b>object</b>	NonResourcePolicyRule is a predicate that matches non-resource requests according to their verb and the target non-resource URL. A NonResourcePolicyRule matches a request if and only if both (a) at least one member of verbs matches the request and (b) at least one member of nonResourceURLs matches the request.
<b>resourceRules</b>	<b>array</b>	<b>resourceRules</b> is a slice of ResourcePolicyRules that identify matching requests according to their verb and the target resource. At least one of <b>resourceRules</b> and <b>nonResourceRules</b> has to be non-empty.

Property	Type	Description
<b>resourceRules[]</b>	<b>object</b>	ResourcePolicyRule is a predicate that matches some resource requests, testing the request's verb and the target resource. A ResourcePolicyRule matches a resource request if and only if: (a) at least one member of verbs matches the request, (b) at least one member of apiGroups matches the request, (c) at least one member of resources matches the request, and (d) either (d1) the request does not specify a namespace (i.e., <b>Namespace=""</b> ) and clusterScope is true or (d2) the request specifies a namespace and least one member of namespaces matches the request's namespace.
<b>subjects</b>	<b>array</b>	subjects is the list of normal user, serviceaccount, or group that this rule cares about. There must be at least one member in this slice. A slice that includes both the system:authenticated and system:unauthenticated user groups matches every request. Required.
<b>subjects[]</b>	<b>object</b>	Subject matches the originator of a request, as identified by the request authentication system. There are three ways of matching an originator; by user, group, or service account.

#### 17.2.1.6. .spec.rules[].nonResourceRules

##### Description

**nonResourceRules** is a list of NonResourcePolicyRules that identify matching requests according to their verb and the target non-resource URL.

##### Type

**array**

#### 17.2.1.7. .spec.rules[].nonResourceRules[]

## Description

NonResourcePolicyRule is a predicate that matches non-resource requests according to their verb and the target non-resource URL. A NonResourcePolicyRule matches a request if and only if both (a) at least one member of verbs matches the request and (b) at least one member of nonResourceURLs matches the request.

## Type

**object**

## Required

- **verbs**
- **nonResourceURLs**

Property	Type	Description
<b>nonResourceURLs</b>	<b>array (string)</b>	<b>nonResourceURLs</b> is a set of url prefixes that a user should have access to and may not be empty. For example: - "/healthz" is legal - "/hea*" is illegal - "/hea" is legal but matches nothing - "/hea/" <b>also matches nothing</b> - <b>"/healthz/"</b> matches all per-component health checks. "*" matches all non-resource urls. if it is present, it must be the only entry. Required.
<b>verbs</b>	<b>array (string)</b>	<b>verbs</b> is a list of matching verbs and may not be empty. "*" matches all verbs. If it is present, it must be the only entry. Required.

### 17.2.1.8. .spec.rules[].resourceRules

## Description

**resourceRules** is a slice of ResourcePolicyRules that identify matching requests according to their verb and the target resource. At least one of **resourceRules** and **nonResourceRules** has to be non-empty.

## Type

**array**

### 17.2.1.9. .spec.rules[].resourceRules[]

## Description

ResourcePolicyRule is a predicate that matches some resource requests, testing the request's verb and the target resource. A ResourcePolicyRule matches a resource request if and only if: (a) at least one member of verbs matches the request, (b) at least one member of apiGroups matches the

request, (c) at least one member of resources matches the request, and (d) either (d1) the request does not specify a namespace (i.e., **Namespace==""**) and **clusterScope** is true or (d2) the request specifies a namespace and least one member of namespaces matches the request's namespace.

## Type

**object**

## Required

- **verbs**
- **apiGroups**
- **resources**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	<b>apiGroups</b> is a list of matching API groups and may not be empty. "*" matches all API groups and, if present, must be the only entry. Required.
<b>clusterScope</b>	<b>boolean</b>	<b>clusterScope</b> indicates whether to match requests that do not specify a namespace (which happens either because the resource is not namespaced or the request targets all namespaces). If this field is omitted or false then the <b>namespaces</b> field must contain a non-empty list.
<b>namespaces</b>	<b>array (string)</b>	<b>namespaces</b> is a list of target namespaces that restricts matches. A request that specifies a target namespace matches only if either (a) this list contains that target namespace or (b) this list contains "". <b>Note that ""</b> matches any specified namespace but does not match a request that <i>does not specify</i> a namespace (see the <b>clusterScope</b> field for that). This list may be empty, but only if <b>clusterScope</b> is true.

Property	Type	Description
<b>resources</b>	<b>array (string)</b>	<b>resources</b> is a list of matching resources (i.e., lowercase and plural) with, if desired, subresource. For example, [ "services", "nodes/status" ]. This list may not be empty. "*" matches all resources and, if present, must be the only entry. Required.
<b>verbs</b>	<b>array (string)</b>	<b>verbs</b> is a list of matching verbs and may not be empty. "*" matches all verbs and, if present, must be the only entry. Required.

#### 17.2.1.10. .spec.rules[].subjects

##### Description

subjects is the list of normal user, serviceaccount, or group that this rule cares about. There must be at least one member in this slice. A slice that includes both the system:authenticated and system:unauthenticated user groups matches every request. Required.

##### Type

**array**

#### 17.2.1.11. .spec.rules[].subjects[]

##### Description

Subject matches the originator of a request, as identified by the request authentication system. There are three ways of matching an originator; by user, group, or service account.

##### Type

**object**

##### Required

- **kind**

Property	Type	Description
<b>group</b>	<b>object</b>	GroupSubject holds detailed information for group-kind subject.
<b>kind</b>	<b>string</b>	<b>kind</b> indicates which one of the other fields is non-empty. Required

Property	Type	Description
<b>serviceAccount</b>	<b>object</b>	ServiceAccountSubject holds detailed information for service-account-kind subject.
<b>user</b>	<b>object</b>	UserSubject holds detailed information for user-kind subject.

#### 17.2.1.12. .spec.rules[].subjects[].group

##### Description

GroupSubject holds detailed information for group-kind subject.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the user group that matches, or "*" to match all user groups. See <a href="https://github.com/kubernetes/apiserver/blob/master/pkg/authentication/user/user.go">https://github.com/kubernetes/apiserver/blob/master/pkg/authentication/user/user.go</a> for some well-known group names. Required.

#### 17.2.1.13. .spec.rules[].subjects[].serviceAccount

##### Description

ServiceAccountSubject holds detailed information for service-account-kind subject.

##### Type

**object**

##### Required

- **namespace**
- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	<b>name</b> is the name of matching ServiceAccount objects, or "*" to match regardless of name. Required.
<b>namespace</b>	<b>string</b>	<b>namespace</b> is the namespace of matching ServiceAccount objects. Required.

#### 17.2.1.14. .spec.rules[].subjects[].user

##### Description

UserSubject holds detailed information for user-kind subject.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	<b>name</b> is the username that matches, or "*" to match all usernames. Required.

#### 17.2.1.15. .status

##### Description

FlowSchemaStatus represents the current state of a FlowSchema.

##### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	<b>conditions</b> is a list of the current states of FlowSchema.
<b>conditions[]</b>	<b>object</b>	FlowSchemaCondition describes conditions for a FlowSchema.

#### 17.2.1.16. .status.conditions

##### Description

**conditions** is a list of the current states of FlowSchema.

Type

**array**

### 17.2.1.17. .status.conditions[]

Description

FlowSchemaCondition describes conditions for a FlowSchema.

Type

**object**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	<b>lastTransitionTime</b> is the last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	<b>message</b> is a human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	<b>reason</b> is a unique, one-word, CamelCase reason for the condition's last transition.
<b>status</b>	<b>string</b>	<b>status</b> is the status of the condition. Can be True, False, Unknown. Required.
<b>type</b>	<b>string</b>	<b>type</b> is the type of the condition. Required.

## 17.2.2. API endpoints

The following API endpoints are available:

- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas**
  - **DELETE**: delete collection of FlowSchema
  - **GET**: list or watch objects of kind FlowSchema
  - **POST**: create a FlowSchema
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas**
  - **GET**: watch individual changes to a list of FlowSchema. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas/{name}**
  - **DELETE**: delete a FlowSchema

- **GET**: read the specified FlowSchema
- **PATCH**: partially update the specified FlowSchema
- **PUT**: replace the specified FlowSchema
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas/{name}**
  - **GET**: watch changes to an object of kind FlowSchema. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas/{name}/status**
  - **GET**: read status of the specified FlowSchema
  - **PATCH**: partially update status of the specified FlowSchema
  - **PUT**: replace status of the specified FlowSchema

### 17.2.2.1. /apis/flowcontrol.apiserver.k8s.io/v1beta3/flowschemas

Table 17.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of FlowSchema

Table 17.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>`continue`</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 17.3. Body parameters

<b>body</b>	<b>DeleteOptions</b> schema	

Table 17.4. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind FlowSchema

Table 17.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

401 - Unauthorized	Empty

### 17.2.2.2. /apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/flowschemas

Table 17.10. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method  
**GET**

**Description**

watch individual changes to a list of FlowSchema. deprecated: use the 'watch' parameter with a list operation instead.

**Table 17.11. HTTP responses**

HTTP code	Reponse body

**HTTP method****DELETE****Description**

delete a FlowSchema

**Table 17.14. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 17.3. PRIORITYLEVELCONFIGURATION [FLOWCONTROL.APISERVER.K8S.IO/V1BETA3]

### Description

PriorityLevelConfiguration represents the configuration of a priority level.

### Type

**object**

### 17.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	<b>metadata</b> is the standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PriorityLevelConfigurationSpec specifies the configuration of a priority level.
<b>status</b>	<b>object</b>	PriorityLevelConfigurationStatus represents the current state of a "request-priority".

### 17.3.1.1. .spec

#### Description

PriorityLevelConfigurationSpec specifies the configuration of a priority level.

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>limited</b>	<b>object</b>	LimitedPriorityLevelConfiguration specifies how to handle requests that are subject to limits. It addresses two issues: - How are requests for this priority level limited? - What should be done with requests that exceed the limit?

Property	Type	Description
<b>type</b>	<b>string</b>	<b>type</b> indicates whether this priority level is subject to limitation on request execution. A value of " <b>Exempt</b> " means that requests of this priority level are not subject to a limit (and thus are never queued) and do not detract from the capacity made available to other priority levels. A value of " <b>Limited</b> " means that (a) requests of this priority level are subject to limits and (b) some of the server's limited capacity is made available exclusively to this priority level. Required.

### 17.3.1.2. .spec.limited

#### Description

LimitedPriorityLevelConfiguration specifies how to handle requests that are subject to limits. It addresses two issues: - How are requests for this priority level limited? - What should be done with requests that exceed the limit?

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>borrowingLimitPercent</b>	<b>integer</b>	<p><b>borrowingLimitPercent</b>, if present, configures a limit on how many seats this priority level can borrow from other priority levels. The limit is known as this level's BorrowingConcurrencyLimit (BorrowingCL) and is a limit on the total number of seats that this level may borrow at any one time. This field holds the ratio of that limit to the level's nominal concurrency limit. When this field is non-nil, it must hold a non-negative integer and the limit is calculated as follows.</p> $\text{BorrowingCL}(i) = \text{round}(\text{NominalCL}(i) * \text{borrowingLimitPercent}(i)/100.0)$ <p>The value of this field can be more than 100, implying that this priority level can borrow a number of seats that is greater than its own nominal concurrency limit (NominalCL). When this field is left <b>nil</b>, the limit is effectively infinite.</p>
<b>lendablePercent</b>	<b>integer</b>	<p><b>lendablePercent</b> prescribes the fraction of the level's NominalCL that can be borrowed by other priority levels. The value of this field must be between 0 and 100, inclusive, and it defaults to 0. The number of seats that other levels can borrow from this level, known as this level's LendableConcurrencyLimit (LendableCL), is defined as follows.</p> $\text{LendableCL}(i) = \text{round}(\text{NominalCL}(i) * \text{lendablePercent}(i)/100.0)$
<b>limitResponse</b>	<b>object</b>	LimitResponse defines how to handle requests that can not be executed right now.

Property	Type	Description
<b>nominalConcurrencyShares</b>	<b>integer</b>	<p><b>nominalConcurrencyShares</b> (NCS) contributes to the computation of the <b>NominalConcurrencyLimit</b> (NominalCL) of this level. This is the number of execution seats available at this priority level. This is used both for requests dispatched from this priority level as well as requests dispatched from other priority levels borrowing seats from this level. The server's concurrency limit (ServerCL) is divided among the Limited priority levels in proportion to their NCS values:</p> $\text{NominalCL}(i) = \text{ceil}(\text{ServerCL} * \text{NCS}(i) / \text{sum\_ncs})$ $\text{sum\_ncs} = \text{sum}[\text{limited priority level } k] \text{NCS}(k)$ <p>Bigger numbers mean a larger nominal concurrency limit, at the expense of every other Limited priority level. This field has a default value of 30.</p>

### 17.3.1.3. .spec.limited.limitResponse

#### Description

LimitResponse defines how to handle requests that can not be executed right now.

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>queuing</b>	<b>object</b>	QueuingConfiguration holds the configuration parameters for queuing

Property	Type	Description
<b>type</b>	<b>string</b>	<b>type</b> is "Queue" or "Reject". "Queue" means that requests that can not be executed upon arrival are held in a queue until they can be executed or a queuing limit is reached. "Reject" means that requests that can not be executed upon arrival are rejected. Required.

#### 17.3.1.4. .spec.limited.limitResponse.queuing

##### Description

QueuingConfiguration holds the configuration parameters for queuing

##### Type

**object**

Property	Type	Description
<b>handSize</b>	<b>integer</b>	<b>handSize</b> is a small positive number that configures the shuffle sharding of requests into queues. When enqueueing a request at this priority level the request's flow identifier (a string pair) is hashed and the hash value is used to shuffle the list of queues and deal a hand of the size specified here. The request is put into one of the shortest queues in that hand. <b>handSize</b> must be no larger than <b>queues</b> , and should be significantly smaller (so that a few heavy flows do not saturate most of the queues). See the user-facing documentation for more extensive guidance on setting this field. This field has a default value of 8.
<b>queueLengthLimit</b>	<b>integer</b>	<b>queueLengthLimit</b> is the maximum number of requests allowed to be waiting in a given queue of this priority level at a time; excess requests are rejected. This value must be positive. If not specified, it will be defaulted to 50.

Property	Type	Description
<b>queues</b>	<b>integer</b>	<b>queues</b> is the number of queues for this priority level. The queues exist independently at each apiserver. The value must be positive. Setting it to 1 effectively precludes shuffleharding and thus makes the distinguisher method of associated flow schemas irrelevant. This field has a default value of 64.

### 17.3.1.5. .status

#### Description

PriorityLevelConfigurationStatus represents the current state of a "request-priority".

#### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	<b>conditions</b> is the current state of "request-priority".
<b>conditions[]</b>	<b>object</b>	PriorityLevelConfigurationCondition defines the condition of priority level.

### 17.3.1.6. .status.conditions

#### Description

**conditions** is the current state of "request-priority".

#### Type

**array**

### 17.3.1.7. .status.conditions[]

#### Description

PriorityLevelConfigurationCondition defines the condition of priority level.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	<b>lastTransitionTime</b> is the last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	<b>message</b> is a human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	<b>reason</b> is a unique, one-word, CamelCase reason for the condition's last transition.
<b>status</b>	<b>string</b>	<b>status</b> is the status of the condition. Can be True, False, Unknown. Required.
<b>type</b>	<b>string</b>	<b>type</b> is the type of the condition. Required.

### 17.3.2. API endpoints

The following API endpoints are available:

- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations**
  - **DELETE**: delete collection of PriorityLevelConfiguration
  - **GET**: list or watch objects of kind PriorityLevelConfiguration
  - **POST**: create a PriorityLevelConfiguration
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations**
  - **GET**: watch individual changes to a list of PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations/{name}**
  - **DELETE**: delete a PriorityLevelConfiguration
  - **GET**: read the specified PriorityLevelConfiguration
  - **PATCH**: partially update the specified PriorityLevelConfiguration
  - **PUT**: replace the specified PriorityLevelConfiguration
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations/{name}**

- **GET**: watch changes to an object of kind PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations/{name}/status**
  - **GET**: read status of the specified PriorityLevelConfiguration
  - **PATCH**: partially update status of the specified PriorityLevelConfiguration
  - **PUT**: replace status of the specified PriorityLevelConfiguration

### 17.3.2.1. /apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations

Table 17.36. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of PriorityLevelConfiguration

Table 17.37. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind PriorityLevelConfiguration

Table 17.40. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

create a PriorityLevelConfiguration

**Table 17.42. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>

Table 17.57. Body parameters

200 - OK	<b>PriorityLevelConfiguration</b> schema
201 - Created	<b>PriorityLevelConfiguration</b> schema
401 - Unauthorized	Empty

#### 17.3.2.4. /apis/flowcontrol.apiserver.k8s.io/v1beta3/watch/prioritylevelconfigurations/{name}

Table 17.59. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PriorityLevelConfiguration

Table 17.60. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PriorityLevelConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 17.61. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

### 17.3.2.5. /apis/flowcontrol.apiserver.k8s.io/v1beta3/prioritylevelconfigurations/{name}/status

Table 17.62. Global path parameters

<b>name</b>	<b>string</b>	name of the PriorityLevelConfiguration

Table 17.63. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### GET

#### Description

read status of the specified PriorityLevelConfiguration

Table 17.64. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">PriorityLevelConfiguration</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified PriorityLevelConfiguration

Table 17.65. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## CHAPTER 18. NETWORKING APIS

### 18.1. NETWORKING APIS

#### 18.1.1. Ingress [networking.k8s.io/v1]

##### Description

Ingress is a collection of rules that allow inbound connections to reach the endpoints defined by a backend. An Ingress can be configured to give services externally-reachable urls, load balance traffic, terminate SSL, offer name based virtual hosting etc.

##### Type

**object**

#### 18.1.2. IngressClass [networking.k8s.io/v1]

##### Description

IngressClass represents the class of the Ingress, referenced by the Ingress Spec. The **ingressclass.kubernetes.io/is-default-class** annotation can be used to indicate that an IngressClass should be considered default. When a single IngressClass resource has this annotation set to true, new Ingress resources without a class specified will be assigned this default class.

##### Type

**object**

#### 18.1.3. NetworkPolicy [networking.k8s.io/v1]

##### Description

NetworkPolicy describes what network traffic is allowed for a set of Pods

##### Type

**object**

### 18.2. INGRESS [NETWORKING.K8S.IO/V1]

##### Description

Ingress is a collection of rules that allow inbound connections to reach the endpoints defined by a backend. An Ingress can be configured to give services externally-reachable urls, load balance traffic, terminate SSL, offer name based virtual hosting etc.

##### Type

**object**

#### 18.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	IngressSpec describes the Ingress the user wishes to exist.
<b>status</b>	<b>object</b>	IngressStatus describe the current state of the Ingress.

### 18.2.1.1. .spec

#### Description

IngressSpec describes the Ingress the user wishes to exist.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>defaultBackend</b>	<b>object</b>	IngressBackend describes all endpoints for a given service and port.
<b>ingressClassName</b>	<b>string</b>	ingressClassName is the name of an IngressClass cluster resource. Ingress controller implementations use this field to know whether they should be serving this Ingress resource, by a transitive connection (controller → IngressClass → Ingress resource). Although the <b>kubernetes.io/ingress.class</b> annotation (simple constant name) was never formally defined, it was widely supported by Ingress controllers to create a direct binding between Ingress controller and Ingress resources. Newly created Ingress resources should prefer using the field. However, even though the annotation is officially deprecated, for backwards compatibility reasons, ingress controllers should still honor that annotation if present.
<b>rules</b>	<b>array</b>	rules is a list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
<b>rules[]</b>	<b>object</b>	IngressRule represents the rules mapping the paths under a specified host to the related backend services. Incoming requests are first evaluated for a host match, then routed to the backend associated with the matching IngressRuleValue.

Property	Type	Description
<b>tls</b>	<b>array</b>	tls represents the TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.
<b>tls[]</b>	<b>object</b>	IngressTLS describes the transport layer security associated with an ingress.

### 18.2.1.2. .spec.defaultBackend

#### Description

IngressBackend describes all endpoints for a given service and port.

#### Type

**object**

Property	Type	Description
<b>resource</b>	<b>TypedLocalObjectReference</b>	resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, a service.Name and service.Port must not be specified. This is a mutually exclusive setting with "Service".
<b>service</b>	<b>object</b>	IngressServiceBackend references a Kubernetes Service as a Backend.

### 18.2.1.3. .spec.defaultBackend.service

#### Description

IngressServiceBackend references a Kubernetes Service as a Backend.

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the referenced service. The service must exist in the same namespace as the Ingress object.
<b>port</b>	<b>object</b>	ServiceBackendPort is the service port being referenced.

#### 18.2.1.4. .spec.defaultBackend.service.port

##### Description

ServiceBackendPort is the service port being referenced.

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the port on the Service. This is a mutually exclusive setting with "Number".
<b>number</b>	<b>integer</b>	number is the numerical port number (e.g. 80) on the Service. This is a mutually exclusive setting with "Name".

#### 18.2.1.5. .spec.rules

##### Description

rules is a list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.

##### Type

**array**

#### 18.2.1.6. .spec.rules[]

##### Description

IngressRule represents the rules mapping the paths under a specified host to the related backend services. Incoming requests are first evaluated for a host match, then routed to the backend associated with the matching IngressRuleValue.

##### Type

**object**

Property	Type	Description
<b>host</b>	<b>string</b>	<p>host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <b>The wildcard character "</b> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If host is precise, the request matches this rule if the http host header is equal to Host. 2. If host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>

Property	Type	Description
<b>http</b>	<b>object</b>	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: <a href="http://&lt;host&gt;/&lt;path&gt;?&lt;searchpart&gt;">http://&lt;host&gt;/&lt;path&gt;?&lt;searchpart&gt;</a> → backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

### 18.2.1.7. .spec.rules[].http

#### Description

HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: <http://<host>/<path>?<searchpart>> → backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

#### Type

**object**

#### Required

- **paths**

Property	Type	Description
<b>paths</b>	<b>array</b>	paths is a collection of paths that map requests to backends.
<b>paths[]</b>	<b>object</b>	HTTPIngressPath associates a path with a backend. Incoming urls matching the path are forwarded to the backend.

### 18.2.1.8. .spec.rules[].http.paths

#### Description

paths is a collection of paths that map requests to backends.

#### Type

**array**

### 18.2.1.9. .spec.rules[].http.paths[]

#### Description

HTTPIngressPath associates a path with a backend. Incoming urls matching the path are forwarded to the backend.

Type

**object**

Required

- **pathType**
- **backend**

Property	Type	Description
<b>backend</b>	<b>object</b>	IngressBackend describes all endpoints for a given service and port.
<b>path</b>	<b>string</b>	path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/' and must be present when using PathType with value "Exact" or "Prefix".
<b>pathType</b>	<b>string</b>	pathType determines the interpretation of the path matching. PathType can be one of the following values: <ul style="list-style-type: none"> <li>* Exact: Matches the URL path exactly.</li> <li>* Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</li> <li>* ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types.</li> </ul>

Property	Type	Description
		<p>Possible enum values: - <b>"Exact"</b> matches the URL path exactly and with case sensitivity. - <b>"ImplementationSpecific"</b> matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. - <b>"Prefix"</b> matches based on a URL path prefix split by '/'. Matching is case sensitive and done on a path element by element basis. A path element refers to the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). If multiple matching paths exist in an Ingress spec, the longest matching path is given priority. Examples: - /foo/bar does not match requests to /foo/barbaz - /foo/bar matches request to /foo/bar and /foo/bar/baz - /foo and /foo/ both match requests to /foo and /foo/. If both paths are present in an Ingress spec, the longest matching path (/foo/) is given priority.</p>

### 18.2.1.10. .spec.rules[].http.paths[].backend

#### Description

IngressBackend describes all endpoints for a given service and port.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>resource</b>	<b>TypedLocalObjectReference</b>	resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, a service.Name and service.Port must not be specified. This is a mutually exclusive setting with "Service".
<b>service</b>	<b>object</b>	IngressServiceBackend references a Kubernetes Service as a Backend.

#### 18.2.1.11. .spec.rules[].http.paths[].backend.service

##### Description

IngressServiceBackend references a Kubernetes Service as a Backend.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the referenced service. The service must exist in the same namespace as the Ingress object.
<b>port</b>	<b>object</b>	ServiceBackendPort is the service port being referenced.

#### 18.2.1.12. .spec.rules[].http.paths[].backend.service.port

##### Description

ServiceBackendPort is the service port being referenced.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the port on the Service. This is a mutually exclusive setting with "Number".
<b>number</b>	<b>integer</b>	number is the numerical port number (e.g. 80) on the Service. This is a mutually exclusive setting with "Name".

### 18.2.1.13. .spec.tls

#### Description

tls represents the TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

#### Type

**array**

### 18.2.1.14. .spec.tls[]

#### Description

IngressTLS describes the transport layer security associated with an ingress.

#### Type

**object**

Property	Type	Description
<b>hosts</b>	<b>array (string)</b>	hosts is a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
<b>secretName</b>	<b>string</b>	secretName is the name of the secret used to terminate TLS traffic on port 443. Field is left optional to allow TLS routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the "Host" header is used for routing.

### 18.2.1.15. `.status`

#### Description

`IngressStatus` describe the current state of the Ingress.

#### Type

**object**

Property	Type	Description
<b>loadBalancer</b>	<b>object</b>	<code>IngressLoadBalancerStatus</code> represents the status of a load-balancer.

### 18.2.1.16. `.status.loadBalancer`

#### Description

`IngressLoadBalancerStatus` represents the status of a load-balancer.

#### Type

**object**

Property	Type	Description
<b>ingress</b>	<b>array</b>	<code>ingress</code> is a list containing ingress points for the load-balancer.
<b>ingress[]</b>	<b>object</b>	<code>IngressLoadBalancerIngress</code> represents the status of a load-balancer ingress point.

### 18.2.1.17. `.status.loadBalancer.ingress`

#### Description

`ingress` is a list containing ingress points for the load-balancer.

#### Type

**array**

### 18.2.1.18. `.status.loadBalancer.ingress[]`

#### Description

`IngressLoadBalancerIngress` represents the status of a load-balancer ingress point.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>hostname</b>	<b>string</b>	hostname is set for load-balancer ingress points that are DNS based.
<b>ip</b>	<b>string</b>	ip is set for load-balancer ingress points that are IP based.
<b>ports</b>	<b>array</b>	ports provides information about the ports exposed by this LoadBalancer.
<b>ports[]</b>	<b>object</b>	IngressPortStatus represents the error condition of a service port

#### 18.2.1.19. `.status.loadBalancer.ingress[].ports`

##### Description

ports provides information about the ports exposed by this LoadBalancer.

##### Type

**array**

#### 18.2.1.20. `.status.loadBalancer.ingress[].ports[]`

##### Description

IngressPortStatus represents the error condition of a service port

##### Type

**object**

##### Required

- **port**
- **protocol**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>error</b>	<b>string</b>	error is to record the problem with the service port The format of the error shall comply with the following rules: - built-in error values shall be specified in this file and those shall use CamelCase names - cloud provider specific error values must have names that comply with the format foo.example.com/CamelCase.
<b>port</b>	<b>integer</b>	port is the port number of the ingress port.
<b>protocol</b>	<b>string</b>	protocol is the protocol of the ingress port. The supported values are: "TCP", "UDP", "SCTP"  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

### 18.2.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/ingresses**
  - **GET**: list or watch objects of kind Ingress
- **/apis/networking.k8s.io/v1/watch/ingresses**
  - **GET**: watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses**
  - **DELETE**: delete collection of Ingress
  - **GET**: list or watch objects of kind Ingress
  - **POST**: create an Ingress
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses**
  - **GET**: watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name}**
  - **DELETE**: delete an Ingress

- **GET**: read the specified Ingress
- **PATCH**: partially update the specified Ingress
- **PUT**: replace the specified Ingress
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses/{name}**
  - **GET**: watch changes to an object of kind Ingress. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name}/status**
  - **GET**: read status of the specified Ingress
  - **PATCH**: partially update status of the specified Ingress
  - **PUT**: replace status of the specified Ingress

### 18.2.2.1. /apis/networking.k8s.io/v1/ingresses

Table 18.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

delete collection of Ingress

Table 18.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 18.11. HTTP responses

create an Ingress

**Table 18.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Ingress. deprecated: use the 'watch' parameter with a list operation instead.

Table 18.17. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

### 18.2.2.5. /apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name}

Table 18.18. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Ingress
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 18.19. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete an Ingress

Table 18.20. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

read the specified Ingress

Table 18.23. HTTP responses

HTTP code	Response body
200 - OK	<b>Ingress</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified Ingress

**Table 18.24. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

### 18.2.2.6. /apis/networking.k8s.io/v1/watch/namespaces/{namespace}/ingresses/{name}

Table 18.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Ingress
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 18.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

## 18.3. INGRESSCLASS [NETWORKING.K8S.IO/V1]

### Description

IngressClass represents the class of the Ingress, referenced by the Ingress Spec. The **ingressclass.kubernetes.io/is-default-class** annotation can be used to indicate that an IngressClass should be considered default. When a single IngressClass resource has this annotation set to true, new Ingress resources without a class specified will be assigned this default class.

### Type

**object**

### 18.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	IngressClassSpec provides information about the class of an Ingress.

### 18.3.1.1. .spec

#### Description

IngressClassSpec provides information about the class of an Ingress.

#### Type

**object**

Property	Type	Description
<b>controller</b>	<b>string</b>	controller refers to the name of the controller that should handle this class. This allows for different "flavors" that are controlled by the same controller. For example, you may have different parameters for the same implementing controller. This should be specified as a domain-prefixed path no more than 250 characters in length, e.g. "acme.io/ingress-controller". This field is immutable.

Property	Type	Description
<b>parameters</b>	<b>object</b>	IngressClassParametersReference identifies an API object. This can be used to specify a cluster or namespace-scoped resource.

### 18.3.1.2. .spec.parameters

#### Description

IngressClassParametersReference identifies an API object. This can be used to specify a cluster or namespace-scoped resource.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	apiGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	kind is the type of resource being referenced.
<b>name</b>	<b>string</b>	name is the name of resource being referenced.
<b>namespace</b>	<b>string</b>	namespace is the namespace of the resource being referenced. This field is required when scope is set to "Namespace" and must be unset when scope is set to "Cluster".
<b>scope</b>	<b>string</b>	scope represents if this refers to a cluster or namespace scoped resource. This may be set to "Cluster" (default) or "Namespace".

## 18.3.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/ingressclasses**
  - **DELETE**: delete collection of IngressClass
  - **GET**: list or watch objects of kind IngressClass
  - **POST**: create an IngressClass
- **/apis/networking.k8s.io/v1/watch/ingressclasses**
  - **GET**: watch individual changes to a list of IngressClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/ingressclasses/{name}**
  - **DELETE**: delete an IngressClass
  - **GET**: read the specified IngressClass
  - **PATCH**: partially update the specified IngressClass
  - **PUT**: replace the specified IngressClass
- **/apis/networking.k8s.io/v1/watch/ingressclasses/{name}**
  - **GET**: watch changes to an object of kind IngressClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**DELETE**

Description

delete collection of IngressClass

Table 18.43. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind IngressClass

Table 18.46. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

create an IngressClass

**Table 18.48. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

delete an IngressClass

**Table 18.55. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 18.4. NETWORKPOLICY [NETWORKING.K8S.IO/V1]

### Description

NetworkPolicy describes what network traffic is allowed for a set of Pods

### Type

**object**

### 18.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	NetworkPolicySpec provides the specification of a NetworkPolicy

Property	Type	Description
<b>status</b>	<b>object</b>	NetworkPolicyStatus describes the current state of the NetworkPolicy.

### 18.4.1.1. .spec

#### Description

NetworkPolicySpec provides the specification of a NetworkPolicy

#### Type

**object**

#### Required

- **podSelector**

Property	Type	Description
<b>egress</b>	<b>array</b>	egress is a list of egress rules to be applied to the selected pods. Outgoing traffic is allowed if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic matches at least one egress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy limits all outgoing traffic (and serves solely to ensure that the pods it selects are isolated by default). This field is beta-level in 1.8
<b>egress[]</b>	<b>object</b>	NetworkPolicyEgressRule describes a particular set of traffic that is allowed out of pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and to. This type is beta-level in 1.8

Property	Type	Description
<b>ingress</b>	<b>array</b>	ingress is a list of ingress rules to be applied to the selected pods. Traffic is allowed to a pod if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic source is the pod's local node, OR if the traffic matches at least one ingress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy does not allow any traffic (and serves solely to ensure that the pods it selects are isolated by default)
<b>ingress[]</b>	<b>object</b>	NetworkPolicyIngressRule describes a particular set of traffic that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and from.
<b>podSelector</b>	<b>LabelSelector</b>	podSelector selects the pods to which this NetworkPolicy object applies. The array of ingress rules is applied to any pods selected by this field. Multiple network policies can select the same set of pods. In this case, the ingress rules for each are combined additively. This field is NOT optional and follows standard label selector semantics. An empty podSelector matches all pods in this namespace.

Property	Type	Description
<b>policyTypes</b>	<b>array (string)</b>	policyTypes is a list of rule types that the NetworkPolicy relates to. Valid options are ["Ingress"], ["Egress"], or ["Ingress", "Egress"]. If this field is not specified, it will default based on the existence of ingress or egress rules; policies that contain an egress section are assumed to affect egress, and all policies (whether or not they contain an ingress section) are assumed to affect ingress. If you want to write an egress-only policy, you must explicitly specify policyTypes [ "Egress" ]. Likewise, if you want to write a policy that specifies that no egress is allowed, you must specify a policyTypes value that include "Egress" (since such a policy would not include an egress section and would otherwise default to just [ "Ingress" ]). This field is beta-level in 1.8

### 18.4.1.2. .spec.egress

#### Description

egress is a list of egress rules to be applied to the selected pods. Outgoing traffic is allowed if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic matches at least one egress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy limits all outgoing traffic (and serves solely to ensure that the pods it selects are isolated by default). This field is beta-level in 1.8

#### Type

**array**

### 18.4.1.3. .spec.egress[]

#### Description

NetworkPolicyEgressRule describes a particular set of traffic that is allowed out of pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and to. This type is beta-level in 1.8

#### Type

**object**

Property	Type	Description
<b>ports</b>	<b>array</b>	ports is a list of destination ports for outgoing traffic. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.
<b>ports[]</b>	<b>object</b>	NetworkPolicyPort describes a port to allow traffic on
<b>to</b>	<b>array</b>	to is a list of destinations for outgoing traffic of pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all destinations (traffic not restricted by destination). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the to list.
<b>to[]</b>	<b>object</b>	NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

#### 18.4.1.4. .spec.egress[].ports

##### Description

ports is a list of destination ports for outgoing traffic. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.

##### Type

**array**

#### 18.4.1.5. .spec.egress[].ports[]

##### Description

NetworkPolicyPort describes a port to allow traffic on

##### Type

**object**

Property	Type	Description
<b>endPort</b>	<b>integer</b>	endPort indicates that the range of ports from port to endPort if set, inclusive, should be allowed by the policy. This field cannot be defined if the port field is not defined or if the port field is defined as a named (string) port. The endPort must be equal or greater than port.
<b>port</b>	<b>IntOrString</b>	port represents the port on the given protocol. This can either be a numerical or named port on a pod. If this field is not provided, this matches all port names and numbers. If present, only traffic on the specified protocol AND port will be matched.
<b>protocol</b>	<b>string</b>	protocol represents the protocol (TCP, UDP, or SCTP) which traffic must match. If not specified, this field defaults to TCP.  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

**18.4.1.6. .spec.egress[].to****Description**

to is a list of destinations for outgoing traffic of pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all destinations (traffic not restricted by destination). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the to list.

**Type**

**array**

**18.4.1.7. .spec.egress[].to[]****Description**

NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

**Type**

**object**

Property	Type	Description
<b>ipBlock</b>	<b>object</b>	IPBlock describes a particular CIDR (Ex. "192.168.1.0/24","2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.
<b>namespaceSelector</b>	<b>LabelSelector</b>	namespaceSelector selects namespaces using cluster-scoped labels. This field follows standard label selector semantics; if present but empty, it selects all namespaces.  If podSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the namespaces selected by namespaceSelector. Otherwise it selects all pods in the namespaces selected by namespaceSelector.
<b>podSelector</b>	<b>LabelSelector</b>	podSelector is a label selector which selects pods. This field follows standard label selector semantics; if present but empty, it selects all pods.  If namespaceSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the Namespaces selected by NamespaceSelector. Otherwise it selects the pods matching podSelector in the policy's own namespace.

#### 18.4.1.8. .spec.egress[].to[].ipBlock

##### Description

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24","2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

##### Type

**object**

**Required**

- **cidr**

Property	Type	Description
<b>cidr</b>	<b>string</b>	cidr is a string representing the IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64"
<b>except</b>	<b>array (string)</b>	except is a slice of CIDRs that should not be included within an IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64" Except values will be rejected if they are outside the cidr range

#### 18.4.1.9. .spec.ingress

##### Description

ingress is a list of ingress rules to be applied to the selected pods. Traffic is allowed to a pod if there are no NetworkPolicies selecting the pod (and cluster policy otherwise allows the traffic), OR if the traffic source is the pod's local node, OR if the traffic matches at least one ingress rule across all of the NetworkPolicy objects whose podSelector matches the pod. If this field is empty then this NetworkPolicy does not allow any traffic (and serves solely to ensure that the pods it selects are isolated by default)

##### Type

**array**

#### 18.4.1.10. .spec.ingress[]

##### Description

NetworkPolicyIngressRule describes a particular set of traffic that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The traffic must match both ports and from.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>from</b>	<b>array</b>	from is a list of sources which should be able to access the pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all sources (traffic not restricted by source). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the from list.
<b>from[]</b>	<b>object</b>	NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed
<b>ports</b>	<b>array</b>	ports is a list of ports which should be made accessible on the pods selected for this rule. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.
<b>ports[]</b>	<b>object</b>	NetworkPolicyPort describes a port to allow traffic on

#### 18.4.1.11. .spec.ingress[].from

##### Description

from is a list of sources which should be able to access the pods selected for this rule. Items in this list are combined using a logical OR operation. If this field is empty or missing, this rule matches all sources (traffic not restricted by source). If this field is present and contains at least one item, this rule allows traffic only if the traffic matches at least one item in the from list.

##### Type

**array**

#### 18.4.1.12. .spec.ingress[].from[]

##### Description

NetworkPolicyPeer describes a peer to allow traffic to/from. Only certain combinations of fields are allowed

## Type

**object**

Property	Type	Description
<b>ipBlock</b>	<b>object</b>	IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.
<b>namespaceSelector</b>	<a href="#">LabelSelector</a>	namespaceSelector selects namespaces using cluster-scoped labels. This field follows standard label selector semantics; if present but empty, it selects all namespaces.  If podSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the namespaces selected by namespaceSelector. Otherwise it selects all pods in the namespaces selected by namespaceSelector.
<b>podSelector</b>	<a href="#">LabelSelector</a>	podSelector is a label selector which selects pods. This field follows standard label selector semantics; if present but empty, it selects all pods.  If namespaceSelector is also set, then the NetworkPolicyPeer as a whole selects the pods matching podSelector in the Namespaces selected by NamespaceSelector. Otherwise it selects the pods matching podSelector in the policy's own namespace.

### 18.4.1.13. .spec.ingress[].from[].ipBlock

#### Description

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

IPBlock describes a particular CIDR (Ex. "192.168.1.0/24", "2001:db8::/64") that is allowed to the pods matched by a NetworkPolicySpec's podSelector. The except entry describes CIDRs that should not be included within this rule.

**Type****object****Required**

- **cidr**

Property	Type	Description

<b>except</b>	<b>array (string)</b>	except is a slice of CIDRs that should not be included within an IPBlock Valid examples are "192.168.1.0/24" or "2001:db8::/64" Except values will be rejected if they are outside the cidr range

**18.4.1.14. .spec.ingress[].ports****Description**

ports is a list of ports which should be made accessible on the pods selected for this rule. Each item in this list is combined using a logical OR. If this field is empty or missing, this rule matches all ports (traffic not restricted by port). If this field is present and contains at least one item, then this rule allows traffic only if the traffic matches at least one port in the list.

**Type****array****18.4.1.15. .spec.ingress[].ports[]****Description**

NetworkPolicyPort describes a port to allow traffic on

**Type****object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>endPort</b>	<b>integer</b>	endPort indicates that the range of ports from port to endPort if set, inclusive, should be allowed by the policy. This field cannot be defined if the port field is not defined or if the port field is defined as a named (string) port. The endPort must be equal or greater than port.
<b>port</b>	<b>IntOrString</b>	port represents the port on the given protocol. This can either be a numerical or named port on a pod. If this field is not provided, this matches all port names and numbers. If present, only traffic on the specified protocol AND port will be matched.
<b>protocol</b>	<b>string</b>	protocol represents the protocol (TCP, UDP, or SCTP) which traffic must match. If not specified, this field defaults to TCP.  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

#### 18.4.1.16. .status

##### Description

NetworkPolicyStatus describes the current state of the NetworkPolicy.

##### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array (Condition)</b>	conditions holds an array of metav1.Condition that describe the state of the NetworkPolicy. Current service state

#### 18.4.2. API endpoints

The following API endpoints are available:

- **/apis/networking.k8s.io/v1/networkpolicies**
  - **GET:** list or watch objects of kind NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/networkpolicies**
  - **GET:** watch individual changes to a list of NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies**
  - **DELETE:** delete collection of NetworkPolicy
  - **GET:** list or watch objects of kind NetworkPolicy
  - **POST:** create a NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/networkpolicies**
  - **GET:** watch individual changes to a list of NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies/{name}**
  - **DELETE:** delete a NetworkPolicy
  - **GET:** read the specified NetworkPolicy
  - **PATCH:** partially update the specified NetworkPolicy
  - **PUT:** replace the specified NetworkPolicy
- **/apis/networking.k8s.io/v1/watch/namespaces/{namespace}/networkpolicies/{name}**
  - **GET:** watch changes to an object of kind NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/networking.k8s.io/v1/namespaces/{namespace}/networkpolicies/{name}/status**
  - **GET:** read status of the specified NetworkPolicy
  - **PATCH:** partially update status of the specified NetworkPolicy
  - **PUT:** replace status of the specified NetworkPolicy

#### 18.4.2.1. /apis/networking.k8s.io/v1/networkpolicies

Table 18.68. Global query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

#### Description

delete collection of NetworkPolicy

Table 18.74. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

**HTTP method****GET****Description**

list or watch objects of kind NetworkPolicy

Table 18.77. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 18.98. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind NetworkPolicy. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

200 - OK	<a href="#">NetworkPolicy</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified NetworkPolicy

Table 18.103. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## CHAPTER 19. NODE APIS

### 19.1. NODE APIS

#### 19.1.1. RuntimeClass [node.k8s.io/v1]

##### Description

RuntimeClass defines a class of container runtime supported in the cluster. The RuntimeClass is used to determine which container runtime is used to run all containers in a pod. RuntimeClasses are manually defined by a user or cluster provisioner, and referenced in the PodSpec. The Kubelet is responsible for resolving the RuntimeClassName reference before running the pod. For more details, see <https://kubernetes.io/docs/concepts/containers/runtime-class/>

##### Type

**object**

### 19.2. RUNTIMECLASS [NODE.K8S.IO/V1]

##### Description

RuntimeClass defines a class of container runtime supported in the cluster. The RuntimeClass is used to determine which container runtime is used to run all containers in a pod. RuntimeClasses are manually defined by a user or cluster provisioner, and referenced in the PodSpec. The Kubelet is responsible for resolving the RuntimeClassName reference before running the pod. For more details, see <https://kubernetes.io/docs/concepts/containers/runtime-class/>

##### Type

**object**

##### Required

- **handler**

#### 19.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>handler</b>	<b>string</b>	handler specifies the underlying runtime and configuration that the CRI implementation will use to handle pods of this class. The possible values are specific to the node & CRI configuration. It is assumed that all handlers are available on every node, and handlers of the same name are equivalent on every node. For example, a handler called "runc" might specify that the runc OCI runtime (using native Linux containers) will be used to run the containers in a pod. The Handler must be lowercase, conform to the DNS Label (RFC 1123) requirements, and is immutable.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>overhead</b>	<b>object</b>	Overhead structure represents the resource overhead associated with running a pod.
<b>scheduling</b>	<b>object</b>	Scheduling specifies the scheduling constraints for nodes supporting a RuntimeClass.

### 19.2.1.1. .overhead

#### Description

Overhead structure represents the resource overhead associated with running a pod.

#### Type

**object**

Property	Type	Description
<b>podFixed</b>	<b>object (Quantity)</b>	podFixed represents the fixed resource overhead associated with running a pod.

**19.2.1.2. .scheduling****Description**

Scheduling specifies the scheduling constraints for nodes supporting a RuntimeClass.

**Type****object**

Property	Type	Description
<b>nodeSelector</b>	<b>object (string)</b>	nodeSelector lists labels that must be present on nodes that support this RuntimeClass. Pods using this RuntimeClass can only be scheduled to a node matched by this selector. The RuntimeClass nodeSelector is merged with a pod's existing nodeSelector. Any conflicts will cause the pod to be rejected in admission.
<b>tolerations</b>	<b>array (Toleration)</b>	tolerations are appended (excluding duplicates) to pods running with this RuntimeClass during admission, effectively unioning the set of nodes tolerated by the pod and the RuntimeClass.

**19.2.2. API endpoints**

The following API endpoints are available:

- **/apis/node.k8s.io/v1/runtimeclasses**
  - **DELETE**: delete collection of RuntimeClass
  - **GET**: list or watch objects of kind RuntimeClass
  - **POST**: create a RuntimeClass
- **/apis/node.k8s.io/v1/watch/runtimeclasses**

- **GET**: watch individual changes to a list of RuntimeClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/node.k8s.io/v1/runtimeclasses/{name}**
  - **DELETE**: delete a RuntimeClass
  - **GET**: read the specified RuntimeClass
  - **PATCH**: partially update the specified RuntimeClass
  - **PUT**: replace the specified RuntimeClass
- **/apis/node.k8s.io/v1/watch/runtimeclasses/{name}**
  - **GET**: watch changes to an object of kind RuntimeClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 19.2.2.1. /apis/node.k8s.io/v1/runtimeclasses

Table 19.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of RuntimeClass

Table 19.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind RuntimeClass

Table 19.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

200 - OK	<b>Status</b> schema
202 - Accepted	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

read the specified RuntimeClass

Table 19.17. HTTP responses

HTTP code	Response body
200 - OK	<b>RuntimeClass</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified RuntimeClass

**Table 19.18. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 19.2.2.4. /apis/node.k8s.io/v1/watch/runtimeclasses/{name}

Table 19.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the RuntimeClass

Table 19.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind `RuntimeClass`. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 19.26. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## CHAPTER 20. POLICY APIS

### 20.1. POLICY APIS

#### 20.1.1. Eviction [policy/v1]

##### Description

Eviction evicts a pod from its node subject to certain policies and safety constraints. This is a subresource of Pod. A request to cause such an eviction is created by POSTing to `.../pods/<pod name>/evictions`.

##### Type

**object**

#### 20.1.2. PodDisruptionBudget [policy/v1]

##### Description

PodDisruptionBudget is an object to define the max disruption that can be caused to a collection of pods

##### Type

**object**

### 20.2. EVICTION [POLICY/V1]

##### Description

Eviction evicts a pod from its node subject to certain policies and safety constraints. This is a subresource of Pod. A request to cause such an eviction is created by POSTing to `.../pods/<pod name>/evictions`.

##### Type

**object**

#### 20.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>deleteOptions</b>	<b>DeleteOptions</b>	DeleteOptions may be provided

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	ObjectMeta describes the pod that is being evicted.

## 20.2.2. API endpoints

The following API endpoints are available:

- **/api/v1/namespaces/{namespace}/pods/{name}/eviction**
  - **POST**: create eviction of a Pod

### 20.2.2.1. /api/v1/namespaces/{namespace}/pods/{name}/eviction

Table 20.1. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Eviction
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 20.2. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****POST****Description**

create eviction of a Pod

**Table 20.3. Body parameters**

Parameter	Type	Description
<b>body</b>	<b>Eviction</b> schema	

**Table 20.4. HTTP responses**

HTTP code	Response body
200 - OK	<b>Eviction</b> schema
201 - Created	<b>Eviction</b> schema

HTTP code	Reponse body
202 - Accepted	<b>Eviction</b> schema
401 - Unauthorized	Empty

## 20.3. PODDISRUPTIONBUDGET [POLICY/V1]

### Description

PodDisruptionBudget is an object to define the max disruption that can be caused to a collection of pods

### Type

**object**

### 20.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>spec</b>	<b>object</b>	PodDisruptionBudgetSpec is a description of a PodDisruptionBudget.
<b>status</b>	<b>object</b>	PodDisruptionBudgetStatus represents information about the status of a PodDisruptionBudget. Status may trail the actual state of a system.

### 20.3.1.1. .spec

#### Description

PodDisruptionBudgetSpec is a description of a PodDisruptionBudget.

#### Type

**object**

Property	Type	Description
<b>maxUnavailable</b>	<b>IntOrString</b>	An eviction is allowed if at most "maxUnavailable" pods selected by "selector" are unavailable after the eviction, i.e. even in absence of the evicted pod. For example, one can prevent all voluntary evictions by specifying 0. This is a mutually exclusive setting with "minAvailable".
<b>minAvailable</b>	<b>IntOrString</b>	An eviction is allowed if at least "minAvailable" pods selected by "selector" will still be available after the eviction, i.e. even in the absence of the evicted pod. So for example you can prevent all voluntary evictions by specifying "100%".
<b>selector</b>	<b>LabelSelector</b>	Label query over pods whose evictions are managed by the disruption budget. A null selector will match no pods, while an empty ({} ) selector will select all pods within the namespace.
<b>unhealthyPodEvictionPolicy</b>	<b>string</b>	UnhealthyPodEvictionPolicy

Property	Type	Description
		<p>defines the criteria for when unhealthy pods should be considered for eviction. Current implementation considers healthy pods, as pods that have <code>status.conditions</code> item with <code>type="Ready",status="True"</code>.</p> <p>Valid policies are <code>IfHealthyBudget</code> and <code>AlwaysAllow</code>. If no policy is specified, the default behavior will be used, which corresponds to the <code>IfHealthyBudget</code> policy.</p> <p><code>IfHealthyBudget</code> policy means that running pods (<code>status.phase="Running"</code>), but not yet healthy can be evicted only if the guarded application is not disrupted (<code>status.currentHealthy</code> is at least equal to <code>status.desiredHealthy</code>). Healthy pods will be subject to the PDB for eviction.</p> <p><code>AlwaysAllow</code> policy means that all running pods (<code>status.phase="Running"</code>), but not yet healthy are considered disrupted and can be evicted regardless of whether the criteria in a PDB is met. This means perspective running pods of a disrupted application might not get a chance to become healthy. Healthy pods will be subject to the PDB for eviction.</p> <p>Additional policies may be added in the future. Clients making eviction decisions should disallow eviction of unhealthy pods if they encounter an unrecognized policy in this field.</p> <p>This field is beta-level. The eviction API uses this field when the feature gate <code>PDBUnhealthyPodEvictionPolicy</code> is enabled (enabled by default).</p> <p>Possible enum values: -  <b>"AlwaysAllow"</b> policy means that all running pods (<code>status.phase="Running"</code>), but not yet healthy are considered disrupted and can be evicted</p>

Property	Type	Description
		<p>regardless of whether the criteria in a PDB is met. This means perspective running pods of a disrupted application might not get a chance to become healthy. Healthy pods will be subject to the PDB for eviction. - <b>"IfHealthyBudget"</b> policy means that running pods (status.phase="Running"), but not yet healthy can be evicted only if the guarded application is not disrupted (status.currentHealthy is at least equal to status.desiredHealthy). Healthy pods will be subject to the PDB for eviction.</p>

### 20.3.1.2. .status

#### Description

PodDisruptionBudgetStatus represents information about the status of a PodDisruptionBudget. Status may trail the actual state of a system.

#### Type

**object**

#### Required

- **disruptionsAllowed**
- **currentHealthy**
- **desiredHealthy**
- **expectedPods**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>conditions</b>	<b>array (Condition)</b>	Conditions contain conditions for PDB. The disruption controller sets the DisruptionAllowed condition. The following are known values for the reason field (additional reasons could be added in the future): - SyncFailed: The controller encountered an error and wasn't able to compute the number of allowed disruptions. Therefore no disruptions are allowed and the status of the condition will be False. - InsufficientPods: The number of pods are either at or below the number required by the PodDisruptionBudget. No disruptions are allowed and the status of the condition will be False. - SufficientPods: There are more pods than required by the PodDisruptionBudget. The condition will be True, and the number of allowed disruptions are provided by the disruptionsAllowed property.
<b>currentHealthy</b>	<b>integer</b>	current number of healthy pods
<b>desiredHealthy</b>	<b>integer</b>	minimum desired number of healthy pods

Property	Type	Description
<b>disruptedPods</b>	<b>object (Time)</b>	DisruptedPods contains information about pods whose eviction was processed by the API server eviction subresource handler but has not yet been observed by the PodDisruptionBudget controller. A pod will be in this map from the time when the API server processed the eviction request to the time when the pod is seen by PDB controller as having been marked for deletion (or after a timeout). The key in the map is the name of the pod and the value is the time when the API server processed the eviction request. If the deletion didn't occur and a pod is still there it will be removed from the list automatically by PodDisruptionBudget controller after some time. If everything goes smooth this map should be empty for the most of the time. Large number of entries in the map may indicate problems with pod deletions.
<b>disruptionsAllowed</b>	<b>integer</b>	Number of pod disruptions that are currently allowed.
<b>expectedPods</b>	<b>integer</b>	total number of pods counted by this disruption budget
<b>observedGeneration</b>	<b>integer</b>	Most recent generation observed when updating this PDB status. DisruptionsAllowed and other status information is valid only if observedGeneration equals to PDB's object generation.

### 20.3.2. API endpoints

The following API endpoints are available:

- **/apis/policy/v1/poddisruptionbudgets**
  - **GET**: list or watch objects of kind PodDisruptionBudget

- **/apis/policy/v1/watch/poddisruptionbudgets**
  - **GET**: watch individual changes to a list of PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets**
  - **DELETE**: delete collection of PodDisruptionBudget
  - **GET**: list or watch objects of kind PodDisruptionBudget
  - **POST**: create a PodDisruptionBudget
- **/apis/policy/v1/watch/namespaces/{namespace}/poddisruptionbudgets**
  - **GET**: watch individual changes to a list of PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets/{name}**
  - **DELETE**: delete a PodDisruptionBudget
  - **GET**: read the specified PodDisruptionBudget
  - **PATCH**: partially update the specified PodDisruptionBudget
  - **PUT**: replace the specified PodDisruptionBudget
- **/apis/policy/v1/watch/namespaces/{namespace}/poddisruptionbudgets/{name}**
  - **GET**: watch changes to an object of kind PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/policy/v1/namespaces/{namespace}/poddisruptionbudgets/{name}/status**
  - **GET**: read status of the specified PodDisruptionBudget
  - **PATCH**: partially update status of the specified PodDisruptionBudget
  - **PUT**: replace status of the specified PodDisruptionBudget

### 20.3.2.1. /apis/policy/v1/poddisruptionbudgets

Table 20.5. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind PodDisruptionBudget

Table 20.6. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">PodDisruptionBudgetList</a> schema
401 - Unauthorized	Empty

### 20.3.2.2. /apis/policy/v1/watch/poddisruptionbudgets

Table 20.7. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead.

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

replace the specified PodDisruptionBudget

Table 20.31. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .

Parameter	Type	Description
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>

### 20.3.2.6. /apis/policy/v1/watch/namespaces/{namespace}/poddisruptionbudgets/{name}

Table 20.34. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PodDisruptionBudget
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 20.35. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PodDisruptionBudget. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 20.40. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## CHAPTER 21. RBAC APIS

### 21.1. RBAC APIS

#### 21.1.1. ClusterRole [rbac.authorization.k8s.io/v1]

##### Description

ClusterRole is a cluster level, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding or ClusterRoleBinding.

##### Type

**object**

#### 21.1.2. ClusterRoleBinding [rbac.authorization.k8s.io/v1]

##### Description

ClusterRoleBinding references a ClusterRole, but not contain it. It can reference a ClusterRole in the global namespace, and adds who information via Subject.

##### Type

**object**

#### 21.1.3. Role [rbac.authorization.k8s.io/v1]

##### Description

Role is a namespaced, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding.

##### Type

**object**

#### 21.1.4. RoleBinding [rbac.authorization.k8s.io/v1]

##### Description

RoleBinding references a role, but does not contain it. It can reference a Role in the same namespace or a ClusterRole in the global namespace. It adds who information via Subjects and namespace information by which namespace it exists in. RoleBindings in a given namespace only have effect in that namespace.

##### Type

**object**

### 21.2. CLUSTERROLE [RBAC.AUTHORIZATION.K8S.IO/V1]

##### Description

ClusterRole is a cluster level, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding or ClusterRoleBinding.

##### Type

**object**

#### 21.2.1. Specification

Property	Type	Description
<b>aggregationRule</b>	<b>object</b>	AggregationRule describes how to locate ClusterRoles to aggregate into the ClusterRole
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata.
<b>rules</b>	<b>array</b>	Rules holds all the PolicyRules for this ClusterRole
<b>rules[]</b>	<b>object</b>	PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

### 21.2.1.1. .aggregationRule

#### Description

AggregationRule describes how to locate ClusterRoles to aggregate into the ClusterRole

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>clusterRoleSelectors</b>	<b>array (LabelSelector)</b>	ClusterRoleSelectors holds a list of selectors which will be used to find ClusterRoles and create the rules. If any of the selectors match, then the ClusterRole's permissions will be added

### 21.2.1.2. .rules

#### Description

Rules holds all the PolicyRules for this ClusterRole

#### Type

**array**

### 21.2.1.3. .rules[]

#### Description

PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

#### Type

**object**

#### Required

- **verbs**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed. "" represents the core API group and "*" represents all API groups.

Property	Type	Description
<b>nonResourceURLs</b>	<b>array (string)</b>	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
<b>resourceNames</b>	<b>array (string)</b>	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
<b>resources</b>	<b>array (string)</b>	Resources is a list of resources this rule applies to. '*' represents all resources.
<b>verbs</b>	<b>array (string)</b>	Verbs is a list of Verbs that apply to ALL the ResourceKinds contained in this rule. '*' represents all verbs.

### 21.2.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/clusterroles**
  - **DELETE**: delete collection of ClusterRole
  - **GET**: list or watch objects of kind ClusterRole
  - **POST**: create a ClusterRole
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterroles**
  - **GET**: watch individual changes to a list of ClusterRole. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/clusterroles/{name}**
  - **DELETE**: delete a ClusterRole
  - **GET**: read the specified ClusterRole

- **PATCH**: partially update the specified ClusterRole
- **PUT**: replace the specified ClusterRole
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterroles/{name}**
  - **GET**: watch changes to an object of kind ClusterRole. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 21.2.2.1. /apis/rbac.authorization.k8s.io/v1/clusterroles

Table 21.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of ClusterRole

Table 21.2. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 21.6. HTTP responses

HTTP code	Response body

401 - Unauthorized	Empty

## HTTP method

**POST****Description**

create a ClusterRole

**Table 21.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

202 - Accepted	<b>ClusterRole</b> schema
401 - Unauthorized	Empty

### 21.2.2.2. /apis/rbac.authorization.k8s.io/v1/watch/clusterroles

Table 21.10. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ClusterRole. deprecated: use the 'watch' parameter with a list operation instead.

#### HTTP method

#### DELETE

#### Description

delete a ClusterRole

Table 21.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 21.3. CLUSTERROLEBINDING [RBAC.AUTHORIZATION.K8S.IO/V1]

### Description

ClusterRoleBinding references a ClusterRole, but not contain it. It can reference a ClusterRole in the global namespace, and adds who information via Subject.

### Type

**object**

### Required

- **roleRef**

### 21.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata.
<b>roleRef</b>	<b>object</b>	RoleRef contains information that points to the role being used

Property	Type	Description
<b>subjects</b>	<b>array</b>	Subjects holds references to the objects the role applies to.
<b>subjects[]</b>	<b>object</b>	Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

### 21.3.1.1. .roleRef

#### Description

RoleRef contains information that points to the role being used

#### Type

**object**

#### Required

- **apiGroup**
- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

### 21.3.1.2. .subjects

#### Description

Subjects holds references to the objects the role applies to.

#### Type

**array**

### 21.3.1.3. .subjects[]

#### Description

Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

### Type

**object**

### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
<b>kind</b>	<b>string</b>	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
<b>name</b>	<b>string</b>	Name of the object being referenced.
<b>namespace</b>	<b>string</b>	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## 21.3.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/clusterrolebindings**
  - **DELETE**: delete collection of ClusterRoleBinding
  - **GET**: list or watch objects of kind ClusterRoleBinding
  - **POST**: create a ClusterRoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterrolebindings**
  - **GET**: watch individual changes to a list of ClusterRoleBinding. deprecated: use the 'watch'

parameter with a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/clusterrolebindings/{name}**
  - **DELETE:** delete a ClusterRoleBinding
  - **GET:** read the specified ClusterRoleBinding
  - **PATCH:** partially update the specified ClusterRoleBinding
  - **PUT:** replace the specified ClusterRoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/clusterrolebindings/{name}**
  - **GET:** watch changes to an object of kind ClusterRoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 21.3.2.1. /apis/rbac.authorization.k8s.io/v1/clusterrolebindings

Table 21.27. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
<b>body</b>	<b>DeleteOptions</b> schema	

Table 21.30. HTTP responses

HTTP code	Reponse body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind ClusterRoleBinding

Table 21.31. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**POST**

**Description**

create a ClusterRoleBinding

**Table 21.33. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### DELETE

#### Description

delete a ClusterRoleBinding

Table 21.40. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 21.50. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ClusterRoleBinding

Table 21.51. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ClusterRoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 21.52. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema

## 21.4. ROLE [RBAC.AUTHORIZATION.K8S.IO/V1]

### Description

Role is a namespaced, logical grouping of PolicyRules that can be referenced as a unit by a RoleBinding.

### Type

**object**

### 21.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata.
<b>rules</b>	<b>array</b>	Rules holds all the PolicyRules for this Role

Property	Type	Description
<b>rules[]</b>	<b>object</b>	PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

#### 21.4.1.1. .rules

##### Description

Rules holds all the PolicyRules for this Role

##### Type

**array**

#### 21.4.1.2. .rules[]

##### Description

PolicyRule holds information that describes a policy rule, but does not contain information about who the rule applies to or which namespace the rule applies to.

##### Type

**object**

##### Required

- **verbs**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed. "" represents the core API group and "*" represents all API groups.

Property	Type	Description
<b>nonResourceURLs</b>	<b>array (string)</b>	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path. Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
<b>resourceNames</b>	<b>array (string)</b>	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
<b>resources</b>	<b>array (string)</b>	Resources is a list of resources this rule applies to. '*' represents all resources.
<b>verbs</b>	<b>array (string)</b>	Verbs is a list of Verbs that apply to ALL the ResourceKinds contained in this rule. '*' represents all verbs.

## 21.4.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/roles**
  - **GET**: list or watch objects of kind Role
- **/apis/rbac.authorization.k8s.io/v1/watch/roles**
  - **GET**: watch individual changes to a list of Role. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/roles**
  - **DELETE**: delete collection of Role
  - **GET**: list or watch objects of kind Role
  - **POST**: create a Role
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles**
  - **GET**: watch individual changes to a list of Role. deprecated: use the 'watch' parameter with

a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/roles/{name}**
  - **DELETE:** delete a Role
  - **GET:** read the specified Role
  - **PATCH:** partially update the specified Role
  - **PUT:** replace the specified Role
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles/{name}**
  - **GET:** watch changes to an object of kind Role. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 21.4.2.1. /apis/rbac.authorization.k8s.io/v1/roles

Table 21.53. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

#### **DELETE**

#### Description

delete collection of Role

Table 21.59. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 21.63. HTTP responses

**POST**

**Description**

create a Role

**Table 21.64. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Role. deprecated: use the 'watch' parameter with a list operation instead.

Table 21.69. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

### 21.4.2.5. /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/roles/{name}

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Role
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 21.71. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete a Role

Table 21.72. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**HTTP method****PATCH****Description**

partially update the specified Role

**Table 21.76. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 21.4.2.6. /apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/roles/{name}

Table 21.82. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Role
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 21.83. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Role. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 21.5. ROLEBINDING [RBAC.AUTHORIZATION.K8S.IO/V1]

### Description

RoleBinding references a role, but does not contain it. It can reference a Role in the same namespace or a ClusterRole in the global namespace. It adds who information via Subjects and namespace information by which namespace it exists in. RoleBindings in a given namespace only have effect in that namespace.

### Type

**object**

### Required

- **roleRef**

### 21.5.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata.

Property	Type	Description
<b>roleRef</b>	<b>object</b>	RoleRef contains information that points to the role being used
<b>subjects</b>	<b>array</b>	Subjects holds references to the objects the role applies to.
<b>subjects[]</b>	<b>object</b>	Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

### 21.5.1.1. .roleRef

#### Description

RoleRef contains information that points to the role being used

#### Type

**object**

#### Required

- **apiGroup**
- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

### 21.5.1.2. .subjects

#### Description

Subjects holds references to the objects the role applies to.

#### Type

**array**

### 21.5.1.3. .subjects[]

#### Description

Subject contains a reference to the object or user identities a role binding applies to. This can either hold a direct API object reference, or a value for non-objects such as user and group names.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
<b>kind</b>	<b>string</b>	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
<b>name</b>	<b>string</b>	Name of the object being referenced.
<b>namespace</b>	<b>string</b>	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

### 21.5.2. API endpoints

The following API endpoints are available:

- **/apis/rbac.authorization.k8s.io/v1/rolebindings**
  - **GET**: list or watch objects of kind RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/rolebindings**
  - **GET**: watch individual changes to a list of RoleBinding. deprecated: use the 'watch' parameter with a list operation instead.

- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings**
  - **DELETE**: delete collection of RoleBinding
  - **GET**: list or watch objects of kind RoleBinding
  - **POST**: create a RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/rolebindings**
  - **GET**: watch individual changes to a list of RoleBinding. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}**
  - **DELETE**: delete a RoleBinding
  - **GET**: read the specified RoleBinding
  - **PATCH**: partially update the specified RoleBinding
  - **PUT**: replace the specified RoleBinding
- **/apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/rolebindings/{name}**
  - **GET**: watch changes to an object of kind RoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 21.5.2.1. /apis/rbac.authorization.k8s.io/v1/rolebindings

Table 21.85. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

#### HTTP method

#### **DELETE**

#### Description

delete collection of RoleBinding

Table 21.91. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

### 21.5.2.6. /apis/rbac.authorization.k8s.io/v1/watch/namespaces/{namespace}/rolebindings/{name}

Table 21.114. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the RoleBinding
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 21.115. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind RoleBinding. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 21.116. HTTP responses**

HTTP code	Reponse body
200 - OK	<b>WatchEvent</b> schema
401 - Unauthorized	Empty

## CHAPTER 22. NETWORK APIS

### 22.1. NETWORK APIS

#### 22.1.1. Route [route.openshift.io/v1]

##### Description

A route allows developers to expose services through an HTTP(S) aware load balancing and proxy layer via a public DNS entry. The route may further specify TLS options and a certificate, or specify a public CNAME that the router should also accept for HTTP and HTTPS traffic. An administrator typically configures their router to be visible outside the cluster firewall, and may also add additional security, caching, or traffic controls on the service content. Routers usually talk directly to the service endpoints. Once a route is created, the **host** field may not be changed. Generally, routers use the oldest route with a given host when resolving conflicts. Routers are subject to additional customization and may support additional controls via the annotations field. Because administrators may configure multiple routers, the route status field is used to return information to clients about the names and states of the route under each router. If a client chooses a duplicate name, for instance, the route status conditions are used to indicate the route cannot be chosen. To enable HTTP/2 ALPN on a route it requires a custom (non-wildcard) certificate. This prevents connection coalescing by clients, notably web browsers. We do not support HTTP/2 ALPN on routes that use the default certificate because of the risk of connection re-use/coalescing. Routes that do not have their own custom certificate will not be HTTP/2 ALPN-enabled on either the frontend or the backend. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

### 22.2. ROUTE [ROUTE.OPENSIFT.IO/V1]

##### Description

A route allows developers to expose services through an HTTP(S) aware load balancing and proxy layer via a public DNS entry. The route may further specify TLS options and a certificate, or specify a public CNAME that the router should also accept for HTTP and HTTPS traffic. An administrator typically configures their router to be visible outside the cluster firewall, and may also add additional security, caching, or traffic controls on the service content. Routers usually talk directly to the service endpoints. Once a route is created, the **host** field may not be changed. Generally, routers use the oldest route with a given host when resolving conflicts. Routers are subject to additional customization and may support additional controls via the annotations field. Because administrators may configure multiple routers, the route status field is used to return information to clients about the names and states of the route under each router. If a client chooses a duplicate name, for instance, the route status conditions are used to indicate the route cannot be chosen. To enable HTTP/2 ALPN on a route it requires a custom (non-wildcard) certificate. This prevents connection coalescing by clients, notably web browsers. We do not support HTTP/2 ALPN on routes that use the default certificate because of the risk of connection re-use/coalescing. Routes that do not have their own custom certificate will not be HTTP/2 ALPN-enabled on either the frontend or the backend. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

##### Required

- **spec**

## 22.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	spec is the desired state of the route
<b>status</b>	<b>object</b>	status is the current state of the route

## 22.2.1.1. .spec

## Description

spec is the desired state of the route

## Type

**object**

## Required

- **to**

Property	Type	Description
<b>alternateBackends</b>	<b>array</b>	alternateBackends allows up to 3 additional backends to be assigned to the route. Only the Service kind is allowed, and it will be defaulted to Service. Use the weight field in RouteTargetReference object to specify relative preference.
<b>alternateBackends[]</b>	<b>object</b>	RouteTargetReference specifies the target that resolve into endpoints. Only the 'Service' kind is allowed. Use 'weight' field to emphasize one over others.
<b>host</b>	<b>string</b>	host is an alias/DNS that points to the service. Optional. If not specified a route name will typically be automatically chosen. Must follow DNS952 subdomain conventions.
<b>path</b>	<b>string</b>	path that the router watches for, to route traffic for to the service. Optional
<b>port</b>	<b>object</b>	If specified, the port to be used by the router. Most routers will use all endpoints exposed by the service by default - set this value to instruct routers which port to use.

Property	Type	Description
<b>subdomain</b>	<b>string</b>	subdomain is a DNS subdomain that is requested within the ingress controller's domain (as a subdomain). If host is set this field is ignored. An ingress controller may choose to ignore this suggested name, in which case the controller will report the assigned name in the status.ingress array or refuse to admit the route. If this value is set and the server does not support this field host will be populated automatically. Otherwise host is left empty. The field may have multiple parts separated by a dot, but not all ingress controllers may honor the request. This field may not be changed after creation except by a user with the update routes/custom-host permission. Example: subdomain <b>frontend</b> automatically receives the router subdomain <b>apps.mycluster.com</b> to have a full hostname <b>frontend.apps.mycluster.com</b> .
<b>tls</b>	<b>object</b>	The tls field provides the ability to configure certificates and termination for the route.
<b>to</b>	<b>object</b>	to is an object the route should use as the primary backend. Only the Service kind is allowed, and it will be defaulted to Service. If the weight field (0-256 default 100) is set to zero, no traffic will be sent to this backend.
<b>wildcardPolicy</b>	<b>string</b>	Wildcard policy if any for the route. Currently only 'Subdomain' or 'None' is allowed.

### 22.2.1.2. .spec.alternateBackends

#### Description

alternateBackends allows up to 3 additional backends to be assigned to the route. Only the Service kind is allowed, and it will be defaulted to Service. Use the weight field in RouteTargetReference object to specify relative preference.

#### Type

**array**

### 22.2.1.3. .spec.alternateBackends[]

#### Description

RouteTargetReference specifies the target that resolve into endpoints. Only the 'Service' kind is allowed. Use 'weight' field to emphasize one over others.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
<b>kind</b>	<b>string</b>	The kind of target that the route is referring to. Currently, only 'Service' is allowed
<b>name</b>	<b>string</b>	name of the service/target that is being referred to. e.g. name of the service
<b>weight</b>	<b>integer</b>	weight as an integer between 0 and 256, default 100, that specifies the target's relative weight against other target reference objects. 0 suppresses requests to this backend.

### 22.2.1.4. .spec.port

#### Description

If specified, the port to be used by the router. Most routers will use all endpoints exposed by the service by default - set this value to instruct routers which port to use.

#### Type

**object**

#### Required

- **targetPort**

Property	Type	Description
<b>targetPort</b>	<b>integer-or-string</b>	

### 22.2.1.5. .spec.tls

#### Description

The `tls` field provides the ability to configure certificates and termination for the route.

#### Type

**object**

#### Required

- **termination**

Property	Type	Description
<b>caCertificate</b>	<b>string</b>	<code>caCertificate</code> provides the cert authority certificate contents
<b>certificate</b>	<b>string</b>	<code>certificate</code> provides certificate contents. This should be a single serving certificate, not a certificate chain. Do not include a CA certificate.
<b>destinationCACertificate</b>	<b>string</b>	<code>destinationCACertificate</code> provides the contents of the ca certificate of the final destination. When using reencrypt termination this file should be provided in order to have routers use it for health checks on the secure connection. If this field is not specified, the router may provide its own destination CA and perform hostname validation using the short service name ( <code>service.namespace.svc</code> ), which allows infrastructure generated certificates to automatically verify.

Property	Type	Description
<b>insecureEdgeTerminationPolicy</b>	<b>string</b>	insecureEdgeTerminationPolicy indicates the desired behavior for insecure connections to a route. While each router may make its own decisions on which ports to expose, this is normally port 80. * Allow - traffic is sent to the server on the insecure port (edge/reencrypt terminations only) (default). * None - no traffic is allowed on the insecure port. * Redirect - clients are redirected to the secure port.
<b>key</b>	<b>string</b>	key provides key file contents
<b>termination</b>	<b>string</b>	termination indicates termination type. * edge - TLS termination is done by the router and http is used to communicate with the backend (default) * passthrough - Traffic is sent straight to the destination without the router providing TLS termination * reencrypt - TLS termination is done by the router and https is used to communicate with the backend

### 22.2.1.6. .spec.to

#### Description

to is an object the route should use as the primary backend. Only the Service kind is allowed, and it will be defaulted to Service. If the weight field (0-256 default 100) is set to zero, no traffic will be sent to this backend.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>kind</b>	<b>string</b>	The kind of target that the route is referring to. Currently, only 'Service' is allowed
<b>name</b>	<b>string</b>	name of the service/target that is being referred to. e.g. name of the service
<b>weight</b>	<b>integer</b>	weight as an integer between 0 and 256, default 100, that specifies the target's relative weight against other target reference objects. 0 suppresses requests to this backend.

### 22.2.1.7. .status

#### Description

status is the current state of the route

#### Type

**object**

Property	Type	Description
<b>ingress</b>	<b>array</b>	ingress describes the places where the route may be exposed. The list of ingress points may contain duplicate Host or RouterName values. Routes are considered live once they are <b>Ready</b>
<b>ingress[]</b>	<b>object</b>	RouteIngress holds information about the places where a route is exposed.

### 22.2.1.8. .status.ingress

#### Description

ingress describes the places where the route may be exposed. The list of ingress points may contain duplicate Host or RouterName values. Routes are considered live once they are **Ready**

#### Type

**array**

### 22.2.1.9. .status.ingress[]

#### Description

RouteIngress holds information about the places where a route is exposed.

## Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	Conditions is the state of the route, may be empty.
<b>conditions[]</b>	<b>object</b>	RouteIngressCondition contains details for the current condition of this route on a particular router.
<b>host</b>	<b>string</b>	Host is the host string under which the route is exposed; this value is required
<b>routerCanonicalHostname</b>	<b>string</b>	CanonicalHostname is the external host name for the router that can be used as a CNAME for the host requested for this route. This value is optional and may not be set in all cases.
<b>routerName</b>	<b>string</b>	Name is a name chosen by the router to identify itself; this value is required
<b>wildcardPolicy</b>	<b>string</b>	Wildcard policy is the wildcard policy that was allowed where this route is exposed.

### 22.2.1.10. .status.ingress[].conditions

#### Description

Conditions is the state of the route, may be empty.

#### Type

**array**

### 22.2.1.11. .status.ingress[].conditions[]

#### Description

RouteIngressCondition contains details for the current condition of this route on a particular router.

#### Type

**object**

#### Required

- **status**

- **type**

Property	Type	Description
<b>lastTransitionTime</b>	<b>string</b>	RFC 3339 date and time when this condition last transitioned
<b>message</b>	<b>string</b>	Human readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	(brief) reason for the condition's last transition, and is usually a machine and human readable constant
<b>status</b>	<b>string</b>	Status is the status of the condition. Can be True, False, Unknown.
<b>type</b>	<b>string</b>	Type is the type of the condition. Currently only Admitted.

### 22.2.2. API endpoints

The following API endpoints are available:

- **/apis/route.openshift.io/v1/routes**
  - **GET**: list objects of kind Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes**
  - **DELETE**: delete collection of Route
  - **GET**: list objects of kind Route
  - **POST**: create a Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes/{name}**
  - **DELETE**: delete a Route
  - **GET**: read the specified Route
  - **PATCH**: partially update the specified Route
  - **PUT**: replace the specified Route
- **/apis/route.openshift.io/v1/namespaces/{namespace}/routes/{name}/status**
  - **GET**: read status of the specified Route

- **PATCH**: partially update status of the specified Route
- **PUT**: replace status of the specified Route

### 22.2.2.1. /apis/route.openshift.io/v1/routes

Table 22.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of Route

Table 22.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 22.6. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

HTTP method

**GET**

**Description**

list objects of kind Route

**Table 22.7. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 22.8. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">RouteList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a Route

**Table 22.9. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### **DELETE**

#### Description

delete a Route

Table 22.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## CHAPTER 23. SCHEDULING APIS

### 23.1. SCHEDULING APIS

#### 23.1.1. PriorityClass [scheduling.k8s.io/v1]

##### Description

PriorityClass defines mapping from a priority class name to the priority integer value. The value can be any valid integer.

##### Type

**object**

### 23.2. PRIORITYCLASS [SCHEDULING.K8S.IO/V1]

##### Description

PriorityClass defines mapping from a priority class name to the priority integer value. The value can be any valid integer.

##### Type

**object**

##### Required

- **value**

#### 23.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>description</b>	<b>string</b>	description is an arbitrary string that usually provides guidelines on when this priority class should be used.

Property	Type	Description
<b>globalDefault</b>	<b>boolean</b>	globalDefault specifies whether this PriorityClass should be considered as the default priority for pods that do not have any priority class. Only one PriorityClass can be marked as <b>globalDefault</b> . However, if more than one PriorityClasses exists with their <b>globalDefault</b> field set to true, the smallest value of such global default PriorityClasses will be used as the default priority.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>preemptionPolicy</b>	<b>string</b>	preemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset.  Possible enum values: - <b>"Never"</b> means that pod never preempts other pods with lower priority. - <b>"PreemptLowerPriority"</b> means that pod can preempt other pods with lower priority.
<b>value</b>	<b>integer</b>	value represents the integer value of this priority class. This is the actual priority that pods receive when they have the name of this class in their pod spec.

## 23.2.2. API endpoints

The following API endpoints are available:

- **/apis/scheduling.k8s.io/v1/priorityclasses**
  - **DELETE**: delete collection of PriorityClass
  - **GET**: list or watch objects of kind PriorityClass
  - **POST**: create a PriorityClass
- **/apis/scheduling.k8s.io/v1/watch/priorityclasses**
  - **GET**: watch individual changes to a list of PriorityClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/scheduling.k8s.io/v1/priorityclasses/{name}**
  - **DELETE**: delete a PriorityClass
  - **GET**: read the specified PriorityClass
  - **PATCH**: partially update the specified PriorityClass
  - **PUT**: replace the specified PriorityClass
- **/apis/scheduling.k8s.io/v1/watch/priorityclasses/{name}**
  - **GET**: watch changes to an object of kind PriorityClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 23.2.2.1. /apis/scheduling.k8s.io/v1/priorityclasses

Table 23.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**DELETE**

Description

delete collection of PriorityClass

Table 23.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

<b>body</b>	<b>DeleteOptions</b> schema	

Table 23.4. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind PriorityClass

Table 23.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**Description**

create a PriorityClass

**Table 23.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

### 23.2.2.2. /apis/scheduling.k8s.io/v1/watch/priorityclasses

Table 23.10. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method  
GET

## Description

watch individual changes to a list of PriorityClass. deprecated: use the 'watch' parameter with a list operation instead.

**Table 23.11. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## HTTP method

### DELETE

## Description

delete a PriorityClass

**Table 23.14. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 23.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PriorityClass

Table 23.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PriorityClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## CHAPTER 24. SECURITY APIS

### 24.1. SECURITY APIS

#### 24.1.1. SecurityContextConstraints [security.openshift.io/v1]

##### Description

SecurityContextConstraints governs the ability to make requests that affect the SecurityContext that will be applied to a container. For historical reasons SCC was exposed under the core Kubernetes API group. That exposure is deprecated and will be removed in a future release - users should instead use the security.openshift.io group to manage SecurityContextConstraints. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

### 24.2. SECURITYCONTEXTCONSTRAINTS [SECURITY.OPENSIFT.IO/V1]

##### Description

SecurityContextConstraints governs the ability to make requests that affect the SecurityContext that will be applied to a container. For historical reasons SCC was exposed under the core Kubernetes API group. That exposure is deprecated and will be removed in a future release - users should instead use the security.openshift.io group to manage SecurityContextConstraints. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

##### Required

- **allowHostDirVolumePlugin**
- **allowHostIPC**
- **allowHostNetwork**
- **allowHostPID**
- **allowHostPorts**
- **allowPrivilegedContainer**
- **readOnlyRootFilesystem**

#### 24.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>allowHostDirVolumePlugin</b>	<b>boolean</b>	AllowHostDirVolumePlugin determines if the policy allow containers to use the HostDir volume plugin
<b>allowHostIPC</b>	<b>boolean</b>	AllowHostIPC determines if the policy allows host ipc in the containers.
<b>allowHostNetwork</b>	<b>boolean</b>	AllowHostNetwork determines if the policy allows the use of HostNetwork in the pod spec.
<b>allowHostPID</b>	<b>boolean</b>	AllowHostPID determines if the policy allows host pid in the containers.
<b>allowHostPorts</b>	<b>boolean</b>	AllowHostPorts determines if the policy allows host ports in the containers.
<b>allowPrivilegeEscalation</b>	``	AllowPrivilegeEscalation determines if a pod can request to allow privilege escalation. If unspecified, defaults to true.
<b>allowPrivilegedContainer</b>	<b>boolean</b>	AllowPrivilegedContainer determines if a container can request to be run as privileged.
<b>allowedCapabilities</b>	``	AllowedCapabilities is a list of capabilities that can be requested to add to the container. Capabilities in this field maybe added at the pod author's discretion. You must not list a capability in both AllowedCapabilities and RequiredDropCapabilities. To allow all capabilities you may use '*'.

Property	Type	Description
<b>allowedFlexVolumes</b>	``	AllowedFlexVolumes is a whitelist of allowed Flexvolumes. Empty or nil indicates that all Flexvolumes may be used. This parameter is effective only when the usage of the Flexvolumes is allowed in the "Volumes" field.
<b>allowedUnsafeSysctls</b>	``	AllowedUnsafeSysctls is a list of explicitly allowed unsafe sysctls, defaults to none. Each entry is either a plain sysctl name or ends in "" in which case it is considered as a prefix of allowed sysctls. Single * means all unsafe sysctls are allowed. Kubelet has to whitelist all allowed unsafe sysctls explicitly to avoid rejection. Examples: e.g. "foo/" allows "foo/bar", "foo/baz", etc. e.g. "foo.*" allows "foo.bar", "foo.baz", etc.
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>defaultAddCapabilities</b>	``	DefaultAddCapabilities is the default set of capabilities that will be added to the container unless the pod spec specifically drops the capability. You may not list a capability in both DefaultAddCapabilities and RequiredDropCapabilities.
<b>defaultAllowPrivilegeEscalation</b>	``	DefaultAllowPrivilegeEscalation controls the default setting for whether a process can gain more privileges than its parent process.

Property	Type	Description
<b>forbiddenSysctls</b>	``	ForbiddenSysctls is a list of explicitly forbidden sysctls, defaults to none. Each entry is either a plain sysctl name or ends in "" in which case it is considered as a prefix of forbidden sysctls. Single * means all sysctls are forbidden. Examples: e.g. "foo/" forbids "foo/bar", "foo/baz", etc. e.g. "foo.*" forbids "foo.bar", "foo.baz", etc.
<b>fsGroup</b>	``	FSGroup is the strategy that will dictate what fs group is used by the SecurityContext.
<b>groups</b>	``	The groups that have permission to use this security context constraints
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>priority</b>	``	Priority influences the sort order of SCCs when evaluating which SCCs to try first for a given pod request based on access in the Users and Groups fields. The higher the int, the higher priority. An unset value is considered a 0 priority. If scores for multiple SCCs are equal they will be sorted from most restrictive to least restrictive. If both priorities and restrictions are equal the SCCs will be sorted by name.
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	ReadOnlyRootFilesystem when set to true will force containers to run with a read only root file system. If the container specifically requests to run with a non-read only root file system the SCC should deny the pod. If set to false the container may run with a read only root file system if it wishes but it will not be forced to.
<b>requiredDropCapabilities</b>	``	RequiredDropCapabilities are the capabilities that will be dropped from the container. These are required to be dropped and cannot be added.
<b>runAsUser</b>	``	RunAsUser is the strategy that will dictate what RunAsUser is used in the SecurityContext.
<b>seLinuxContext</b>	``	SELinuxContext is the strategy that will dictate what labels will be set in the SecurityContext.
<b>seccompProfiles</b>	``	SeccompProfiles lists the allowed profiles that may be set for the pod or container's seccomp annotations. An unset (nil) or empty value means that no profiles may be specified by the pod or container. The wildcard '*' may be used to allow all profiles. When used to generate a value for a pod the first non-wildcard profile will be used as the default.

Property	Type	Description
<b>supplementalGroups</b>	``	SupplementalGroups is the strategy that will dictate what supplemental groups are used by the SecurityContext.
<b>users</b>	``	The users who have permissions to use this security context constraints
<b>volumes</b>	``	Volumes is a white list of allowed volume plugins. FSType corresponds directly with the field names of a VolumeSource (azureFile, configMap, emptyDir). To allow all volumes you may use "*". To allow no volumes, set to ["none"].

## 24.2.2. API endpoints

The following API endpoints are available:

- **/apis/security.openshift.io/v1/securitycontextconstraints**
  - **DELETE**: delete collection of SecurityContextConstraints
  - **GET**: list objects of kind SecurityContextConstraints
  - **POST**: create SecurityContextConstraints
- **/apis/security.openshift.io/v1/securitycontextconstraints/{name}**
  - **DELETE**: delete SecurityContextConstraints
  - **GET**: read the specified SecurityContextConstraints
  - **PATCH**: partially update the specified SecurityContextConstraints
  - **PUT**: replace the specified SecurityContextConstraints

### 24.2.2.1. /apis/security.openshift.io/v1/securitycontextconstraints

Table 24.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**DELETE**

**Description**

delete collection of SecurityContextConstraints

**Table 24.2. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 24.5. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">SecurityContextConstraintsList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

Description

create SecurityContextConstraints

Table 24.6. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

##### DELETE

#### Description

delete SecurityContextConstraints

Table 24.11. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## CHAPTER 25. SECURITY-INTERNAL APIS

### 25.1. SECURITY INTERNAL APIS

#### 25.1.1. RangeAllocation [security.internal.openshift.io/v1]

##### Description

RangeAllocation is used so we can easily expose a RangeAllocation typed for security group This is an internal API, not intended for external consumption. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

### 25.2. RANGEALLOCATION [SECURITY.INTERNAL.OPENSIFT.IO/V1]

##### Description

RangeAllocation is used so we can easily expose a RangeAllocation typed for security group This is an internal API, not intended for external consumption. Compatibility level 1: Stable within a major release for a minimum of 12 months or 3 minor releases (whichever is longer).

##### Type

**object**

#### 25.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>data</b>	<b>string</b>	data is a byte array representing the serialized state of a range allocation. It is a bitmap with each bit set to one to represent a range is taken.

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>range</b>	<b>string</b>	range is a string representing a unique label for a range of uids, "10000000000-20000000000/10000".

### 25.2.2. API endpoints

The following API endpoints are available:

- **/apis/security.internal.openshift.io/v1/rangeallocations**
  - **DELETE**: delete collection of RangeAllocation
  - **GET**: list objects of kind RangeAllocation
  - **POST**: create a RangeAllocation
- **/apis/security.internal.openshift.io/v1/rangeallocations/{name}**
  - **DELETE**: delete a RangeAllocation
  - **GET**: read the specified RangeAllocation
  - **PATCH**: partially update the specified RangeAllocation
  - **PUT**: replace the specified RangeAllocation

#### 25.2.2.1. /apis/security.internal.openshift.io/v1/rangeallocations

Table 25.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**DELETE**

## Description

delete collection of RangeAllocation

Table 25.2. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP code	Reponse body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

## HTTP method

**GET****Description**

list objects of kind RangeAllocation

**Table 25.4. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 25.5. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">RangeAllocationList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

Description

create a RangeAllocation

Table 25.6. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 25.7. Body parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the RangeAllocation

Table 25.10. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete a RangeAllocation

Table 25.11. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## CHAPTER 26. SNAPSHOT APIS

### 26.1. SNAPSHOT APIS

#### 26.1.1. VolumeSnapshot [snapshot.storage.k8s.io/v1]

##### Description

VolumeSnapshot is a user's request for either creating a point-in-time snapshot of a persistent volume, or binding to a pre-existing snapshot.

##### Type

**object**

#### 26.1.2. VolumeSnapshotClass [snapshot.storage.k8s.io/v1]

##### Description

VolumeSnapshotClass specifies parameters that a underlying storage system uses when creating a volume snapshot. A specific VolumeSnapshotClass is used by specifying its name in a VolumeSnapshot object. VolumeSnapshotClasses are non-namespaced

##### Type

**object**

#### 26.1.3. VolumeSnapshotContent [snapshot.storage.k8s.io/v1]

##### Description

VolumeSnapshotContent represents the actual "on-disk" snapshot object in the underlying storage system

##### Type

**object**

### 26.2. VOLUMESNAPSHOT [SNAPSHOT.STORAGE.K8S.IO/V1]

##### Description

VolumeSnapshot is a user's request for either creating a point-in-time snapshot of a persistent volume, or binding to a pre-existing snapshot.

##### Type

**object**

##### Required

- **spec**

#### 26.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	spec defines the desired characteristics of a snapshot requested by a user. More info: <a href="https://kubernetes.io/docs/concepts/storage/volume-snapshots#volumesnapshots">https://kubernetes.io/docs/concepts/storage/volume-snapshots#volumesnapshots</a> Required.
<b>status</b>	<b>object</b>	status represents the current information of a snapshot. Consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.

## 26.2.1.1. .spec

**Description**

spec defines the desired characteristics of a snapshot requested by a user. More info: <https://kubernetes.io/docs/concepts/storage/volume-snapshots#volumesnapshots> Required.

**Type**

**object**

**Required**

- **source**

Property	Type	Description
<b>source</b>	<b>object</b>	source specifies where a snapshot will be created from. This field is immutable after creation. Required.
<b>volumeSnapshotClassName</b>	<b>string</b>	VolumeSnapshotClassName is the name of the VolumeSnapshotClass requested by the VolumeSnapshot. VolumeSnapshotClassName may be left nil to indicate that the default SnapshotClass should be used. A given cluster may have multiple default Volume SnapshotClasses: one default per CSI Driver. If a VolumeSnapshot does not specify a SnapshotClass, VolumeSnapshotSource will be checked to figure out what the associated CSI Driver is, and the default VolumeSnapshotClass associated with that CSI Driver will be used. If more than one VolumeSnapshotClass exist for a given CSI Driver and more than one have been marked as default, CreateSnapshot will fail and generate an event. Empty string is not allowed for this field.

**26.2.1.2. .spec.source****Description**

source specifies where a snapshot will be created from. This field is immutable after creation. Required.

**Type**

**object**

Property	Type	Description
<b>persistentVolumeClaimName</b>	<b>string</b>	persistentVolumeClaimName specifies the name of the PersistentVolumeClaim object representing the volume from which a snapshot should be created. This PVC is assumed to be in the same namespace as the VolumeSnapshot object. This field should be set if the snapshot does not exist, and needs to be created. This field is immutable.
<b>volumeSnapshotContentName</b>	<b>string</b>	volumeSnapshotContentName specifies the name of a pre-existing VolumeSnapshotContent object representing an existing volume snapshot. This field should be set if the snapshot already exists and only needs a representation in Kubernetes. This field is immutable.

### 26.2.1.3. .status

#### Description

status represents the current information of a snapshot. Consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>boundVolumeSnapshotContentName</b>	<b>string</b>	boundVolumeSnapshotContentName is the name of the VolumeSnapshotContent object to which this VolumeSnapshot object intends to bind to. If not specified, it indicates that the VolumeSnapshot object has not been successfully bound to a VolumeSnapshotContent object yet. NOTE: To avoid possible security issues, consumers must verify binding between VolumeSnapshot and VolumeSnapshotContent objects is successful (by validating that both VolumeSnapshot and VolumeSnapshotContent point at each other) before using this object.
<b>creationTime</b>	<b>string</b>	creationTime is the timestamp when the point-in-time snapshot is taken by the underlying storage system. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "creation_time" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "creation_time" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. If not specified, it may indicate that the creation time of the snapshot is unknown.

Property	Type	Description
<b>error</b>	<b>object</b>	error is the last observed error during snapshot creation, if any. This field could be helpful to upper level controllers(i.e., application controller) to decide whether they should continue on waiting for the snapshot to be created based on the type of error reported. The snapshot controller will keep retrying when an error occurs during the snapshot creation. Upon success, this error field will be cleared.
<b>readyToUse</b>	<b>boolean</b>	readyToUse indicates if the snapshot is ready to be used to restore a volume. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "ready_to_use" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "ready_to_use" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it, otherwise, this field will be set to "True". If not specified, it means the readiness of a snapshot is unknown.

Property	Type	Description
<b>restoreSize</b>	<b>integer-or-string</b>	restoreSize represents the minimum size of volume required to create a volume from this snapshot. In dynamic snapshot creation case, this field will be filled in by the snapshot controller with the "size_bytes" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "size_bytes" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. When restoring a volume from this snapshot, the size of the volume MUST NOT be smaller than the restoreSize if it is specified, otherwise the restoration will fail. If not specified, it indicates that the size is unknown.

#### 26.2.1.4. .status.error

##### Description

error is the last observed error during snapshot creation, if any. This field could be helpful to upper level controllers(i.e., application controller) to decide whether they should continue on waiting for the snapshot to be created based on the type of error reported. The snapshot controller will keep retrying when an error occurs during the snapshot creation. Upon success, this error field will be cleared.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	message is a string detailing the encountered error during snapshot creation if specified. NOTE: message may be logged, and it should not contain sensitive information.
<b>time</b>	<b>string</b>	time is the timestamp when the error was encountered.

#### 26.2.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshots**
  - **GET**: list objects of kind VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots**
  - **DELETE**: delete collection of VolumeSnapshot
  - **GET**: list objects of kind VolumeSnapshot
  - **POST**: create a VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots/{name}**
  - **DELETE**: delete a VolumeSnapshot
  - **GET**: read the specified VolumeSnapshot
  - **PATCH**: partially update the specified VolumeSnapshot
  - **PUT**: replace the specified VolumeSnapshot
- **/apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots/{name}/status**
  - **GET**: read status of the specified VolumeSnapshot
  - **PATCH**: partially update status of the specified VolumeSnapshot
  - **PUT**: replace status of the specified VolumeSnapshot

### 26.2.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshots

Table 26.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list objects of kind VolumeSnapshot

**Table 26.2. HTTP responses**

HTTP code	Reponse body

### 26.2.2.2. /apis/snapshot.storage.k8s.io/v1/namespaces/{namespace}/volumesnapshots

Table 26.3. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 26.4. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of VolumeSnapshot

Table 26.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a VolumeSnapshot

**Table 26.9. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### DELETE

#### Description

delete a VolumeSnapshot

Table 26.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 26.3. VOLUMESNAPSHOTCLASS [SNAPSHOT.STORAGE.K8S.IO/V1]

### Description

VolumeSnapshotClass specifies parameters that a underlying storage system uses when creating a volume snapshot. A specific VolumeSnapshotClass is used by specifying its name in a VolumeSnapshot object. VolumeSnapshotClasses are non-namespaced

### Type

**object**

### Required

- **deletionPolicy**
- **driver**

### 26.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>deletionPolicy</b>	<b>string</b>	deletionPolicy determines whether a VolumeSnapshotContent created through the VolumeSnapshotClass should be deleted when its bound VolumeSnapshot is deleted. Supported values are "Retain" and "Delete". "Retain" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are kept. "Delete" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are deleted. Required.
<b>driver</b>	<b>string</b>	driver is the name of the storage driver that handles this VolumeSnapshotClass. Required.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>parameters</b>	<b>object (string)</b>	parameters is a key-value map with storage driver specific parameters for creating snapshots. These values are opaque to Kubernetes.

### 26.3.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses**
  - **DELETE:** delete collection of VolumeSnapshotClass
  - **GET:** list objects of kind VolumeSnapshotClass
  - **POST:** create a VolumeSnapshotClass
- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses/{name}**
  - **DELETE:** delete a VolumeSnapshotClass
  - **GET:** read the specified VolumeSnapshotClass
  - **PATCH:** partially update the specified VolumeSnapshotClass
  - **PUT:** replace the specified VolumeSnapshotClass

### 26.3.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses

Table 26.35. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of VolumeSnapshotClass

Table 26.36. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

**POST****Description**

create a VolumeSnapshotClass

**Table 26.40. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### **DELETE**

#### Description

delete a VolumeSnapshotClass

Table 26.45. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 26.4. VOLUMESNAPSHOTCONTENT [SNAPSHOT.STORAGE.K8S.IO/V1]

### Description

VolumeSnapshotContent represents the actual "on-disk" snapshot object in the underlying storage system

### Type

**object**

### Required

- **spec**

### 26.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	spec defines properties of a VolumeSnapshotContent created by the underlying storage system. Required.

Property	Type	Description
<b>status</b>	<b>object</b>	status represents the current information of a snapshot.

### 26.4.1.1. .spec

#### Description

spec defines properties of a VolumeSnapshotContent created by the underlying storage system. Required.

#### Type

**object**

#### Required

- **deletionPolicy**
- **driver**
- **source**
- **volumeSnapshotRef**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>deletionPolicy</b>	<b>string</b>	deletionPolicy determines whether this VolumeSnapshotContent and its physical snapshot on the underlying storage system should be deleted when its bound VolumeSnapshot is deleted. Supported values are "Retain" and "Delete". "Retain" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are kept. "Delete" means that the VolumeSnapshotContent and its physical snapshot on underlying storage system are deleted. For dynamically provisioned snapshots, this field will automatically be filled in by the CSI snapshotter sidecar with the "DeletionPolicy" field defined in the corresponding VolumeSnapshotClass. For pre-existing snapshots, users <b>MUST</b> specify this field when creating the VolumeSnapshotContent object. Required.
<b>driver</b>	<b>string</b>	driver is the name of the CSI driver used to create the physical snapshot on the underlying storage system. This <b>MUST</b> be the same as the name returned by the CSI GetPluginName() call for that driver. Required.
<b>source</b>	<b>object</b>	source specifies whether the snapshot is (or should be) dynamically provisioned or already exists, and just requires a Kubernetes object representation. This field is immutable after creation. Required.

Property	Type	Description
<b>sourceVolumeMode</b>	<b>string</b>	SourceVolumeMode is the mode of the volume whose snapshot is taken. Can be either "Filesystem" or "Block". If not specified, it indicates the source volume's mode is unknown. This field is immutable. This field is an alpha field.
<b>volumeSnapshotClassName</b>	<b>string</b>	name of the VolumeSnapshotClass from which this snapshot was (or will be) created. Note that after provisioning, the VolumeSnapshotClass may be deleted or recreated with different set of values, and as such, should not be referenced post-snapshot creation.
<b>volumeSnapshotRef</b>	<b>object</b>	volumeSnapshotRef specifies the VolumeSnapshot object to which this VolumeSnapshotContent object is bound. VolumeSnapshot.Spec.VolumeSnapshotContentName field must reference to this VolumeSnapshotContent's name for the bidirectional binding to be valid. For a pre-existing VolumeSnapshotContent object, name and namespace of the VolumeSnapshot object MUST be provided for binding to happen. This field is immutable after creation. Required.

### 26.4.1.2. .spec.source

#### Description

source specifies whether the snapshot is (or should be) dynamically provisioned or already exists, and just requires a Kubernetes object representation. This field is immutable after creation. Required.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>snapshotHandle</b>	<b>string</b>	snapshotHandle specifies the CSI "snapshot_id" of a pre-existing snapshot on the underlying storage system for which a Kubernetes object representation was (or should be) created. This field is immutable.
<b>volumeHandle</b>	<b>string</b>	volumeHandle specifies the CSI "volume_id" of the volume from which a snapshot should be dynamically taken from. This field is immutable.

### 26.4.1.3. .spec.volumeSnapshotRef

#### Description

volumeSnapshotRef specifies the VolumeSnapshot object to which this VolumeSnapshotContent object is bound. VolumeSnapshot.Spec.VolumeSnapshotContentName field must reference to this VolumeSnapshotContent's name for the bidirectional binding to be valid. For a pre-existing VolumeSnapshotContent object, name and namespace of the VolumeSnapshot object **MUST** be provided for binding to happen. This field is immutable after creation. Required.

#### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object. TODO: this design is not final and this field is subject to change in the future.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>

Property	Type	Description
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 26.4.1.4. .status

##### Description

status represents the current information of a snapshot.

##### Type

**object**

Property	Type	Description
<b>creationTime</b>	<b>integer</b>	creationTime is the timestamp when the point-in-time snapshot is taken by the underlying storage system. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "creation_time" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "creation_time" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. If not specified, it indicates the creation time is unknown. The format of this field is a Unix nanoseconds time encoded as an int64. On Unix, the command <b>date +%s%N</b> returns the current time in nanoseconds since 1970-01-01 00:00:00 UTC.
<b>error</b>	<b>object</b>	error is the last observed error during snapshot creation, if any. Upon success after retry, this error field will be cleared.

Property	Type	Description
<b>readyToUse</b>	<b>boolean</b>	readyToUse indicates if a snapshot is ready to be used to restore a volume. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "ready_to_use" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "ready_to_use" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it, otherwise, this field will be set to "True". If not specified, it means the readiness of a snapshot is unknown.
<b>restoreSize</b>	<b>integer</b>	restoreSize represents the complete size of the snapshot in bytes. In dynamic snapshot creation case, this field will be filled in by the CSI snapshotter sidecar with the "size_bytes" value returned from CSI "CreateSnapshot" gRPC call. For a pre-existing snapshot, this field will be filled with the "size_bytes" value returned from the CSI "ListSnapshots" gRPC call if the driver supports it. When restoring a volume from this snapshot, the size of the volume MUST NOT be smaller than the restoreSize if it is specified, otherwise the restoration will fail. If not specified, it indicates that the size is unknown.
<b>snapshotHandle</b>	<b>string</b>	snapshotHandle is the CSI "snapshot_id" of a snapshot on the underlying storage system. If not specified, it indicates that dynamic snapshot creation has either failed or it is still in progress.

#### 26.4.1.5. .status.error

##### Description

error is the last observed error during snapshot creation, if any. Upon success after retry, this error field will be cleared.

## Type

### object

Property	Type	Description
<b>message</b>	<b>string</b>	message is a string detailing the encountered error during snapshot creation if specified. NOTE: message may be logged, and it should not contain sensitive information.
<b>time</b>	<b>string</b>	time is the timestamp when the error was encountered.

## 26.4.2. API endpoints

The following API endpoints are available:

- **/apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents**
  - **DELETE**: delete collection of VolumeSnapshotContent
  - **GET**: list objects of kind VolumeSnapshotContent

### 26.4.2.1. /apis/snapshot.storage.k8s.io/v1/volumesnapshotcontents

Table 26.56. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**DELETE**

## Description

delete collection of VolumeSnapshotContent

Table 26.57. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue`</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 26.60. HTTP responses

HTTP code	Response body
200 - OK	<b>VolumeSnapshotContentList</b> schema
401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a VolumeSnapshotContent

**Table 26.61. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### **DELETE**

#### Description

delete a VolumeSnapshotContent

Table 26.66. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## CHAPTER 27. STORAGE APIS

### 27.1. STORAGE APIS

#### 27.1.1. CSIDriver [storage.k8s.io/v1]

##### Description

CSIDriver captures information about a Container Storage Interface (CSI) volume driver deployed on the cluster. Kubernetes attach detach controller uses this object to determine whether attach is required. Kubelet uses this object to determine whether pod information needs to be passed on mount. CSIDriver objects are non-namespaced.

##### Type

**object**

#### 27.1.2. CSINode [storage.k8s.io/v1]

##### Description

CSINode holds information about all CSI drivers installed on a node. CSI drivers do not need to create the CSINode object directly. As long as they use the node-driver-registrar sidecar container, the kubelet will automatically populate the CSINode object for the CSI driver as part of kubelet plugin registration. CSINode has the same name as a node. If the object is missing, it means either there are no CSI Drivers available on the node, or the Kubelet version is low enough that it doesn't create this object. CSINode has an OwnerReference that points to the corresponding node object.

##### Type

**object**

#### 27.1.3. CSIStorageCapacity [storage.k8s.io/v1]

##### Description

CSIStorageCapacity stores the result of one CSI GetCapacity call. For a given StorageClass, this describes the available capacity in a particular topology segment. This can be used when considering where to instantiate new PersistentVolumes.

For example this can express things like: - StorageClass "standard" has "1234 GiB" available in "topology.kubernetes.io/zone=us-east1" - StorageClass "localssd" has "10 GiB" available in "kubernetes.io/hostname=knnode-abc123"

The following three cases all imply that no capacity is available for a certain combination: - no object exists with suitable topology and storage class name - such an object exists, but the capacity is unset - such an object exists, but the capacity is zero

The producer of these objects can decide which approach is more suitable.

They are consumed by the kube-scheduler when a CSI driver opts into capacity-aware scheduling with CSIDriverSpec.StorageCapacity. The scheduler compares the MaximumVolumeSize against the requested size of pending volumes to filter out unsuitable nodes. If MaximumVolumeSize is unset, it falls back to a comparison against the less precise Capacity. If that is also unset, the scheduler assumes that capacity is insufficient and tries some other node.

##### Type

**object**

### 27.1.4. StorageClass [storage.k8s.io/v1]

#### Description

StorageClass describes the parameters for a class of storage for which PersistentVolumes can be dynamically provisioned.

StorageClasses are non-namespaced; the name of the storage class according to etcd is in ObjectMeta.Name.

#### Type

**object**

### 27.1.5. VolumeAttachment [storage.k8s.io/v1]

#### Description

VolumeAttachment captures the intent to attach or detach the specified volume to/from the specified node.

VolumeAttachment objects are non-namespaced.

#### Type

**object**

## 27.2. CSIDRIVER [STORAGE.K8S.IO/V1]

#### Description

CSIDriver captures information about a Container Storage Interface (CSI) volume driver deployed on the cluster. Kubernetes attach detach controller uses this object to determine whether attach is required. Kubelet uses this object to determine whether pod information needs to be passed on mount. CSIDriver objects are non-namespaced.

#### Type

**object**

#### Required

- **spec**

### 27.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object metadata. metadata.Name indicates the name of the CSI driver that this object refers to; it MUST be the same name returned by the CSI GetPluginName() call for that driver. The driver name must be 63 characters or less, beginning and ending with an alphanumeric character ([a-z0-9A-Z]) with dashes (-), dots (.), and alphanumerics between. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	CSIDriverSpec is the specification of a CSIDriver.

### 27.2.1.1. .spec

#### Description

CSIDriverSpec is the specification of a CSIDriver.

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>attachRequired</b>	<b>boolean</b>	<p>attachRequired indicates this CSI volume driver requires an attach operation (because it implements the CSI ControllerPublishVolume() method), and that the Kubernetes attach detach controller should call the attach volume interface which checks the volumeattachment status and waits until the volume is attached before proceeding to mounting. The CSI external-attacher coordinates with CSI volume driver and updates the volumeattachment status when the attach operation is complete. If the CSIDriverRegistry feature gate is enabled and the value is specified to false, the attach operation will be skipped. Otherwise the attach operation will be called.</p> <p>This field is immutable.</p>
<b>fsGroupPolicy</b>	<b>string</b>	<p>fsGroupPolicy defines if the underlying volume supports changing ownership and permission of the volume before being mounted. Refer to the specific FSGroupPolicy values for additional details.</p> <p>This field is immutable.</p> <p>Defaults to ReadWriteOnceWithFSType, which will examine each volume to determine if Kubernetes should modify ownership and permissions of the volume. With the default policy the defined fsGroup will only be applied if a fstype is defined and the volume's access mode contains ReadWriteOnce.</p>

Property	Type	Description
<b>podInfoOnMount</b>	<b>boolean</b>	<p>podInfoOnMount indicates this CSI volume driver requires additional pod information (like podName, podUID, etc.) during mount operations, if set to true. If set to false, pod information will not be passed on mount. Default is false.</p> <p>The CSI driver specifies podInfoOnMount as part of driver deployment. If true, Kubelet will pass pod information as VolumeContext in the CSI NodePublishVolume() calls. The CSI driver is responsible for parsing and validating the information passed in as VolumeContext.</p> <p>The following VolumeContext will be passed if podInfoOnMount is set to true. This list might grow, but the prefix will be used.</p> <p>"csi.storage.k8s.io/pod.name": pod.Name  "csi.storage.k8s.io/pod.namespace": pod.Namespace  "csi.storage.k8s.io/pod.uid": string(pod.UID)  "csi.storage.k8s.io/ephemeral": "true" if the volume is an ephemeral inline volume defined by a CSIVolumeSource, otherwise "false"</p> <p>"csi.storage.k8s.io/ephemeral" is a new feature in Kubernetes 1.16. It is only required for drivers which support both the "Persistent" and "Ephemeral" VolumeLifecycleMode. Other drivers can leave pod info disabled and/or ignore this field. As Kubernetes 1.15 doesn't support this field, drivers can only support one mode when deployed on such a cluster and the deployment determines which mode that is, for example via a command line parameter of the driver.</p> <p>This field is immutable.</p>

Property	Type	Description
<b>requiresRepublish</b>	<b>boolean</b>	<p>requiresRepublish indicates the CSI driver wants <b>NodePublishVolume</b> being periodically called to reflect any possible change in the mounted volume. This field defaults to false.</p> <p>Note: After a successful initial NodePublishVolume call, subsequent calls to NodePublishVolume should only update the contents of the volume. New mount points will not be seen by a running container.</p>
<b>seLinuxMount</b>	<b>boolean</b>	<p>seLinuxMount specifies if the CSI driver supports "-o context" mount option.</p> <p>When "true", the CSI driver must ensure that all volumes provided by this CSI driver can be mounted separately with different <b>-o context</b> options. This is typical for storage backends that provide volumes as filesystems on block devices or as independent shared volumes. Kubernetes will call NodeStage / NodePublish with "-o context=xyz" mount option when mounting a ReadWriteOncePod volume used in Pod that has explicitly set SELinux context. In the future, it may be expanded to other volume AccessModes. In any case, Kubernetes will ensure that the volume is mounted only with a single SELinux context.</p> <p>When "false", Kubernetes won't pass any special SELinux mount options to the driver. This is typical for volumes that represent subdirectories of a bigger shared filesystem.</p> <p>Default is "false".</p>

Property	Type	Description
<b>storageCapacity</b>	<b>boolean</b>	<p>storageCapacity indicates that the CSI volume driver wants pod scheduling to consider the storage capacity that the driver deployment will report by creating CSISStorageCapacity objects with capacity information, if set to true.</p> <p>The check can be enabled immediately when deploying a driver. In that case, provisioning new volumes with late binding will pause until the driver deployment has published some suitable CSISStorageCapacity object.</p> <p>Alternatively, the driver can be deployed with the field unset or false and it can be flipped later when storage capacity information has been published.</p> <p>This field was immutable in Kubernetes <math>\leq</math> 1.22 and now is mutable.</p>
<b>tokenRequests</b>	<b>array</b>	<p>tokenRequests indicates the CSI driver needs pods' service account tokens it is mounting volume for to do necessary authentication. Kubelet will pass the tokens in VolumeContext in the CSI NodePublishVolume calls. The CSI driver should parse and validate the following VolumeContext:</p> <pre>"csi.storage.k8s.io/serviceAccount.tokens": { "&lt;audience&gt;": {   "token": &lt;token&gt;,   "expirationTimestamp":     &lt;expiration timestamp in RFC3339&gt;, }, ... }</pre> <p>Note: Audience in each TokenRequest should be different and at most one token is empty string. To receive a new token after expiry, RequiresRepublish can be used to trigger NodePublishVolume periodically.</p>

Property	Type	Description
<b>tokenRequests[]</b>	<b>object</b>	TokenRequest contains parameters of a service account token.
<b>volumeLifecycleModes</b>	<b>array (string)</b>	<p>volumeLifecycleModes defines what kind of volumes this CSI volume driver supports. The default if the list is empty is "Persistent", which is the usage defined by the CSI specification and implemented in Kubernetes via the usual PV/PVC mechanism.</p> <p>The other mode is "Ephemeral". In this mode, volumes are defined inline inside the pod spec with CSIVolumeSource and their lifecycle is tied to the lifecycle of that pod. A driver has to be aware of this because it is only going to get a NodePublishVolume call for such a volume.</p> <p>For more information about implementing this mode, see <a href="https://kubernetes-csi.github.io/docs/ephemeral-local-volumes.html">https://kubernetes-csi.github.io/docs/ephemeral-local-volumes.html</a> A driver can support one or more of these modes and more modes may be added in the future.</p> <p>This field is beta. This field is immutable.</p>

### 27.2.1.2. .spec.tokenRequests

#### Description

tokenRequests indicates the CSI driver needs pods' service account tokens it is mounting volume for to do necessary authentication. Kubelet will pass the tokens in VolumeContext in the CSI NodePublishVolume calls. The CSI driver should parse and validate the following VolumeContext: "csi.storage.k8s.io/serviceAccount.tokens": { "<audience>": { "token": <token>, "expirationTimestamp": <expiration timestamp in RFC3339>, }, ... }

Note: Audience in each TokenRequest should be different and at most one token is empty string. To receive a new token after expiry, RequiresRepublish can be used to trigger NodePublishVolume periodically.

#### Type

**array**

### 27.2.1.3. .spec.tokenRequests[]

#### Description

TokenRequest contains parameters of a service account token.

#### Type

**object**

#### Required

- **audience**

Property	Type	Description
<b>audience</b>	<b>string</b>	audience is the intended audience of the token in "TokenRequestSpec". It will default to the audiences of kube apiserver.
<b>expirationSeconds</b>	<b>integer</b>	expirationSeconds is the duration of validity of the token in "TokenRequestSpec". It has the same default value of "ExpirationSeconds" in "TokenRequestSpec".

### 27.2.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csidrivers**
  - **DELETE**: delete collection of CSIDriver
  - **GET**: list or watch objects of kind CSIDriver
  - **POST**: create a CSIDriver
- **/apis/storage.k8s.io/v1/watch/csidrivers**
  - **GET**: watch individual changes to a list of CSIDriver. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/csidrivers/{name}**
  - **DELETE**: delete a CSIDriver
  - **GET**: read the specified CSIDriver
  - **PATCH**: partially update the specified CSIDriver
  - **PUT**: replace the specified CSIDriver
- **/apis/storage.k8s.io/v1/watch/csidrivers/{name}**

- **GET**: watch changes to an object of kind CSIDriver. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 27.2.2.1. /apis/storage.k8s.io/v1/csidrivers

Table 27.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of CSIDriver

Table 27.2. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

**HTTP method****GET****Description**

list or watch objects of kind CSIDriver

**Table 27.5. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.6. HTTP responses

200 - OK	<b>CSIDriverList</b> schema
401 - Unauthorized	Empty

## HTTP method

**POST****Description**

create a CSIDriver

**Table 27.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### **DELETE**

#### Description

delete a CSIDriver

Table 27.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

200 - OK	<b>CSIDriver</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified CSIDriver

**Table 27.18. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 27.2.2.4. /apis/storage.k8s.io/v1/watch/csidrivers/{name}

Table 27.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the CSIDriver

Table 27.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CSIDriver. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 27.26. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## 27.3. CSINODE [STORAGE.K8S.IO/V1]

### Description

CSINode holds information about all CSI drivers installed on a node. CSI drivers do not need to create the CSINode object directly. As long as they use the node-driver-registrar sidecar container, the kubelet will automatically populate the CSINode object for the CSI driver as part of kubelet plugin registration. CSINode has the same name as a node. If the object is missing, it means either there are no CSI Drivers available on the node, or the Kubelet version is low enough that it doesn't create this object. CSINode has an OwnerReference that points to the corresponding node object.

### Type

**object**

### Required

- **spec**

### 27.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. metadata.name must be the Kubernetes node name.
<b>spec</b>	<b>object</b>	CSINodeSpec holds information about the specification of all CSI drivers installed on a node

### 27.3.1.1. .spec

#### Description

CSINodeSpec holds information about the specification of all CSI drivers installed on a node

#### Type

**object**

#### Required

- **drivers**

Property	Type	Description
<b>drivers</b>	<b>array</b>	drivers is a list of information of all CSI Drivers existing on a node. If all drivers in the list are uninstalled, this can become empty.
<b>drivers[]</b>	<b>object</b>	CSINodeDriver holds information about the specification of one CSI driver installed on a node

### 27.3.1.2. .spec.drivers

#### Description

drivers is a list of information of all CSI Drivers existing on a node. If all drivers in the list are uninstalled, this can become empty.

#### Type

**array**

### 27.3.1.3. .spec.drivers[]

#### Description

CSINodeDriver holds information about the specification of one CSI driver installed on a node

#### Type

**object****Required**

- **name**
- **nodeID**

Property	Type	Description
<b>allocatable</b>	<b>object</b>	VolumeNodeResources is a set of resource limits for scheduling of volumes.
<b>name</b>	<b>string</b>	name represents the name of the CSI driver that this object refers to. This <b>MUST</b> be the same name returned by the CSI <code>GetPluginName()</code> call for that driver.
<b>nodeID</b>	<b>string</b>	nodeID of the node from the driver point of view. This field enables Kubernetes to communicate with storage systems that do not share the same nomenclature for nodes. For example, Kubernetes may refer to a given node as "node1", but the storage system may refer to the same node as "nodeA". When Kubernetes issues a command to the storage system to attach a volume to a specific node, it can use this field to refer to the node name using the ID that the storage system will understand, e.g. "nodeA" instead of "node1". This field is required.

Property	Type	Description
<b>topologyKeys</b>	<b>array (string)</b>	topologyKeys is the list of keys supported by the driver. When a driver is initialized on a cluster, it provides a set of topology keys that it understands (e.g. "company.com/zone", "company.com/region"). When a driver is initialized on a node, it provides the same topology keys along with values. Kubelet will expose these topology keys as labels on its own node object. When Kubernetes does topology aware provisioning, it can use this list to determine which labels it should retrieve from the node object and pass back to the driver. It is possible for different nodes to use different topology keys. This can be empty if driver does not support topology.

#### 27.3.1.4. .spec.drivers[].allocatable

##### Description

VolumeNodeResources is a set of resource limits for scheduling of volumes.

##### Type

**object**

Property	Type	Description
<b>count</b>	<b>integer</b>	count indicates the maximum number of unique volumes managed by the CSI driver that can be used on a node. A volume that is both attached and mounted on a node is considered to be used once, not twice. The same rule applies for a unique volume that is shared among multiple pods on the same node. If this field is not specified, then the supported number of volumes on this node is unbounded.

#### 27.3.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csinodes**
  - **DELETE**: delete collection of CSINode
  - **GET**: list or watch objects of kind CSINode
  - **POST**: create a CSINode
- **/apis/storage.k8s.io/v1/watch/csinodes**
  - **GET**: watch individual changes to a list of CSINode. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/csinodes/{name}**
  - **DELETE**: delete a CSINode
  - **GET**: read the specified CSINode
  - **PATCH**: partially update the specified CSINode
  - **PUT**: replace the specified CSINode
- **/apis/storage.k8s.io/v1/watch/csinodes/{name}**
  - **GET**: watch changes to an object of kind CSINode. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 27.3.2.1. /apis/storage.k8s.io/v1/csinodes

Table 27.27. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of CSINode

Table 27.28. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

create a CSINode

**Table 27.33. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

401 - Unauthorized	Empty

### 27.3.2.2. /apis/storage.k8s.io/v1/watch/csinodes

Table 27.36. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method  
GET

**Description**

watch individual changes to a list of CSINode. deprecated: use the 'watch' parameter with a list operation instead.

**Table 27.37. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****DELETE****Description**

delete a CSINode

**Table 27.40. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CSINode. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 27.52. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## 27.4. CSISTORAGECAPACITY [STORAGE.K8S.IO/V1]

### Description

CSISStorageCapacity stores the result of one CSI GetCapacity call. For a given StorageClass, this describes the available capacity in a particular topology segment. This can be used when considering where to instantiate new PersistentVolumes.

For example this can express things like: - StorageClass "standard" has "1234 GiB" available in "topology.kubernetes.io/zone=us-east1" - StorageClass "localssd" has "10 GiB" available in "kubernetes.io/hostname=knnode-abc123"

The following three cases all imply that no capacity is available for a certain combination: - no object exists with suitable topology and storage class name - such an object exists, but the capacity is unset - such an object exists, but the capacity is zero

The producer of these objects can decide which approach is more suitable.

They are consumed by the kube-scheduler when a CSI driver opts into capacity-aware scheduling with CSIDriverSpec.StorageCapacity. The scheduler compares the MaximumVolumeSize against the requested size of pending volumes to filter out unsuitable nodes. If MaximumVolumeSize is unset, it falls back to a comparison against the less precise Capacity. If that is also unset, the scheduler assumes that capacity is insufficient and tries some other node.

### Type

**object**

### Required

- **storageClassName**

### 27.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>capacity</b>	<b>Quantity</b>	<p>capacity is the value reported by the CSI driver in its GetCapacityResponse for a GetCapacityRequest with topology and parameters that match the previous fields.</p> <p>The semantic is currently (CSI spec 1.2) defined as: The available capacity, in bytes, of the storage that can be used to provision volumes. If not set, that information is currently unavailable.</p>
<b>kind</b>	<b>string</b>	<p>Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a></p>
<b>maximumVolumeSize</b>	<b>Quantity</b>	<p>maximumVolumeSize is the value reported by the CSI driver in its GetCapacityResponse for a GetCapacityRequest with topology and parameters that match the previous fields.</p> <p>This is defined since CSI spec 1.4.0 as the largest size that may be used in a CreateVolumeRequest.capacity_range.required_bytes field to create a volume with the same parameters as those in GetCapacityRequest. The corresponding value in the Kubernetes API is ResourceRequirements.Requests in a volume claim.</p>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	<p>Standard object's metadata. The name has no particular meaning. It must be a DNS subdomain (dots allowed, 253 characters). To ensure that there are no conflicts with other CSI drivers on the cluster, the recommendation is to use <code>csisc-&lt;uuid&gt;</code>, a generated name, or a reverse-domain name which ends with the unique CSI driver name.</p> <p>Objects are namespaced.</p> <p>More info:  <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>
<b>nodeTopology</b>	<b>LabelSelector</b>	<p><code>nodeTopology</code> defines which nodes have access to the storage for which capacity was reported. If not set, the storage is not accessible from any node in the cluster. If empty, the storage is accessible from all nodes. This field is immutable.</p>
<b>storageClassName</b>	<b>string</b>	<p><code>storageClassName</code> represents the name of the <code>StorageClass</code> that the reported capacity applies to. It must meet the same requirements as the name of a <code>StorageClass</code> object (non-empty, DNS subdomain). If that object no longer exists, the <code>CSISStorageCapacity</code> object is obsolete and should be removed by its creator. This field is immutable.</p>

## 27.4.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/csistoragecapacities**
  - **GET**: list or watch objects of kind `CSISStorageCapacity`

- **/apis/storage.k8s.io/v1/watch/csistoragecapacities**
  - **GET**: watch individual changes to a list of CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/namespaces/{namespace}/csistoragecapacities**
  - **DELETE**: delete collection of CSIStorageCapacity
  - **GET**: list or watch objects of kind CSIStorageCapacity
  - **POST**: create a CSIStorageCapacity
- **/apis/storage.k8s.io/v1/watch/namespaces/{namespace}/csistoragecapacities**
  - **GET**: watch individual changes to a list of CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/namespaces/{namespace}/csistoragecapacities/{name}**
  - **DELETE**: delete a CSIStorageCapacity
  - **GET**: read the specified CSIStorageCapacity
  - **PATCH**: partially update the specified CSIStorageCapacity
  - **PUT**: replace the specified CSIStorageCapacity
- **/apis/storage.k8s.io/v1/watch/namespaces/{namespace}/csistoragecapacities/{name}**
  - **GET**: watch changes to an object of kind CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 27.4.2.1. /apis/storage.k8s.io/v1/csistoragecapacities

Table 27.53. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind CSISStorageCapacity

HTTP code	Response body
401 - Unauthorized	Empty

### 27.4.2.2. /apis/storage.k8s.io/v1/watch/csistoragecapacities

Table 27.55. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

create a CSISStorageCapacity

**Table 27.64. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 27.76. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 27.82. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the CSISStorageCapacity
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 27.83. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CSIStorageCapacity. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 27.5. STORAGECLASS [STORAGE.K8S.IO/V1]

### Description

StorageClass describes the parameters for a class of storage for which PersistentVolumes can be dynamically provisioned.

StorageClasses are non-namespaced; the name of the storage class according to etcd is in ObjectMeta.Name.

### Type

**object**

### Required

- **provisioner**

### 27.5.1. Specification

Property	Type	Description
<b>allowVolumeExpansion</b>	<b>boolean</b>	allowVolumeExpansion shows whether the storage class allow volume expand.
<b>allowedTopologies</b>	<b>array</b> <b>(TopologySelectorTerm)</b>	allowedTopologies restrict the node topologies where volumes can be dynamically provisioned. Each volume plugin defines its own supported topology specifications. An empty TopologySelectorTerm list means there is no topology restriction. This field is only honored by servers that enable the VolumeScheduling feature.

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>mountOptions</b>	<b>array (string)</b>	mountOptions controls the mountOptions for dynamically provisioned PersistentVolumes of this storage class. e.g. ["ro", "soft"]. Not validated - mount of the PVs will simply fail if one is invalid.
<b>parameters</b>	<b>object (string)</b>	parameters holds the parameters for the provisioner that should create volumes of this storage class.
<b>provisioner</b>	<b>string</b>	provisioner indicates the type of the provisioner.

Property	Type	Description
<b>reclaimPolicy</b>	<b>string</b>	<p>reclaimPolicy controls the reclaimPolicy for dynamically provisioned PersistentVolumes of this storage class. Defaults to Delete.</p> <p>Possible enum values: - <b>"Delete"</b> means the volume will be deleted from Kubernetes on release from its claim. The volume plugin must support Deletion. - <b>"Recycle"</b> means the volume will be recycled back into the pool of unbound persistent volumes on release from its claim. The volume plugin must support Recycling. - <b>"Retain"</b> means the volume will be left in its current phase (Released) for manual reclamation by the administrator. The default policy is Retain.</p>
<b>volumeBindingMode</b>	<b>string</b>	<p>volumeBindingMode indicates how PersistentVolumeClaims should be provisioned and bound. When unset, VolumeBindingImmediate is used. This field is only honored by servers that enable the VolumeScheduling feature.</p> <p>Possible enum values: - <b>"Immediate"</b> indicates that PersistentVolumeClaims should be immediately provisioned and bound. This is the default mode. - <b>"WaitForFirstConsumer"</b> indicates that PersistentVolumeClaims should not be provisioned and bound until the first Pod is created that references the PersistentVolumeClaim. The volume provisioning and binding will occur during Pod scheduling.</p>

### 27.5.2. API endpoints

The following API endpoints are available:

- `/apis/storage.k8s.io/v1/storageclasses`

- **DELETE**: delete collection of StorageClass
- **GET**: list or watch objects of kind StorageClass
- **POST**: create a StorageClass
- **/apis/storage.k8s.io/v1/watch/storageclasses**
  - **GET**: watch individual changes to a list of StorageClass. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/storageclasses/{name}**
  - **DELETE**: delete a StorageClass
  - **GET**: read the specified StorageClass
  - **PATCH**: partially update the specified StorageClass
  - **PUT**: replace the specified StorageClass
- **/apis/storage.k8s.io/v1/watch/storageclasses/{name}**
  - **GET**: watch changes to an object of kind StorageClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Table 27.85. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of StorageClass

Table 27.86. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.90. HTTP responses

create a StorageClass

**Table 27.91. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

### 27.5.2.2. /apis/storage.k8s.io/v1/watch/storageclasses

Table 27.94. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method  
GET

## Description

watch individual changes to a list of StorageClass. deprecated: use the 'watch' parameter with a list operation instead.

**Table 27.95. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

### 27.5.2.3. /apis/storage.k8s.io/v1/storageclasses/{name}

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the StorageClass

**Table 27.97. Global query parameters**

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

### DELETE

## Description

delete a StorageClass

**Table 27.98. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**HTTP method****PATCH****Description**

partially update the specified StorageClass

**Table 27.102. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 27.108. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the StorageClass

Table 27.109. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind StorageClass. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

## 27.6. VOLUMEATTACHMENT [STORAGE.K8S.IO/V1]

### Description

VolumeAttachment captures the intent to attach or detach the specified volume to/from the specified node.

VolumeAttachment objects are non-namespaced.

### Type

**object**

### Required

- **spec**

### 27.6.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	VolumeAttachmentSpec is the specification of a VolumeAttachment request.
<b>status</b>	<b>object</b>	VolumeAttachmentStatus is the status of a VolumeAttachment request.

### 27.6.1.1. .spec

#### Description

VolumeAttachmentSpec is the specification of a VolumeAttachment request.

#### Type

**object**

#### Required

- **attacher**
- **source**
- **nodeName**

Property	Type	Description
<b>attacher</b>	<b>string</b>	attacher indicates the name of the volume driver that MUST handle this request. This is the name returned by GetPluginName().
<b>nodeName</b>	<b>string</b>	nodeName represents the node that the volume should be attached to.

Property	Type	Description
<b>source</b>	<b>object</b>	VolumeAttachmentSource represents a volume that should be attached. Right now only PersistentVolumes can be attached via external attacher, in future we may allow also inline volumes in pods. Exactly one member can be set.

### 27.6.1.2. .spec.source

#### Description

VolumeAttachmentSource represents a volume that should be attached. Right now only PersistentVolumes can be attached via external attacher, in future we may allow also inline volumes in pods. Exactly one member can be set.

#### Type

**object**

Property	Type	Description
<b>inlineVolumeSpec</b>	<b>PersistentVolumeSpec</b>	inlineVolumeSpec contains all the information necessary to attach a persistent volume defined by a pod's inline VolumeSource. This field is populated only for the CSIMigration feature. It contains translated fields from a pod's inline VolumeSource to a PersistentVolumeSpec. This field is beta-level and is only honored by servers that enabled the CSIMigration feature.
<b>persistentVolumeName</b>	<b>string</b>	persistentVolumeName represents the name of the persistent volume to attach.

### 27.6.1.3. .status

#### Description

VolumeAttachmentStatus is the status of a VolumeAttachment request.

#### Type

**object**

#### Required

- **attached**

Property	Type	Description
<b>attachError</b>	<b>object</b>	VolumeError captures an error encountered during a volume operation.
<b>attached</b>	<b>boolean</b>	attached indicates the volume is successfully attached. This field must only be set by the entity completing the attach operation, i.e. the external-attacher.
<b>attachmentMetadata</b>	<b>object (string)</b>	attachmentMetadata is populated with any information returned by the attach operation, upon successful attach, that must be passed into subsequent WaitForAttach or Mount calls. This field must only be set by the entity completing the attach operation, i.e. the external-attacher.
<b>detachError</b>	<b>object</b>	VolumeError captures an error encountered during a volume operation.

#### 27.6.1.4. .status.attachError

##### Description

VolumeError captures an error encountered during a volume operation.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	message represents the error encountered during Attach or Detach operation. This string may be logged, so it should not contain sensitive information.
<b>time</b>	<b>Time</b>	time represents the time the error was encountered.

#### 27.6.1.5. .status.detachError

##### Description

VolumeError captures an error encountered during a volume operation.

Type  
object

Property	Type	Description
<b>message</b>	<b>string</b>	message represents the error encountered during Attach or Detach operation. This string may be logged, so it should not contain sensitive information.
<b>time</b>	<b>Time</b>	time represents the time the error was encountered.

## 27.6.2. API endpoints

The following API endpoints are available:

- **/apis/storage.k8s.io/v1/volumeattachments**
  - **DELETE**: delete collection of VolumeAttachment
  - **GET**: list or watch objects of kind VolumeAttachment
  - **POST**: create a VolumeAttachment
- **/apis/storage.k8s.io/v1/watch/volumeattachments**
  - **GET**: watch individual changes to a list of VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/storage.k8s.io/v1/volumeattachments/{name}**
  - **DELETE**: delete a VolumeAttachment
  - **GET**: read the specified VolumeAttachment
  - **PATCH**: partially update the specified VolumeAttachment
  - **PUT**: replace the specified VolumeAttachment
- **/apis/storage.k8s.io/v1/watch/volumeattachments/{name}**
  - **GET**: watch changes to an object of kind VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/storage.k8s.io/v1/volumeattachments/{name}/status**
  - **GET**: read status of the specified VolumeAttachment
  - **PATCH**: partially update status of the specified VolumeAttachment
  - **PUT**: replace status of the specified VolumeAttachment

## 27.6.2.1. /apis/storage.k8s.io/v1/volumeattachments

Table 27.111. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**DELETE**

## Description

delete collection of VolumeAttachment

Table 27.112. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

**HTTP method****GET****Description**

list or watch objects of kind VolumeAttachment

Table 27.115. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 27.116. HTTP responses

HTTP code	Response body

create a VolumeAttachment

**Table 27.117. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 27.124. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 27.134. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the VolumeAttachment

Table 27.135. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind VolumeAttachment. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## CHAPTER 28. STORAGE VERSION MIGRATION APIS

### 28.1. STORAGE VERSION MIGRATION APIS

#### 28.1.1. StorageVersionMigration [migration.k8s.io/v1alpha1]

##### Description

StorageVersionMigration represents a migration of stored data to the latest storage version.

##### Type

**object**

### 28.2. STORAGEVERSIONMIGRATION [MIGRATION.K8S.IO/V1ALPHA1]

##### Description

StorageVersionMigration represents a migration of stored data to the latest storage version.

##### Type

**object**

#### 28.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	Specification of the migration.
<b>status</b>	<b>object</b>	Status of the migration.

### 28.2.1.1. .spec

#### Description

Specification of the migration.

#### Type

**object**

#### Required

- **resource**

Property	Type	Description
<b>continueToken</b>	<b>string</b>	The token used in the list options to get the next chunk of objects to migrate. When the <code>.status.conditions</code> indicates the migration is "Running", users can use this token to check the progress of the migration.
<b>resource</b>	<b>object</b>	The resource that is being migrated. The migrator sends requests to the endpoint serving the resource. Immutable.

### 28.2.1.2. .spec.resource

#### Description

The resource that is being migrated. The migrator sends requests to the endpoint serving the resource. Immutable.

#### Type

**object**

Property	Type	Description
<b>group</b>	<b>string</b>	The name of the group.
<b>resource</b>	<b>string</b>	The name of the resource.
<b>version</b>	<b>string</b>	The name of the version.

### 28.2.1.3. .status

#### Description

Status of the migration.

#### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	The latest available observations of the migration's current state.
<b>conditions[]</b>	<b>object</b>	Describes the state of a migration at a certain point.

### 28.2.1.4. .status.conditions

#### Description

The latest available observations of the migration's current state.

#### Type

**array**

### 28.2.1.5. .status.conditions[]

#### Description

Describes the state of a migration at a certain point.

#### Type

**object**

#### Required

- **status**
- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>lastUpdateTime</b>	<b>string</b>	The last time this condition was updated.
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of the condition.

## 28.2.2. API endpoints

The following API endpoints are available:

- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations**
  - **DELETE**: delete collection of StorageVersionMigration
  - **GET**: list objects of kind StorageVersionMigration
  - **POST**: create a StorageVersionMigration
- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations/{name}**
  - **DELETE**: delete a StorageVersionMigration
  - **GET**: read the specified StorageVersionMigration
  - **PATCH**: partially update the specified StorageVersionMigration
  - **PUT**: replace the specified StorageVersionMigration
- **/apis/migration.k8s.io/v1alpha1/storageversionmigrations/{name}/status**
  - **GET**: read status of the specified StorageVersionMigration
  - **PATCH**: partially update status of the specified StorageVersionMigration
  - **PUT**: replace status of the specified StorageVersionMigration

### 28.2.2.1. /apis/migration.k8s.io/v1alpha1/storageversionmigrations

Table 28.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**DELETE**

## Description

delete collection of StorageVersionMigration

Table 28.2. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 28.3. HTTP responses

200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

HTTP method

**GET****Description**

list objects of kind StorageVersionMigration

**Table 28.4. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 28.5. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">StorageVersionMigrationList</a> schema
401 - Unauthorized	Empty

## HTTP method

**POST**

## Description

create a StorageVersionMigration

Table 28.6. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### DELETE

#### Description

delete a StorageVersionMigration

Table 28.11. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**object**

### 29.2. LOGICALVOLUME [TOPOLVM.IO/V1]

##### Description

LogicalVolume is the Schema for the logicalvolumes API

##### Type

**object**

#### 29.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	LogicalVolumeSpec defines the desired state of LogicalVolume
<b>status</b>	<b>object</b>	LogicalVolumeStatus defines the observed state of LogicalVolume

### 29.2.1.1. .spec

#### Description

LogicalVolumeSpec defines the desired state of LogicalVolume

#### Type

**object**

#### Required

- **name**
- **nodeName**
- **size**

Property	Type	Description
<b>accessType</b>	<b>string</b>	'accessType' specifies how the user intends to consume the snapshot logical volume. Set to "ro" when creating a snapshot and to "rw" when restoring a snapshot or creating a clone. This field is populated only when LogicalVolume has a source.
<b>deviceClass</b>	<b>string</b>	
<b>name</b>	<b>string</b>	
<b>nodeName</b>	<b>string</b>	
<b>size</b>	<b>integer-or-string</b>	

Property	Type	Description
<b>source</b>	<b>string</b>	'source' specifies the logicalvolume name of the source; if present. This field is populated only when LogicalVolume has a source.

### 29.2.1.2. .status

#### Description

LogicalVolumeStatus defines the observed state of LogicalVolume

#### Type

**object**

Property	Type	Description
<b>code</b>	<b>integer</b>	A Code is an unsigned 32-bit error code as defined in the gRPC spec.
<b>currentSize</b>	<b>integer-or-string</b>	
<b>message</b>	<b>string</b>	
<b>volumeID</b>	<b>string</b>	INSERT ADDITIONAL STATUS FIELD - define observed state of cluster Important: Run "make" to regenerate code after modifying this file

### 29.2.2. API endpoints

The following API endpoints are available:

- **/apis/topolvm.io/v1/logicalvolumes**
  - **DELETE**: delete collection of LogicalVolume
  - **GET**: list objects of kind LogicalVolume
  - **POST**: create a LogicalVolume
- **/apis/topolvm.io/v1/logicalvolumes/{name}**
  - **DELETE**: delete a LogicalVolume
  - **GET**: read the specified LogicalVolume

- **PATCH**: partially update the specified LogicalVolume
- **PUT**: replace the specified LogicalVolume
- **/apis/topolvm.io/v1/logicalvolumes/{name}/status**
  - **GET**: read status of the specified LogicalVolume
  - **PATCH**: partially update status of the specified LogicalVolume
  - **PUT**: replace status of the specified LogicalVolume

### 29.2.2.1. /apis/topolvm.io/v1/logicalvolumes

Table 29.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of LogicalVolume

Table 29.2. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 29.3. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

HTTP method

**GET**

**Description**

list objects of kind LogicalVolume

**Table 29.4. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. <b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 29.5. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">LogicalVolumeList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a LogicalVolume

**Table 29.6. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 29.7. Body parameters**

#### HTTP method

#### **DELETE**

#### Description

delete a LogicalVolume

Table 29.11. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## CHAPTER 30. WEBHOOK APIS

### 30.1. WEBHOOK APIS

#### 30.1.1. MutatingWebhookConfiguration [admissionregistration.k8s.io/v1]

##### Description

MutatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and may change the object.

##### Type

**object**

#### 30.1.2. ValidatingWebhookConfiguration [admissionregistration.k8s.io/v1]

##### Description

ValidatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and object without changing it.

##### Type

**object**

### 30.2. MUTATINGWEBHOOKCONFIGURATION [ADMISSIONREGISTRATION.K8S.IO/V1]

##### Description

MutatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and may change the object.

##### Type

**object**

#### 30.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
<b>webhooks</b>	<b>array</b>	Webhooks is a list of webhooks and the affected resources and operations.
<b>webhooks[]</b>	<b>object</b>	MutatingWebhook describes an admission webhook and the resources and operations it applies to.

### 30.2.1.1. .webhooks

#### Description

Webhooks is a list of webhooks and the affected resources and operations.

#### Type

**array**

### 30.2.1.2. .webhooks[]

#### Description

MutatingWebhook describes an admission webhook and the resources and operations it applies to.

#### Type

**object**

#### Required

- **name**
- **clientConfig**
- **sideEffects**

- **admissionReviewVersions**

Property	Type	Description
<b>admissionReviewVersions</b>	<b>array (string)</b>	AdmissionReviewVersions is an ordered list of preferred <b>AdmissionReview</b> versions the Webhook expects. API server will try to use first version in the list which it supports. If none of the versions specified in this list supported by API server, validation will fail for this object. If a persisted webhook configuration specifies allowed versions and does not include any versions known to the API Server, calls to the webhook will fail and be subject to the failure policy.
<b>clientConfig</b>	<b>object</b>	WebhookClientConfig contains the information to make a TLS connection with the webhook
<b>failurePolicy</b>	<b>string</b>	<p>FailurePolicy defines how unrecognized errors from the admission endpoint are handled - allowed values are Ignore or Fail. Defaults to Fail.</p> <p>Possible enum values: - <b>"Fail"</b> means that an error calling the webhook causes the admission to fail. - <b>"Ignore"</b> means that an error calling the webhook is ignored.</p>

Property	Type	Description
<b>matchConditions</b>	<b>array</b>	<p>MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.</p> <p>The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped</p> <p>This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.</p>
<b>matchConditions[]</b>	<b>object</b>	MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Property	Type	Description
<b>matchPolicy</b>	<b>string</b>	<p>matchPolicy defines how the "rules" list is used to match incoming requests. Allowed values are "Exact" or "Equivalent".</p> <ul style="list-style-type: none"> <li>- Exact: match a request only if it exactly matches a specified rule. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, but "rules" only included <b>apiGroups: ["apps"], apiVersions:["v1"], resources: ["deployments"]</b>, a request to apps/v1beta1 or extensions/v1beta1 would not be sent to the webhook.</li> <li>- Equivalent: match a request if modifies a resource listed in rules, even via another API group or version. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, and "rules" only included <b>apiGroups: ["apps"], apiVersions:["v1"], resources: ["deployments"]</b>, a request to apps/v1beta1 or extensions/v1beta1 would be converted to apps/v1 and sent to the webhook.</li> </ul> <p>Defaults to "Equivalent"</p> <p>Possible enum values: - <b>"Equivalent"</b> means requests should be sent to the webhook if they modify a resource listed in rules via another API group or version. - <b>"Exact"</b> means requests should only be sent to the webhook if they exactly match a given rule.</p>

Property	Type	Description
<b>name</b>	<b>string</b>	The name of the admission webhook. Name should be fully qualified, e.g., imagepolicy.kubernetes.io, where "imagepolicy" is the name of the webhook, and kubernetes.io is the name of the organization. Required.
<b>namespaceSelector</b>	<b>LabelSelector</b>	<p>NamespaceSelector decides whether to run the webhook on an object based on whether the namespace for that object matches the selector. If the object itself is a namespace, the matching is performed on object.metadata.labels. If the object is another cluster scoped resource, it never skips the webhook.</p> <p>For example, to run the webhook on any objects whose namespace is not associated with "runlevel" of "0" or "1"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [ { "key": "runlevel", "operator": "NotIn", "values": [ "0", "1" ] } ] }</p> <p>If instead you want to only run the webhook on any objects whose namespace is associated with the "environment" of "prod" or "staging"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [ { "key": "environment", "operator": "In", "values": [ "prod", "staging" ] } ] }</p> <p>See <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/</a> for more examples of label selectors.</p> <p>Default to the empty LabelSelector, which matches everything.</p>

Property	Type	Description
<b>objectSelector</b>	<b>LabelSelector</b>	ObjectSelector decides whether to run the webhook based on if the object has matching labels. objectSelector is evaluated against both the oldObject and newObject that would be sent to the webhook, and is considered to match if either object matches the selector. A null object (oldObject in the case of create, or newObject in the case of delete) or an object that cannot have labels (like a DeploymentRollback or a PodProxyOptions object) is not considered to match. Use the object selector only if the webhook is opt-in, because end users may skip the admission webhook by setting the labels. Default to the empty LabelSelector, which matches everything.

Property	Type	Description
<b>reinvocationPolicy</b>	<b>string</b>	<p>reinvocationPolicy indicates whether this webhook should be called multiple times as part of a single admission evaluation. Allowed values are "Never" and "IfNeeded".</p> <p>Never: the webhook will not be called more than once in a single admission evaluation.</p> <p>IfNeeded: the webhook will be called at least one additional time as part of the admission evaluation if the object being admitted is modified by other admission plugins after the initial webhook call. Webhooks that specify this option <b>must</b> be idempotent, able to process objects they previously admitted.</p> <p>Note: * the number of additional invocations is not guaranteed to be exactly one. * if additional invocations result in further modifications to the object, webhooks are not guaranteed to be invoked again. * webhooks that use this option may be reordered to minimize the number of additional invocations. * to validate an object after all mutations are guaranteed complete, use a validating admission webhook instead.</p> <p>Defaults to "Never".</p> <p>Possible enum values: - <b>"IfNeeded"</b> indicates that the webhook may be called at least one additional time as part of the admission evaluation if the object being admitted is modified by other admission plugins after the initial webhook call. - <b>"Never"</b> indicates that the webhook must not be called more than once in a single admission evaluation.</p>

Property	Type	Description
<b>rules</b>	<b>array</b>	Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches <i>any</i> Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.
<b>rules[]</b>	<b>object</b>	RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Property	Type	Description
<b>sideEffects</b>	<b>string</b>	<p>SideEffects states whether this webhook has side effects. Acceptable values are: None, NoneOnDryRun (webhooks created via v1beta1 may also specify Some or Unknown). Webhooks with side effects MUST implement a reconciliation system, since a request may be rejected by a future step in the admission chain and the side effects therefore need to be undone. Requests with the dryRun attribute will be auto-rejected if they match a webhook with sideEffects == Unknown or Some.</p> <p>Possible enum values: - <b>"None"</b> means that calling the webhook will have no side effects. - <b>"NoneOnDryRun"</b> means that calling the webhook will possibly have side effects, but if the request being reviewed has the dry-run attribute, the side effects will be suppressed. - <b>"Some"</b> means that calling the webhook will possibly have side effects. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail. - <b>"Unknown"</b> means that no information is known about the side effects of calling the webhook. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>TimeoutSeconds specifies the timeout for this webhook. After the timeout passes, the webhook call will be ignored or the API call will fail based on the failure policy. The timeout value must be between 1 and 30 seconds. Default to 10 seconds.</p>

### 30.2.1.3. .webhooks[].clientConfig

#### Description

WebhookClientConfig contains the information to make a TLS connection with the webhook

Type

**object**

Property	Type	Description
<b>caBundle</b>	<b>string</b>	<b>caBundle</b> is a PEM encoded CA bundle which will be used to validate the webhook's server certificate. If unspecified, system trust roots on the apiserver are used.
<b>service</b>	<b>object</b>	ServiceReference holds a reference to Service.legacy.k8s.io

Property	Type	Description
<b>url</b>	<b>string</b>	<p><b>url</b> gives the location of the webhook, in standard URL form (<b>scheme://host:port/path</b>). Exactly one of <b>url</b> or <b>service</b> must be specified.</p> <p>The <b>host</b> should not refer to a service running in the cluster; use the <b>service</b> field instead. The host might be resolved via external DNS in some apiservers (e.g., <b>kube-apiserver</b> cannot resolve in-cluster DNS as that would be a layering violation). <b>host</b> may also be an IP address.</p> <p>Please note that using <b>localhost</b> or <b>127.0.0.1</b> as a <b>host</b> is risky unless you take great care to run this webhook on all hosts which run an apiserver which might need to make calls to this webhook. Such installs are likely to be non-portable, i.e., not easy to turn up in a new cluster.</p> <p>The scheme must be "https"; the URL must begin with "https://".</p> <p>A path is optional, and if present may be any string permissible in a URL. You may use the path to pass an arbitrary string to the webhook, for example, a cluster identifier.</p> <p>Attempting to use a user or basic auth e.g. "user:password@" is not allowed. Fragments ("#...") and query parameters ("?...") are not allowed, either.</p>

#### 30.2.1.4. .webhooks[].clientConfig.service

##### Description

ServiceReference holds a reference to Service.legacy.k8s.io

##### Type

**object**

**Required**

- **namespace**
- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	<b>name</b> is the name of the service. Required
<b>namespace</b>	<b>string</b>	<b>namespace</b> is the namespace of the service. Required
<b>path</b>	<b>string</b>	<b>path</b> is an optional URL path which will be sent in any request to this service.
<b>port</b>	<b>integer</b>	If specified, the port on the service that hosting webhook. Default to 443 for backward compatibility. <b>port</b> should be a valid port number (1-65535, inclusive).

**30.2.1.5. .webhooks[].matchConditions****Description**

MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.

The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped

This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.

**Type**

**array**

**30.2.1.6. .webhooks[].matchConditions[]****Description**

MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

**Type**

**object**

**Required**

- **name**

- **name**
- **expression**

Property	Type	Description
<b>expression</b>	<b>string</b>	<p>Expression represents the expression which will be evaluated by CEL. Must evaluate to bool. CEL expressions have access to the contents of the AdmissionRequest and Authorizer, organized into CEL variables:</p> <p>'object' - The object from the incoming request. The value is null for DELETE requests.</p> <p>'oldObject' - The existing object. The value is null for CREATE requests.</p> <p>'request' - Attributes of the admission request(/pkg/apis/admission/types.go#AdmissionRequest).</p> <p>'authorizer' - A CEL Authorizer. May be used to perform authorization checks for the principal (user or service account) of the request. See <a href="https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authorizer">https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authorizer</a></p> <p>'authorizer.requestResource' - A CEL ResourceCheck constructed from the 'authorizer' and configured with the request resource. Documentation on CEL: <a href="https://kubernetes.io/docs/reference/using-api/cel/">https://kubernetes.io/docs/reference/using-api/cel/</a></p> <p>Required.</p>

Property	Type	Description
<b>name</b>	<b>string</b>	Name is an identifier for this match condition, used for strategic merging of MatchConditions, as well as providing an identifier for logging purposes. A good name should be descriptive of the associated expression. Name must be a qualified name consisting of alphanumeric characters, '-', '_' or '.', and must start and end with an alphanumeric character (e.g. 'MyName', or 'my.name', or '123-abc', regex used for validation is '([A-Za-z0-9][-A-Za-z0-9.]*)?[A-Za-z0-9]!') with an optional DNS subdomain prefix and '/' (e.g. 'example.com/MyName')
		Required.

### 30.2.1.7. .webhooks[].rules

#### Description

Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches *any* Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.

#### Type

**array**

### 30.2.1.8. .webhooks[].rules[]

#### Description

RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

#### Type

**object**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	APIGroups is the API groups the resources belong to. " <b>is all groups. If "</b> is present, the length of the slice must be one. Required.

Property	Type	Description
<b>apiVersions</b>	<b>array (string)</b>	APIVersions is the API versions the resources belong to. <b>" is all versions. If "</b> is present, the length of the slice must be one. Required.
<b>operations</b>	<b>array (string)</b>	Operations is the operations the admission hook cares about - CREATE, UPDATE, DELETE, CONNECT or * for all of those operations and any future admission operations that are added. If '*' is present, the length of the slice must be one. Required.
<b>resources</b>	<b>array (string)</b>	<p>Resources is a list of resources this rule applies to.</p> <p>For example: 'pods' means pods. 'pods/log' means the log subresource of pods. <b>" means all resources, but not subresources. 'pods/' means all subresources of pods. '/scale' means all scale subresources. '/'* means all resources and their subresources.</b></p> <p>If wildcard is present, the validation rule will ensure resources do not overlap with each other.</p> <p>Depending on the enclosing object, subresources might not be allowed. Required.</p>

Property	Type	Description
<b>scope</b>	<b>string</b>	scope specifies the scope of this rule. Valid values are "Cluster", "Namespaced", and "" "Cluster" means that only cluster-scoped resources will match this rule. Namespace API objects are cluster-scoped. "Namespaced" means that only namespaced resources will match this rule. "" means that there are no scope restrictions. Subresources match the scope of their parent resource. Default is "*".

### 30.2.2. API endpoints

The following API endpoints are available:

- **/apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations**
  - **DELETE:** delete collection of MutatingWebhookConfiguration
  - **GET:** list or watch objects of kind MutatingWebhookConfiguration
  - **POST:** create a MutatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations**
  - **GET:** watch individual changes to a list of MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations/{name}**
  - **DELETE:** delete a MutatingWebhookConfiguration
  - **GET:** read the specified MutatingWebhookConfiguration
  - **PATCH:** partially update the specified MutatingWebhookConfiguration
  - **PUT:** replace the specified MutatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations/{name}**
  - **GET:** watch changes to an object of kind MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 30.2.2.1. /apis/admissionregistration.k8s.io/v1/mutatingwebhookconfigurations

Table 30.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

### DELETE

#### Description

delete collection of MutatingWebhookConfiguration

Table 30.2. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>

Parameter	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Table 30.3. Body parameters

Parameter	Type	Description
<b>body</b>	<b>DeleteOptions</b> schema	

Table 30.4. HTTP responses

HTTP code	Reponse body
200 - OK	<b>Status</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind MutatingWebhookConfiguration

**Table 30.5. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 30.6. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">MutatingWebhookConfigurationList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a MutatingWebhookConfiguration

**Table 30.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

202 - Accepted	<a href="#">MutatingWebhookConfiguration</a> schema
401 - Unauthorized	Empty

### 30.2.2.2. /apis/admissionregistration.k8s.io/v1/watch/mutatingwebhookconfigurations

Table 30.10. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

**GET****Description**

watch individual changes to a list of MutatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.

**Table 30.11. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

<b>name</b>	<b>string</b>	name of the MutatingWebhookConfiguration

**Table 30.13. Global query parameters**

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****DELETE****Description**

delete a MutatingWebhookConfiguration

**Table 30.14. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

### 30.3. VALIDATINGWEBHOOKCONFIGURATION [ADMISSIONREGISTRATION.K8S.IO/V1]

#### Description

ValidatingWebhookConfiguration describes the configuration of and admission webhook that accept or reject and object without changing it.

#### Type

**object**

#### 30.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .

Property	Type	Description
<b>webhooks</b>	<b>array</b>	Webhooks is a list of webhooks and the affected resources and operations.
<b>webhooks[]</b>	<b>object</b>	ValidatingWebhook describes an admission webhook and the resources and operations it applies to.

### 30.3.1.1. .webhooks

#### Description

Webhooks is a list of webhooks and the affected resources and operations.

#### Type

**array**

### 30.3.1.2. .webhooks[]

#### Description

ValidatingWebhook describes an admission webhook and the resources and operations it applies to.

#### Type

**object**

#### Required

- **name**
- **clientConfig**
- **sideEffects**
- **admissionReviewVersions**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>admissionReviewVersions</b>	<b>array (string)</b>	AdmissionReviewVersions is an ordered list of preferred <b>AdmissionReview</b> versions the Webhook expects. API server will try to use first version in the list which it supports. If none of the versions specified in this list supported by API server, validation will fail for this object. If a persisted webhook configuration specifies allowed versions and does not include any versions known to the API Server, calls to the webhook will fail and be subject to the failure policy.
<b>clientConfig</b>	<b>object</b>	WebhookClientConfig contains the information to make a TLS connection with the webhook
<b>failurePolicy</b>	<b>string</b>	FailurePolicy defines how unrecognized errors from the admission endpoint are handled - allowed values are Ignore or Fail. Defaults to Fail.  Possible enum values: - <b>"Fail"</b> means that an error calling the webhook causes the admission to fail. - <b>"Ignore"</b> means that an error calling the webhook is ignored.

Property	Type	Description
<b>matchConditions</b>	<b>array</b>	<p>MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.</p> <p>The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped</p> <p>This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.</p>
<b>matchConditions[]</b>	<b>object</b>	MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

Property	Type	Description
<b>matchPolicy</b>	<b>string</b>	<p>matchPolicy defines how the "rules" list is used to match incoming requests. Allowed values are "Exact" or "Equivalent".</p> <ul style="list-style-type: none"> <li>- Exact: match a request only if it exactly matches a specified rule. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, but "rules" only included <b>apiGroups: ["apps"], apiVersions: ["v1"], resources: ["deployments"]</b>, a request to apps/v1beta1 or extensions/v1beta1 would not be sent to the webhook.</li> <li>- Equivalent: match a request if modifies a resource listed in rules, even via another API group or version. For example, if deployments can be modified via apps/v1, apps/v1beta1, and extensions/v1beta1, and "rules" only included <b>apiGroups: ["apps"], apiVersions: ["v1"], resources: ["deployments"]</b>, a request to apps/v1beta1 or extensions/v1beta1 would be converted to apps/v1 and sent to the webhook.</li> </ul> <p>Defaults to "Equivalent"</p> <p>Possible enum values: - <b>"Equivalent"</b> means requests should be sent to the webhook if they modify a resource listed in rules via another API group or version. - <b>"Exact"</b> means requests should only be sent to the webhook if they exactly match a given rule.</p>
<b>name</b>	<b>string</b>	<p>The name of the admission webhook. Name should be fully qualified, e.g., imagepolicy.kubernetes.io, where "imagepolicy" is the name of the webhook, and kubernetes.io is the name of the organization. Required.</p>

Property	Type	Description
<b>namespaceSelector</b>	<b>LabelSelector</b>	<p>NamespaceSelector decides whether to run the webhook on an object based on whether the namespace for that object matches the selector. If the object itself is a namespace, the matching is performed on object.metadata.labels. If the object is another cluster scoped resource, it never skips the webhook.</p> <p>For example, to run the webhook on any objects whose namespace is not associated with "runlevel" of "0" or "1"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [ { "key": "runlevel", "operator": "NotIn", "values": [ "0", "1" ] } ] }</p> <p>If instead you want to only run the webhook on any objects whose namespace is associated with the "environment" of "prod" or "staging"; you will set the selector as follows: "namespaceSelector": { "matchExpressions": [ { "key": "environment", "operator": "In", "values": [ "prod", "staging" ] } ] }</p> <p>See <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels</a> for more examples of label selectors.</p> <p>Default to the empty LabelSelector, which matches everything.</p>

Property	Type	Description
<b>objectSelector</b>	<b>LabelSelector</b>	ObjectSelector decides whether to run the webhook based on if the object has matching labels. objectSelector is evaluated against both the oldObject and newObject that would be sent to the webhook, and is considered to match if either object matches the selector. A null object (oldObject in the case of create, or newObject in the case of delete) or an object that cannot have labels (like a DeploymentRollback or a PodProxyOptions object) is not considered to match. Use the object selector only if the webhook is opt-in, because end users may skip the admission webhook by setting the labels. Default to the empty LabelSelector, which matches everything.
<b>rules</b>	<b>array</b>	Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches <i>any</i> Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.
<b>rules[]</b>	<b>object</b>	RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

Property	Type	Description
<b>sideEffects</b>	<b>string</b>	<p>SideEffects states whether this webhook has side effects. Acceptable values are: None, NoneOnDryRun (webhooks created via v1beta1 may also specify Some or Unknown). Webhooks with side effects MUST implement a reconciliation system, since a request may be rejected by a future step in the admission chain and the side effects therefore need to be undone. Requests with the dryRun attribute will be auto-rejected if they match a webhook with sideEffects == Unknown or Some.</p> <p>Possible enum values: - <b>"None"</b> means that calling the webhook will have no side effects. - <b>"NoneOnDryRun"</b> means that calling the webhook will possibly have side effects, but if the request being reviewed has the dry-run attribute, the side effects will be suppressed. - <b>"Some"</b> means that calling the webhook will possibly have side effects. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail. - <b>"Unknown"</b> means that no information is known about the side effects of calling the webhook. If a request with the dry-run attribute would trigger a call to this webhook, the request will instead fail.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>TimeoutSeconds specifies the timeout for this webhook. After the timeout passes, the webhook call will be ignored or the API call will fail based on the failure policy. The timeout value must be between 1 and 30 seconds. Default to 10 seconds.</p>

### 30.3.1.3. .webhooks[].clientConfig

#### Description

WebhookClientConfig contains the information to make a TLS connection with the webhook

Type

**object**

Property	Type	Description
<b>caBundle</b>	<b>string</b>	<b>caBundle</b> is a PEM encoded CA bundle which will be used to validate the webhook's server certificate. If unspecified, system trust roots on the apiserver are used.
<b>service</b>	<b>object</b>	ServiceReference holds a reference to Service.legacy.k8s.io

Property	Type	Description
<b>url</b>	<b>string</b>	<p><b>url</b> gives the location of the webhook, in standard URL form (<b>scheme://host:port/path</b>). Exactly one of <b>url</b> or <b>service</b> must be specified.</p> <p>The <b>host</b> should not refer to a service running in the cluster; use the <b>service</b> field instead. The host might be resolved via external DNS in some apiservers (e.g., <b>kube-apiserver</b> cannot resolve in-cluster DNS as that would be a layering violation). <b>host</b> may also be an IP address.</p> <p>Please note that using <b>localhost</b> or <b>127.0.0.1</b> as a <b>host</b> is risky unless you take great care to run this webhook on all hosts which run an apiserver which might need to make calls to this webhook. Such installs are likely to be non-portable, i.e., not easy to turn up in a new cluster.</p> <p>The scheme must be "https"; the URL must begin with "https://".</p> <p>A path is optional, and if present may be any string permissible in a URL. You may use the path to pass an arbitrary string to the webhook, for example, a cluster identifier.</p> <p>Attempting to use a user or basic auth e.g. "user:password@" is not allowed. Fragments ("#...") and query parameters ("?...") are not allowed, either.</p>

#### 30.3.1.4. .webhooks[].clientConfig.service

##### Description

ServiceReference holds a reference to Service.legacy.k8s.io

##### Type

**object**

**Required**

- **namespace**
- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	<b>name</b> is the name of the service. Required
<b>namespace</b>	<b>string</b>	<b>namespace</b> is the namespace of the service. Required
<b>path</b>	<b>string</b>	<b>path</b> is an optional URL path which will be sent in any request to this service.
<b>port</b>	<b>integer</b>	If specified, the port on the service that hosting webhook. Default to 443 for backward compatibility. <b>port</b> should be a valid port number (1-65535, inclusive).

**30.3.1.5. .webhooks[].matchConditions****Description**

MatchConditions is a list of conditions that must be met for a request to be sent to this webhook. Match conditions filter requests that have already been matched by the rules, namespaceSelector, and objectSelector. An empty list of matchConditions matches all requests. There are a maximum of 64 match conditions allowed.

The exact matching logic is (in order): 1. If ANY matchCondition evaluates to FALSE, the webhook is skipped. 2. If ALL matchConditions evaluate to TRUE, the webhook is called. 3. If any matchCondition evaluates to an error (but none are FALSE): - If failurePolicy=Fail, reject the request - If failurePolicy=Ignore, the error is ignored and the webhook is skipped

This is an alpha feature and managed by the AdmissionWebhookMatchConditions feature gate.

**Type**

**array**

**30.3.1.6. .webhooks[].matchConditions[]****Description**

MatchCondition represents a condition which must be fulfilled for a request to be sent to a webhook.

**Type**

**object**

**Required**

- **name**

- **name**
- **expression**

Property	Type	Description
<b>expression</b>	<b>string</b>	<p>Expression represents the expression which will be evaluated by CEL. Must evaluate to bool. CEL expressions have access to the contents of the AdmissionRequest and Authorizer, organized into CEL variables:</p> <p>'object' - The object from the incoming request. The value is null for DELETE requests.</p> <p>'oldObject' - The existing object. The value is null for CREATE requests.</p> <p>'request' - Attributes of the admission request (/pkg/apis/admission/types.go#AdmissionRequest).</p> <p>'authorizer' - A CEL Authorizer. May be used to perform authorization checks for the principal (user or service account) of the request. See <a href="https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authorizer">https://pkg.go.dev/k8s.io/apiserver/pkg/cel/library#Authorizer</a></p> <p>'authorizer.requestResource' - A CEL ResourceCheck constructed from the 'authorizer' and configured with the request resource. Documentation on CEL: <a href="https://kubernetes.io/docs/reference/using-api/cel/">https://kubernetes.io/docs/reference/using-api/cel/</a></p> <p>Required.</p>

Property	Type	Description
<b>name</b>	<b>string</b>	Name is an identifier for this match condition, used for strategic merging of MatchConditions, as well as providing an identifier for logging purposes. A good name should be descriptive of the associated expression. Name must be a qualified name consisting of alphanumeric characters, '-', '_' or '.', and must start and end with an alphanumeric character (e.g. 'MyName', or 'my.name', or '123-abc', regex used for validation is '([A-Za-z0-9](- _ \.)*)?[A-Za-z0-9]!') with an optional DNS subdomain prefix and '/' (e.g. 'example.com/MyName')
		Required.

### 30.3.1.7. .webhooks[].rules

#### Description

Rules describes what operations on what resources/subresources the webhook cares about. The webhook cares about an operation if it matches *any* Rule. However, in order to prevent ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks from putting the cluster in a state which cannot be recovered from without completely disabling the plugin, ValidatingAdmissionWebhooks and MutatingAdmissionWebhooks are never called on admission requests for ValidatingWebhookConfiguration and MutatingWebhookConfiguration objects.

#### Type

**array**

### 30.3.1.8. .webhooks[].rules[]

#### Description

RuleWithOperations is a tuple of Operations and Resources. It is recommended to make sure that all the tuple expansions are valid.

#### Type

**object**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	APIGroups is the API groups the resources belong to. " <b>is all groups. If "</b> is present, the length of the slice must be one. Required.

Property	Type	Description
<b>apiVersions</b>	<b>array (string)</b>	APIVersions is the API versions the resources belong to. <b>" is all versions. If "</b> is present, the length of the slice must be one. Required.
<b>operations</b>	<b>array (string)</b>	Operations is the operations the admission hook cares about - CREATE, UPDATE, DELETE, CONNECT or * for all of those operations and any future admission operations that are added. If '*' is present, the length of the slice must be one. Required.
<b>resources</b>	<b>array (string)</b>	<p>Resources is a list of resources this rule applies to.</p> <p>For example: 'pods' means pods. 'pods/log' means the log subresource of pods. <b>" means all resources, but not subresources. 'pods/' means all subresources of pods. '/scale' means all scale subresources. '/'* means all resources and their subresources.</b></p> <p>If wildcard is present, the validation rule will ensure resources do not overlap with each other.</p> <p>Depending on the enclosing object, subresources might not be allowed. Required.</p>

Property	Type	Description
<b>scope</b>	<b>string</b>	scope specifies the scope of this rule. Valid values are "Cluster", "Namespaced", and "" "Cluster" means that only cluster-scoped resources will match this rule. Namespace API objects are cluster-scoped. "Namespaced" means that only namespaced resources will match this rule. "" means that there are no scope restrictions. Subresources match the scope of their parent resource. Default is "*".

### 30.3.2. API endpoints

The following API endpoints are available:

- **/apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations**
  - **DELETE:** delete collection of ValidatingWebhookConfiguration
  - **GET:** list or watch objects of kind ValidatingWebhookConfiguration
  - **POST:** create a ValidatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations**
  - **GET:** watch individual changes to a list of ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations/{name}**
  - **DELETE:** delete a ValidatingWebhookConfiguration
  - **GET:** read the specified ValidatingWebhookConfiguration
  - **PATCH:** partially update the specified ValidatingWebhookConfiguration
  - **PUT:** replace the specified ValidatingWebhookConfiguration
- **/apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations/{name}**
  - **GET:** watch changes to an object of kind ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 30.3.2.1. /apis/admissionregistration.k8s.io/v1/validatingwebhookconfigurations

Table 30.27. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**DELETE**

Description

delete collection of ValidatingWebhookConfiguration

Table 30.28. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

**HTTP method****GET****Description**

list or watch objects of kind ValidatingWebhookConfiguration

**Table 30.31. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. 401 - Unauthorized	Empty

HTTP method

**POST****Description**

create a ValidatingWebhookConfiguration

**Table 30.33. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 30.43. HTTP responses

HTTP code	Response body
200 - OK	<b>ValidatingWebhookConfiguration</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified ValidatingWebhookConfiguration

**Table 30.44. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

### 30.3.2.4. /apis/admissionregistration.k8s.io/v1/watch/validatingwebhookconfigurations/{name}

Table 30.50. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ValidatingWebhookConfiguration

Table 30.51. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ValidatingWebhookConfiguration. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
