## Abstract

This document provides details about the REST API functions in MicroShift.

# Table of Contents

<b>CHAPTER 1. UNDERSTANDING API TIERS</b> .....	<b>50</b>
1.1. API TIERS	50
API tier 1	50
API tier 2	50
API tier 3	50
API tier 4	50
1.2. MAPPING API TIERS TO API GROUPS	50
1.2.1. Support for Kubernetes API groups	51
1.2.2. Support for OpenShift API groups	51
1.3. API DEPRECATION POLICY	51
1.3.1. Deprecating parts of the API	51
1.3.2. Deprecating CLI elements	52
1.3.3. Deprecating an entire component	53
<b>CHAPTER 2. UNDERSTANDING API COMPATIBILITY GUIDELINES</b> .....	<b>54</b>
2.1. API COMPATIBILITY GUIDELINES	54
2.2. API COMPATIBILITY EXCEPTIONS	55
Functional defaults between an upgraded cluster and a new installation	55
Usage of API fields that have the prefix "unsupported" or undocumented annotations	55
API availability per product installation topology	55
2.3. API COMPATIBILITY COMMON TERMINOLOGY	55
2.3.1. Application Programming Interface (API)	55
2.3.2. Application Operating Environment (AOE)	55
2.3.3. Compatibility in a virtualized environment	56
2.3.4. Compatibility in a cloud environment	56
2.3.5. Major, minor, and z-stream releases	56
2.3.6. Extended user support (EUS)	56
2.3.7. Developer Preview	56
2.3.8. Technology Preview	57
<b>CHAPTER 3. API INDEX</b> .....	<b>58</b>
<b>CHAPTER 4. API OBJECT REFERENCE</b> .....	<b>61</b>
4.1. COMMON OBJECT REFERENCE	61
4.1.1. io.k8s.api.admissionregistration.v1.MutatingWebhookConfigurationList schema	61
Schema	61
4.1.2. io.k8s.api.admissionregistration.v1.ValidatingWebhookConfigurationList schema	62
Schema	62
4.1.3. io.k8s.api.apps.v1.ControllerRevisionList schema	63
Schema	63
4.1.4. io.k8s.api.apps.v1.DaemonSetList schema	64
Schema	64
4.1.5. io.k8s.api.apps.v1.DeploymentList schema	65
Schema	65
4.1.6. io.k8s.api.apps.v1.ReplicaSetList schema	66
Schema	66
4.1.7. io.k8s.api.apps.v1.StatefulSetList schema	66
Schema	67
4.1.8. io.k8s.api.autoscaling.v2.HorizontalPodAutoscalerList schema	67
Schema	68
4.1.9. io.k8s.api.batch.v1.CronJobList schema	68
Schema	68

---

4.1.10. io.k8s.api.batch.v1.JobList schema	69
Schema	69
4.1.11. io.k8s.api.certificates.v1.CertificateSigningRequestList schema	70
Schema	70
4.1.12. io.k8s.api.coordination.v1.LeaseList schema	71
Schema	71
4.1.13. io.k8s.api.core.v1.Affinity schema	72
Schema	72
4.1.14. io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource schema	73
Schema	73
4.1.15. io.k8s.api.core.v1.AzureDiskVolumeSource schema	74
Schema	74
4.1.16. io.k8s.api.core.v1.AzureFilePersistentVolumeSource schema	75
Schema	75
4.1.17. io.k8s.api.core.v1.AzureFileVolumeSource schema	76
Schema	76
4.1.18. io.k8s.api.core.v1.Capabilities schema	76
Schema	77
4.1.19. io.k8s.api.core.v1.CephFSPersistentVolumeSource schema	77
Schema	77
4.1.20. io.k8s.api.core.v1.CephFSVolumeSource schema	78
Schema	78
4.1.21. io.k8s.api.core.v1.CinderPersistentVolumeSource schema	79
Schema	79
4.1.22. io.k8s.api.core.v1.CinderVolumeSource schema	80
Schema	80
4.1.23. io.k8s.api.core.v1.ClaimSource schema	81
Schema	81
4.1.24. io.k8s.api.core.v1.ComponentStatusList schema	82
Schema	82
4.1.25. io.k8s.api.core.v1.ConfigMapEnvSource schema	83
Schema	83
4.1.26. io.k8s.api.core.v1.ConfigMapKeySelector schema	84
Schema	84
4.1.27. io.k8s.api.core.v1.ConfigMapList schema	84
Schema	84
4.1.28. io.k8s.api.core.v1.ConfigMapProjection schema	85
Schema	85
4.1.29. io.k8s.api.core.v1.ConfigMapVolumeSource schema	86
Schema	86
4.1.30. io.k8s.api.core.v1.Container schema	87
Schema	88

# CHAPTER 1. UNDERSTANDING API TIERS

## IMPORTANT

This guidance does not cover layered Red Hat build of MicroShift offerings.

Red Hat requests that application developers validate that any behavior they depend on is explicitly defined in the formal API documentation to prevent introducing dependencies on unspecified implementation-specific behavior or dependencies on bugs in a particular implementation of an API. For example, new releases of an ingress router may not be compatible with older releases if an application uses an undocumented API or relies on undefined behavior.

## 1.1. API TIERS

All commercially supported APIs, components, and features are associated under one of the following support levels:

### API tier 1

APIs and application operating environments (AOEs) are stable within a major release. They may be deprecated within a major release, but they will not be removed until a subsequent major release.

### API tier 2

APIs and AOEs are stable within a major release for a minimum of 9 months or 3 minor releases from the announcement of deprecation, whichever is longer.

### API tier 3

This level applies to languages, tools, applications, and optional Operators included with Red Hat build of MicroShift through Operator Hub. Each component will specify a lifetime during which the API and AOE will be supported. Newer versions of language runtime specific components will attempt to be as API and AOE compatible from minor version to minor version as possible. Minor version to minor version compatibility is not guaranteed, however.

Components and developer tools that receive continuous updates through the Operator Hub, referred to as Operators and operands, should be considered API tier 3. Developers should use caution and understand how these components may change with each minor release. Users are encouraged to consult the compatibility guidelines documented by the component.

### API tier 4

No compatibility is provided. API and AOE can change at any point. These capabilities should not be used by applications needing long-term support.

It is common practice for Operators to use custom resource definitions (CRDs) internally to accomplish a task. These objects are not meant for use by actors external to the Operator and are intended to be hidden. If any CRD is not meant for use by actors external to the Operator, the **operators.operatorframework.io/internal-objects** annotation in the Operators **ClusterServiceVersion** (CSV) should be specified to signal that the corresponding resource is internal use only and the CRD may be explicitly labeled as tier 4.

## 1.2. MAPPING API TIERS TO API GROUPS

For each API tier defined by Red Hat, we provide a mapping table for specific API groups where the upstream communities are committed to maintain forward compatibility. Any API group that does not specify an explicit compatibility level and is not specifically discussed below is assigned API tier 3 by default except for **v1alpha1** APIs which are assigned tier 4 by default.

### 1.2.1. Support for Kubernetes API groups

API groups that end with the suffix **\*.k8s.io** or have the form **version.<name>** with no suffix are governed by the Kubernetes deprecation policy and follow a general mapping between API version exposed and corresponding support tier unless otherwise specified.

API version example	API tier
<b>v1</b>	Tier 1
<b>v1beta1</b>	Tier 2
<b>v1alpha1</b>	Tier 4

### 1.2.2. Support for OpenShift API groups

API groups that end with the suffix **\*.openshift.io** are governed by the Red Hat build of MicroShift deprecation policy and follow a general mapping between API version exposed and corresponding compatibility level unless otherwise specified.

API version example	API tier
<b>route.openshift.io/v1</b>	Tier 1
<b>security.openshift.io/v1</b>	Tier 1 except for <b>RangeAllocation</b> (tier 4) and <b>*Reviews</b> (tier 2)

## 1.3. API DEPRECATION POLICY

Red Hat build of MicroShift is composed of many components sourced from many upstream communities. It is anticipated that the set of components, the associated API interfaces, and correlated features will evolve over time and might require formal deprecation in order to remove the capability.

### 1.3.1. Deprecating parts of the API

Red Hat build of MicroShift is a distributed system where multiple components interact with a shared state managed by the cluster control plane through a set of structured APIs. Per Kubernetes conventions, each API presented by Red Hat build of MicroShift is associated with a group identifier and each API group is independently versioned. Each API group is managed in a distinct upstream community including Kubernetes, Metal3, Multus, Operator Framework, Open Cluster Management, OpenShift itself, and more.

While each upstream community might define their own unique deprecation policy for a given API group and version, Red Hat normalizes the community specific policy to one of the compatibility levels defined prior based on our integration in and awareness of each upstream community to simplify end-user consumption and support.

The deprecation policy and schedule for APIs vary by compatibility level.

The deprecation policy covers all elements of the API including:

- REST resources, also known as API objects
- Fields of REST resources
- Annotations on REST resources, excluding version-specific qualifiers
- Enumerated or constant values

Other than the most recent API version in each group, older API versions must be supported after their announced deprecation for a duration of no less than:

API tier	Duration
Tier 1	Stable within a major release. They may be deprecated within a major release, but they will not be removed until a subsequent major release.
Tier 2	9 months or 3 releases from the announcement of deprecation, whichever is longer.
Tier 3	See the component-specific schedule.
Tier 4	None. No compatibility is guaranteed.

The following rules apply to all tier 1 APIs:

- API elements can only be removed by incrementing the version of the group.
- API objects must be able to round-trip between API versions without information loss, with the exception of whole REST resources that do not exist in some versions. In cases where equivalent fields do not exist between versions, data will be preserved in the form of annotations during conversion.
- API versions in a given group can not deprecate until a new API version at least as stable is released, except in cases where the entire API object is being removed.

### 1.3.2. Deprecating CLI elements

Client-facing CLI commands are not versioned in the same way as the API, but are user-facing component systems. The two major ways a user interacts with a CLI are through a command or flag, which is referred to in this context as CLI elements.

All CLI elements default to API tier 1 unless otherwise noted or the CLI depends on a lower tier API.

	Element	API tier
Generally available (GA)	Flags and commands	Tier 1
Technology Preview	Flags and commands	Tier 3
Developer Preview	Flags and commands	Tier 4

### 1.3.3. Deprecating an entire component

The duration and schedule for deprecating an entire component maps directly to the duration associated with the highest API tier of an API exposed by that component. For example, a component that surfaced APIs with tier 1 and 2 could not be removed until the tier 1 deprecation schedule was met.

API tier	Duration
Tier 1	Stable within a major release. They may be deprecated within a major release, but they will not be removed until a subsequent major release.
Tier 2	9 months or 3 releases from the announcement of deprecation, whichever is longer.
Tier 3	See the component-specific schedule.
Tier 4	None. No compatibility is guaranteed.

## CHAPTER 2. UNDERSTANDING API COMPATIBILITY GUIDELINES

Follow the compatibility guidelines to understand the APIs enabled for Red Hat build of MicroShift.

### IMPORTANT

This guidance does not cover layered Red Hat build of MicroShift offerings.

### 2.1. API COMPATIBILITY GUIDELINES

Red Hat recommends that application developers adopt the following principles in order to improve compatibility with Red Hat build of MicroShift:

- Use APIs and components with support tiers that match the application's need.
- Build applications using the published client libraries where possible.
- Applications are only guaranteed to run correctly if they execute in an environment that is as new as the environment it was built to execute against. An application that was built for Red Hat build of MicroShift 4.14 is not guaranteed to function properly on Red Hat build of MicroShift 4.13.
- Do not design applications that rely on configuration files provided by system packages or other components. These files can change between versions unless the upstream community is explicitly committed to preserving them. Where appropriate, depend on any Red Hat provided interface abstraction over those configuration files in order to maintain forward compatibility. Direct file system modification of configuration files is discouraged, and users are strongly encouraged to integrate with an Operator provided API where available to avoid dual-writer conflicts.
- Do not depend on API fields prefixed with **unsupported<FieldName>** or annotations that are not explicitly mentioned in product documentation.
- Do not depend on components with shorter compatibility guarantees than your application.
- Do not perform direct storage operations on the etcd server. All etcd access must be performed via the api-server or through documented backup and restore procedures.

Red Hat recommends that application developers follow the [compatibility guidelines](#) defined by Red Hat Enterprise Linux (RHEL). Red Hat build of MicroShift strongly recommends the following guidelines when building an application or hosting an application on the platform:

- Do not depend on a specific Linux kernel or Red Hat build of MicroShift version.
- Avoid reading from **proc**, **sys**, and **debug** file systems, or any other pseudo file system.
- Avoid using **ioctl**s to directly interact with hardware.
- Avoid direct interaction with **cgroups** in order to not conflict with Red Hat build of MicroShift host-agents that provide the container execution environment.

**NOTE**

During the lifecycle of a release, Red Hat makes commercially reasonable efforts to maintain API and application operating environment (AOE) compatibility across all minor releases and z-stream releases. If necessary, Red Hat might make exceptions to this compatibility goal for critical impact security or other significant issues.

## 2.2. API COMPATIBILITY EXCEPTIONS

The following are exceptions to compatibility in Red Hat build of MicroShift:

### Functional defaults between an upgraded cluster and a new installation

No assurances are made at this time that a new installation of a product minor release will have the same functional defaults as a version of the product that was installed with a prior minor release and upgraded to the equivalent version. For example, future versions of the product may provision cloud infrastructure with different defaults than prior minor versions. In addition, different default security choices may be made in future versions of the product than those made in past versions of the product. Past versions of the product will forward upgrade, but preserve legacy choices where appropriate specifically to maintain backwards compatibility.

### Usage of API fields that have the prefix "unsupported" or undocumented annotations

Select APIs in the product expose fields with the prefix **unsupported<FieldName>**. No assurances are made at this time that usage of this field is supported across releases or within a release. Product support can request a customer to specify a value in this field when debugging specific problems, but its usage is not supported outside of that interaction. Usage of annotations on objects that are not explicitly documented are not assured support across minor releases.

### API availability per product installation topology

The OpenShift distribution will continue to evolve its supported installation topology, and not all APIs in one install topology will necessarily be included in another. For example, certain topologies may restrict read/write access to particular APIs if they are in conflict with the product installation topology or not include a particular API at all if not pertinent to that topology. APIs that exist in a given topology will be supported in accordance with the compatibility tiers defined above.

## 2.3. API COMPATIBILITY COMMON TERMINOLOGY

### 2.3.1. Application Programming Interface (API)

An API is a public interface implemented by a software program that enables it to interact with other software. In Red Hat build of MicroShift, the API is served from a centralized API server and is used as the hub for all system interaction.

### 2.3.2. Application Operating Environment (AOE)

An AOE is the integrated environment that executes the end-user application program. The AOE is a containerized environment that provides isolation from the host operating system (OS). At a minimum, AOE allows the application to run in an isolated manner from the host OS libraries and binaries, but still share the same OS kernel as all other containers on the host. The AOE is enforced at runtime and it describes the interface between an application and its operating environment. It includes intersection points between the platform, operating system and environment, with the user application including projection of downward API, DNS, resource accounting, device access, platform workload identity, isolation among containers, isolation between containers and host OS.

The AOE does not include components that might vary by installation, such as Container Network

Interface (CNI) plugin selection or extensions to the product such as admission hooks. Components that integrate with the cluster at a level below the container environment might be subjected to additional variation between versions.

### 2.3.3. Compatibility in a virtualized environment

Virtual environments emulate bare-metal environments such that unprivileged applications that run on bare-metal environments will run, unmodified, in corresponding virtual environments. Virtual environments present simplified abstracted views of physical resources, so some differences might exist.

### 2.3.4. Compatibility in a cloud environment

Red Hat build of MicroShift might choose to offer integration points with a hosting cloud environment via cloud provider specific integrations. The compatibility of these integration points are specific to the guarantee provided by the native cloud vendor and its intersection with the Red Hat build of MicroShift compatibility window. Where Red Hat build of MicroShift provides an integration with a cloud environment natively as part of the default installation, Red Hat develops against stable cloud API endpoints to provide commercially reasonable support with forward looking compatibility that includes stable deprecation policies. Example areas of integration between the cloud provider and Red Hat build of MicroShift include, but are not limited to, dynamic volume provisioning, service load balancer integration, pod workload identity, dynamic management of compute, and infrastructure provisioned as part of initial installation.

### 2.3.5. Major, minor, and z-stream releases

A Red Hat major release represents a significant step in the development of a product. Minor releases appear more frequently within the scope of a major release and represent deprecation boundaries that might impact future application compatibility. A z-stream release is an update to a minor release which provides a stream of continuous fixes to an associated minor release. API and AOE compatibility is never broken in a z-stream release except when this policy is explicitly overridden in order to respond to an unforeseen security impact.

For example, in the release 4.13.2:

- 4 is the major release version
- 13 is the minor release version
- 2 is the z-stream release version

### 2.3.6. Extended user support (EUS)

A minor release in an Red Hat build of MicroShift major release that has an extended support window for critical bug fixes. Users are able to migrate between EUS releases by incrementally adopting minor versions between EUS releases. It is important to note that the deprecation policy is defined across minor releases and not EUS releases. As a result, an EUS user might have to respond to a deprecation when migrating to a future EUS while sequentially upgrading through each minor release.

### 2.3.7. Developer Preview

An optional product capability that is not officially supported by Red Hat, but is intended to provide a mechanism to explore early phase technology. By default, Developer Preview functionality is opt-in, and subject to removal at any time. Enabling a Developer Preview feature might render a cluster unsupported dependent upon the scope of the feature.

### 2.3.8. Technology Preview

An optional product capability that provides early access to upcoming product innovations to test functionality and provide feedback during the development process. The feature is not fully supported, might not be functionally complete, and is not intended for production use. Usage of a Technology Preview function requires explicit opt-in. Learn more about the [Technology Preview Features Support Scope](#).

## CHAPTER 4. API OBJECT REFERENCE

### 4.1. COMMON OBJECT REFERENCE

#### 4.1.1. io.k8s.api.admissionregistration.v1.MutatingWebhookConfigurationList schema

##### Description

MutatingWebhookConfigurationList is a list of MutatingWebhookConfiguration.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (MutatingWebhookConfiguration)</b>	List of MutatingWebhookConfiguration.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<a href="#">ListMeta</a>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.2. io.k8s.api.admissionregistration.v1.ValidatingWebhookConfigurationList schema

##### Description

ValidatingWebhookConfigurationList is a list of ValidatingWebhookConfiguration.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ValidatingWebhookConfiguration)</b>	List of ValidatingWebhookConfiguration.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<a href="#">ListMeta</a>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

### 4.1.3. io.k8s.api.apps.v1.ControllerRevisionList schema

#### Description

ControllerRevisionList is a resource containing a list of ControllerRevision objects.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ControllerRevision)</b>	Items is the list of ControllerRevisions
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<a href="#">ListMeta</a>	More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.4. io.k8s.api.apps.v1.DaemonSetList schema

##### Description

DaemonSetList is a collection of daemon sets.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (DaemonSet)</b>	A list of daemon sets.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<a href="#">ListMeta</a>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.5. io.k8s.api.apps.v1.DeploymentList schema

##### Description

DeploymentList is a list of Deployments.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<a href="#">array (Deployment)</a>	Items is the list of Deployments.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<a href="#">ListMeta</a>	Standard list metadata.

## 4.1.6. io.k8s.api.apps.v1.ReplicaSetList schema

### Description

ReplicaSetList is a collection of ReplicaSets.

### Type

**object**

### Required

- **items**

### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ReplicaSet)</b>	List of ReplicaSets. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

## 4.1.7. io.k8s.api.apps.v1.StatefulSetList schema

### Description

StatefulSetList is a collection of StatefulSets.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (StatefulSet)</b>	Items is the list of stateful sets.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

### 4.1.8. io.k8s.api.autoscaling.v2.HorizontalPodAutoscalerList schema

#### Description

HorizontalPodAutoscalerList is a list of horizontal pod autoscaler objects.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array</b> ( <a href="#">HorizontalPodAutoscaler</a> )	items is the list of horizontal pod autoscaler objects.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<a href="#">ListMeta</a>	metadata is the standard list metadata.

#### 4.1.9. io.k8s.api.batch.v1.CronJobList schema

##### Description

CronJobList is a collection of cron jobs.

##### Type

**object**

##### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (CronJob)</b>	items is the list of CronJobs.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.10. io.k8s.api.batch.v1.JobList schema

##### Description

JobList is a collection of jobs.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Job)</b>	items is the list of Jobs.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.11. io.k8s.api.certificates.v1.CertificateSigningRequestList schema

##### Description

CertificateSigningRequestList is a collection of CertificateSigningRequest objects

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array</b> <b>(CertificateSigningRequest)</b>	items is a collection of CertificateSigningRequest objects
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	

#### 4.1.12. io.k8s.api.coordination.v1.LeaseList schema

##### Description

LeaseList is a list of Lease objects.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Lease)</b>	items is a list of schema objects.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.13. io.k8s.api.core.v1.Affinity schema

##### Description

Affinity is a group of affinity scheduling rules.

##### Type

**object**

##### Schema

Property	Type	Description
<b>nodeAffinity</b>	<b>NodeAffinity</b>	Describes node affinity scheduling rules for the pod.
<b>podAffinity</b>	<b>PodAffinity</b>	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).

Property	Type	Description
<b>podAntiAffinity</b>	<b>PodAntiAffinity</b>	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

#### 4.1.14. io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource schema

##### Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly value true will force the readOnly setting in VolumeMounts. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>volumeID</b>	<b>string</b>	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

#### 4.1.15. io.k8s.api.core.v1.AzureDiskVolumeSource schema

##### Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **diskName**
- **diskURI**

##### Schema

Property	Type	Description
<b>cachingMode</b>	<b>string</b>	cachingMode is the Host Caching mode: None, Read Only, Read Write.  Possible enum values: - <b>"None"</b> - <b>"ReadOnly"</b> - <b>"ReadWrite"</b>
<b>diskName</b>	<b>string</b>	diskName is the Name of the data disk in the blob storage
<b>diskURI</b>	<b>string</b>	diskURI is the URI of data disk in the blob storage

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>kind</b>	<b>string</b>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared  Possible enum values: - <b>"Dedicated"</b> - <b>"Managed"</b> - <b>"Shared"</b>
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

#### 4.1.16. io.k8s.api.core.v1.AzureFilePersistentVolumeSource schema

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

##### Schema

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

Property	Type	Description
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>secretNamespace</b>	<b>string</b>	secretNamespace is the namespace of the secret that contains Azure Storage Account Name and Key default is the same as the Pod
<b>shareName</b>	<b>string</b>	shareName is the azure Share Name

#### 4.1.17. io.k8s.api.core.v1.AzureFileVolumeSource schema

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

##### Schema

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>shareName</b>	<b>string</b>	shareName is the azure share Name

#### 4.1.18. io.k8s.api.core.v1.Capabilities schema

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

## Schema

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities
<b>drop</b>	<b>array (string)</b>	Removed capabilities

**4.1.19. io.k8s.api.core.v1.CephFSPersistentVolumeSource schema**

## Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

## Type

**object**

## Required

- **monitors**

## Schema

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
<b>secretRef</b>	<b>SecretReference</b>	secretRef is Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>user</b>	<b>string</b>	user is Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 4.1.20. io.k8s.api.core.v1.CephFSVolumeSource schema

##### Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**

##### Schema

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef is Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>user</b>	<b>string</b>	user is optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 4.1.21. io.k8s.api.core.v1.CinderPersistentVolumeSource schema

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>SecretReference</b>	secretRef is Optional: points to a secret object containing parameters used to connect to OpenStack.
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 4.1.22. io.k8s.api.core.v1.CinderVolumeSource schema

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef is optional: points to a secret object containing parameters used to connect to OpenStack.
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 4.1.23. io.k8s.api.core.v1.ClaimSource schema

##### Description

ClaimSource describes a reference to a ResourceClaim.

Exactly one of these fields should be set. Consumers of this type must treat an empty object as if it has an unknown value.

##### Type

**object**

##### Schema

Property	Type	Description
<b>resourceClaimName</b>	<b>string</b>	ResourceClaimName is the name of a ResourceClaim object in the same namespace as this pod.

Property	Type	Description
<b>resourceClaimTemplateName</b>	<b>string</b>	<p>ResourceClaimTemplateName is the name of a ResourceClaimTemplate object in the same namespace as this pod.</p> <p>The template will be used to create a new ResourceClaim, which will be bound to this pod. When this pod is deleted, the ResourceClaim will also be deleted. The name of the ResourceClaim will be &lt;pod name&gt;-&lt;resource name&gt;, where &lt;resource name&gt; is the PodResourceClaim.Name. Pod validation will reject the pod if the concatenated name is not valid for a ResourceClaim (e.g. too long).</p> <p>An existing ResourceClaim with that name that is not owned by the pod will not be used for the pod to avoid using an unrelated resource by mistake. Scheduling and pod startup are then blocked until the unrelated ResourceClaim is removed.</p> <p>This field is immutable and no changes will be made to the corresponding ResourceClaim by the control plane after creating the ResourceClaim.</p>

#### 4.1.24. io.k8s.api.core.v1.ComponentStatusList schema

##### Description

Status of all the conditions for the component as a list of ComponentStatus objects. Deprecated: This API is deprecated in v1.19+

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ComponentStatus)</b>	List of ComponentStatus objects.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.25. io.k8s.api.core.v1.ConfigMapEnvSource schema

##### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

##### Type

**object**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Property	Type	Description
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 4.1.26. io.k8s.api.core.v1.ConfigMapKeySelector schema

##### Description

Selects a key from a ConfigMap.

##### Type

**object**

##### Required

- **key**

##### Schema

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 4.1.27. io.k8s.api.core.v1.ConfigMapList schema

##### Description

ConfigMapList is a resource containing a list of ConfigMap objects.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ConfigMap)</b>	Items is the list of ConfigMaps.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.28. io.k8s.api.core.v1.ConfigMapProjection schema

##### Description

Adapts a ConfigMap into a projected volume.

The contents of the target ConfigMap's Data field will be presented in a projected volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. Note that this is identical to a configmap volume source without the default mode.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>items</b>	<b>array (KeyToPath)</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

#### 4.1.29. io.k8s.api.core.v1.ConfigMapVolumeSource schema

##### Description

Adapts a ConfigMap into a volume.

The contents of the target ConfigMap's Data field will be presented in a volume as files using the keys in the Data field as the file names, unless the items element is populated with specific mappings of keys to paths. ConfigMap volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array (KeyToPath)</b>	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional specify whether the ConfigMap or its keys must be defined

### 4.1.30. io.k8s.api.core.v1.Container schema

#### Description

A single application container that you want to run within a pod.

#### Type

**object**

#### Required

- **name**

## Schema

Property	Type	Description
<b>args</b>	<b>array (string)</b>	Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
<b>command</b>	<b>array (string)</b>	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
<b>env</b>	<b>array (EnvVar)</b>	List of environment variables to set in the container. Cannot be updated.

Property	Type	Description
<b>envFrom</b>	<b>array (EnvFromSource)</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
<b>imagePullPolicy</b>	<b>string</b>	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>  Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
<b>lifecycle</b>	<b>Lifecycle</b>	Actions that the management system should take in response to container lifecycle events. Cannot be updated.

Property	Type	Description
<b>livenessProbe</b>	<b>Probe</b>	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>name</b>	<b>string</b>	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
<b>ports</b>	<b>array (ContainerPort)</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>readinessProbe</b>	<b>Probe</b>	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>resizePolicy</b>	<b>array (ContainerResizePolicy)</b>	Resources resize policy for the container.
<b>resources</b>	<b>ResourceRequirements</b>	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>securityContext</b>	<b>SecurityContext</b>	SecurityContext defines the security options the container should be run with. If set, the fields of SecurityContext override the equivalent fields of PodSecurityContext. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
<b>startupProbe</b>	<b>Probe</b>	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Property	Type	Description
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array (VolumeDevice)</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeMounts</b>	<b>array (VolumeMount)</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

## 4.1.31. io.k8s.api.core.v1.ContainerPort schema

## Description

ContainerPort represents a network port in a single container.

## Type

**object**

## Required

- **containerPort**

## Schema

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

### 4.1.32. io.k8s.api.core.v1.ContainerResizePolicy schema

## Description

ContainerResizePolicy represents resource resize policy for the container.

## Type

**object**

## Required

- **resourceName**

- **restartPolicy**

#### Schema

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

### 4.1.33. io.k8s.api.core.v1.CSIPersistentVolumeSource schema

#### Description

Represents storage that is managed by an external CSI volume driver (Beta feature)

#### Type

**object**

#### Required

- **driver**
- **volumeHandle**

#### Schema

Property	Type	Description
<b>controllerExpandSecretRef</b>	<b>SecretReference</b>	controllerExpandSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI ControllerExpandVolume call. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secrets are passed.

Property	Type	Description
<b>controllerPublishSecretRef</b>	<b>SecretReference</b>	controllerPublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI ControllerPublishVolume and ControllerUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secrets are passed.
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume. Required.
<b>fsType</b>	<b>string</b>	fsType to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs".
<b>nodeExpandSecretRef</b>	<b>SecretReference</b>	nodeExpandSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodeExpandVolume call. This is a beta field which is enabled default by CSINodeExpandSecret feature gate. This field is optional, may be omitted if no secret is required. If the secret object contains more than one secret, all secrets are passed.
<b>nodePublishSecretRef</b>	<b>SecretReference</b>	nodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secrets are passed.

Property	Type	Description
<b>nodeStageSecretRef</b>	<b>SecretReference</b>	nodeStageSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodeStageVolume and NodeStageVolume and NodeUnstageVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secrets are passed.
<b>readOnly</b>	<b>boolean</b>	readOnly value to pass to ControllerPublishVolumeRequest. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes of the volume to publish.
<b>volumeHandle</b>	<b>string</b>	volumeHandle is the unique volume name returned by the CSI volume plugin's CreateVolume to refer to the volume on all subsequent calls. Required.

#### 4.1.34. io.k8s.api.core.v1.CSIVolumeSource schema

##### Description

Represents a source location of a volume to mount, managed by an external CSI driver

##### Type

**object**

##### Required

- **driver**

##### Schema

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
<b>nodePublishSecretRef</b>	<b>LocalObjectReference</b>	nodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
<b>readOnly</b>	<b>boolean</b>	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

#### 4.1.35. io.k8s.api.core.v1.DownwardAPIProjection schema

##### Description

Represents downward API info for projecting into a projected volume. Note that this is identical to a downwardAPI volume source without the default mode.

##### Type

**object**

##### Schema

Property	Type	Description
<b>items</b>	<b>array (DownwardAPIVolumeFile)</b>	Items is a list of DownwardAPIVolume file

#### 4.1.36. io.k8s.api.core.v1.DownwardAPIVolumeFile schema

##### Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

Type

**object**

Required

- **path**

Schema

Property	Type	Description
<b>fieldRef</b>	<b>ObjectFieldSelector</b>	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
<b>mode</b>	<b>integer</b>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
<b>resourceFieldRef</b>	<b>ResourceFieldSelector</b>	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

#### 4.1.37. io.k8s.api.core.v1.DownwardAPIVolumeSource schema

Description

DownwardAPIVolumeSource represents a volume containing downward API info. Downward API volumes support ownership management and SELinux relabeling.

Type

**object**

## Schema

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array</b> ( <a href="#">DownwardAPIVolumeFile</a> )	Items is a list of downward API volume file

## 4.1.38. io.k8s.api.core.v1.EmptyDirVolumeSource schema

## Description

Represents an empty directory for a pod. Empty directory volumes support ownership management and SELinux relabeling.

## Type

**object**

## Schema

Property	Type	Description
<b>medium</b>	<b>string</b>	medium represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Property	Type	Description
<b>sizeLimit</b>	<b>Quantity</b>	sizeLimit is the total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

### 4.1.39. io.k8s.api.core.v1.EndpointsList schema

#### Description

EndpointsList is a list of endpoints.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Endpoints)</b>	List of endpoints.

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.40. io.k8s.api.core.v1.EnvFromSource schema

##### Description

EnvFromSource represents the source of a set of ConfigMaps

##### Type

**object**

##### Schema

Property	Type	Description
<b>configMapRef</b>	<b>ConfigMapEnvSource</b>	The ConfigMap to select from
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>SecretEnvSource</b>	The Secret to select from

#### 4.1.41. io.k8s.api.core.v1.EnvVar schema

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

## Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>EnvVarSource</b>	Source for the environment variable's value. Cannot be used if value is not empty.

## 4.1.42. io.k8s.api.core.v1.EnvVarSource schema

## Description

EnvVarSource represents a source for the value of an EnvVar.

## Type

**object**

## Schema

Property	Type	Description
<b>configMapKeyRef</b>	<b>ConfigMapKeySelector</b>	Selects a key of a ConfigMap.

Property	Type	Description
<b>fieldRef</b>	<b>ObjectFieldSelector</b>	Selects a field of the pod: supports metadata.name, metadata.namespace, <b>metadata.labels['&lt;KEY&gt;']</b> , <b>metadata.annotations['&lt;KEY&gt;']</b> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
<b>resourceFieldRef</b>	<b>ResourceFieldSelector</b>	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
<b>secretKeyRef</b>	<b>SecretKeySelector</b>	Selects a key of a secret in the pod's namespace

#### 4.1.43. io.k8s.api.core.v1.EphemeralContainer schema

##### Description

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

##### Type

**object**

##### Required

- **name**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array (EnvVar)</b>	<p>List of environment variables to set in the container. Cannot be updated.</p>

Property	Type	Description
<b>envFrom</b>	<b>array (EnvFromSource)</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
<b>imagePullPolicy</b>	<b>string</b>	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>  Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail If the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
<b>lifecycle</b>	<b>Lifecycle</b>	Lifecycle is not allowed for ephemeral containers.
<b>livenessProbe</b>	<b>Probe</b>	Probes are not allowed for ephemeral containers.

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
<b>ports</b>	<b>array (ContainerPort)</b>	Ports are not allowed for ephemeral containers.
<b>readinessProbe</b>	<b>Probe</b>	Probes are not allowed for ephemeral containers.
<b>resizePolicy</b>	<b>array (ContainerResizePolicy)</b>	Resources resize policy for the container.
<b>resources</b>	<b>ResourceRequirements</b>	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
<b>securityContext</b>	<b>SecurityContext</b>	Optional: SecurityContext defines the security options the ephemeral container should be run with. If set, the fields of SecurityContext override the equivalent fields of PodSecurityContext.
<b>startupProbe</b>	<b>Probe</b>	Probes are not allowed for ephemeral containers.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Property	Type	Description
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>targetContainerName</b>	<b>string</b>	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array (VolumeDevice)</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeMounts</b>	<b>array (VolumeMount)</b>	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 4.1.44. io.k8s.api.core.v1.EphemeralVolumeSource schema

##### Description

Represents an ephemeral volume that is handled by a normal storage driver.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>volumeClaimTemplate</b>	<b>PersistentVolumeClaimTemplate</b>	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <b>&lt;pod name&gt;-&lt;volume name&gt;</b> where <b>&lt;volume name&gt;</b> is the name from the <b>PodSpec.Volumes</b> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <b>not</b> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

#### 4.1.45. io.k8s.api.core.v1.EventList schema

##### Description

EventList is a list of events.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Event)</b>	List of events
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.46. io.k8s.api.core.v1.EventSource schema

##### Description

EventSource contains information for an event.

##### Type

**object**

##### Schema

Property	Type	Description
<b>component</b>	<b>string</b>	Component from which the event is generated.
<b>host</b>	<b>string</b>	Node name on which the event is generated.

#### 4.1.47. io.k8s.api.core.v1.ExecAction schema

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

##### Schema

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 4.1.48. io.k8s.api.core.v1.FCVolumeSource schema

##### Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>lun</b>	<b>integer</b>	lun is Optional: FC target lun number
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

Property	Type	Description
<b>targetWWNs</b>	<b>array (string)</b>	targetWWNs is Optional: FC target worldwide names (WWNs)
<b>wwids</b>	<b>array (string)</b>	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

#### 4.1.49. io.k8s.api.core.v1.FlexPersistentVolumeSource schema

##### Description

FlexPersistentVolumeSource represents a generic persistent volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

##### Required

- **driver**

##### Schema

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

Property	Type	Description
<b>secretRef</b>	<a href="#">SecretReference</a>	secretRef is Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

#### 4.1.50. io.k8s.api.core.v1.FlexVolumeSource schema

##### Description

FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

##### Required

- **driver**

##### Schema

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

Property	Type	Description
<b>secretRef</b>	<a href="#">LocalObjectReference</a>	secretRef is Optional: secretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

#### 4.1.51. io.k8s.api.core.v1.FlockerVolumeSource schema

##### Description

Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Schema

Property	Type	Description
<b>datasetName</b>	<b>string</b>	datasetName is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated
<b>datasetUUID</b>	<b>string</b>	datasetUUID is the UUID of the dataset. This is unique identifier of a Flocker dataset

#### 4.1.52. io.k8s.api.core.v1.GCEPersistentDiskVolumeSource schema

##### Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **pdName**

## Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>pdName</b>	<b>string</b>	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

## 4.1.53. io.k8s.api.core.v1.GitRepoVolumeSource schema

## Description

Represents a volume that is populated with the contents of a git repository. Git repo volumes do not support ownership management. Git repo volumes support SELinux relabeling.

DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

**Type****object****Required**

- **repository**

**Schema**

Property	Type	Description
<b>directory</b>	<b>string</b>	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
<b>repository</b>	<b>string</b>	repository is the URL
<b>revision</b>	<b>string</b>	revision is the commit hash for the specified revision.

**4.1.54. io.k8s.api.core.v1.GlusterfsPersistentVolumeSource schema****Description**

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

**Type****object****Required**

- **endpoints**
- **path**

**Schema**

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>endpointsNamespace</b>	<b>string</b>	endpointsNamespace is the namespace that contains Glusterfs endpoint. If this field is empty, the EndpointNamespace defaults to the same namespace as the bound PVC. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 4.1.55. io.k8s.api.core.v1.GlusterfsVolumeSource schema

##### Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **endpoints**
- **path**

##### Schema

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 4.1.56. io.k8s.api.core.v1.GRPCAction schema

##### Description

##### Type

**object**

##### Required

- **port**

##### Schema

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 4.1.57. io.k8s.api.core.v1.HostAlias schema

##### Description

HostAlias holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.

Type

**object**

Schema

Property	Type	Description
<b>hostnames</b>	<b>array (string)</b>	Hostnames for the above IP address.
<b>ip</b>	<b>string</b>	IP address of the host file entry.

#### 4.1.58. io.k8s.api.core.v1.HostPathVolumeSource schema

Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

Type

**object**

Required

- **path**

Schema

Property	Type	Description
<b>path</b>	<b>string</b>	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - <b>"BlockDevice"</b> A block device must exist at the given path - <b>"CharDevice"</b> A character device must exist at the given path - <b>"Directory"</b> A directory must exist at the given path - <b>"DirectoryOrCreate"</b> If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - <b>"File"</b> A file must exist at the given path - <b>"FileOrCreate"</b> If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - <b>"Socket"</b> A UNIX socket must exist at the given path</p>

#### 4.1.59. io.k8s.api.core.v1.HTTPGetAction schema

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

##### Schema

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array (HTTPHeader)</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 4.1.60. io.k8s.api.core.v1.HTTPHeader schema

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 4.1.61. io.k8s.api.core.v1.ISCSIPersistentVolumeSource schema

## Description

ISCSIPersistentVolumeSource represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

## Type

**object**

## Required

- **targetPortal**
- **iqn**
- **lun**

## Schema

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is Target iSCSI Qualified Name.
<b>iscsiInterface</b>	<b>string</b>	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).

Property	Type	Description
<b>lun</b>	<b>integer</b>	lun is iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
<b>secretRef</b>	<b>SecretReference</b>	secretRef is the CHAP Secret for iSCSI target and initiator authentication
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 4.1.62. io.k8s.api.core.v1.ISCSIVolumeSource schema

##### Description

Represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **targetPortal**
- **iqn**
- **lun**

##### Schema

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication

Property	Type	Description
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is the target iSCSI Qualified Name.
<b>iscsilInterface</b>	<b>string</b>	iscsilInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<b>lun</b>	<b>integer</b>	lun represents iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef is the CHAP Secret for iSCSI target and initiator authentication

Property	Type	Description
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 4.1.63. io.k8s.api.core.v1.KeyToPath schema

##### Description

Maps a string key to a path within a volume.

##### Type

**object**

##### Required

- **key**
- **path**

##### Schema

Property	Type	Description
<b>key</b>	<b>string</b>	key is the key to project.
<b>mode</b>	<b>integer</b>	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>path</b>	<b>string</b>	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

#### 4.1.64. io.k8s.api.core.v1.Lifecycle schema

##### Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

## Schema

Property	Type	Description
<b>postStart</b>	<a href="#">LifecycleHandler</a>	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
<b>preStop</b>	<a href="#">LifecycleHandler</a>	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The Pod's termination grace period countdown begins before the PreStop hook is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period (unless delayed by finalizers). Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

### 4.1.65. io.k8s.api.core.v1.LifecycleHandler schema

#### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

## Schema

Property	Type	Description
<b>exec</b>	<a href="#">ExecAction</a>	Exec specifies the action to take.
<b>httpGet</b>	<a href="#">HTTPGetAction</a>	HTTPGet specifies the http request to perform.
<b>tcpSocket</b>	<a href="#">TCPSocketAction</a>	Deprecated. TCPSocket is NOT supported as a LifecycleHandler and kept for the backward compatibility. There are no validation of this field and lifecycle hooks will fail in runtime when tcp handler is specified.

### 4.1.66. io.k8s.api.core.v1.LimitRangeList schema

## Description

LimitRangeList is a list of LimitRange items.

## Type

**object**

## Required

- **items**

## Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>items</b>	<b>array (LimitRange)</b>	Items is a list of LimitRange objects. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.67. io.k8s.api.core.v1.LocalObjectReference schema

##### Description

LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

##### Type

**object**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

#### 4.1.68. io.k8s.api.core.v1.LocalVolumeSource schema

##### Description

Local represents directly-attached storage with node affinity (Beta feature)

##### Type

**object**

##### Required

- **path**

#### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. It applies only when the Path is a block device. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default value is to auto-select a filesystem if unspecified.
<b>path</b>	<b>string</b>	path of the full path to the volume on the node. It can be either a directory or block device (disk, partition, ...).

#### 4.1.69. io.k8s.api.core.v1.NamespaceList schema

##### Description

NamespaceList is a list of Namespaces.

##### Type

**object**

##### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Namespace)</b>	Items is the list of Namespace objects in the list. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.70. io.k8s.api.core.v1.NFSVolumeSource schema

##### Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **server**
- **path**

##### Schema

Property	Type	Description
<b>path</b>	<b>string</b>	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

Property	Type	Description
<b>server</b>	<b>string</b>	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

#### 4.1.71. io.k8s.api.core.v1.NodeAffinity schema

##### Description

Node affinity is a group of node affinity scheduling rules.

##### Type

**object**

##### Schema

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array (PreferredSchedulingTerm)</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>NodeSelector</b>	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

## 4.1.72. io.k8s.api.core.v1.NodeList schema

### Description

NodeList is the whole list of all Nodes which have been registered with master.

### Type

**object**

### Required

- **items**

### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Node)</b>	List of nodes
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

## 4.1.73. io.k8s.api.core.v1.NodeSelector schema

### Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

### Type

**object**

## Required

- **nodeSelectorTerms**

## Schema

Property	Type	Description
<b>nodeSelectorTerms</b>	<b>array (NodeSelectorTerm)</b>	Required. A list of node selector terms. The terms are ORed.

## 4.1.74. io.k8s.api.core.v1.NodeSelectorRequirement schema

## Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

## Type

**object**

## Required

- **key**
- **operator**

## Schema

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>

Property	Type	Description
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 4.1.75. io.k8s.api.core.v1.NodeSelectorTerm schema

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

##### Schema

Property	Type	Description
<b>matchExpressions</b>	<b>array (NodeSelectorRequirement)</b>	A list of node selector requirements by node's labels.
<b>matchFields</b>	<b>array (NodeSelectorRequirement)</b>	A list of node selector requirements by node's fields.

#### 4.1.76. io.k8s.api.core.v1.ObjectFieldSelector schema

##### Description

ObjectFieldSelector selects an APIVersioned field of an object.

##### Type

**object**

##### Required

- **fieldPath**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 4.1.77. io.k8s.api.core.v1.ObjectReference schema

##### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

##### Type

**object**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Property	Type	Description
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 4.1.78. io.k8s.api.core.v1.PersistentVolumeClaim schema

##### Description

PersistentVolumeClaim is a user's request for and claim to a persistent volume

##### Type

**object**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes
<b>status</b>	<b>object</b>	PersistentVolumeClaimStatus is the current status of a persistent volume claim.

..spec Description::

+

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Property	Type	Description
<b>dataSource</b>	<b>object</b>	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
<b>dataSourceRef</b>	<b>object</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

..spec.dataSource Description::

+

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

### Type

**object**

Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

..spec.dataSourceRef Description::

+

dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: \* While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. \* While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. \* While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

## Type

**object**

### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

..spec.resources Description::

+

ResourceRequirements describes the compute resource requirements.

**Type**

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in <code>spec.resourceClaims</code>, that are used by this container.</p> <p>This is an alpha field and requires enabling the <code>DynamicResourceAllocation</code> feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in <code>PodSpec.ResourceClaims</code> .
<b>limits</b>	<b>object (Quantity)</b>	<p>Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a></p>
<b>requests</b>	<b>object (Quantity)</b>	<p>Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a></p>

`..spec.resources.claims` Description::

+

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container.

This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

#### Type

**array**

`..spec.resources.claims[]` Description::

+

ResourceClaim references one entry in PodSpec.ResourceClaims.

### Type

**object**

### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

..status Description::

+

PersistentVolumeClaimStatus is the current status of a persistent volume claim.

### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Property	Type	Description
<b>allocatedResources</b>	<b>object (Quantity)</b>	allocatedResources is the storage resource within AllocatedResources tracks the capacity allocated to a PVC. It may be larger than the actual capacity when a volume expansion operation is requested. For storage quota, the larger value from allocatedResources and PVC.spec.resources is used. If allocatedResources is not set, PVC.spec.resources alone is used for quota calculation. If a volume expansion capacity request is lowered, allocatedResources is only lowered if there are no expansion operations in progress and if the actual volume capacity is equal or lower than the requested capacity. This is an alpha field and requires enabling RecoverVolumeExpansionFailure feature.
<b>capacity</b>	<b>object (Quantity)</b>	capacity represents the actual resources of the underlying volume.
<b>conditions</b>	<b>array</b>	conditions is the current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
<b>conditions[]</b>	<b>object</b>	PersistentVolumeClaimCondition contains details about state of pvc

Property	Type	Description
<b>phase</b>	<b>string</b>	<p>phase represents the current phase of PersistentVolumeClaim.</p> <p>Possible enum values: - <b>"Bound"</b> used for PersistentVolumeClaims that are bound - <b>"Lost"</b> used for PersistentVolumeClaims that lost their underlying PersistentVolume. The claim was bound to a PersistentVolume and this volume does not exist any longer and all data on it was lost. - <b>"Pending"</b> used for PersistentVolumeClaims that are not yet bound</p>

Property	Type	Description
<b>resizeStatus</b>	<b>string</b>	<p>resizeStatus stores status of resize operation. ResizeStatus is not set by default but when expansion is complete resizeStatus is set to empty string by resize controller or kubelet. This is an alpha field and requires enabling RecoverVolumeExpansionFailure feature.</p> <p>Possible enum values: - "" When expansion is complete, the empty string is set by resize controller or kubelet. - <b>"ControllerExpansionFailed"</b> State set when expansion has failed in resize controller with a terminal error. Transient errors such as timeout should not set this status and should leave ResizeStatus unmodified, so as resize controller can resume the volume expansion. - <b>"ControllerExpansionInProgress"</b> State set when resize controller starts expanding the volume in control-plane - <b>"NodeExpansionFailed"</b> State set when expansion has failed in kubelet with a terminal error. Transient errors don't set NodeExpansionFailed. - <b>"NodeExpansionInProgress"</b> State set when kubelet starts expanding the volume. - <b>"NodeExpansionPending"</b> State set when resize controller has finished expanding the volume but further expansion is needed on the node.</p>

..status.conditions Description::

+

conditions is the current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.

Type

**array**

..status.conditions[] Description::

+

PersistentVolumeClaimCondition contains details about state of pvc

Type

**object**

Required

- **type**
- **status**

Property	Type	Description
<b>lastProbeTime</b>	<b>Time</b>	lastProbeTime is the time we probed the condition.
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime is the time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	message is the human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	reason is a unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
<b>status</b>	<b>string</b>	
<b>type</b>	<b>string</b>	

#### 4.1.79. io.k8s.api.core.v1.PersistentVolumeClaimList schema

Description

PersistentVolumeClaimList is a list of PersistentVolumeClaim items.

Type

**object**

Required

- **items**

## Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array</b> <b>(PersistentVolumeClaim)</b>	items is a list of persistent volume claims. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

## 4.1.80. io.k8s.api.core.v1.PersistentVolumeClaimSpec schema

## Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

## Type

**object**

## Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>dataSource</b>	<b>TypedLocalObjectReference</b>	dataSource field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot) * An existing PVC (PersistentVolumeClaim) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. When the AnyVolumeDataSource feature gate is enabled, dataSource contents will be copied to dataSourceRef, and dataSourceRef contents will be copied to dataSource when dataSourceRef.namespace is not specified. If the namespace is specified, then dataSourceRef will not be copied to dataSource.

Property	Type	Description
<b>dataSourceRef</b>	<b>TypedObjectReference</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>ResourceRequirements</b>	resources represents the minimum resources the volume should have. If RecoverVolumeExpansionFailure feature is enabled users are allowed to specify resource requirements that are lower than previous value but must still be higher than capacity recorded in the status field of the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.  Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

#### 4.1.81. io.k8s.api.core.v1.PersistentVolumeClaimTemplate schema

##### Description

PersistentVolumeClaimTemplate is used to produce PersistentVolumeClaim objects as part of an EphemeralVolumeSource.

##### Type

**object**

**Required**

- **spec**

**Schema**

Property	Type	Description
<b>metadata</b>	<a href="#">ObjectMeta</a>	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
<b>spec</b>	<a href="#">PersistentVolumeClaimSpec</a>	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**4.1.82. io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource schema****Description**

PersistentVolumeClaimVolumeSource references the user's PVC in the same namespace. This volume finds the bound PV and mounts that volume for the pod. A

PersistentVolumeClaimVolumeSource is, essentially, a wrapper around another type of volume that is owned by someone else (the system).

**Type**

**object**

**Required**

- **claimName**

**Schema**

Property	Type	Description
<b>claimName</b>	<b>string</b>	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>readOnly</b>	<b>boolean</b>	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

### 4.1.83. io.k8s.api.core.v1.PersistentVolumeList schema

#### Description

PersistentVolumeList is a list of PersistentVolume items.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (PersistentVolume)</b>	items is a list of persistent volumes. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes">https://kubernetes.io/docs/concepts/storage/persistent-volumes</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

### 4.1.84. io.k8s.api.core.v1.PersistentVolumeSpec schema

#### Description

PersistentVolumeSpec is the specification of a persistent volume.

Type  
object

Schema

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains all ways the volume can be mounted. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes</a>
<b>awsElasticBlockStore</b>	<b><a href="#">AWSElasticBlockStoreVolumeSource</a></b>	awsElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>azureDisk</b>	<b><a href="#">AzureDiskVolumeSource</a></b>	azureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
<b>azureFile</b>	<b><a href="#">AzureFilePersistentVolumeSource</a></b>	azureFile represents an Azure File Service mount on the host and bind mount to the pod.
<b>capacity</b>	<b>object (Quantity)</b>	capacity is the description of the persistent volume's resources and capacity. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity">https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity</a>
<b>cephfs</b>	<b><a href="#">CephFSPersistentVolumeSource</a></b>	cephFS represents a Ceph FS mount on the host that shares a pod's lifetime
<b>cinder</b>	<b><a href="#">CinderPersistentVolumeSource</a></b>	cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Property	Type	Description
<b>claimRef</b>	<b>ObjectReference</b>	claimRef is part of a bi-directional binding between PersistentVolume and PersistentVolumeClaim. Expected to be non-nil when bound. claim.VolumeName is the authoritative bind between PV and PVC. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#binding">https://kubernetes.io/docs/concepts/storage/persistent-volumes#binding</a>
<b>csi</b>	<b>CSIPersistentVolumeSource</b>	csi represents storage that is handled by an external CSI driver (Beta feature).
<b>fc</b>	<b>FCVolumeSource</b>	fc represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
<b>flexVolume</b>	<b>FlexPersistentVolumeSource</b>	flexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
<b>flocker</b>	<b>FlockerVolumeSource</b>	flocker represents a Flocker volume attached to a kubelet's host machine and exposed to the pod for its usage. This depends on the Flocker control service being running
<b>gcePersistentDisk</b>	<b>GCEPersistentDiskVolumeSource</b>	gcePersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. Provisioned by an admin. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>glusterfs</b>	<b>GlusterfsPersistentVolumeSource</b>	glusterfs represents a Glusterfs volume that is attached to a host and exposed to the pod. Provisioned by an admin. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>

Property	Type	Description
<b>hostPath</b>	<b>HostPathVolumeSource</b>	hostPath represents a directory on the host. Provisioned by a developer or tester. This is useful for single-node development and testing only! On-host storage is not supported in any way and WILL NOT WORK in a multi-node cluster. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
<b>iscsi</b>	<b>ISCSIPersistentVolumeSource</b>	iscsi represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. Provisioned by an admin.
<b>local</b>	<b>LocalVolumeSource</b>	local represents directly-attached storage with node affinity
<b>mountOptions</b>	<b>array (string)</b>	mountOptions is the list of mount options, e.g. ["ro", "soft"]. Not validated - mount will simply fail if one is invalid. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes/#mount-options">https://kubernetes.io/docs/concepts/storage/persistent-volumes/#mount-options</a>
<b>nfs</b>	<b>NFSVolumeSource</b>	nfs represents an NFS mount on the host. Provisioned by an admin. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>nodeAffinity</b>	<b>VolumeNodeAffinity</b>	nodeAffinity defines constraints that limit what nodes this volume can be accessed from. This field influences the scheduling of pods that use this volume.

Property	Type	Description
<b>persistentVolumeReclaimPolicy</b>	<b>string</b>	<p>persistentVolumeReclaimPolicy defines what happens to a persistent volume when released from its claim. Valid options are Retain (default for manually created PersistentVolumes), Delete (default for dynamically provisioned PersistentVolumes), and Recycle (deprecated). Recycle must be supported by the volume plugin underlying this PersistentVolume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#reclaiming">https://kubernetes.io/docs/concepts/storage/persistent-volumes#reclaiming</a></p> <p>Possible enum values: - <b>"Delete"</b> means the volume will be deleted from Kubernetes on release from its claim. The volume plugin must support Deletion. - <b>"Recycle"</b> means the volume will be recycled back into the pool of unbound persistent volumes on release from its claim. The volume plugin must support Recycling. - <b>"Retain"</b> means the volume will be left in its current phase (Released) for manual reclamation by the administrator. The default policy is Retain.</p>
<b>photonPersistentDisk</b>	<b>PhotonPersistentDiskVolumeSource</b>	photonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
<b>portworxVolume</b>	<b>PortworxVolumeSource</b>	portworxVolume represents a portworx volume attached and mounted on kubelets host machine
<b>quobyte</b>	<b>QuobyteVolumeSource</b>	quobyte represents a Quobyte mount on the host that shares a pod's lifetime
<b>rbd</b>	<b>RBDPersistentVolumeSource</b>	rbd represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>

Property	Type	Description
<b>scaleIO</b>	<a href="#">ScaleIOPersistentVolumeSource</a>	scaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of StorageClass to which this persistent volume belongs. Empty value means that this volume does not belong to any StorageClass.
<b>storageos</b>	<a href="#">StorageOSPersistentVolumeSource</a>	storageOS represents a StorageOS volume that is attached to the kubelet's host machine and mounted into the pod More info: <a href="https://examples.k8s.io/volumes/storageos/README.md">https://examples.k8s.io/volumes/storageos/README.md</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines if a volume is intended to be used with a formatted filesystem or to remain in raw block state. Value of Filesystem is implied when not included in spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>vsphereVolume</b>	<a href="#">VsphereVirtualDiskVolumeSource</a>	vsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

#### 4.1.85. io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource schema

##### Description

Represents a Photon Controller persistent disk resource.

##### Type

**object**

## Required

- **pdID**

## Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>pdID</b>	<b>string</b>	pdID is the ID that identifies Photon Controller persistent disk

**4.1.86. io.k8s.api.core.v1.PodAffinity schema**

## Description

Pod affinity is a group of inter pod affinity scheduling rules.

## Type

**object**

## Schema

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b> <b>(WeightedPodAffinityTerm)</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array (PodAffinityTerm)</b>	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

#### 4.1.87. io.k8s.api.core.v1.PodAffinityTerm schema

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

##### Schema

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 4.1.88. io.k8s.api.core.v1.PodAntiAffinity schema

##### Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array (WeightedPodAffinityTerm)</b>	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array (PodAffinityTerm)</b>	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

#### 4.1.89. io.k8s.api.core.v1.PodDNSConfig schema

##### Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

##### Type

**object**

##### Schema

Property	Type	Description
<b>nameservers</b>	<b>array (string)</b>	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
<b>options</b>	<b>array (PodDNSConfigOption)</b>	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
<b>searches</b>	<b>array (string)</b>	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

#### 4.1.90. io.k8s.api.core.v1.PodDNSConfigOption schema

##### Description

PodDNSConfigOption defines DNS resolver options of a pod.

##### Type

**object**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Required.
<b>value</b>	<b>string</b>	

#### 4.1.91. io.k8s.api.core.v1.PodList schema

##### Description

PodList is a list of Pods.

##### Type

**object**

##### Required

- **items**

## Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Pod)</b>	List of pods. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

## 4.1.92. io.k8s.api.core.v1.PodOS schema

## Description

PodOS defines the OS parameters of a pod.

## Type

**object**

## Required

- **name**

## Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name is the name of the operating system. The currently supported values are linux and windows. Additional value may be defined in future and can be one of: <a href="https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration">https://github.com/opencontainers/runtime-spec/blob/master/config.md#platform-specific-configuration</a> Clients should expect to handle additional values and treat unrecognized values in this field as os: null

#### 4.1.93. io.k8s.api.core.v1.PodReadinessGate schema

##### Description

PodReadinessGate contains the reference to a pod condition

##### Type

**object**

##### Required

- **conditionType**

##### Schema

Property	Type	Description
<b>conditionType</b>	<b>string</b>	ConditionType refers to a condition in the pod's condition list with matching type.

#### 4.1.94. io.k8s.api.core.v1.PodResourceClaim schema

##### Description

PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.

##### Type

**object**

##### Required

- **name**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name uniquely identifies this resource claim inside the pod. This must be a DNS_LABEL.
<b>source</b>	<a href="#">ClaimSource</a>	Source describes where to find the ResourceClaim.

#### 4.1.95. io.k8s.api.core.v1.PodSchedulingGate schema

##### Description

PodSchedulingGate is associated to a Pod to guard its scheduling.

##### Type

**object**

##### Required

- **name**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the scheduling gate. Each scheduling gate must have a unique name field.

#### 4.1.96. io.k8s.api.core.v1.PodSecurityContext schema

##### Description

PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsGroup</b>	<b>integer</b>	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>
<b>fsGroupChangePolicy</b>	<b>string</b>	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership(and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Always"</b> indicates that volume's ownership and permissions should always be changed whenever volume is mounted inside a Pod. This the default behavior. -  <b>"OnRootMismatch"</b> indicates that volume's ownership and permissions will be changed only when permission and ownership of root directory does not match with expected permissions on the volume. This can help shorten the time it takes to change ownership and permissions of a volume.</p>

Property	Type	Description
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>seLinuxOptions</b>	<b>SELinuxOptions</b>	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<b>seccompProfile</b>	<b>SeccompProfile</b>	The seccomp options to use by the containers in this pod. Note that this field cannot be set when spec.os.name is windows.
<b>supplementalGroups</b>	<b>array (integer)</b>	A list of groups applied to the first process run in each container, in addition to the container's primary GID, the fsGroup (if specified), and group memberships defined in the container image for the uid of the container process. If unspecified, no additional groups are added to any container. Note that group memberships defined in the container image for the uid of the container process are still effective, even if they are not included in this list. Note that this field cannot be set when spec.os.name is windows.
<b>sysctls</b>	<b>array (Sysctl)</b>	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>windowsOptions</b>	<b>WindowsSecurityContextOptions</b>	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

#### 4.1.97. io.k8s.api.core.v1.PodSpec schema

##### Description

PodSpec is a description of a pod.

##### Type

**object**

##### Required

- **containers**

##### Schema

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
<b>affinity</b>	<b>Affinity</b>	If specified, the pod's scheduling constraints
<b>automountServiceAccountToken</b>	<b>boolean</b>	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
<b>containers</b>	<b>array (Container)</b>	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

Property	Type	Description
<b>dnsConfig</b>	<b>PodDNSConfig</b>	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
<b>dnsPolicy</b>	<b>string</b>	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - <b>"ClusterFirst"</b> indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"ClusterFirstWithHostNet"</b> indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"Default"</b> indicates that the pod should use the default (as determined by kubelet) DNS settings. - <b>"None"</b> indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
<b>enableServiceLinks</b>	<b>boolean</b>	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

Property	Type	Description
<b>ephemeralContainers</b>	<b>array (EphemeralContainer)</b>	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's <code>ephemeralcontainers</code> subresource.
<b>hostAliases</b>	<b>array (HostAlias)</b>	<code>HostAliases</code> is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non- <code>hostNetwork</code> pods.
<b>hostIPC</b>	<b>boolean</b>	Use the host's ipc namespace. Optional: Default to false.
<b>hostNetwork</b>	<b>boolean</b>	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
<b>hostPID</b>	<b>boolean</b>	Use the host's pid namespace. Optional: Default to false.
<b>hostUsers</b>	<b>boolean</b>	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with <code>CAP_SYS_MODULE</code> . When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the <code>UserNamespacesSupport</code> feature.

Property	Type	Description
<b>hostname</b>	<b>string</b>	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
<b>imagePullSecrets</b>	<b>array (LocalObjectReference)</b>	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
<b>initContainers</b>	<b>array (Container)</b>	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Property	Type	Description
<b>nodeName</b>	<b>string</b>	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
<b>nodeSelector</b>	<b>object (string)</b>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Property	Type	Description
<b>os</b>	<b>PodOS</b>	<p>Specifies the OS of the containers in the pod. Some pod and container fields are restricted if this is set.</p> <p>If the OS field is set to linux, the following fields must be unset: - securityContext.windowsOptions</p> <p>If the OS field is set to windows, following fields must be unset: - spec.hostPID - spec.hostIPC - spec.hostUsers - spec.securityContext.seLinuxOptions - spec.securityContext.seccompProfile - spec.securityContext.fsGroup - spec.securityContext.fsGroupChangePolicy - spec.securityContext.sysctls - spec.shareProcessNamespace - spec.securityContext.runAsUser - spec.securityContext.runAsGroup - spec.securityContext.supplementalGroups - spec.containers[].<b>securityContext.seLinuxOptions</b> - <b>spec.containers[].securityContext.seccompProfile</b> - spec.containers[].<b>securityContext.capabilities</b> - <b>spec.containers[].securityContext.readOnlyRootFilesystem</b> - spec.containers[].<b>securityContext.privileged</b> - <b>spec.containers[].securityContext.allowPrivilegeEscalation</b> - spec.containers[].<b>securityContext.procMount</b> - <b>spec.containers[].securityContext.runAsUser</b> - spec.containers[*].securityContext.runAsGroup</p>

Property	Type	Description
<b>overhead</b>	<b>object (Quantity)</b>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md">https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md</a>
<b>preemptionPolicy</b>	<b>string</b>	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset.  Possible enum values: - <b>"Never"</b> means that pod never preempts other pods with lower priority. - <b>"PreemptLowerPriority"</b> means that pod can preempt other pods with lower priority.
<b>priority</b>	<b>integer</b>	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
<b>priorityClassName</b>	<b>string</b>	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
<b>readinessGates</b>	<b>array (PodReadinessGate)</b>	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates">https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates</a>
<b>resourceClaims</b>	<b>array (PodResourceClaim)</b>	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable.

Property	Type	Description
<b>restartPolicy</b>	<b>string</b>	<p>Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a></p> <p>Possible enum values: - <b>"Always"</b> - <b>"Never"</b> - <b>"OnFailure"</b></p>
<b>runtimeClassName</b>	<b>string</b>	<p>RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class">https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</a></p>
<b>schedulerName</b>	<b>string</b>	<p>If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.</p>
<b>schedulingGates</b>	<b>array (PodSchedulingGate)</b>	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>

Property	Type	Description
<b>securityContext</b>	<b>PodSecurityContext</b>	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
<b>serviceAccount</b>	<b>string</b>	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
<b>serviceAccountName</b>	<b>string</b>	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
<b>setHostnameAsFQDN</b>	<b>boolean</b>	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
<b>shareProcessNamespace</b>	<b>boolean</b>	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.

Property	Type	Description
<b>subdomain</b>	<b>string</b>	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
<b>tolerations</b>	<b>array (Toleration)</b>	If specified, the pod's tolerations.
<b>topologySpreadConstraints</b>	<b>array (TopologySpreadConstraint)</b>	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
<b>volumes</b>	<b>array (Volume)</b>	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

#### 4.1.98. io.k8s.api.core.v1.PodTemplateList schema

##### Description

PodTemplateList is a list of PodTemplates.

##### Type

**object**

**Required**

- **items**

**Schema**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (PodTemplate)</b>	List of pod templates
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**4.1.99. io.k8s.api.core.v1.PodTemplateSpec schema****Description**

PodTemplateSpec describes the data a pod should have when created from a template

**Type**

**object**

**Schema**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>metadata</b>	<a href="#">ObjectMeta</a>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<a href="#">PodSpec</a>	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

#### 4.1.100. io.k8s.api.core.v1.PortworxVolumeSource schema

##### Description

PortworxVolumeSource represents a Portworx volume resource.

##### Type

**object**

##### Required

- **volumelD**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>volumelD</b>	<b>string</b>	volumelD uniquely identifies a Portworx volume

#### 4.1.101. io.k8s.api.core.v1.PreferredSchedulingTerm schema

## Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

## Type

**object**

## Required

- **weight**
- **preference**

## Schema

Property	Type	Description
<b>preference</b>	<a href="#">NodeSelectorTerm</a>	A node selector term, associated with the corresponding weight.
<b>weight</b>	<b>integer</b>	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

## 4.1.102. io.k8s.api.core.v1.Probe schema

### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

### Type

**object**

### Schema

Property	Type	Description
<b>exec</b>	<a href="#">ExecAction</a>	Exec specifies the action to take.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<a href="#">GRPCAction</a>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<a href="#">HTTPGetAction</a>	HTTPGet specifies the http request to perform.

Property	Type	Description
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>TCPSocketAction</b>	TCPSocket specifies an action involving a TCP port.
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.

Property	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 4.1.103. io.k8s.api.core.v1.ProjectedVolumeSource schema

##### Description

Represents a projected volume source

##### Type

**object**

##### Schema

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>sources</b>	<b>array (VolumeProjection)</b>	sources is the list of volume projections

#### 4.1.104. io.k8s.api.core.v1.QuobyteVolumeSource schema

##### Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **registry**

- **volume**

#### Schema

Property	Type	Description
<b>group</b>	<b>string</b>	group to map volume access to Default is no group
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
<b>registry</b>	<b>string</b>	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
<b>tenant</b>	<b>string</b>	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
<b>user</b>	<b>string</b>	user to map volume access to Defaults to serviceaccount user
<b>volume</b>	<b>string</b>	volume is a string that references an already created Quobyte volume by name.

#### 4.1.105. io.k8s.api.core.v1.RBDPersistentVolumeSource schema

##### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**
- **image**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
<b>image</b>	<b>string</b>	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>keyring</b>	<b>string</b>	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>monitors</b>	<b>array (string)</b>	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>pool</b>	<b>string</b>	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>SecretReference</b>	secretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

## 4.1.106. io.k8s.api.core.v1.RBDVolumeSource schema

### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

### Type

**object**

### Required

- **monitors**
- **image**

### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. <b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

#### 4.1.107. io.k8s.api.core.v1.ReplicationControllerList schema

##### Description

ReplicationControllerList is a collection of replication controllers.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>items</b>	<b>array (ReplicationController)</b>	List of replication controllers. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.108. io.k8s.api.core.v1.ResourceClaim schema

##### Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

##### Type

**object**

##### Required

- **name**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in pod.spec.resourceClaims of the Pod where this field is used. It makes that resource available inside a container.

#### 4.1.109. io.k8s.api.core.v1.ResourceFieldSelector schema

**Description**

ResourceFieldSelector represents container resources (cpu, memory) and their output format

**Type**

**object**

**Required**

- **resource**

**Schema**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

**4.1.110. io.k8s.api.core.v1.ResourceQuotaList schema****Description**

ResourceQuotaList is a list of ResourceQuota items.

**Type**

**object**

**Required**

- **items**

**Schema**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>items</b>	<b>array (ResourceQuota)</b>	Items is a list of ResourceQuota objects. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.111. io.k8s.api.core.v1.ResourceRequirements schema

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

##### Schema

Property	Type	Description
<b>claims</b>	<b>array (ResourceClaim)</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 4.1.112. io.k8s.api.core.v1.ScaleIOPersistentVolumeSource schema

##### Description

ScaleIOPersistentVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**
- **system**
- **secretRef**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs"
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.

Property	Type	Description
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>SecretReference</b>	secretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled is the flag to enable/disable SSL communication with Gateway, default false
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 4.1.113. io.k8s.api.core.v1.ScaleIOVolumeSource schema

##### Description

ScaleIOVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**

- **system**
- **secretRef**

## Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled Flag enable/disable SSL communication with Gateway, default false
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.

Property	Type	Description
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 4.1.114. io.k8s.api.core.v1.SeccompProfile schema

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

##### Schema

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 4.1.115. io.k8s.api.core.v1.SecretEnvSource schema

##### Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

##### Type

**object**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

#### 4.1.116. io.k8s.api.core.v1.SecretKeySelector schema

##### Description

SecretKeySelector selects a key of a Secret.

#### Type

**object**

#### Required

- **key**

#### Schema

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

### 4.1.117. io.k8s.api.core.v1.SecretList schema

#### Description

SecretList is a list of Secret.

#### Type

**object**

#### Required

- **items**

#### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>items</b>	<b>array (Secret)</b>	Items is a list of secret objects. More info: <a href="https://kubernetes.io/docs/concepts/configuration/secret">https://kubernetes.io/docs/concepts/configuration/secret</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.118. io.k8s.api.core.v1.SecretProjection schema

##### Description

Adapts a secret into a projected volume.

The contents of the target Secret's Data field will be presented in a projected volume as files using the keys in the Data field as the file names. Note that this is identical to a secret volume source without the default mode.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>items</b>	<b>array (KeyToPath)</b>	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its key must be defined

#### 4.1.119. io.k8s.api.core.v1.SecretReference schema

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

##### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 4.1.120. io.k8s.api.core.v1.SecretVolumeSource schema

##### Description

Adapts a Secret into a volume.

The contents of the target Secret's Data field will be presented in a volume as files using the keys in the Data field as the file names. Secret volumes support ownership management and SELinux relabeling.

## Type

**object**

## Schema

Property	Type	Description
<b>defaultMode</b>	<b>integer</b>	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
<b>items</b>	<b>array (KeyToPath)</b>	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
<b>optional</b>	<b>boolean</b>	optional field specify whether the Secret or its keys must be defined
<b>secretName</b>	<b>string</b>	secretName is the name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

## 4.1.121. io.k8s.api.core.v1.SecurityContext schema

### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

### Type

**object**

### Schema

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>Capabilities</b>	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime. Note that this field cannot be set when spec.os.name is windows.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>SELinuxOptions</b>	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seccompProfile</b>	<b>SeccompProfile</b>	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>windowsOptions</b>	<a href="#">WindowsSecurityContextOptions</a>	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

#### 4.1.122. io.k8s.api.core.v1.SELinuxOptions schema

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

##### Schema

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 4.1.123. io.k8s.api.core.v1.ServiceAccountList schema

##### Description

ServiceAccountList is a list of ServiceAccount objects

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (ServiceAccount)</b>	List of ServiceAccounts. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.124. io.k8s.api.core.v1.ServiceAccountTokenProjection schema

##### Description

ServiceAccountTokenProjection represents a projected service account token volume. This projection can be used to insert a service account token into the pods runtime filesystem for use against APIs (Kubernetes API Server or otherwise).

##### Type

**object**

##### Required

- **path**

##### Schema

Property	Type	Description
<b>audience</b>	<b>string</b>	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
<b>expirationSeconds</b>	<b>integer</b>	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
<b>path</b>	<b>string</b>	path is the path relative to the mount point of the file to project the token into.

#### 4.1.125. io.k8s.api.core.v1.ServiceList schema

##### Description

ServiceList holds a list of services.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Service)</b>	List of services
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.126. io.k8s.api.core.v1.StorageOSPersistentVolumeSource schema

##### Description

Represents a StorageOS persistent volume resource.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>ObjectReference</b>	secretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

#### 4.1.127. io.k8s.api.core.v1.StorageOSVolumeSource schema

##### Description

Represents a StorageOS persistent volume resource.

##### Type

**object**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>LocalObjectReference</b>	secretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

#### 4.1.128. io.k8s.api.core.v1.Sysctl schema

##### Description

Sysctl defines a kernel parameter to be set

##### Type

**object**

##### Required

- **name**

- **value**

#### Schema

Property	Type	Description
<b>name</b>	<b>string</b>	Name of a property to set
<b>value</b>	<b>string</b>	Value of a property to set

### 4.1.129. io.k8s.api.core.v1.TCPSocketAction schema

#### Description

TCPSocketAction describes an action based on opening a socket

#### Type

**object**

#### Required

- **port**

#### Schema

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

### 4.1.130. io.k8s.api.core.v1.Toleration schema

#### Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

#### Type

**object**

#### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>effect</b>	<b>string</b>	<p>Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: -  <b>"NoExecute"</b> Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. -  <b>"NoSchedule"</b> Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. -  <b>"PreferNoSchedule"</b> Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
<b>key</b>	<b>string</b>	<p>Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.</p>
<b>operator</b>	<b>string</b>	<p>Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.</p> <p>Possible enum values: - <b>"Equal"</b>  - <b>"Exists"</b></p>

Property	Type	Description
<b>tolerationSeconds</b>	<b>integer</b>	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
<b>value</b>	<b>string</b>	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

#### 4.1.131. io.k8s.api.core.v1.TopologySelectorLabelRequirement schema

##### Description

A topology selector requirement is a selector that matches given label. This is an alpha feature and may change in the future.

##### Type

**object**

##### Required

- **key**
- **values**

##### Schema

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>values</b>	<b>array (string)</b>	An array of string values. One value must match the label to be selected. Each entry in Values is ORed.

#### 4.1.132. io.k8s.api.core.v1.TopologySelectorTerm schema

##### Description

A topology selector term represents the result of label queries. A null or empty topology selector term matches no objects. The requirements of them are ANDed. It provides a subset of functionality as NodeSelectorTerm. This is an alpha feature and may change in the future.

#### Type

**object**

#### Schema

Property	Type	Description
<b>matchLabelExpressions</b>	<b>array</b> ( <b>TopologySelectorLabelRequirement</b> )	A list of topology selector requirements by labels.

### 4.1.133. io.k8s.api.core.v1.TopologySpreadConstraint schema

#### Description

TopologySpreadConstraint specifies how to spread matching pods among the given topology.

#### Type

**object**

#### Required

- **maxSkew**
- **topologyKey**
- **whenUnsatisfiable**

#### Schema

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Property	Type	Description
<b>matchLabelKeys</b>	<b>array (string)</b>	<p>MatchLabelKeys is a set of pod label keys to select the pods over which spreading will be calculated. The keys are used to lookup values from the incoming pod labels, those key-value labels are ANDed with labelSelector to select the group of existing pods over which spreading will be calculated for the incoming pod. The same key is forbidden to exist in both MatchLabelKeys and LabelSelector. MatchLabelKeys cannot be set when LabelSelector isn't set. Keys that don't exist in the incoming pod labels will be ignored. A null or empty list means only match against labelSelector.</p> <p>This is a beta field and requires the MatchLabelKeysInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>maxSkew</b>	<b>integer</b>	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <b>whenUnsatisfiable=DoNotSchedule</b>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. The global minimum is the minimum number of matching pods in an eligible domain or zero if the number of eligible domains is less than MinDomains. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 2/2/1: In this case, the global minimum is 1.   zone1   zone2   zone3     P P   P P   P   - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 2/2/2; scheduling it onto zone1(zone2) would make the ActualSkew(3-1) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <b>whenUnsatisfiable=ScheduleAnyway</b>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>

Property	Type	Description
<b>minDomains</b>	<b>integer</b>	<p>MinDomains indicates a minimum number of eligible domains. When the number of eligible domains with matching topology keys is less than minDomains, Pod Topology Spread treats "global minimum" as 0, and then the calculation of Skew is performed. And when the number of eligible domains with matching topology keys equals or greater than minDomains, this value has no effect on scheduling. As a result, when the number of eligible domains is less than minDomains, scheduler won't schedule more than maxSkew Pods to those domains. If value is nil, the constraint behaves as if MinDomains is equal to 1. Valid values are integers greater than 0. When value is not nil, WhenUnsatisfiable must be DoNotSchedule.</p> <p>For example, in a 3-zone cluster, MaxSkew is set to 2, MinDomains is set to 5 and pods with the same labelSelector spread as 2/2/2:   zone1   zone2   zone3     P P   P P   P P   The number of domains is less than 5(MinDomains), so "global minimum" is treated as 0. In this situation, new pod with the same labelSelector cannot be scheduled, because computed skew will be 3(3 - 0) if new Pod is scheduled to any of the three zones, it will violate MaxSkew.</p> <p>This is a beta field and requires the MinDomainsInPodTopologySpread feature gate to be enabled (enabled by default).</p>

Property	Type	Description
<b>nodeAffinityPolicy</b>	<b>string</b>	<p>NodeAffinityPolicy indicates how we will treat Pod's nodeAffinity/nodeSelector when calculating pod topology spread skew. Options are: - Honor: only nodes matching nodeAffinity/nodeSelector are included in the calculations. - Ignore: nodeAffinity/nodeSelector are ignored. All nodes are included in the calculations.</p> <p>If this value is nil, the behavior is equivalent to the Honor policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>
<b>nodeTaintsPolicy</b>	<b>string</b>	<p>NodeTaintsPolicy indicates how we will treat node taints when calculating pod topology spread skew. Options are: - Honor: nodes without taints, along with tainted nodes for which the incoming pod has a toleration, are included. - Ignore: node taints are ignored. All nodes are included.</p> <p>If this value is nil, the behavior is equivalent to the Ignore policy. This is a beta-level feature default enabled by the NodeInclusionPolicyInPodTopologySpread feature flag.</p> <p>Possible enum values: - <b>"Honor"</b> means use this scheduling directive when calculating pod topology spread skew. - <b>"Ignore"</b> means ignore this scheduling directive when calculating pod topology spread skew.</p>

Property	Type	Description
<b>topologyKey</b>	<b>string</b>	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. We define a domain as a particular instance of a topology. Also, we define an eligible domain as a domain whose nodes meet the requirements of nodeAffinityPolicy and nodeTaintsPolicy. e.g. If TopologyKey is "kubernetes.io/hostname", each Node is a domain of that topology. And, if TopologyKey is "topology.kubernetes.io/zone", each zone is a domain of that topology. It's a required field.

Property	Type	Description
<b>whenUnsatisfiable</b>	<b>string</b>	<p>WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <b>more</b> imbalanced. It's a required field.</p> <p>Possible enum values: - <b>"DoNotSchedule"</b> instructs the scheduler not to schedule the pod when constraints are not satisfied. - <b>"ScheduleAnyway"</b> instructs the scheduler to schedule the pod even if constraints are not satisfied.</p>

#### 4.1.134. io.k8s.api.core.v1.TypedLocalObjectReference schema

##### Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

##### Type

**object**

##### Required

- **kind**

- **name**

#### Schema

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

#### 4.1.135. io.k8s.api.core.v1.TypedObjectReference schema

##### Description

##### Type

**object**

##### Required

- **kind**
- **name**

#### Schema

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

Property	Type	Description
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

#### 4.1.136. io.k8s.api.core.v1.Volume schema

##### Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

##### Type

**object**

##### Required

- **name**

##### Schema

Property	Type	Description
<b>awsElasticBlockStore</b>	<b><a href="#">AWSElasticBlockStoreVolumeSource</a></b>	awsElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>azureDisk</b>	<b><a href="#">AzureDiskVolumeSource</a></b>	azureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
<b>azureFile</b>	<b><a href="#">AzureFileVolumeSource</a></b>	azureFile represents an Azure File Service mount on the host and bind mount to the pod.

Property	Type	Description
<b>cephfs</b>	<b>CephFSVolumeSource</b>	cephFS represents a Ceph FS mount on the host that shares a pod's lifetime
<b>cinder</b>	<b>CinderVolumeSource</b>	cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>configMap</b>	<b>ConfigMapVolumeSource</b>	configMap represents a configMap that should populate this volume
<b>csi</b>	<b>CSIVolumeSource</b>	csi (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
<b>downwardAPI</b>	<b>DownwardAPIVolumeSource</b>	downwardAPI represents downward API about the pod that should populate this volume
<b>emptyDir</b>	<b>EmptyDirVolumeSource</b>	emptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Property	Type	Description
<b>ephemeral</b>	<b><a href="#">EphemeralVolumeSource</a></b>	<p>ephemeral represents a volume that is handled by a cluster storage driver. The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see <a href="#">EphemeralVolumeSource</a> for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
<b>fc</b>	<b><a href="#">FCVolumeSource</a></b>	<p>fc represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
<b>flexVolume</b>	<b><a href="#">FlexVolumeSource</a></b>	<p>flexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>

Property	Type	Description
<b>flocker</b>	<b>FlockerVolumeSource</b>	flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
<b>gcePersistentDisk</b>	<b>GCEPersistentDiskVolumeSource</b>	gcePersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersisitentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersisitentdisk</a>
<b>gitRepo</b>	<b>GitRepoVolumeSource</b>	gitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
<b>glusterfs</b>	<b>GlusterfsVolumeSource</b>	glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
<b>hostPath</b>	<b>HostPathVolumeSource</b>	hostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
<b>iscsi</b>	<b>ISCSIVolumeSource</b>	iscsi represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>

Property	Type	Description
<b>name</b>	<b>string</b>	name of the volume. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>nfs</b>	<b>NFSVolumeSource</b>	nfs represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>persistentVolumeClaim</b>	<b>PersistentVolumeClaimVolumeSource</b>	persistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
<b>photonPersistentDisk</b>	<b>PhotonPersistentDiskVolumeSource</b>	photonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
<b>portworxVolume</b>	<b>PortworxVolumeSource</b>	portworxVolume represents a portworx volume attached and mounted on kubelets host machine
<b>projected</b>	<b>ProjectedVolumeSource</b>	projected items for all in one resources secrets, configmaps, and downward API
<b>quobyte</b>	<b>QuobyteVolumeSource</b>	quobyte represents a Quobyte mount on the host that shares a pod's lifetime
<b>rbd</b>	<b>RBDVolumeSource</b>	rbd represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
<b>scaleIO</b>	<b>ScaleIOVolumeSource</b>	scaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.

Property	Type	Description
<b>secret</b>	<a href="#">SecretVolumeSource</a>	secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
<b>storageos</b>	<a href="#">StorageOSVolumeSource</a>	storageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
<b>vsphereVolume</b>	<a href="#">VsphereVirtualDiskVolumeSource</a>	vsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

#### 4.1.137. io.k8s.api.core.v1.VolumeDevice schema

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

##### Required

- **name**
- **devicePath**

##### Schema

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

#### 4.1.138. io.k8s.api.core.v1.VolumeMount schema

##### Description

VolumeMount describes a mounting of a Volume within a container.

##### Type

**object**

##### Required

- **name**

- `mountPath`

## Schema

Property	Type	Description
<code>mountPath</code>	<code>string</code>	Path within the container at which the volume should be mounted. Must not contain ':'.
<code>mountPropagation</code>	<code>string</code>	<p><code>mountPropagation</code> determines how mounts are propagated from the host to container and the other way around. When not set, <code>MountPropagationNone</code> is used. This field is beta in 1.10.</p> <p>Possible enum values: - <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). - <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). - <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<code>name</code>	<code>string</code>	This must match the Name of a Volume.
<code>readOnly</code>	<code>boolean</code>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.

Property	Type	Description
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

#### 4.1.139. io.k8s.api.core.v1.VolumeNodeAffinity schema

##### Description

VolumeNodeAffinity defines constraints that limit what nodes this volume can be accessed from.

##### Type

**object**

##### Schema

Property	Type	Description
<b>required</b>	<a href="#">NodeSelector</a>	required specifies hard node constraints that must be met.

#### 4.1.140. io.k8s.api.core.v1.VolumeProjection schema

##### Description

Projection that may be projected along with other supported volume types

##### Type

**object**

##### Schema

Property	Type	Description
<b>configMap</b>	<a href="#">ConfigMapProjection</a>	configMap information about the configMap data to project
<b>downwardAPI</b>	<a href="#">DownwardAPIProjection</a>	downwardAPI information about the downwardAPI data to project

Property	Type	Description
<b>secret</b>	<a href="#">SecretProjection</a>	secret information about the secret data to project
<b>serviceAccountToken</b>	<a href="#">ServiceAccountTokenProjection</a>	serviceAccountToken is information about the serviceAccountToken data to project

#### 4.1.141. io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource schema

##### Description

Represents a vSphere volume resource.

##### Type

**object**

##### Required

- **volumePath**

##### Schema

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>storagePolicyID</b>	<b>string</b>	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
<b>storagePolicyName</b>	<b>string</b>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<b>volumePath</b>	<b>string</b>	volumePath is the path that identifies vSphere volume vmdk

#### 4.1.142. io.k8s.api.core.v1.WeightedPodAffinityTerm schema

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

## Type

**object**

## Required

- **weight**
- **podAffinityTerm**

## Schema

Property	Type	Description
<b>podAffinityTerm</b>	<b>PodAffinityTerm</b>	Required. A pod affinity term, associated with the corresponding weight.
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

## 4.1.143. io.k8s.api.core.v1.WindowsSecurityContextOptions schema

## Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

## Type

**object**

## Schema

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.

Property	Type	Description
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 4.1.144. io.k8s.api.discovery.v1.EndpointSliceList schema

##### Description

EndpointSliceList represents a list of endpoint slices

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (EndpointSlice)</b>	items is the list of endpoint slices
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata.

#### 4.1.145. io.k8s.api.events.v1.EventList schema

##### Description

EventList is a list of Event objects.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (Event)</b>	items is a list of schema objects.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.146. io.k8s.api.flowcontrol.v1beta3.FlowSchemaList schema

##### Description

FlowSchemaList is a list of FlowSchema objects.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (FlowSchema)</b>	<b>items</b> is a list of FlowSchemas.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	<b>metadata</b> is the standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.147. io.k8s.api.flowcontrol.v1beta3.PriorityLevelConfigurationList schema

##### Description

PriorityLevelConfigurationList is a list of PriorityLevelConfiguration objects.

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (PriorityLevelConfiguration)</b>	<b>items</b> is a list of request-priorities.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. #### 4.1.164. io.k8s.apixtensions-apiserver.pkg.apis.apixtensions.v1.ExternalDocumentation schema

##### Description

ExternalDocumentation allows referencing an external resource for extended documentation.

##### Type

**object**

##### Schema

Property	Type	Description
<b>description</b>	<b>string</b>	

Property	Type	Description
<b>url</b>	<b>string</b>	

#### 4.1.165. io.k8s.apixtensions-apiserver.pkg.apis.apixtensions.v1.JSON schema

##### Description

JSON represents any valid JSON value. These types are supported: bool, int64, float64, string, []interface{}, map[string]interface{} and nil.

##### Type

..

#### 4.1.166. io.k8s.apixtensions-apiserver.pkg.apis.apixtensions.v1.JSONSchemaProps schema

##### Description

JSONSchemaProps is a JSON-Schema following Specification Draft 4 (<http://json-schema.org/>).

##### Type

**object**

##### Schema

Property	Type	Description
<b>\$ref</b>	<b>string</b>	
<b>\$schema</b>	<b>string</b>	
<b>additionalItems</b>	<b>JSONSchemaPropsOrBool</b>	
<b>additionalProperties</b>	<b>JSONSchemaPropsOrBool</b>	
<b>allOf</b>	<b>array (undefined)</b>	
<b>anyOf</b>	<b>array (undefined)</b>	
<b>default</b>	<b>JSON</b>	default is a default value for undefined object fields. Defaulting is a beta feature under the CustomResourceDefaulting feature gate. Defaulting requires spec.preserveUnknownFields to be false.
<b>definitions</b>	<b>object (undefined)</b>	
<b>dependencies</b>	<b>object (undefined)</b>	

Property	Type	Description
<b>description</b>	<b>string</b>	
<b>enum</b>	<b>array (JSON)</b>	
<b>example</b>	<b>JSON</b>	
<b>exclusiveMaximum</b>	<b>boolean</b>	
<b>exclusiveMinimum</b>	<b>boolean</b>	
<b>externalDocs</b>	<b>ExternalDocumentation</b>	
<b>format</b>	<b>string</b>	<p>format is an OpenAPI v3 format string. Unknown formats are ignored. The following formats are validated:</p> <ul style="list-style-type: none"> <li>- bsonobjectid: a bson object ID, i.e. a 24 characters hex string</li> <li>- uri: an URI as parsed by Golang <code>net/url.ParseRequestURI</code></li> <li>- email: an email address as parsed by Golang <code>net/mail.ParseAddress</code></li> <li>- hostname: a valid representation for an Internet host name, as defined by RFC 1034, section 3.1 [RFC1034].</li> <li>- ipv4: an IPv4 IP as parsed by Golang <code>net.ParseIP</code></li> <li>- ipv6: an IPv6 IP as parsed by Golang <code>net.ParseIP</code></li> <li>- cidr: a CIDR as parsed by Golang <code>net.ParseCIDR</code></li> <li>- mac: a MAC address as parsed by Golang <code>net.ParseMAC</code></li> <li>- uuid: an UUID that allows uppercase defined by the regex <code>(?i)^[0-9a-f]{8}-?[0-9a-f]{4}-?[0-9a-f]{4}-?[0-9a-f]{4}-?[0-9a-f]{12}\$</code></li> <li>- uuid3: an UUID3 that allows uppercase defined by the regex <code>(?i)^[0-9a-f]{8}-?[0-9a-f]{4}-?3[0-9a-f]{3}-?[0-9a-f]{4}-?[0-9a-f]{12}\$</code></li> <li>- uuid4: an UUID4 that allows uppercase defined by the regex <code>(?i)^[0-9a-f]{8}-?[0-9a-f]{4}-?4[0-9a-f]{3}-?[89ab][0-9a-f]{3}-?[0-9a-f]{12}\$</code></li> <li>- uuid5: an UUID5 that allows uppercase defined by the regex <code>(?i)^[0-9a-f]{8}-?[0-9a-f]{4}-?5[0-9a-f]{3}-?[89ab][0-9a-f]{3}-?[0-9a-f]{12}\$</code></li> </ul>

Property	Type	Description
		<p>- isbn: an ISBN10 or ISBN13 number string like "0321751043" or "978-0321751041" - isbn10: an ISBN10 number string like "0321751043" - isbn13: an ISBN13 number string like "978-0321751041" - creditcard: a credit card number defined by the regex <code>^(?:4[0-9]{12}(?:[0-9]{3})?[5[1-5][0-9]{14} 6(?:011 5[0-9][0-9])[0-9]{12} 3[47][0-9]{13} 3(?:0[0-5]  [68][0-9])[0-9]{11} (?:2131 1800 35\d{3})\d{11})\$</code> with any non digit characters mixed in - ssn: a U.S. social security number following the regex <code>^\d{3}[- ]?\d{2}[- ]?\d{4}\$</code> - hexcolor: an hexadecimal color code like "FFFFFF: following the regex <code>^[0-9a-fA-F]{3}([0-9a-fA-F]{6})\$</code> - rgbcolor: an RGB color code like rgb like "rgb(255,255,255)" - byte: base64 encoded binary data - password: any kind of string - date: a date string like "2006-01-02" as defined by full-date in RFC3339 - duration: a duration string like "22 ns" as parsed by Golang time.ParseDuration or compatible with Scala duration format - datetime: a date time string like "2014-12-15T19:30:20.000Z" as defined by date-time in RFC3339.</p>

<b>x-kubernetes-embedded-resource</b>	<b>boolean</b>	x-kubernetes-embedded-resource defines that the value is an embedded Kubernetes runtime.Object, with TypeMeta and ObjectMeta. The type must be object. It is allowed to further restrict the embedded object. kind, apiVersion and metadata are validated automatically. x-kubernetes-preserve-unknown-fields is allowed to be true, but does not have to be if the object is fully specified (up to kind, apiVersion, metadata).

Property	Type	Description
<b>x-kubernetes-int-or-string</b>	<b>boolean</b>	<p>x-kubernetes-int-or-string specifies that this value is either an integer or a string. If this is true, an empty type is allowed and type as child of anyOf is permitted if following one of the following patterns:</p> <p>1) anyOf: - type: integer - type: string 2) allOf: - anyOf: - type: integer - type: string - ... zero or more</p>
<b>x-kubernetes-list-map-keys</b>	<b>array (string)</b>	<p>x-kubernetes-list-map-keys annotates an array with the x-kubernetes-list-type <b>map</b> by specifying the keys used as the index of the map.</p> <p>This tag <b>MUST</b> only be used on lists that have the "x-kubernetes-list-type" extension set to "map". Also, the values specified for this attribute must be a scalar typed field of the child structure (no nesting is supported).</p> <p>The properties specified must either be required or have a default value, to ensure those properties are present for all list items.</p>

Property	Type	Description
<b>x-kubernetes-list-type</b>	<b>string</b>	<p>x-kubernetes-list-type annotates an array to further describe its topology. This extension must only be used on lists and may have 3 possible values:</p> <p>1) <b>atomic</b>: the list is treated as a single entity, like a scalar. Atomic lists will be entirely replaced when updated. This extension may be used on any type of list (struct, scalar, ...). 2) <b>set</b>: Sets are lists that must not have multiple items with the same value. Each value must be a scalar, an object with x-kubernetes-map-type <b>atomic</b> or an array with x-kubernetes-list-type <b>atomic</b>. 3) <b>map</b>: These lists are like maps in that their elements have a non-index key used to identify them. Order is preserved upon merge. The map tag must only be used on a list with elements of type object. Defaults to atomic for arrays.</p>
<b>x-kubernetes-map-type</b>	<b>string</b>	<p>x-kubernetes-map-type annotates an object to further describe its topology. This extension must only be used when type is object and may have 2 possible values:</p> <p>1) <b>granular</b>: These maps are actual maps (key-value pairs) and each fields are independent from each other (they can each be manipulated by separate actors). This is the default behaviour for all maps. 2) <b>atomic</b>: the list is treated as a single entity, like a scalar. Atomic maps will be entirely replaced when updated.</p>

Property	Type	Description
<b>x-kubernetes-preserve-unknown-fields</b>	<b>boolean</b>	x-kubernetes-preserve-unknown-fields stops the API server decoding step from pruning fields which are not specified in the validation schema. This affects fields recursively, but switches back to normal pruning behaviour if nested properties or additionalProperties are specified in the schema. This can either be true or undefined. False is forbidden.
<b>x-kubernetes-validations</b>	<b>array (ValidationRule)</b>	x-kubernetes-validations describes a list of validation rules written in the CEL expression language. This field is an alpha-level. Using this field requires the feature gate <b>CustomResourceValidationExpressions</b> to be enabled.

#### 4.1.167. io.k8s.apimachinery.pkg.apis.extensions.v1.JSONSchemaPropsOrArray schema

##### Description

JSONSchemaPropsOrArray represents a value that can either be a JSONSchemaProps or an array of JSONSchemaProps. Mainly here for serialization purposes.

##### Type

..

#### 4.1.168. io.k8s.apimachinery.pkg.apis.extensions.v1.JSONSchemaPropsOrBool schema

##### Description

JSONSchemaPropsOrBool represents JSONSchemaProps or a boolean value. Defaults to true for the boolean property.

##### Type

..

#### 4.1.169. io.k8s.apimachinery.pkg.apis.extensions.v1.JSONSchemaPropsOrStringArray schema

##### Description

JSONSchemaPropsOrStringArray represents a JSONSchemaProps or a string array.

##### Type

..

## 4.1.170. io.k8s.apiextensions-apiserver.pkg.apis.apiextensions.v1.ValidationRule schema

### Description

ValidationRule describes a validation rule written in the CEL expression language.

### Type

**object**

### Required

- **rule**

### Schema

Property	Type	Description
<b>message</b>	<b>string</b>	Message represents the message displayed when validation fails. The message is required if the Rule contains line breaks. The message must not contain line breaks. If unset, the message is "failed rule: {Rule}". e.g. "must be a URL with the host matching spec.host"

Property	Type	Description
<b>messageExpression</b>	<b>string</b>	<p>MessageExpression declares a CEL expression that evaluates to the validation failure message that is returned when this rule fails. Since messageExpression is used as a failure message, it must evaluate to a string. If both message and messageExpression are present on a rule, then messageExpression will be used if validation fails. If messageExpression results in a runtime error, the runtime error is logged, and the validation failure message is produced as if the messageExpression field were unset. If messageExpression evaluates to an empty string, a string with only spaces, or a string that contains line breaks, then the validation failure message will also be produced as if the messageExpression field were unset, and the fact that messageExpression produced an empty string/string with only spaces/string with line breaks will be logged. messageExpression has access to all the same variables as the rule; the only difference is the return type. Example: "x must be less than max ("string(self.max)")"</p>
<b>rule</b>	<b>string</b>	<p>Rule represents the expression which will be evaluated by CEL. ref: <a href="https://github.com/google/cel-spec">https://github.com/google/cel-spec</a> The Rule is scoped to the location of the x-kubernetes-validations extension in the schema. The <b>self</b> variable in the CEL expression is bound to the scoped value. Example: - Rule scoped to the root of a resource with a status subresource: {"rule": "self.status.actual &lt;= self.spec.maxDesired"}</p> <p>If the Rule is scoped to an object with properties, the accessible properties of the object are field selectable via <b>self.field</b> and field</p>

Property	Type	Description
		<p>presence can be checked via <code>has(self.field)</code>. Null valued fields are treated as absent fields in CEL expressions. If the Rule is scoped to an object with <code>additionalProperties</code> (i.e. a map) the value of the map are accessible via <code>self[mapKey]</code>, map containment can be checked via <code>mapKey in self</code> and all entries of the map are accessible via CEL macros and functions such as <code>self.all(...)</code>. If the Rule is scoped to an array, the elements of the array are accessible via <code>self[i]</code> and also by macros and functions. If the Rule is scoped to a scalar, <code>self</code> is bound to the scalar value. Examples: - Rule scoped to a map of objects: <pre>{ "rule": "self.components['Widget'].priority &lt; 10" }</pre> - Rule scoped to a list of integers: <pre>{ "rule": "self.values.all(value, value &gt;= 0 &amp;&amp; value &lt; 100)" }</pre> - Rule scoped to a string value: <pre>{ "rule": "self.startsWith('kube')" }</pre></p> <p>The <code>apiVersion</code>, <code>kind</code>, <code>metadata.name</code> and <code>metadata.generateName</code> are always accessible from the root of the object and from any <code>x-kubernetes-embedded-resource</code> annotated objects. No other metadata properties are accessible.</p> <p>Unknown data preserved in custom resources via <code>x-kubernetes-preserve-unknown-fields</code> is not accessible in CEL expressions. This includes: - Unknown field values that are preserved by object schemas with <code>x-kubernetes-preserve-unknown-fields</code>. - Object properties where the property schema is of an "unknown type". An "unknown type" is recursively defined as: - A schema with no type and <code>x-kubernetes-preserve-unknown-fields</code> set to true - An array where the items schema is of an</p>

Property	Type	Description
		<p>"unknown type" - An object where the additionalProperties schema is of an "unknown type"</p> <p>Only property names of the form <b>[a-zA-Z_-]/[a-zA-Z0-9_-]/*</b> are accessible. Accessible property names are escaped according to the following rules when accessed in the expression: - ' escapes to <code>'_underscores_'</code> - '.' escapes to <code>'_dot_'</code> - '-' escapes to <code>'_dash_'</code> - '/' escapes to <code>'_slash_'</code> -</p> <p>Property names that exactly match a CEL RESERVED keyword escape to <code>'_{keyword}_'</code>. The keywords are: "true", "false", "null", "in", "as", "break", "const", "continue", "else", "for", "function", "if", "import", "let", "loop", "package", "namespace", "return".</p> <p>Examples: - Rule accessing a property named "namespace":  <code>{ "rule": self.__namespace__ → O }</code> - Rule accessing a property named "x-prop": <code>{ "rule": self.x__dash__prop → O }</code> - Rule accessing a property named "redactd": <code>{ "rule": self.redact__underscores__d → O }</code></p> <p>Equality on arrays with x-kubernetes-list-type of 'set' or 'map' ignores element order, i.e. <code>[1, 2] == [2, 1]</code>. Concatenation on arrays with x-kubernetes-list-type use the semantics of the list type:</p> <ul style="list-style-type: none"> <li>- 'set': <b>X + Y</b> performs a union where the array positions of all elements in <b>X</b> are preserved and non-intersecting elements in <b>Y</b> are appended, retaining their partial order.</li> <li>- 'map': <b>X + Y</b> performs a merge where the array positions of all keys in <b>X</b> are preserved but the values are overwritten by values in <b>Y</b> when the key sets of <b>X</b> and <b>Y</b> intersect. Elements in <b>Y</b> with non-intersecting keys are appended, retaining their partial order.</li> </ul>

#### 4.1.171. io.k8s.apimachinery.pkg.api.resource.Quantity schema

## Description

Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to `String()` and `AsInt64()` accessors. The serialization format is:

```
<quantity> ::= <signedNumber><suffix>
```

(Note that `<suffix>` may be empty, from the `""` case in `<decimalSI>`.)

```
<digit> ::= 0 | 1 | ... | 9
<digits> ::= <digit> | <digit><digits>
<number> ::= <digits> | <digits>.<digits> |
<digits>.|.<digits>
<sign> ::= "+" | "-"
<signedNumber> ::= <number> | <sign><number>
<suffix> ::=
<binarySI> | <decimalExponent> | <decimalSI>
<binarySI> ::= Ki | Mi | Gi | Ti | Pi | Ei
```

(International System of units; See: <http://physics.nist.gov/cuu/Units/binary.html>)

```
<decimalSI> ::= m | "" | k | M | G | T | P | E
```

(Note that  $1024 = 1\text{Ki}$  but  $1000 = 1\text{k}$ ; I didn't choose the capitalization.)

```
<decimalExponent> ::= "e" <signedNumber> | "E" <signedNumber>
```

No matter which of the three exponent forms is used, no quantity may represent a number greater than  $2^{63}-1$  in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: `0.1m` will rounded up to `1m`.) This may be extended in the future if we require larger or smaller quantities.

When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.

Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that:

- No precision is lost - No fractional digits will be emitted - The exponent (or suffix) is as large as possible.

The sign will be omitted unless the number is negative.

Examples:

- `1.5` will be serialized as `"1500m"` - `1.5Gi` will be serialized as `"1536Mi"`

Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.

Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)

This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.

## Type

**string**

## 4.1.172. io.k8s.apimachinery.pkg.apis.meta.v1.Condition schema

### Description

Condition contains details for one aspect of the current state of this API Resource.

### Type

**object**

### Required

- **type**
- **status**
- **lastTransitionTime**
- **reason**
- **message**

### Schema

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime is the last time the condition transitioned from one status to another. This should be when the underlying condition changed. If that is not known, then using the time when the API field changed is acceptable.
<b>message</b>	<b>string</b>	message is a human readable message indicating details about the transition. This may be an empty string.
<b>observedGeneration</b>	<b>integer</b>	observedGeneration represents the .metadata.generation that the condition was set based upon. For instance, if .metadata.generation is currently 12, but the .status.conditions[x].observedGeneration is 9, the condition is out of date with respect to the current state of the instance.

Property	Type	Description
<b>reason</b>	<b>string</b>	reason contains a programmatic identifier indicating the reason for the condition's last transition. Producers of specific condition types may define expected values and meanings for this field, and whether the values are considered a guaranteed API. The value should be a CamelCase string. This field may not be empty.
<b>status</b>	<b>string</b>	status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	type of condition in CamelCase or in foo.example.com/CamelCase.

#### 4.1.173. io.k8s.apimachinery.pkg.apis.meta.v1.DeleteOptions schema

##### Description

DeleteOptions may be provided when deleting an API object.

##### Type

**object**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>dryRun</b>	<b>array (string)</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Property	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>preconditions</b>	<b>Preconditions</b>	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

Property	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

#### 4.1.174. io.k8s.apimachinery.pkg.apis.meta.v1.FieldsV1 schema

##### Description

FieldsV1 stores a set of fields in a data structure like a Trie, in JSON format.

Each key is either a '.' representing the field itself, and will always map to an empty set, or a string representing a sub-field or item. The string will follow one of these four formats: 'f:<name>', where <name> is the name of a field in a struct, or key in a map 'v:<value>', where <value> is the exact json formatted value of a list item 'i:<index>', where <index> is position of a item in a list 'k:<keys>', where <keys> is a map of a list item's key fields to their unique values. If a key maps to an empty Fields value, the field that key represents is part of the set.

The exact format is defined in sigs.k8s.io/structured-merge-diff

##### Type

**object**

#### 4.1.175. io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector schema

##### Description

A label selector is a label query over a set of resources. The result of matchLabels and matchExpressions are ANDed. An empty label selector matches all objects. A null label selector matches no objects.

##### Type

**object**

##### Schema

Property	Type	Description
<b>matchExpressions</b>	<b>array</b> <b>(LabelSelectorRequirement)</b>	matchExpressions is a list of label selector requirements. The requirements are ANDed.

Property	Type	Description
<b>matchLabels</b>	<b>object (string)</b>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

#### 4.1.176. io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement schema

##### Description

A label selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

##### Type

**object**

##### Required

- **key**
- **operator**

##### Schema

Property	Type	Description
<b>key</b>	<b>string</b>	key is the label key that the selector applies to.
<b>operator</b>	<b>string</b>	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
<b>values</b>	<b>array (string)</b>	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

#### 4.1.177. io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta schema

##### Description

ListMeta describes metadata that synthetic resources must have, including lists and various status objects. A resource may have only one of {ObjectMeta, ListMeta}.

## Type

**object**

## Schema

Property	Type	Description
<b>continue</b>	<b>string</b>	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
<b>remainingItemCount</b>	<b>integer</b>	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <b>estimating</b> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Property	Type	Description
<b>resourceVersion</b>	<b>string</b>	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>selfLink</b>	<b>string</b>	Deprecated: selfLink is a legacy read-only field that is no longer populated by the system.

#### 4.1.178. io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry schema

##### Description

ManagedFieldsEntry is a workflow-id, a FieldSet and the group version of the resource that the fieldset applies to.

##### Type

**object**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
<b>fieldsType</b>	<b>string</b>	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
<b>fieldsV1</b>	<b>FieldsV1</b>	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Property	Type	Description
<b>manager</b>	<b>string</b>	Manager is an identifier of the workflow managing these fields.
<b>operation</b>	<b>string</b>	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
<b>subresource</b>	<b>string</b>	Subresource is the name of the subresource used to update that object, or empty string if the object was updated through the main resource. The value of this field is used to distinguish between managers, even if they share the same name. For example, a status update will be distinct from a regular update using the same manager name. Note that the APIVersion field is not related to the Subresource field and it always corresponds to the version of the main resource.
<b>time</b>	<b>Time</b>	Time is the timestamp of when the ManagedFields entry was added. The timestamp will also be updated if a field is added, the manager changes any of the owned fields value or removes a field. The timestamp does not update when a field is removed from the entry because another manager took it over.

#### 4.1.179. io.k8s.apimachinery.pkg.apis.meta.v1.MicroTime schema

##### Description

MicroTime is version of Time with microsecond level precision.

##### Type

**string**

#### 4.1.180. io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta schema

##### Description

ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.

##### Type

**object**

## Schema

Property	Type	Description
<b>annotations</b>	<b>object (string)</b>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/annotations">https://kubernetes.io/docs/concepts/overview/working-with-objects/annotations</a>
<b>creationTimestamp</b>	<b>Time</b>	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>deletionGracePeriodSeconds</b>	<b>integer</b>	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Property	Type	Description
<b>deletionTimestamp</b>	<b>Time</b>	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Property	Type	Description
<b>finalizers</b>	<b>array (string)</b>	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Property	Type	Description
<b>generateName</b>	<b>string</b>	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will return a 409.</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
<b>generation</b>	<b>integer</b>	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
<b>labels</b>	<b>object (string)</b>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels</a></p>

Property	Type	Description
<b>managedFields</b>	<b>array (ManagedFieldsEntry)</b>	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
<b>name</b>	<b>string</b>	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names#names</a>
<b>namespace</b>	<b>string</b>	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces</a>

Property	Type	Description
<b>ownerReferences</b>	<b>array (OwnerReference)</b>	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
<b>resourceVersion</b>	<b>string</b>	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
<b>selfLink</b>	<b>string</b>	Deprecated: selfLink is a legacy read-only field that is no longer populated by the system.
<b>uid</b>	<b>string</b>	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids</a></p>

## 4.1.181. io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference schema

### Description

OwnerReference contains enough information to let you identify an owning object. An owning object must be in the same namespace as the dependent, or be cluster-scoped, so there is no namespace field.

### Type

**object**

### Required

- **apiVersion**
- **kind**
- **name**
- **uid**

### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>blockOwnerDeletion</b>	<b>boolean</b>	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. See <a href="https://kubernetes.io/docs/concepts/architecture/garbage-collection/#foreground-deletion">https://kubernetes.io/docs/concepts/architecture/garbage-collection/#foreground-deletion</a> for how the garbage collector interacts with this field and enforces the foreground deletion. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
<b>controller</b>	<b>boolean</b>	If true, this reference points to the managing controller.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names#names</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids</a>

#### 4.1.182. io.k8s.apimachinery.pkg.apis.meta.v1.Patch schema

##### Description

Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

##### Type

**object**

#### 4.1.183. io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions schema

##### Description

Preconditions must be fulfilled before an operation (update, delete, etc.) is carried out.

##### Type

**object**

##### Schema

Property	Type	Description
<b>resourceVersion</b>	<b>string</b>	Specifies the target ResourceVersion
<b>uid</b>	<b>string</b>	Specifies the target UID.

#### 4.1.184. io.k8s.apimachinery.pkg.apis.meta.v1.Status schema

##### Description

Status is a return value for calls that don't return other objects.

##### Type

**object**

##### Schema

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>code</b>	<b>integer</b>	Suggested HTTP return code for this status, 0 if not set.
<b>details</b>	<b>StatusDetails</b>	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>message</b>	<b>string</b>	A human-readable description of the status of this operation.
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>reason</b>	<b>string</b>	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.

Property	Type	Description
<b>status</b>	<b>string</b>	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

#### 4.1.185. io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause schema

##### Description

StatusCause provides more information about an api.Status failure, including cases when multiple errors are encountered.

##### Type

**object**

##### Schema

Property	Type	Description
<b>field</b>	<b>string</b>	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
<b>message</b>	<b>string</b>	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
<b>reason</b>	<b>string</b>	A machine-readable description of the cause of the error. If this value is empty there is no information available.

#### 4.1.186. io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails schema

##### Description

StatusDetails is a set of additional properties that MAY be set by the server to provide additional information about a response. The Reason field of a Status object defines what attributes will be set.

Clients must ignore fields that do not match the defined type of each attribute, and should assume that any attribute may be empty, invalid, or under defined.

## Type

**object**

## Schema

Property	Type	Description
<b>causes</b>	<b>array (StatusCause)</b>	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
<b>group</b>	<b>string</b>	The group attribute of the resource associated with the status StatusReason.
<b>kind</b>	<b>string</b>	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
<b>retryAfterSeconds</b>	<b>integer</b>	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action - for those errors this field may indicate how long to wait before taking the alternate action.
<b>uid</b>	<b>string</b>	UID of the resource. (when there is a single resource which can be described). More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names#uids</a>

### 4.1.187. io.k8s.apimachinery.pkg.apis.meta.v1.Time schema

**Description**

Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.

**Type**

**string**

**4.1.188. io.k8s.apimachinery.pkg.apis.meta.v1.WatchEvent schema****Description**

Event represents a single event to a watched resource.

**Type**

**object**

**Required**

- **type**
- **object**

**Schema**

Property	Type	Description
<b>object</b>	<a href="#">RawExtension</a>	Object is: * If Type is Added or Modified: the new state of the object. * If Type is Deleted: the state of the object immediately before deletion. * If Type is Error: *Status is recommended; other types may make sense depending on context.
<b>type</b>	<b>string</b>	

**4.1.189. io.k8s.apimachinery.pkg.runtime.RawExtension schema****Description**

RawExtension is used to hold extensions in external versions.

To use this, make a field which has RawExtension as its type in your external, versioned struct, and Object in your internal struct. You also need to register your various plugin types.

```
type MyAPIObject struct {
    runtime.TypeMeta `json:",inline"`
    MyPlugin runtime.Object `json:"myPlugin"`
}
```

```
type PluginA struct {
    AOption string `json:"aOption"`
}
```

```
type MyAPIObject struct {
  runtime.TypeMeta `json:",inline"`
  MyPlugin runtime.RawExtension `json:"myPlugin"`
}
```

```
type PluginA struct {
  AOption string `json:"aOption"`
}
```

```
{
  "kind":"MyAPIObject",
  "apiVersion":"v1",
  "myPlugin": {
    "kind":"PluginA",
    "aOption":"foo",
  },
}
```

So what happens? Decode first uses json or yaml to unmarshal the serialized data into your external MyAPIObject. That causes the raw JSON to be stored, but not unpacked. The next step is to copy (using pkg/conversion) into the internal struct. The runtime package's DefaultScheme has conversion functions installed which will unpack the JSON stored in RawExtension, turning it into the correct object type, and storing it in the Object. (TODO: In the case where the object is of an unknown type, a runtime.Unknown object will be created and stored.)

## Type

**object**

### 4.1.190. io.k8s.apimachinery.pkg.util.intstr.IntOrString schema

#### Description

IntOrString is a type that can hold an int32 or a string. When used in JSON or YAML marshalling and unmarshalling, it produces or consumes the inner type. This allows you to have, for example, a JSON field that can accept a name or number.

## Type

**string**

### 4.1.191. io.k8s.kube-aggregator.pkg.apis.apiregistration.v1.APIServiceList schema

#### Description

APIServiceList is a list of APIService objects.

## Type

**object**

## Required

- **items**

## Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (APIService)</b>	Items is the list of APIService
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 4.1.192. io.k8s.migration.v1alpha1.StorageVersionMigrationList schema

##### Description

StorageVersionMigrationList is a list of StorageVersionMigration

##### Type

**object**

##### Required

- **items**

##### Schema

<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (SecurityContextConstraints)</b>	List of securitycontextconstraints. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

#### 4.1.199. io.topolvm.v1.LogicalVolumeList schema

##### Description

LogicalVolumeList is a list of LogicalVolume

##### Type

**object**

##### Required

- **items**

##### Schema

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>items</b>	<b>array (LogicalVolume)</b>	List of logicalvolumes. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ListMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

## CHAPTER 5. EXTENSION APIS

### 5.1. API EXTENSIONS APIS

#### 5.1.1. CustomResourceDefinition [apiextensions.k8s.io/v1]

##### Description

CustomResourceDefinition represents a resource that should be exposed on the API server. Its name MUST be in the format <.spec.name>.<.spec.group>.

##### Type

**object**

### 5.2. CUSTOMRESOURCEDEFINITION [APIEXTENSIONS.K8S.IO/V1]

##### Description

CustomResourceDefinition represents a resource that should be exposed on the API server. Its name MUST be in the format <.spec.name>.<.spec.group>.

##### Type

**object**

##### Required

- **spec**

#### 5.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	CustomResourceDefinitionSpec describes how a user wants their resource to appear
<b>status</b>	<b>object</b>	CustomResourceDefinitionStatus indicates the state of the CustomResourceDefinition

### 5.2.1.1. .spec

#### Description

CustomResourceDefinitionSpec describes how a user wants their resource to appear

#### Type

**object**

#### Required

- **group**
- **names**
- **scope**
- **versions**

Property	Type	Description
<b>conversion</b>	<b>object</b>	CustomResourceConversion describes how to convert different versions of a CR.

Property	Type	Description
<b>group</b>	<b>string</b>	group is the API group of the defined custom resource. The custom resources are served under <b>/apis/&lt;group&gt;/...</b> . Must match the name of the CustomResourceDefinition (in the form <b>&lt;names.plural&gt;.&lt;group&gt;</b> ).
<b>names</b>	<b>object</b>	CustomResourceDefinitionNames indicates the names to serve this CustomResourceDefinition
<b>preserveUnknownFields</b>	<b>boolean</b>	preserveUnknownFields indicates that object fields which are not specified in the OpenAPI schema should be preserved when persisting to storage. apiVersion, kind, metadata and known fields inside metadata are always preserved. This field is deprecated in favor of setting <b>x-preserve-unknown-fields</b> to true in <b>spec.versions[*].schema.openAPIV3Schema</b> . See <a href="https://kubernetes.io/docs/tasks/extend-kubernetes/custom-resources/custom-resource-definitions/#field-pruning">https://kubernetes.io/docs/tasks/extend-kubernetes/custom-resources/custom-resource-definitions/#field-pruning</a> for details.
<b>scope</b>	<b>string</b>	scope indicates whether the defined custom resource is cluster- or namespace-scoped. Allowed values are <b>Cluster</b> and <b>Namespaced</b> .

Property	Type	Description
<b>versions</b>	<b>array</b>	versions is the list of all API versions of the defined custom resource. Version names are used to compute the order in which served versions are listed in API discovery. If the version string is "kube-like", it will sort above non "kube-like" version strings, which are ordered lexicographically. "Kube-like" versions start with a "v", then are followed by a number (the major version), then optionally the string "alpha" or "beta" and another number (the minor version). These are sorted first by GA > beta > alpha (where GA is a version with no suffix such as beta or alpha), and then by comparing major version, then minor version. An example sorted list of versions: v10, v2, v1, v11beta2, v10beta3, v3beta1, v12alpha1, v11alpha2, foo1, foo10.
<b>versions[]</b>	<b>object</b>	CustomResourceDefinitionVersion describes a version for CRD.

### 5.2.1.2. .spec.conversion

#### Description

CustomResourceConversion describes how to convert different versions of a CR.

#### Type

**object**

#### Required

- **strategy**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>strategy</b>	<b>string</b>	strategy specifies how custom resources are converted between versions. Allowed values are: - <b>"None"</b> : The converter only change the apiVersion and would not touch any other field in the custom resource. - <b>"Webhook"</b> : API Server will call to an external webhook to do the conversion. Additional information is needed for this option. This requires spec.preserveUnknownFields to be false, and spec.conversion.webhook to be set.
<b>webhook</b>	<b>object</b>	WebhookConversion describes how to call a conversion webhook

### 5.2.1.3. .spec.conversion.webhook

#### Description

WebhookConversion describes how to call a conversion webhook

#### Type

**object**

#### Required

- **conversionReviewVersions**

Property	Type	Description
<b>clientConfig</b>	<b>object</b>	WebhookClientConfig contains the information to make a TLS connection with the webhook.

Property	Type	Description
<b>conversionReviewVersions</b>	<b>array (string)</b>	conversionReviewVersions is an ordered list of preferred <b>ConversionReview</b> versions the Webhook expects. The API server will use the first version in the list which it supports. If none of the versions specified in this list are supported by API server, conversion will fail for the custom resource. If a persisted Webhook configuration specifies allowed versions and does not include any versions known to the API Server, calls to the webhook will fail.

#### 5.2.1.4. .spec.conversion.webhook.clientConfig

##### Description

WebhookClientConfig contains the information to make a TLS connection with the webhook.

##### Type

**object**

Property	Type	Description
<b>caBundle</b>	<b>string</b>	caBundle is a PEM encoded CA bundle which will be used to validate the webhook's server certificate. If unspecified, system trust roots on the apiserver are used.
<b>service</b>	<b>object</b>	ServiceReference holds a reference to Service.legacy.k8s.io

Property	Type	Description
<b>url</b>	<b>string</b>	<p>url gives the location of the webhook, in standard URL form (<b>scheme://host:port/path</b>). Exactly one of <b>url</b> or <b>service</b> must be specified.</p> <p>The <b>host</b> should not refer to a service running in the cluster; use the <b>service</b> field instead. The host might be resolved via external DNS in some apiservers (e.g., <b>kube-apiserver</b> cannot resolve in-cluster DNS as that would be a layering violation). <b>host</b> may also be an IP address.</p> <p>Please note that using <b>localhost</b> or <b>127.0.0.1</b> as a <b>host</b> is risky unless you take great care to run this webhook on all hosts which run an apiserver which might need to make calls to this webhook. Such installs are likely to be non-portable, i.e., not easy to turn up in a new cluster.</p> <p>The scheme must be "https"; the URL must begin with "https://".</p> <p>A path is optional, and if present may be any string permissible in a URL. You may use the path to pass an arbitrary string to the webhook, for example, a cluster identifier.</p> <p>Attempting to use a user or basic auth e.g. "user:password@" is not allowed. Fragments ("#...") and query parameters ("?...") are not allowed, either.</p>

### 5.2.1.5. .spec.conversion.webhook.clientConfig.service

#### Description

ServiceReference holds a reference to Service.legacy.k8s.io

#### Type

**object**

#### Required

- **namespace**

- `namespace`

- `name`

Property	Type	Description
<code>name</code>	<code>string</code>	<code>name</code> is the name of the service. Required
<code>namespace</code>	<code>string</code>	<code>namespace</code> is the namespace of the service. Required
<code>path</code>	<code>string</code>	<code>path</code> is an optional URL path at which the webhook will be contacted.
<code>port</code>	<code>integer</code>	<code>port</code> is an optional service port at which the webhook will be contacted. <b>port</b> should be a valid port number (1-65535, inclusive). Defaults to 443 for backward compatibility.

#### 5.2.1.6. `.spec.names`

##### Description

`CustomResourceDefinitionNames` indicates the names to serve this `CustomResourceDefinition`

##### Type

`object`

##### Required

- `plural`
- `kind`

Property	Type	Description
<code>categories</code>	<code>array (string)</code>	<code>categories</code> is a list of grouped resources this custom resource belongs to (e.g. 'all'). This is published in API discovery documents, and used by clients to support invocations like <b>kubectl get all</b> .

Property	Type	Description
<b>kind</b>	<b>string</b>	kind is the serialized kind of the resource. It is normally CamelCase and singular. Custom resource instances will use this value as the <b>kind</b> attribute in API calls.
<b>listKind</b>	<b>string</b>	listKind is the serialized kind of the list for this resource. Defaults to "`kind` List".
<b>plural</b>	<b>string</b>	plural is the plural name of the resource to serve. The custom resources are served under <b>/apis/&lt;group&gt;/&lt;version&gt;/.../&lt;plural&gt;</b> . Must match the name of the CustomResourceDefinition (in the form <b>&lt;names.plural&gt;</b> . <b>&lt;group&gt;</b> ). Must be all lowercase.
<b>shortNames</b>	<b>array (string)</b>	shortNames are short names for the resource, exposed in API discovery documents, and used by clients to support invocations like <b>kubectl get &lt;shortname&gt;</b> . It must be all lowercase.
<b>singular</b>	<b>string</b>	singular is the singular name of the resource. It must be all lowercase. Defaults to lowercased <b>kind</b> .

### 5.2.1.7. .spec.versions

#### Description

versions is the list of all API versions of the defined custom resource. Version names are used to compute the order in which served versions are listed in API discovery. If the version string is "kube-like", it will sort above non "kube-like" version strings, which are ordered lexicographically. "Kube-like" versions start with a "v", then are followed by a number (the major version), then optionally the string "alpha" or "beta" and another number (the minor version). These are sorted first by GA > beta > alpha (where GA is a version with no suffix such as beta or alpha), and then by comparing major version, then minor version. An example sorted list of versions: v10, v2, v1, v11beta2, v10beta3, v3beta1, v12alpha1, v11alpha2, foo1, foo10.

#### Type

**array**

### 5.2.1.8. .spec.versions[]

**Description**

CustomResourceDefinitionVersion describes a version for CRD.

**Type**

**object**

**Required**

- **name**
- **served**
- **storage**

Property	Type	Description
<b>additionalPrinterColumns</b>	<b>array</b>	additionalPrinterColumns specifies additional columns returned in Table output. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#receiving-resources-as-tables">https://kubernetes.io/docs/reference/using-api/api-concepts/#receiving-resources-as-tables</a> for details. If no columns are specified, a single column displaying the age of the custom resource is used.
<b>additionalPrinterColumns[]</b>	<b>object</b>	CustomResourceColumnDefinition specifies a column for server side printing.
<b>deprecated</b>	<b>boolean</b>	deprecated indicates this version of the custom resource API is deprecated. When set to true, API requests to this version receive a warning header in the server response. Defaults to false.
<b>deprecationWarning</b>	<b>string</b>	deprecationWarning overrides the default warning returned to API clients. May only be set when <b>deprecated</b> is true. The default warning indicates this version is deprecated and recommends use of the newest served version of equal or greater stability, if one exists.

Property	Type	Description
<b>name</b>	<b>string</b>	name is the version name, e.g. "v1", "v2beta1", etc. The custom resources are served under this version at <b>/apis/&lt;group&gt;/&lt;version&gt;/...</b> if <b>served</b> is true.
<b>schema</b>	<b>object</b>	CustomResourceValidation is a list of validation methods for CustomResources.
<b>served</b>	<b>boolean</b>	served is a flag enabling/disabling this version from being served via REST APIs
<b>storage</b>	<b>boolean</b>	storage indicates this version should be used when persisting custom resources to storage. There must be exactly one version with storage=true.
<b>subresources</b>	<b>object</b>	CustomResourceSubresources defines the status and scale subresources for CustomResources.

### 5.2.1.9. .spec.versions[].additionalPrinterColumns

#### Description

additionalPrinterColumns specifies additional columns returned in Table output. See <https://kubernetes.io/docs/reference/using-api/api-concepts/#receiving-resources-as-tables> for details. If no columns are specified, a single column displaying the age of the custom resource is used.

#### Type

**array**

### 5.2.1.10. .spec.versions[].additionalPrinterColumns[]

#### Description

CustomResourceColumnDefinition specifies a column for server side printing.

#### Type

**object**

#### Required

- **name**
- **type**

- `jsonPath`

Property	Type	Description
<b>description</b>	<b>string</b>	description is a human readable description of this column.
<b>format</b>	<b>string</b>	format is an optional OpenAPI type definition for this column. The 'name' format is applied to the primary identifier column to assist in clients identifying column is the resource name. See <a href="https://github.com/OAI/OpenAPI-Specification/blob/master/versions/2.0.md#data-types">https://github.com/OAI/OpenAPI-Specification/blob/master/versions/2.0.md#data-types</a> for details.
<b>jsonPath</b>	<b>string</b>	jsonPath is a simple JSON path (i.e. with array notation) which is evaluated against each custom resource to produce the value for this column.
<b>name</b>	<b>string</b>	name is a human readable name for the column.
<b>priority</b>	<b>integer</b>	priority is an integer defining the relative importance of this column compared to others. Lower numbers are considered higher priority. Columns that may be omitted in limited space scenarios should be given a priority greater than 0.
<b>type</b>	<b>string</b>	type is an OpenAPI type definition for this column. See <a href="https://github.com/OAI/OpenAPI-Specification/blob/master/versions/2.0.md#data-types">https://github.com/OAI/OpenAPI-Specification/blob/master/versions/2.0.md#data-types</a> for details.

### 5.2.1.11. `.spec.versions[].schema`

#### Description

CustomResourceValidation is a list of validation methods for CustomResources.

#### Type

**object**

Property	Type	Description
<b>openAPIV3Schema</b>	<a href="#">JSONSchemaProps</a>	openAPIV3Schema is the OpenAPI v3 schema to use for validation and pruning.

### 5.2.1.12. .spec.versions[].subresources

#### Description

CustomResourceSubresources defines the status and scale subresources for CustomResources.

#### Type

**object**

Property	Type	Description
<b>scale</b>	<b>object</b>	CustomResourceSubresourceScale defines how to serve the scale subresource for CustomResources.
<b>status</b>	<b>object</b>	CustomResourceSubresourceStatus defines how to serve the status subresource for CustomResources. Status is represented by the <b>.status</b> JSON path inside of a CustomResource. When set, * exposes a /status subresource for the custom resource * PUT requests to the /status subresource take a custom resource object, and ignore changes to anything except the status stanza * PUT/POST/PATCH requests to the custom resource ignore changes to the status stanza

### 5.2.1.13. .spec.versions[].subresources.scale

#### Description

CustomResourceSubresourceScale defines how to serve the scale subresource for CustomResources.

#### Type

**object**

#### Required

- **specReplicasPath**
- **statusReplicasPath**

Property	Type	Description
<b>labelSelectorPath</b>	<b>string</b>	labelSelectorPath defines the JSON path inside of a custom resource that corresponds to Scale <b>status.selector</b> . Only JSON paths without the array notation are allowed. Must be a JSON Path under <b>.status</b> or <b>.spec</b> . Must be set to work with HorizontalPodAutoscaler. The field pointed by this JSON path must be a string field (not a complex selector struct) which contains a serialized label selector in string form. More info: <a href="https://kubernetes.io/docs/tasks/access-kubernetes-api/custom-resources/custom-resource-definitions#scale-subresource">https://kubernetes.io/docs/tasks/access-kubernetes-api/custom-resources/custom-resource-definitions#scale-subresource</a> If there is no value under the given path in the custom resource, the <b>status.selector</b> value in the <b>/scale</b> subresource will default to the empty string.
<b>specReplicasPath</b>	<b>string</b>	specReplicasPath defines the JSON path inside of a custom resource that corresponds to Scale <b>spec.replicas</b> . Only JSON paths without the array notation are allowed. Must be a JSON Path under <b>.spec</b> . If there is no value under the given path in the custom resource, the <b>/scale</b> subresource will return an error on GET.
<b>statusReplicasPath</b>	<b>string</b>	statusReplicasPath defines the JSON path inside of a custom resource that corresponds to Scale <b>status.replicas</b> . Only JSON paths without the array notation are allowed. Must be a JSON Path under <b>.status</b> . If there is no value under the given path in the custom resource, the <b>status.replicas</b> value in the <b>/scale</b> subresource will default to 0.

#### 5.2.1.14. .spec.versions[].subresources.status

## Description

CustomResourceSubresourceStatus defines how to serve the status subresource for CustomResources. Status is represented by the **.status** JSON path inside of a CustomResource. When set, \* exposes a /status subresource for the custom resource \* PUT requests to the /status subresource take a custom resource object, and ignore changes to anything except the status stanza \* PUT/POST/PATCH requests to the custom resource ignore changes to the status stanza

## Type

**object**

### 5.2.1.15. .status

## Description

CustomResourceDefinitionStatus indicates the state of the CustomResourceDefinition

## Type

**object**

Property	Type	Description
<b>acceptedNames</b>	<b>object</b>	CustomResourceDefinitionNames indicates the names to serve this CustomResourceDefinition
<b>conditions</b>	<b>array</b>	conditions indicate state for particular aspects of a CustomResourceDefinition
<b>conditions[]</b>	<b>object</b>	CustomResourceDefinitionCondition contains details for the current condition of this pod.
<b>storedVersions</b>	<b>array (string)</b>	storedVersions lists all versions of CustomResources that were ever persisted. Tracking these versions allows a migration path for stored versions in etcd. The field is mutable so a migration controller can finish a migration to another version (ensuring no old objects are left in storage), and then remove the rest of the versions from this list. Versions may not be removed from <b>spec.versions</b> while they exist in this list.

### 5.2.1.16. .status.acceptedNames

## Description

CustomResourceDefinitionNames indicates the names to serve this CustomResourceDefinition

## Type

**object**

## Required

- plural
- kind

Property	Type	Description
<b>categories</b>	<b>array (string)</b>	categories is a list of grouped resources this custom resource belongs to (e.g. 'all'). This is published in API discovery documents, and used by clients to support invocations like <b>kubectl get all</b> .
<b>kind</b>	<b>string</b>	kind is the serialized kind of the resource. It is normally CamelCase and singular. Custom resource instances will use this value as the <b>kind</b> attribute in API calls.
<b>listKind</b>	<b>string</b>	listKind is the serialized kind of the list for this resource. Defaults to "`kind` List".
<b>plural</b>	<b>string</b>	plural is the plural name of the resource to serve. The custom resources are served under <b>/apis/&lt;group&gt;/&lt;version&gt;/.../&lt;plural&gt;</b> . Must match the name of the CustomResourceDefinition (in the form <b>&lt;names.plural&gt;.&lt;group&gt;</b> ). Must be all lowercase.
<b>shortNames</b>	<b>array (string)</b>	shortNames are short names for the resource, exposed in API discovery documents, and used by clients to support invocations like <b>kubectl get &lt;shortname&gt;</b> . It must be all lowercase.
<b>singular</b>	<b>string</b>	singular is the singular name of the resource. It must be all lowercase. Defaults to lowercased <b>kind</b> .

## 5.2.1.17. .status.conditions

## Description

conditions indicate state for particular aspects of a CustomResourceDefinition

Type

**array**

### 5.2.1.18. .status.conditions[]

Description

CustomResourceDefinitionCondition contains details for the current condition of this pod.

Type

**object**

Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	message is a human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	reason is a unique, one-word, CamelCase reason for the condition's last transition.
<b>status</b>	<b>string</b>	status is the status of the condition. Can be True, False, Unknown.
<b>type</b>	<b>string</b>	type is the type of the condition. Types include Established, NamesAccepted and Terminating.

### 5.2.2. API endpoints

The following API endpoints are available:

- **/apis/apiextensions.k8s.io/v1/customresourcedefinitions**
  - **DELETE**: delete collection of CustomResourceDefinition
  - **GET**: list or watch objects of kind CustomResourceDefinition
  - **POST**: create a CustomResourceDefinition

- **/apis/apiextensions.k8s.io/v1/watch/customresourcedefinitions**
  - **GET**: watch individual changes to a list of CustomResourceDefinition. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apiextensions.k8s.io/v1/customresourcedefinitions/{name}**
  - **DELETE**: delete a CustomResourceDefinition
  - **GET**: read the specified CustomResourceDefinition
  - **PATCH**: partially update the specified CustomResourceDefinition
  - **PUT**: replace the specified CustomResourceDefinition
- **/apis/apiextensions.k8s.io/v1/watch/customresourcedefinitions/{name}**
  - **GET**: watch changes to an object of kind CustomResourceDefinition. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/apiextensions.k8s.io/v1/customresourcedefinitions/{name}/status**
  - **GET**: read status of the specified CustomResourceDefinition
  - **PATCH**: partially update status of the specified CustomResourceDefinition
  - **PUT**: replace status of the specified CustomResourceDefinition

### 5.2.2.1. /apis/apiextensions.k8s.io/v1/customresourcedefinitions

Table 5.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of CustomResourceDefinition

Table 5.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

Parameter	Type	Description
<b>body</b>	<b>DeleteOptions</b> schema	

Table 5.4. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind CustomResourceDefinition

Table 5.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 5.6. HTTP responses

**Table 5.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

### 5.2.2.2. /apis/apiextensions.k8s.io/v1/watch/customresourcedefinitions

Table 5.10. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of CustomResourceDefinition. deprecated: use the 'watch' parameter with a list operation instead.

#### HTTP method

#### DELETE

#### Description

delete a CustomResourceDefinition

Table 5.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 5.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the CustomResourceDefinition

Table 5.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CustomResourceDefinition. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## CHAPTER 6. REGISTRATION APIS

### 6.1. API REGISTRATION APIS

#### 6.1.1. APIService [apiregistration.k8s.io/v1]

##### Description

APIService represents a server for a particular GroupVersion. Name must be "version.group".

##### Type

**object**

### 6.2. APISERVICE [APIREGISTRATION.K8S.IO/V1]

##### Description

APIService represents a server for a particular GroupVersion. Name must be "version.group".

##### Type

**object**

#### 6.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	APIServiceSpec contains information for locating and communicating with a server. Only https is supported, though you are able to disable certificate verification.
<b>status</b>	<b>object</b>	APIServiceStatus contains derived information about an API server

### 6.2.1.1. .spec

#### Description

APIServiceSpec contains information for locating and communicating with a server. Only https is supported, though you are able to disable certificate verification.

#### Type

**object**

#### Required

- **groupPriorityMinimum**
- **versionPriority**

Property	Type	Description
<b>caBundle</b>	<b>string</b>	CABundle is a PEM encoded CA bundle which will be used to validate an API server's serving certificate. If unspecified, system trust roots on the apiserver are used.
<b>group</b>	<b>string</b>	Group is the API group name this server hosts

Property	Type	Description
<b>groupPriorityMinimum</b>	<b>integer</b>	<p>GroupPriorityMinimum is the priority this group should have at least. Higher priority means that the group is preferred by clients over lower priority ones. Note that other versions of this group might specify even higher GroupPriorityMinimum values such that the whole group gets a higher priority. The primary sort is based on GroupPriorityMinimum, ordered highest number to lowest (20 before 10). The secondary sort is based on the alphabetical comparison of the name of the object. (v1.bar before v1.foo) We'd recommend something like: *.k8s.io (except extensions) at 18000 and PaaSes (OpenShift, Deis) are recommended to be in the 2000s</p>
<b>insecureSkipTLSVerify</b>	<b>boolean</b>	<p>InsecureSkipTLSVerify disables TLS certificate verification when communicating with this server. This is strongly discouraged. You should use the CABundle instead.</p>
<b>service</b>	<b>object</b>	<p>ServiceReference holds a reference to Service.legacy.k8s.io</p>
<b>version</b>	<b>string</b>	<p>Version is the API version this server hosts. For example, "v1"</p>

Property	Type	Description
<b>versionPriority</b>	<b>integer</b>	VersionPriority controls the ordering of this API version inside of its group. Must be greater than zero. The primary sort is based on VersionPriority, ordered highest to lowest (20 before 10). Since it's inside of a group, the number can be small, probably in the 10s. In case of equal version priorities, the version string will be used to compute the order inside a group. If the version string is "kube-like", it will sort above non "kube-like" version strings, which are ordered lexicographically. "Kube-like" versions start with a "v", then are followed by a number (the major version), then optionally the string "alpha" or "beta" and another number (the minor version). These are sorted first by GA > beta > alpha (where GA is a version with no suffix such as beta or alpha), and then by comparing major version, then minor version. An example sorted list of versions: v10, v2, v1, v11beta2, v10beta3, v3beta1, v12alpha1, v11alpha2, foo1, foo10.

### 6.2.1.2. .spec.service

#### Description

ServiceReference holds a reference to Service.legacy.k8s.io

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name is the name of the service
<b>namespace</b>	<b>string</b>	Namespace is the namespace of the service

Property	Type	Description
<b>port</b>	<b>integer</b>	If specified, the port on the service that hosting webhook. Default to 443 for backward compatibility. <b>port</b> should be a valid port number (1-65535, inclusive).

### 6.2.1.3. .status

#### Description

APIServiceStatus contains derived information about an API server

#### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	Current service state of apiService.
<b>conditions[]</b>	<b>object</b>	APIServiceCondition describes the state of an APIService at a particular point

### 6.2.1.4. .status.conditions

#### Description

Current service state of apiService.

#### Type

**array**

### 6.2.1.5. .status.conditions[]

#### Description

APIServiceCondition describes the state of an APIService at a particular point

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	Human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	Unique, one-word, CamelCase reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status is the status of the condition. Can be True, False, Unknown.
<b>type</b>	<b>string</b>	Type is the type of the condition.

## 6.2.2. API endpoints

The following API endpoints are available:

- **/apis/apiregistration.k8s.io/v1/apiservices**
  - **DELETE**: delete collection of APIService
  - **GET**: list or watch objects of kind APIService
  - **POST**: create an APIService
- **/apis/apiregistration.k8s.io/v1/watch/apiservices**
  - **GET**: watch individual changes to a list of APIService. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apiregistration.k8s.io/v1/apiservices/{name}**
  - **DELETE**: delete an APIService
  - **GET**: read the specified APIService
  - **PATCH**: partially update the specified APIService
  - **PUT**: replace the specified APIService
- **/apis/apiregistration.k8s.io/v1/watch/apiservices/{name}**
  - **GET**: watch changes to an object of kind APIService. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/apiregistration.k8s.io/v1/apiservices/{name}/status**

- **GET**: read status of the specified APIService
- **PATCH**: partially update status of the specified APIService
- **PUT**: replace status of the specified APIService

### 6.2.2.1. /apis/apiregistration.k8s.io/v1/apiservices

Table 6.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of APIService

Table 6.2. Query parameters

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

<b>body</b>	<b>DeleteOptions</b> schema	

Table 6.4. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind APIService

**Table 6.5. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

### 6.2.2.3. /apis/apiregistration.k8s.io/v1/apiservices/{name}

Table 6.12. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the APIService

Table 6.13. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### DELETE

#### Description

delete an APIService

Table 6.14. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

read the specified APIService

Table 6.17. HTTP responses

HTTP code	Response body
200 - OK	<b>APIService</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified APIService

**Table 6.18. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 6.2.2.4. /apis/apiregistration.k8s.io/v1/watch/apiservices/{name}

Table 6.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the APIService

Table 6.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind APIService. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## CHAPTER 7. APPS APIS

### 7.1. APPS APIS

#### 7.1.1. ControllerRevision [apps/v1]

##### Description

ControllerRevision implements an immutable snapshot of state data. Clients are responsible for serializing and deserializing the objects that contain their internal state. Once a ControllerRevision has been successfully created, it can not be updated. The API Server will fail validation of all requests that attempt to mutate the Data field. ControllerRevisions may, however, be deleted. Note that, due to its use by both the DaemonSet and StatefulSet controllers for update and rollback, this object is beta. However, it may be subject to name and representation changes in future releases, and clients should not depend on its stability. It is primarily for internal use by controllers.

##### Type

**object**

#### 7.1.2. DaemonSet [apps/v1]

##### Description

DaemonSet represents the configuration of a daemon set.

##### Type

**object**

#### 7.1.3. Deployment [apps/v1]

##### Description

Deployment enables declarative updates for Pods and ReplicaSets.

##### Type

**object**

#### 7.1.4. ReplicaSet [apps/v1]

##### Description

ReplicaSet ensures that a specified number of pod replicas are running at any given time.

##### Type

**object**

#### 7.1.5. StatefulSet [apps/v1]

##### Description

StatefulSet represents a set of pods with consistent identities. Identities are defined as: - Network: A single stable DNS and hostname. - Storage: As many VolumeClaims as requested.

The StatefulSet guarantees that a given network identity will always map to the same storage identity.

##### Type

**object**

## 7.2. CONTROLLERREVISION [APPS/V1]

### Description

ControllerRevision implements an immutable snapshot of state data. Clients are responsible for serializing and deserializing the objects that contain their internal state. Once a ControllerRevision has been successfully created, it can not be updated. The API Server will fail validation of all requests that attempt to mutate the Data field. ControllerRevisions may, however, be deleted. Note that, due to its use by both the DaemonSet and StatefulSet controllers for update and rollback, this object is beta. However, it may be subject to name and representation changes in future releases, and clients should not depend on its stability. It is primarily for internal use by controllers.

### Type

**object**

### Required

- **revision**

### 7.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>data</b>	<b>RawExtension</b>	Data is the serialized representation of the state.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>revision</b>	<b>integer</b>	Revision indicates the revision of the state represented by Data.

## 7.2.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/controllerrevisions**
  - **GET**: list or watch objects of kind ControllerRevision
- **/apis/apps/v1/watch/controllerrevisions**
  - **GET**: watch individual changes to a list of ControllerRevision. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/controllerrevisions**
  - **DELETE**: delete collection of ControllerRevision
  - **GET**: list or watch objects of kind ControllerRevision
  - **POST**: create a ControllerRevision
- **/apis/apps/v1/watch/namespaces/{namespace}/controllerrevisions**
  - **GET**: watch individual changes to a list of ControllerRevision. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/controllerrevisions/{name}**
  - **DELETE**: delete a ControllerRevision
  - **GET**: read the specified ControllerRevision
  - **PATCH**: partially update the specified ControllerRevision
  - **PUT**: replace the specified ControllerRevision
- **/apis/apps/v1/watch/namespaces/{namespace}/controllerrevisions/{name}**
  - **GET**: watch changes to an object of kind ControllerRevision. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 7.2.2.1. /apis/apps/v1/controllerrevisions

Table 7.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. ### 7.2.2.2. /apis/apps/v1/watch/controllerrevisions

Table 7.3. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ControllerRevision. deprecated: use the 'watch' parameter with a list operation instead.

#### **DELETE**

#### Description

delete collection of ControllerRevision

Table 7.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind ControllerRevision

Table 7.10. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**Table 7.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ControllerRevision
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 7.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ControllerRevision. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

HTTP code	Response body
200 - OK	<b>WatchEvent</b> schema
401 - Unauthorized	Empty

## 7.3. DAEMONSET [APPS/V1]

### Description

DaemonSet represents the configuration of a daemon set.

### Type

**object**

### 7.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	DaemonSetSpec is the specification of a daemon set.

Property	Type	Description
<b>status</b>	<b>object</b>	DaemonSetStatus represents the current status of a daemon set.

### 7.3.1.1. .spec

#### Description

DaemonSetSpec is the specification of a daemon set.

#### Type

**object**

#### Required

- **selector**
- **template**

Property	Type	Description
<b>minReadySeconds</b>	<b>integer</b>	The minimum number of seconds for which a newly created DaemonSet pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready).
<b>revisionHistoryLimit</b>	<b>integer</b>	The number of old history to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.
<b>selector</b>	<b>LabelSelector</b>	A label query over pods that are managed by the daemon set. Must match in order to be controlled. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Property	Type	Description
<b>template</b>	<b>PodTemplateSpec</b>	An object that describes the pod that will be created. The DaemonSet will create exactly one copy of this pod on every node that matches the template's node selector (or on every node if no node selector is specified). The only allowed template.spec.restartPolicy value is "Always". More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template</a>
<b>updateStrategy</b>	<b>object</b>	DaemonSetUpdateStrategy is a struct used to control the update strategy for a DaemonSet.

### 7.3.1.2. .spec.updateStrategy

#### Description

DaemonSetUpdateStrategy is a struct used to control the update strategy for a DaemonSet.

#### Type

**object**

Property	Type	Description
<b>rollingUpdate</b>	<b>object</b>	Spec to control the desired behavior of daemon set rolling update.
<b>type</b>	<b>string</b>	Type of daemon set update. Can be "RollingUpdate" or "OnDelete". Default is RollingUpdate.  Possible enum values: - <b>"OnDelete"</b> Replace the old daemons only when it's killed - <b>"RollingUpdate"</b> Replace the old daemons by new ones using rolling update i.e replace them on each node one after the other.

### 7.3.1.3. .spec.updateStrategy.rollingUpdate

#### Description

Spec to control the desired behavior of daemon set rolling update.

Type  
object

Property	Type	Description
<b>maxSurge</b>	<b>IntOrString</b>	<p>The maximum number of nodes with an existing available DaemonSet pod that can have an updated DaemonSet pod during during an update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up to a minimum of 1. Default value is 0. Example: when this is set to 30%, at most 30% of the total number of nodes that should be running the daemon pod (i.e. <code>status.desiredNumberScheduled</code>) can have their a new pod created before the old pod is marked as deleted. The update starts by launching new pods on 30% of nodes. Once an updated pod is available (Ready for at least <code>minReadySeconds</code>) the old DaemonSet pod on that node is marked deleted. If the old pod becomes unavailable for any reason (Ready transitions to false, is evicted, or is drained) an updated pod is immediately created on that node without considering surge limits. Allowing surge implies the possibility that the resources consumed by the daemonset on any given node can double if the readiness check fails, and so resource intensive daemonsets should take into account that they may cause evictions during disruption.</p>

Property	Type	Description
<b>maxUnavailable</b>	<b>IntOrString</b>	The maximum number of DaemonSet pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of total number of DaemonSet pods at the start of the update (ex: 10%). Absolute number is calculated from percentage by rounding up. This cannot be 0 if MaxSurge is 0 Default value is 1. Example: when this is set to 30%, at most 30% of the total number of nodes that should be running the daemon pod (i.e. status.desiredNumberScheduled) can have their pods stopped for an update at any given time. The update starts by stopping at most 30% of those DaemonSet pods and then brings up new DaemonSet pods in their place. Once the new pods are available, it then proceeds onto other DaemonSet pods, thus ensuring that at least 70% of original number of DaemonSet pods are available at all times during the update.

#### 7.3.1.4. .status

##### Description

DaemonSetStatus represents the current status of a daemon set.

##### Type

**object**

##### Required

- **currentNumberScheduled**
- **numberMisscheduled**
- **desiredNumberScheduled**
- **numberReady**

Property	Type	Description
<b>collisionCount</b>	<b>integer</b>	Count of hash collisions for the DaemonSet. The DaemonSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a DaemonSet's current state.
<b>conditions[]</b>	<b>object</b>	DaemonSetCondition describes the state of a DaemonSet at a certain point.
<b>currentNumberScheduled</b>	<b>integer</b>	The number of nodes that are running at least 1 daemon pod and are supposed to run the daemon pod. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/">https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/</a>
<b>desiredNumberScheduled</b>	<b>integer</b>	The total number of nodes that should be running the daemon pod (including nodes correctly running the daemon pod). More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/">https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/</a>
<b>numberAvailable</b>	<b>integer</b>	The number of nodes that should be running the daemon pod and have one or more of the daemon pod running and available (ready for at least spec.minReadySeconds)
<b>numberMisscheduled</b>	<b>integer</b>	The number of nodes that are running the daemon pod, but are not supposed to run the daemon pod. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/">https://kubernetes.io/docs/concepts/workloads/controllers/daemonset/</a>

Property	Type	Description
<b>numberReady</b>	<b>integer</b>	numberReady is the number of nodes that should be running the daemon pod and have one or more of the daemon pod running with a Ready Condition.
<b>numberUnavailable</b>	<b>integer</b>	The number of nodes that should be running the daemon pod and have none of the daemon pod running and available (ready for at least spec.minReadySeconds)
<b>observedGeneration</b>	<b>integer</b>	The most recent generation observed by the daemon set controller.
<b>updatedNumberScheduled</b>	<b>integer</b>	The total number of nodes that are running updated daemon pod

### 7.3.1.5. .status.conditions

#### Description

Represents the latest available observations of a DaemonSet's current state.

#### Type

**array**

### 7.3.1.6. .status.conditions[]

#### Description

DaemonSetCondition describes the state of a DaemonSet at a certain point.

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transitioned from one status to another.

Property	Type	Description
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of DaemonSet condition.

### 7.3.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/daemonsets**
  - **GET**: list or watch objects of kind DaemonSet
- **/apis/apps/v1/watch/daemonsets**
  - **GET**: watch individual changes to a list of DaemonSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/daemonsets**
  - **DELETE**: delete collection of DaemonSet
  - **GET**: list or watch objects of kind DaemonSet
  - **POST**: create a DaemonSet
- **/apis/apps/v1/watch/namespaces/{namespace}/daemonsets**
  - **GET**: watch individual changes to a list of DaemonSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/daemonsets/{name}**
  - **DELETE**: delete a DaemonSet
  - **GET**: read the specified DaemonSet
  - **PATCH**: partially update the specified DaemonSet
  - **PUT**: replace the specified DaemonSet
- **/apis/apps/v1/watch/namespaces/{namespace}/daemonsets/{name}**
  - **GET**: watch changes to an object of kind DaemonSet. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector'

parameter.

- **/apis/apps/v1/namespaces/{namespace}/daemonsets/{name}/status**
  - **GET**: read status of the specified DaemonSet
  - **PATCH**: partially update status of the specified DaemonSet
  - **PUT**: replace status of the specified DaemonSet

### 7.3.2.1. /apis/apps/v1/daemonsets

Table 7.33. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

#### Description

delete collection of DaemonSet

Table 7.39. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

**HTTP method****GET****Description**

list or watch objects of kind DaemonSet

Table 7.42. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. create a DaemonSet

**Table 7.44. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the DaemonSet
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 7.63. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind DaemonSet. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 7.64. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the DaemonSet
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 7.66. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### GET

#### Description

read status of the specified DaemonSet

Table 7.67. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">DaemonSet</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified DaemonSet

Table 7.68. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## 7.4. DEPLOYMENT [APPS/V1]

### Description

Deployment enables declarative updates for Pods and ReplicaSets.

### Type

**object**

### 7.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	DeploymentSpec is the specification of the desired behavior of the Deployment.
<b>status</b>	<b>object</b>	DeploymentStatus is the most recently observed status of the Deployment.

#### 7.4.1.1. .spec

##### Description

DeploymentSpec is the specification of the desired behavior of the Deployment.

##### Type

**object**

##### Required

- **selector**
- **template**

Property	Type	Description
<b>minReadySeconds</b>	<b>integer</b>	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
<b>paused</b>	<b>boolean</b>	Indicates that the deployment is paused.

Property	Type	Description
<b>progressDeadlineSeconds</b>	<b>integer</b>	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
<b>replicas</b>	<b>integer</b>	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
<b>revisionHistoryLimit</b>	<b>integer</b>	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.
<b>selector</b>	<b>LabelSelector</b>	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment. It must match the pod template's labels.
<b>strategy</b>	<b>object</b>	DeploymentStrategy describes how to replace existing pods with new ones.
<b>template</b>	<b>PodTemplateSpec</b>	Template describes the pods that will be created. The only allowed template.spec.restartPolicy value is "Always".

### 7.4.1.2. .spec.strategy

#### Description

DeploymentStrategy describes how to replace existing pods with new ones.

#### Type

**object**

Property	Type	Description
<b>rollingUpdate</b>	<b>object</b>	Spec to control the desired behavior of rolling update.
<b>type</b>	<b>string</b>	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.  Possible enum values: - <b>"Recreate"</b> Kill all existing pods before creating new ones. - <b>"RollingUpdate"</b> Replace the old ReplicaSets by new one using rolling update i.e gradually scale down the old ReplicaSets and scale up the new one.

### 7.4.1.3. .spec.strategy.rollingUpdate

#### Description

Spec to control the desired behavior of rolling update.

#### Type

**object**

Property	Type	Description
<b>maxSurge</b>	<b>IntOrString</b>	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new ReplicaSet can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new ReplicaSet can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.

Property	Type	Description
<b>maxUnavailable</b>	<b>IntOrString</b>	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This can not be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old ReplicaSet can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old ReplicaSet can be scaled down further, followed by scaling up the new ReplicaSet, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

#### 7.4.1.4. .status

##### Description

DeploymentStatus is the most recently observed status of the Deployment.

##### Type

**object**

Property	Type	Description
<b>availableReplicas</b>	<b>integer</b>	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
<b>collisionCount</b>	<b>integer</b>	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a deployment's current state.

Property	Type	Description
<b>conditions[]</b>	<b>object</b>	DeploymentCondition describes the state of a deployment at a certain point.
<b>observedGeneration</b>	<b>integer</b>	The generation observed by the deployment controller.
<b>readyReplicas</b>	<b>integer</b>	readyReplicas is the number of pods targeted by this Deployment with a Ready Condition.
<b>replicas</b>	<b>integer</b>	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
<b>unavailableReplicas</b>	<b>integer</b>	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.
<b>updatedReplicas</b>	<b>integer</b>	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

#### 7.4.1.5. .status.conditions

##### Description

Represents the latest available observations of a deployment's current state.

##### Type

**array**

#### 7.4.1.6. .status.conditions[]

##### Description

DeploymentCondition describes the state of a deployment at a certain point.

##### Type

**object**

##### Required

- **type**

- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transitioned from one status to another.
<b>lastUpdateTime</b>	<b>Time</b>	The last time this condition was updated.
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of deployment condition.

## 7.4.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/deployments**
  - **GET**: list or watch objects of kind Deployment
- **/apis/apps/v1/watch/deployments**
  - **GET**: watch individual changes to a list of Deployment. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/deployments**
  - **DELETE**: delete collection of Deployment
  - **GET**: list or watch objects of kind Deployment
  - **POST**: create a Deployment
- **/apis/apps/v1/watch/namespaces/{namespace}/deployments**
  - **GET**: watch individual changes to a list of Deployment. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/deployments/{name}**
  - **DELETE**: delete a Deployment

- **GET**: read the specified Deployment
- **PATCH**: partially update the specified Deployment
- **PUT**: replace the specified Deployment
- **/apis/apps/v1/watch/namespaces/{namespace}/deployments/{name}**
  - **GET**: watch changes to an object of kind Deployment. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/apps/v1/namespaces/{namespace}/deployments/{name}/status**
  - **GET**: read status of the specified Deployment
  - **PATCH**: partially update status of the specified Deployment
  - **PUT**: replace status of the specified Deployment

#### 7.4.2.1. /apis/apps/v1/deployments

Table 7.74. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind Deployment

**Table 7.75. HTTP responses**

HTTP code	Response body
200 - OK	<b>DeploymentList</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

### 7.4.2.2. /apis/apps/v1/watch/deployments

Table 7.76. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 7.79. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete collection of Deployment

Table 7.80. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind Deployment

Table 7.83. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**Description**

create a Deployment

**Table 7.85. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### Description

delete a Deployment

Table 7.93. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 7.110. Body parameters

Parameter	Type	Description

Table 7.111. HTTP responses

HTTP code	Response body
200 - OK	<b>Deployment</b> schema
201 - Created	<b>Deployment</b> schema
401 - Unauthorized	Empty

**HTTP method****PUT****Description**

replace status of the specified Deployment

**Table 7.112. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

## 7.5. REPLICASET [APPS/V1]

### Description

ReplicaSet ensures that a specified number of pod replicas are running at any given time.

### Type

**object**

### 7.5.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	If the Labels of a ReplicaSet are empty, they are defaulted to be the same as the Pod(s) that the ReplicaSet manages. Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	ReplicaSetSpec is the specification of a ReplicaSet.
<b>status</b>	<b>object</b>	ReplicaSetStatus represents the current status of a ReplicaSet.

### 7.5.1.1. .spec

#### Description

ReplicaSetSpec is the specification of a ReplicaSet.

#### Type

**object**

#### Required

- **selector**

Property	Type	Description
<b>minReadySeconds</b>	<b>integer</b>	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
<b>replicas</b>	<b>integer</b>	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller</a>

Property	Type	Description
<b>selector</b>	<a href="#">LabelSelector</a>	Selector is a label query over pods that should match the replica count. Label keys and values that must match in order to be controlled by this replica set. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
<b>template</b>	<a href="#">PodTemplateSpec</a>	Template is the object that describes the pod that will be created if insufficient replicas are detected. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template</a>

### 7.5.1.2. .status

#### Description

ReplicaSetStatus represents the current status of a ReplicaSet.

#### Type

**object**

#### Required

- **replicas**

Property	Type	Description
<b>availableReplicas</b>	<b>integer</b>	The number of available replicas (ready for at least <code>minReadySeconds</code> ) for this replica set.
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a replica set's current state.
<b>conditions[]</b>	<b>object</b>	ReplicaSetCondition describes the state of a replica set at a certain point.

Property	Type	Description
<b>fullyLabeledReplicas</b>	<b>integer</b>	The number of pods that have labels matching the labels of the pod template of the replicaset.
<b>observedGeneration</b>	<b>integer</b>	ObservedGeneration reflects the generation of the most recently observed ReplicaSet.
<b>readyReplicas</b>	<b>integer</b>	readyReplicas is the number of pods targeted by this ReplicaSet with a Ready Condition.
<b>replicas</b>	<b>integer</b>	Replicas is the most recently observed number of replicas. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller">https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller</a>

### 7.5.1.3. .status.conditions

#### Description

Represents the latest available observations of a replica set's current state.

#### Type

**array**

### 7.5.1.4. .status.conditions[]

#### Description

ReplicaSetCondition describes the state of a replica set at a certain point.

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	The last time the condition transitioned from one status to another.

Property	Type	Description
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of replica set condition.

## 7.5.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/replicasets**
  - **GET**: list or watch objects of kind ReplicaSet
- **/apis/apps/v1/watch/replicasets**
  - **GET**: watch individual changes to a list of ReplicaSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/replicasets**
  - **DELETE**: delete collection of ReplicaSet
  - **GET**: list or watch objects of kind ReplicaSet
  - **POST**: create a ReplicaSet
- **/apis/apps/v1/watch/namespaces/{namespace}/replicasets**
  - **GET**: watch individual changes to a list of ReplicaSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/replicasets/{name}**
  - **DELETE**: delete a ReplicaSet
  - **GET**: read the specified ReplicaSet
  - **PATCH**: partially update the specified ReplicaSet
  - **PUT**: replace the specified ReplicaSet
- **/apis/apps/v1/watch/namespaces/{namespace}/replicasets/{name}**
  - **GET**: watch changes to an object of kind ReplicaSet. deprecated: use the 'watch' parameter

with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

- **/apis/apps/v1/namespaces/{namespace}/replicasets/{name}/status**
  - **GET**: read status of the specified ReplicaSet
  - **PATCH**: partially update status of the specified ReplicaSet
  - **PUT**: replace status of the specified ReplicaSet

### 7.5.2.1. /apis/apps/v1/replicasets

Table 7.115. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind ReplicaSet

Table 7.116. HTTP responses

#### HTTP method

#### **DELETE**

#### Description

delete collection of ReplicaSet

Table 7.121. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

list or watch objects of kind ReplicaSet

Table 7.124. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 7.125. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">ReplicaSetList</a> schema
401 - Unauthorized	Empty

HTTP method  
**POST**

**Description**

create a ReplicaSet

**Table 7.126. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

201 - Created	<a href="#">ReplicaSet</a> schema
202 - Accepted	<a href="#">ReplicaSet</a> schema
401 - Unauthorized	Empty

#### 7.5.2.4. /apis/apps/v1/watch/namespaces/{namespace}/replicasets

Table 7.129. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 7.130. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. #### HTTP method

#### DELETE

#### Description

delete a ReplicaSet

Table 7.134. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

## 7.6. STATEFULSET [APPS/V1]

### Description

StatefulSet represents a set of pods with consistent identities. Identities are defined as: - Network: A single stable DNS and hostname. - Storage: As many VolumeClaims as requested.

The StatefulSet guarantees that a given network identity will always map to the same storage identity.

### Type

**object**

### 7.6.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	A StatefulSetSpec is the specification of a StatefulSet.
<b>status</b>	<b>object</b>	StatefulSetStatus represents the current state of a StatefulSet.

### 7.6.1.1. .spec

#### Description

A StatefulSetSpec is the specification of a StatefulSet.

#### Type

**object**

#### Required

- **selector**
- **template**
- **serviceName**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>minReadySeconds</b>	<b>integer</b>	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
<b>ordinals</b>	<b>object</b>	StatefulSetOrdinals describes the policy used for replica ordinal assignment in this StatefulSet.
<b>persistentVolumeClaimRetentionPolicy</b>	<b>object</b>	StatefulSetPersistentVolumeClaimRetentionPolicy describes the policy used for PVCs created from the StatefulSet VolumeClaimTemplates.
<b>podManagementPolicy</b>	<b>string</b>	<p>podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <b>OrderedReady</b>, where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <b>Parallel</b> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.</p> <p>Possible enum values: - <b>"OrderedReady"</b> will create pods in strictly increasing order on scale up and strictly decreasing order on scale down, progressing only when the previous pod is ready or terminated. At most one pod will be changed at any time. - <b>"Parallel"</b> will create and delete pods as soon as the stateful set replica count is changed, and will not wait for pods to be ready or complete termination.</p>

Property	Type	Description
<b>replicas</b>	<b>integer</b>	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
<b>revisionHistoryLimit</b>	<b>integer</b>	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
<b>serviceName</b>	<b>string</b>	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.

Property	Type	Description
<b>template</b>	<b>PodTemplateSpec</b>	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet. Each pod will be named with the format <statefulsetname>-<podindex>. For example, a pod in a StatefulSet named "web" with index number "3" would be named "web-3". The only allowed template.spec.restartPolicy value is "Always".
<b>updateStrategy</b>	<b>object</b>	StatefulSetUpdateStrategy indicates the strategy that the StatefulSet controller will use to perform updates. It includes any additional parameters necessary to perform the update for the indicated strategy.
<b>volumeClaimTemplates</b>	<b>array (PersistentVolumeClaim)</b>	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

### 7.6.1.2. .spec.ordinals

#### Description

StatefulSetOrdinals describes the policy used for replica ordinal assignment in this StatefulSet.

#### Type

**object**

Property	Type	Description
<b>start</b>	<b>integer</b>	start is the number representing the first replica's index. It may be used to number replicas from an alternate index (eg: 1-indexed) over the default 0-indexed names, or to orchestrate progressive movement of replicas from one StatefulSet to another. If set, replica indices will be in the range: [.spec.ordinals.start, .spec.ordinals.start + .spec.replicas). If unset, defaults to 0. Replica indices will be in the range: [0, .spec.replicas).

### 7.6.1.3. .spec.persistentVolumeClaimRetentionPolicy

#### Description

StatefulSetPersistentVolumeClaimRetentionPolicy describes the policy used for PVCs created from the StatefulSet VolumeClaimTemplates.

#### Type

**object**

Property	Type	Description
<b>whenDeleted</b>	<b>string</b>	WhenDeleted specifies what happens to PVCs created from StatefulSet VolumeClaimTemplates when the StatefulSet is deleted. The default policy of <b>Retain</b> causes PVCs to not be affected by StatefulSet deletion. The <b>Delete</b> policy causes those PVCs to be deleted.
<b>whenScaled</b>	<b>string</b>	WhenScaled specifies what happens to PVCs created from StatefulSet VolumeClaimTemplates when the StatefulSet is scaled down. The default policy of <b>Retain</b> causes PVCs to not be affected by a scaledown. The <b>Delete</b> policy causes the associated PVCs for any excess pods above the replica count to be deleted.

### 7.6.1.4. .spec.updateStrategy

#### Description

StatefulSetUpdateStrategy indicates the strategy that the StatefulSet controller will use to perform updates. It includes any additional parameters necessary to perform the update for the indicated strategy.

#### Type

**object**

Property	Type	Description
<b>rollingUpdate</b>	<b>object</b>	RollingUpdateStatefulSetStrategy is used to communicate parameter for RollingUpdateStatefulSetStrategyType.
<b>type</b>	<b>string</b>	<p>Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.</p> <p>Possible enum values: -  <b>"OnDelete"</b> triggers the legacy behavior. Version tracking and ordered rolling restarts are disabled. Pods are recreated from the StatefulSetSpec when they are manually deleted. When a scale operation is performed with this strategy, specification version indicated by the StatefulSet's currentRevision. -  <b>"RollingUpdate"</b> indicates that update will be applied to all Pods in the StatefulSet with respect to the StatefulSet ordering constraints. When a scale operation is performed with this strategy, new Pods will be created from the specification version indicated by the StatefulSet's updateRevision.</p>

### 7.6.1.5. .spec.updateStrategy.rollingUpdate

#### Description

RollingUpdateStatefulSetStrategy is used to communicate parameter for RollingUpdateStatefulSetStrategyType.

#### Type

**object**

Property	Type	Description
<b>maxUnavailable</b>	<b>IntOrString</b>	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding up. This can not be 0. Defaults to 1. This field is alpha-level and is only honored by servers that enable the MaxUnavailableStatefulSet feature. The field applies to all pods in the range 0 to Replicas-1. That means if there is any unavailable pod in the range 0 to Replicas-1, it will be counted towards MaxUnavailable.
<b>partition</b>	<b>integer</b>	Partition indicates the ordinal at which the StatefulSet should be partitioned for updates. During a rolling update, all pods from ordinal Replicas-1 to Partition are updated. All pods from ordinal Partition-1 to 0 remain untouched. This is helpful in being able to do a canary based deployment. The default value is 0.

### 7.6.1.6. .status

#### Description

StatefulSetStatus represents the current state of a StatefulSet.

#### Type

**object**

#### Required

- **replicas**

Property	Type	Description
<b>availableReplicas</b>	<b>integer</b>	Total number of available pods (ready for at least minReadySeconds) targeted by this statefulset.

Property	Type	Description
<b>collisionCount</b>	<b>integer</b>	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a statefulset's current state.
<b>conditions[]</b>	<b>object</b>	StatefulSetCondition describes the state of a statefulset at a certain point.
<b>currentReplicas</b>	<b>integer</b>	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
<b>currentRevision</b>	<b>string</b>	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
<b>observedGeneration</b>	<b>integer</b>	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
<b>readyReplicas</b>	<b>integer</b>	readyReplicas is the number of pods created for this StatefulSet with a Ready Condition.
<b>replicas</b>	<b>integer</b>	replicas is the number of Pods created by the StatefulSet controller.
<b>updateRevision</b>	<b>string</b>	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Property	Type	Description
<b>updatedReplicas</b>	<b>integer</b>	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

### 7.6.1.7. .status.conditions

#### Description

Represents the latest available observations of a statefulset's current state.

#### Type

**array**

### 7.6.1.8. .status.conditions[]

#### Description

StatefulSetCondition describes the state of a statefulset at a certain point.

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	A human readable message indicating details about the transition.
<b>reason</b>	<b>string</b>	The reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of statefulset condition.

## 7.6.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/statefulsets**
  - **GET**: list or watch objects of kind StatefulSet
- **/apis/apps/v1/watch/statefulsets**
  - **GET**: watch individual changes to a list of StatefulSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/statefulsets**
  - **DELETE**: delete collection of StatefulSet
  - **GET**: list or watch objects of kind StatefulSet
  - **POST**: create a StatefulSet
- **/apis/apps/v1/watch/namespaces/{namespace}/statefulsets**
  - **GET**: watch individual changes to a list of StatefulSet. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/apps/v1/namespaces/{namespace}/statefulsets/{name}**
  - **DELETE**: delete a StatefulSet
  - **GET**: read the specified StatefulSet
  - **PATCH**: partially update the specified StatefulSet
  - **PUT**: replace the specified StatefulSet
- **/apis/apps/v1/watch/namespaces/{namespace}/statefulsets/{name}**
  - **GET**: watch changes to an object of kind StatefulSet. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status**
  - **GET**: read status of the specified StatefulSet
  - **PATCH**: partially update status of the specified StatefulSet
  - **PUT**: replace status of the specified StatefulSet

### 7.6.2.1. /apis/apps/v1/statefulsets

Table 7.156. Global query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 7.158. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of StatefulSet. deprecated: use the 'watch' parameter with a list operation instead.

#### HTTP method

#### **DELETE**

#### Description

delete collection of StatefulSet

Table 7.162. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind StatefulSet

Table 7.165. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a StatefulSet

**Table 7.167. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### **DELETE**

#### Description

delete a StatefulSet

Table 7.175. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

<b>name</b>	<b>string</b>	name of the StatefulSet
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 7.186. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind StatefulSet. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 7.195. Body parameters**

Parameter	Type	Description
<b>body</b>	<a href="#">StatefulSet</a> schema	

Table 7.196. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">StatefulSet</a> schema
201 - Created	<a href="#">StatefulSet</a> schema
401 - Unauthorized	Empty

## CHAPTER 8. AUTHENTICATION APIS

### 8.1. AUTHENTICATION APIS

#### 8.1.1. TokenRequest [authentication.k8s.io/v1]

##### Description

TokenRequest requests a token for a given service account.

##### Type

**object**

#### 8.1.2. TokenReview [authentication.k8s.io/v1]

##### Description

TokenReview attempts to authenticate a token to a known user. Note: TokenReview requests may be cached by the webhook token authenticator plugin in the kube-apiserver.

##### Type

**object**

### 8.2. TOKENREQUEST [AUTHENTICATION.K8S.IO/V1]

##### Description

TokenRequest requests a token for a given service account.

##### Type

**object**

##### Required

- **spec**

#### 8.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	TokenRequestSpec contains client provided parameters of a token request.
<b>status</b>	<b>object</b>	TokenRequestStatus is the result of a token request.

### 8.2.1.1. .spec

#### Description

TokenRequestSpec contains client provided parameters of a token request.

#### Type

**object**

#### Required

- **audiences**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>audiences</b>	<b>array (string)</b>	Audiences are the intended audiences of the token. A recipient of a token must identify themselves with an identifier in the list of audiences of the token, and otherwise should reject the token. A token issued for multiple audiences may be used to authenticate against any of the audiences listed but implies a high degree of trust between the target audiences.
<b>boundObjectRef</b>	<b>object</b>	BoundObjectReference is a reference to an object that a token is bound to.
<b>expirationSeconds</b>	<b>integer</b>	ExpirationSeconds is the requested duration of validity of the request. The token issuer may return a token with a different validity duration so a client needs to check the 'expiration' field in a response.

### 8.2.1.2. .spec.boundObjectRef

#### Description

BoundObjectReference is a reference to an object that a token is bound to.

#### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>kind</b>	<b>string</b>	Kind of the referent. Valid kinds are 'Pod' and 'Secret'.
<b>name</b>	<b>string</b>	Name of the referent.
<b>uid</b>	<b>string</b>	UID of the referent.

### 8.2.1.3. .status

#### Description

TokenRequestStatus is the result of a token request.

## Type

**object**

## Required

- **token**
- **expirationTimestamp**

Property	Type	Description
<b>expirationTimestamp</b>	<b>Time</b>	ExpirationTimestamp is the time of expiration of the returned token.
<b>token</b>	<b>string</b>	Token is the opaque bearer token.

## 8.2.2. API endpoints

The following API endpoints are available:

- **/api/v1/namespaces/{namespace}/serviceaccounts/{name}/token**
  - **POST**: create token of a ServiceAccount

### 8.2.2.1. /api/v1/namespaces/{namespace}/serviceaccounts/{name}/token

Table 8.1. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the TokenRequest
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 8.2. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****POST****Description**

create token of a ServiceAccount

**Table 8.3. Body parameters**

Parameter	Type	Description
<b>body</b>	<b>TokenRequest</b> schema	

**Table 8.4. HTTP responses**

HTTP code	Response body
200 - OK	<b>TokenRequest</b> schema

HTTP code	Reponse body
201 - Created	<b>TokenRequest</b> schema
202 - Accepted	<b>TokenRequest</b> schema
401 - Unauthorized	Empty

## 8.3. TOKENREVIEW [AUTHENTICATION.K8S.IO/V1]

### Description

TokenReview attempts to authenticate a token to a known user. Note: TokenReview requests may be cached by the webhook token authenticator plugin in the kube-apiserver.

### Type

**object**

### Required

- **spec**

### 8.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	TokenReviewSpec is a description of the token authentication request.
<b>status</b>	<b>object</b>	TokenReviewStatus is the result of the token authentication request.

### 8.3.1.1. .spec

#### Description

TokenReviewSpec is a description of the token authentication request.

#### Type

**object**

Property	Type	Description
<b>audiences</b>	<b>array (string)</b>	Audiences is a list of the identifiers that the resource server presented with the token identifies as. Audience-aware token authenticators will verify that the token was intended for at least one of the audiences in this list. If no audiences are provided, the audience will default to the audience of the Kubernetes apiserver.
<b>token</b>	<b>string</b>	Token is the opaque bearer token.

### 8.3.1.2. .status

#### Description

TokenReviewStatus is the result of the token authentication request.

#### Type

**object**

Property	Type	Description
<b>audiences</b>	<b>array (string)</b>	Audiences are audience identifiers chosen by the authenticator that are compatible with both the TokenReview and token. An identifier is any identifier in the intersection of the TokenReviewSpec audiences and the token's audiences. A client of the TokenReview API that sets the spec.audiences field should validate that a compatible audience identifier is returned in the status.audiences field to ensure that the TokenReview server is audience aware. If a TokenReview returns an empty status.audience field where status.authenticated is "true", the token is valid against the audience of the Kubernetes API server.
<b>authenticated</b>	<b>boolean</b>	Authenticated indicates that the token was associated with a known user.
<b>error</b>	<b>string</b>	Error indicates that the token couldn't be checked
<b>user</b>	<b>object</b>	UserInfo holds the information about the user needed to implement the user.Info interface.

### 8.3.1.3. .status.user

#### Description

UserInfo holds the information about the user needed to implement the user.Info interface.

#### Type

**object**

Property	Type	Description
<b>extra</b>	<b>object</b>	Any additional information provided by the authenticator.
<b>extra{}</b>	<b>array (string)</b>	

Property	Type	Description
<b>groups</b>	<b>array (string)</b>	The names of groups this user is a part of.
<b>uid</b>	<b>string</b>	A unique value that identifies this user across time. If this user is deleted and another user by the same name is added, they will have different UIDs.
<b>username</b>	<b>string</b>	The name that uniquely identifies this user among all active users.

#### 8.3.1.4. .status.user.extra

##### Description

Any additional information provided by the authenticator.

##### Type

**object**

### 8.3.2. API endpoints

The following API endpoints are available:

- **/apis/authentication.k8s.io/v1/tokenreviews**
  - **POST**: create a TokenReview

#### 8.3.2.1. /apis/authentication.k8s.io/v1/tokenreviews

Table 8.5. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .

Parameter	Type	Description
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****POST****Description**

create a TokenReview

**Table 8.6. Body parameters**

Parameter	Type	Description
<b>body</b>	<b>TokenReview</b> schema	

**Table 8.7. HTTP responses**

HTTP code	Response body
200 - OK	<b>TokenReview</b> schema
201 - Created	<b>TokenReview</b> schema
202 - Accepted	<b>TokenReview</b> schema
401 - Unauthorized	Empty

## CHAPTER 9. AUTHORIZATION APIS

### 9.1. AUTHORIZATION APIS

#### 9.1.1. LocalSubjectAccessReview [authorization.k8s.io/v1]

##### Description

LocalSubjectAccessReview checks whether or not a user or group can perform an action in a given namespace. Having a namespace scoped resource makes it much easier to grant namespace scoped policy that includes permissions checking.

##### Type

**object**

#### 9.1.2. SelfSubjectAccessReview [authorization.k8s.io/v1]

##### Description

SelfSubjectAccessReview checks whether or the current user can perform an action. Not filling in a spec.namespace means "in all namespaces". Self is a special case, because users should always be able to check whether they can perform an action

##### Type

**object**

#### 9.1.3. SelfSubjectRulesReview [authorization.k8s.io/v1]

##### Description

SelfSubjectRulesReview enumerates the set of actions the current user can perform within a namespace. The returned list of actions may be incomplete depending on the server's authorization mode, and any errors experienced during the evaluation. SelfSubjectRulesReview should be used by UIs to show/hide actions, or to quickly let an end user reason about their permissions. It should NOT Be used by external systems to drive authorization decisions as this raises confused deputy, cache lifetime/revocation, and correctness concerns. SubjectAccessReview, and LocalAccessReview are the correct way to defer authorization decisions to the API server.

##### Type

**object**

#### 9.1.4. SubjectAccessReview [authorization.k8s.io/v1]

##### Description

SubjectAccessReview checks whether or not a user or group can perform an action.

##### Type

**object**

### 9.2. LOCALSUBJECTACCESSREVIEW [AUTHORIZATION.K8S.IO/V1]

##### Description

LocalSubjectAccessReview checks whether or not a user or group can perform an action in a given namespace. Having a namespace scoped resource makes it much easier to grant namespace scoped policy that includes permissions checking.

Type

**object**

Required

- **spec**

### 9.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	SubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set
<b>status</b>	<b>object</b>	SubjectAccessReviewStatus

#### 9.2.1.1. .spec

**Description**

SubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set

**Type**

**object**

Property	Type	Description
<b>extra</b>	<b>object</b>	Extra corresponds to the user.Info.GetExtra() method from the authenticator. Since that is input to the authorizer it needs a reflection here.
<b>extra{}</b>	<b>array (string)</b>	
<b>groups</b>	<b>array (string)</b>	Groups is the groups you're testing for.
<b>nonResourceAttributes</b>	<b>object</b>	NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface
<b>resourceAttributes</b>	<b>object</b>	ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface
<b>uid</b>	<b>string</b>	UID information about the requesting user.
<b>user</b>	<b>string</b>	User is the user you're testing for. If you specify "User" but not "Groups", then is it interpreted as "What if User were not a member of any groups"

**9.2.1.2. .spec.extra****Description**

Extra corresponds to the user.Info.GetExtra() method from the authenticator. Since that is input to the authorizer it needs a reflection here.

**Type**

**object**

**9.2.1.3. .spec.nonResourceAttributes****Description**

NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface

### Type

**object**

Property	Type	Description
<b>path</b>	<b>string</b>	Path is the URL path of the request
<b>verb</b>	<b>string</b>	Verb is the standard HTTP verb

### 9.2.1.4. .spec.resourceAttributes

#### Description

ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface

### Type

**object**

Property	Type	Description
<b>group</b>	<b>string</b>	Group is the API Group of the Resource. "*" means all.
<b>name</b>	<b>string</b>	Name is the name of the resource being requested for a "get" or deleted for a "delete". "" (empty) means all.
<b>namespace</b>	<b>string</b>	Namespace is the namespace of the action being requested. Currently, there is no distinction between no namespace and all namespaces "" (empty) is defaulted for LocalSubjectAccessReviews "" (empty) is empty for cluster-scoped resources "" (empty) means "all" for namespace scoped resources from a SubjectAccessReview or SelfSubjectAccessReview
<b>resource</b>	<b>string</b>	Resource is one of the existing resource types. "*" means all.
<b>subresource</b>	<b>string</b>	Subresource is one of the existing resource types. "" means none.

Property	Type	Description
<b>verb</b>	<b>string</b>	Verb is a kubernetes resource API verb, like: get, list, watch, create, update, delete, proxy. "*" means all.
<b>version</b>	<b>string</b>	Version is the API Version of the Resource. "*" means all.

### 9.2.1.5. .status

#### Description

SubjectAccessReviewStatus

#### Type

**object**

#### Required

- **allowed**

Property	Type	Description
<b>allowed</b>	<b>boolean</b>	Allowed is required. True if the action would be allowed, false otherwise.
<b>denied</b>	<b>boolean</b>	Denied is optional. True if the action would be denied, otherwise false. If both allowed is false and denied is false, then the authorizer has no opinion on whether to authorize the action. Denied may not be true if Allowed is true.
<b>evaluationError</b>	<b>string</b>	EvaluationError is an indication that some error occurred during the authorization check. It is entirely possible to get an error and be able to continue determine authorization status in spite of it. For instance, RBAC can be missing a role, but enough roles are still present and bound to reason about the request.
<b>reason</b>	<b>string</b>	Reason is optional. It indicates why a request was allowed or denied.

## 9.2.2. API endpoints

The following API endpoints are available:

- **/apis/authorization.k8s.io/v1/namespaces/{namespace}/localsubjectaccessreviews**
  - **POST**: create a LocalSubjectAccessReview

### 9.2.2.1. /apis/authorization.k8s.io/v1/namespaces/{namespace}/localsubjectaccessreviews

Table 9.1. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 9.2. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**POST**

Description

create a LocalSubjectAccessReview

Table 9.3. Body parameters

Parameter	Type	Description
<b>body</b>	<b>LocalSubjectAccessReview</b> schema	

Table 9.4. HTTP responses

HTTP code	Reponse body
200 - OK	<b>LocalSubjectAccessReview</b> schema
201 - Created	<b>LocalSubjectAccessReview</b> schema
202 - Accepted	<b>LocalSubjectAccessReview</b> schema
401 - Unauthorized	Empty

## 9.3. SELFSUBJECTACCESSREVIEW [AUTHORIZATION.K8S.IO/V1]

Description

SelfSubjectAccessReview checks whether or the current user can perform an action. Not filling in a spec.namespace means "in all namespaces". Self is a special case, because users should always be able to check whether they can perform an action

Type

**object**

Required

- **spec**

### 9.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	SelfSubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set
<b>status</b>	<b>object</b>	SubjectAccessReviewStatus

### 9.3.1.1. .spec

#### Description

SelfSubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set

#### Type

**object**

Property	Type	Description
<b>nonResourceAttributes</b>	<b>object</b>	NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface
<b>resourceAttributes</b>	<b>object</b>	ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface

### 9.3.1.2. .spec.nonResourceAttributes

#### Description

NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface

#### Type

**object**

Property	Type	Description
<b>path</b>	<b>string</b>	Path is the URL path of the request
<b>verb</b>	<b>string</b>	Verb is the standard HTTP verb

### 9.3.1.3. .spec.resourceAttributes

#### Description

ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface

#### Type

**object**

Property	Type	Description
<b>group</b>	<b>string</b>	Group is the API Group of the Resource. "*" means all.
<b>name</b>	<b>string</b>	Name is the name of the resource being requested for a "get" or deleted for a "delete". "" (empty) means all.

Property	Type	Description
<b>namespace</b>	<b>string</b>	Namespace is the namespace of the action being requested. Currently, there is no distinction between no namespace and all namespaces "" (empty) is defaulted for LocalSubjectAccessReviews "" (empty) is empty for cluster-scoped resources "" (empty) means "all" for namespace scoped resources from a SubjectAccessReview or SelfSubjectAccessReview
<b>resource</b>	<b>string</b>	Resource is one of the existing resource types. "*" means all.
<b>subresource</b>	<b>string</b>	Subresource is one of the existing resource types. "" means none.
<b>verb</b>	<b>string</b>	Verb is a kubernetes resource API verb, like: get, list, watch, create, update, delete, proxy. "*" means all.
<b>version</b>	<b>string</b>	Version is the API Version of the Resource. "*" means all.

#### 9.3.1.4. .status

##### Description

SubjectAccessReviewStatus

##### Type

**object**

##### Required

- **allowed**

Property	Type	Description
<b>allowed</b>	<b>boolean</b>	Allowed is required. True if the action would be allowed, false otherwise.

Property	Type	Description
<b>denied</b>	<b>boolean</b>	Denied is optional. True if the action would be denied, otherwise false. If both allowed is false and denied is false, then the authorizer has no opinion on whether to authorize the action. Denied may not be true if Allowed is true.
<b>evaluationError</b>	<b>string</b>	EvaluationError is an indication that some error occurred during the authorization check. It is entirely possible to get an error and be able to continue determine authorization status in spite of it. For instance, RBAC can be missing a role, but enough roles are still present and bound to reason about the request.
<b>reason</b>	<b>string</b>	Reason is optional. It indicates why a request was allowed or denied.

### 9.3.2. API endpoints

The following API endpoints are available:

- **/apis/authorization.k8s.io/v1/selfsubjectaccessreviews**
  - **POST**: create a SelfSubjectAccessReview

#### 9.3.2.1. /apis/authorization.k8s.io/v1/selfsubjectaccessreviews

Table 9.5. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****POST****Description**

create a SelfSubjectAccessReview

401 - Unauthorized	Empty

## 9.4. SELFSUBJECTRULESREVIEW [AUTHORIZATION.K8S.IO/V1]

### Description

SelfSubjectRulesReview enumerates the set of actions the current user can perform within a namespace. The returned list of actions may be incomplete depending on the server's authorization mode, and any errors experienced during the evaluation. SelfSubjectRulesReview should be used by UIs to show/hide actions, or to quickly let an end user reason about their permissions. It should NOT Be used by external systems to drive authorization decisions as this raises confused deputy, cache lifetime/revocation, and correctness concerns. SubjectAccessReview, and LocalAccessReview are the correct way to defer authorization decisions to the API server.

### Type

**object**

### Required

- **spec**

### 9.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	SelfSubjectRulesReviewSpec defines the specification for SelfSubjectRulesReview.
<b>status</b>	<b>object</b>	SubjectRulesReviewStatus contains the result of a rules check. This check can be incomplete depending on the set of authorizers the server is configured with and any errors experienced during evaluation. Because authorization rules are additive, if a rule appears in a list it's safe to assume the subject has that permission, even if that list is incomplete.

#### 9.4.1.1. .spec

##### Description

SelfSubjectRulesReviewSpec defines the specification for SelfSubjectRulesReview.

##### Type

**object**

Property	Type	Description
<b>namespace</b>	<b>string</b>	Namespace to evaluate rules for. Required.

#### 9.4.1.2. .status

##### Description

SubjectRulesReviewStatus contains the result of a rules check. This check can be incomplete depending on the set of authorizers the server is configured with and any errors experienced during evaluation. Because authorization rules are additive, if a rule appears in a list it's safe to assume the subject has that permission, even if that list is incomplete.

##### Type

**object**

Required

- **resourceRules**
- **nonResourceRules**
- **incomplete**

Property	Type	Description
<b>evaluationError</b>	<b>string</b>	EvaluationError can appear in combination with Rules. It indicates an error occurred during rule evaluation, such as an authorizer that doesn't support rule evaluation, and that ResourceRules and/or NonResourceRules may be incomplete.
<b>incomplete</b>	<b>boolean</b>	Incomplete is true when the rules returned by this call are incomplete. This is most commonly encountered when an authorizer, such as an external authorizer, doesn't support rules evaluation.
<b>nonResourceRules</b>	<b>array</b>	NonResourceRules is the list of actions the subject is allowed to perform on non-resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.
<b>nonResourceRules[]</b>	<b>object</b>	NonResourceRule holds information that describes a rule for the non-resource
<b>resourceRules</b>	<b>array</b>	ResourceRules is the list of actions the subject is allowed to perform on resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.
<b>resourceRules[]</b>	<b>object</b>	ResourceRule is the list of actions the subject is allowed to perform on resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.

### 9.4.1.3. .status.nonResourceRules

#### Description

NonResourceRules is the list of actions the subject is allowed to perform on non-resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.

#### Type

**array**

### 9.4.1.4. .status.nonResourceRules[]

#### Description

NonResourceRule holds information that describes a rule for the non-resource

#### Type

**object**

#### Required

- **verbs**

Property	Type	Description
<b>nonResourceURLs</b>	<b>array (string)</b>	NonResourceURLs is a set of partial urls that a user should have access to. <b>s are allowed, but only as the full, final step in the path.</b> "" means all.
<b>verbs</b>	<b>array (string)</b>	Verb is a list of kubernetes non-resource API verbs, like: get, post, put, delete, patch, head, options. "*" means all.

### 9.4.1.5. .status.resourceRules

#### Description

ResourceRules is the list of actions the subject is allowed to perform on resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.

#### Type

**array**

### 9.4.1.6. .status.resourceRules[]

#### Description

ResourceRule is the list of actions the subject is allowed to perform on resources. The list ordering isn't significant, may contain duplicates, and possibly be incomplete.

#### Type

**object**

#### Required

- **verbs**

- **verbs**

Property	Type	Description
<b>apiGroups</b>	<b>array (string)</b>	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed. "*" means all.
<b>resourceNames</b>	<b>array (string)</b>	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed. "*" means all.
<b>resources</b>	<b>array (string)</b>	Resources is a list of resources this rule applies to. "" <b>means all in the specified apiGroups.</b> "/foo" represents the subresource 'foo' for all resources in the specified apiGroups.
<b>verbs</b>	<b>array (string)</b>	Verb is a list of kubernetes resource API verbs, like: get, list, watch, create, update, delete, proxy. "*" means all.

## 9.4.2. API endpoints

The following API endpoints are available:

- **/apis/authorization.k8s.io/v1/selfsubjectrulesreviews**
  - **POST**: create a SelfSubjectRulesReview

### 9.4.2.1. /apis/authorization.k8s.io/v1/selfsubjectrulesreviews

Table 9.8. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****POST****Description**

create a SelfSubjectRulesReview

**Table 9.9. Body parameters**

Parameter	Type	Description
<b>body</b>	<b>SelfSubjectRulesReview</b> schema	

**Table 9.10. HTTP responses**

HTTP code	Response body
200 - OK	<b>SelfSubjectRulesReview</b> schema

HTTP code	Response body
201 - Created	<b>SelfSubjectRulesReview</b> schema
202 - Accepted	<b>SelfSubjectRulesReview</b> schema
401 - Unauthorized	Empty

## 9.5. SUBJECTACCESSREVIEW [AUTHORIZATION.K8S.IO/V1]

### Description

SubjectAccessReview checks whether or not a user or group can perform an action.

### Type

**object**

### Required

- **spec**

### 9.5.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	SubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set
<b>status</b>	<b>object</b>	SubjectAccessReviewStatus

### 9.5.1.1. .spec

#### Description

SubjectAccessReviewSpec is a description of the access request. Exactly one of ResourceAuthorizationAttributes and NonResourceAuthorizationAttributes must be set

#### Type

**object**

Property	Type	Description
<b>extra</b>	<b>object</b>	Extra corresponds to the user.Info.GetExtra() method from the authenticator. Since that is input to the authorizer it needs a reflection here.
<b>extra{}</b>	<b>array (string)</b>	
<b>groups</b>	<b>array (string)</b>	Groups is the groups you're testing for.
<b>nonResourceAttributes</b>	<b>object</b>	NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface

Property	Type	Description
<b>resourceAttributes</b>	<b>object</b>	ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface
<b>uid</b>	<b>string</b>	UID information about the requesting user.
<b>user</b>	<b>string</b>	User is the user you're testing for. If you specify "User" but not "Groups", then is it interpreted as "What if User were not a member of any groups"

### 9.5.1.2. .spec.extra

#### Description

Extra corresponds to the `user.Info.GetExtra()` method from the authenticator. Since that is input to the authorizer it needs a reflection here.

#### Type

**object**

### 9.5.1.3. .spec.nonResourceAttributes

#### Description

NonResourceAttributes includes the authorization attributes available for non-resource requests to the Authorizer interface

#### Type

**object**

Property	Type	Description
<b>path</b>	<b>string</b>	Path is the URL path of the request
<b>verb</b>	<b>string</b>	Verb is the standard HTTP verb

### 9.5.1.4. .spec.resourceAttributes

#### Description

ResourceAttributes includes the authorization attributes available for resource requests to the Authorizer interface

#### Type

**object**

Property	Type	Description
<b>group</b>	<b>string</b>	Group is the API Group of the Resource. "*" means all.
<b>name</b>	<b>string</b>	Name is the name of the resource being requested for a "get" or deleted for a "delete". "" (empty) means all.
<b>namespace</b>	<b>string</b>	Namespace is the namespace of the action being requested. Currently, there is no distinction between no namespace and all namespaces "" (empty) is defaulted for LocalSubjectAccessReviews "" (empty) is empty for cluster-scoped resources "" (empty) means "all" for namespace scoped resources from a SubjectAccessReview or SelfSubjectAccessReview
<b>resource</b>	<b>string</b>	Resource is one of the existing resource types. "*" means all.
<b>subresource</b>	<b>string</b>	Subresource is one of the existing resource types. "" means none.
<b>verb</b>	<b>string</b>	Verb is a kubernetes resource API verb, like: get, list, watch, create, update, delete, proxy. "*" means all.
<b>version</b>	<b>string</b>	Version is the API Version of the Resource. "*" means all.

### 9.5.1.5. .status

#### Description

SubjectAccessReviewStatus

#### Type

**object**

#### Required

- **allowed**

Property	Type	Description
<b>allowed</b>	<b>boolean</b>	Allowed is required. True if the action would be allowed, false otherwise.
<b>denied</b>	<b>boolean</b>	Denied is optional. True if the action would be denied, otherwise false. If both allowed is false and denied is false, then the authorizer has no opinion on whether to authorize the action. Denied may not be true if Allowed is true.
<b>evaluationError</b>	<b>string</b>	EvaluationError is an indication that some error occurred during the authorization check. It is entirely possible to get an error and be able to continue determine authorization status in spite of it. For instance, RBAC can be missing a role, but enough roles are still present and bound to reason about the request.
<b>reason</b>	<b>string</b>	Reason is optional. It indicates why a request was allowed or denied.

## 9.5.2. API endpoints

The following API endpoints are available:

- **/apis/authorization.k8s.io/v1/subjectaccessreviews**
  - **POST**: create a SubjectAccessReview

### 9.5.2.1. /apis/authorization.k8s.io/v1/subjectaccessreviews

Table 9.11. Global query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## CHAPTER 10. AUTOSCALING APIS

### 10.1. AUTOSCALING APIS

#### 10.1.1. Scale [autoscaling/v1]

##### Description

Scale represents a scaling request for a resource.

##### Type

**object**

#### 10.1.2. HorizontalPodAutoscaler [autoscaling/v2]

##### Description

HorizontalPodAutoscaler is the configuration for a horizontal pod autoscaler, which automatically manages the replica count of any resource implementing the scale subresource based on the metrics specified.

##### Type

**object**

### 10.2. HORIZONTALPODAUTOSCALER [AUTOSCALING/V2]

##### Description

HorizontalPodAutoscaler is the configuration for a horizontal pod autoscaler, which automatically manages the replica count of any resource implementing the scale subresource based on the metrics specified.

##### Type

**object**

#### 10.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	metadata is the standard object metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	HorizontalPodAutoscalerSpec describes the desired functionality of the HorizontalPodAutoscaler.
<b>status</b>	<b>object</b>	HorizontalPodAutoscalerStatus describes the current status of a horizontal pod autoscaler.

### 10.2.1.1. .spec

#### Description

HorizontalPodAutoscalerSpec describes the desired functionality of the HorizontalPodAutoscaler.

#### Type

**object**

#### Required

- **scaleTargetRef**
- **maxReplicas**

Property	Type	Description
<b>behavior</b>	<b>object</b>	HorizontalPodAutoscalerBehavior configures the scaling behavior of the target in both Up and Down directions (scaleUp and scaleDown fields respectively).

Property	Type	Description
<b>maxReplicas</b>	<b>integer</b>	maxReplicas is the upper limit for the number of replicas to which the autoscaler can scale up. It cannot be less than minReplicas.
<b>metrics</b>	<b>array</b>	metrics contains the specifications for which to use to calculate the desired replica count (the maximum replica count across all metrics will be used). The desired replica count is calculated multiplying the ratio between the target value and the current value by the current number of pods. Ergo, metrics used must decrease as the pod count is increased, and vice-versa. See the individual metric source types for more information about how each type of metric must respond. If not set, the default metric will be set to 80% average CPU utilization.
<b>metrics[]</b>	<b>object</b>	MetricSpec specifies how to scale based on a single metric (only <b>type</b> and one other matching field should be set at once).
<b>minReplicas</b>	<b>integer</b>	minReplicas is the lower limit for the number of replicas to which the autoscaler can scale down. It defaults to 1 pod. minReplicas is allowed to be 0 if the alpha feature gate HPAScaleToZero is enabled and at least one Object or External metric is configured. Scaling is active as long as at least one metric value is available.
<b>scaleTargetRef</b>	<b>object</b>	CrossVersionObjectReference contains enough information to let you identify the referred resource.

### 10.2.1.2. .spec.behavior

#### Description

HorizontalPodAutoscalerBehavior configures the scaling behavior of the target in both Up and Down directions (scaleUp and scaleDown fields respectively).

Type  
object

Property	Type	Description
<b>scaleDown</b>	<b>object</b>	HPAScalingRules configures the scaling behavior for one direction. These Rules are applied after calculating DesiredReplicas from metrics for the HPA. They can limit the scaling velocity by specifying scaling policies. They can prevent flapping by specifying the stabilization window, so that the number of replicas is not set instantly, instead, the safest value from the stabilization window is chosen.
<b>scaleUp</b>	<b>object</b>	HPAScalingRules configures the scaling behavior for one direction. These Rules are applied after calculating DesiredReplicas from metrics for the HPA. They can limit the scaling velocity by specifying scaling policies. They can prevent flapping by specifying the stabilization window, so that the number of replicas is not set instantly, instead, the safest value from the stabilization window is chosen.

### 10.2.1.3. .spec.behavior.scaleDown

#### Description

HPAScalingRules configures the scaling behavior for one direction. These Rules are applied after calculating DesiredReplicas from metrics for the HPA. They can limit the scaling velocity by specifying scaling policies. They can prevent flapping by specifying the stabilization window, so that the number of replicas is not set instantly, instead, the safest value from the stabilization window is chosen.

Type  
object

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>policies</b>	<b>array</b>	policies is a list of potential scaling polices which can be used during scaling. At least one policy must be specified, otherwise the HPAScalingRules will be discarded as invalid
<b>policies[]</b>	<b>object</b>	HPAScalingPolicy is a single policy which must hold true for a specified past interval.
<b>selectPolicy</b>	<b>string</b>	selectPolicy is used to specify which policy should be used. If not set, the default value Max is used.
<b>stabilizationWindowSeconds</b>	<b>integer</b>	stabilizationWindowSeconds is the number of seconds for which past recommendations should be considered while scaling up or scaling down. StabilizationWindowSeconds must be greater than or equal to zero and less than or equal to 3600 (one hour). If not set, use the default values: - For scale up: 0 (i.e. no stabilization is done). - For scale down: 300 (i.e. the stabilization window is 300 seconds long).

#### 10.2.1.4. .spec.behavior.scaleDown.policies

##### Description

policies is a list of potential scaling polices which can be used during scaling. At least one policy must be specified, otherwise the HPAScalingRules will be discarded as invalid

##### Type

**array**

#### 10.2.1.5. .spec.behavior.scaleDown.policies[]

##### Description

HPAScalingPolicy is a single policy which must hold true for a specified past interval.

##### Type

**object**

##### Required

- **type**
- **value**

- **periodSeconds**

Property	Type	Description
<b>periodSeconds</b>	<b>integer</b>	periodSeconds specifies the window of time for which the policy should hold true. PeriodSeconds must be greater than zero and less than or equal to 1800 (30 min).
<b>type</b>	<b>string</b>	type is used to specify the scaling policy.
<b>value</b>	<b>integer</b>	value contains the amount of change which is permitted by the policy. It must be greater than zero

#### 10.2.1.6. .spec.behavior.scaleUp

##### Description

HPAScalingRules configures the scaling behavior for one direction. These Rules are applied after calculating DesiredReplicas from metrics for the HPA. They can limit the scaling velocity by specifying scaling policies. They can prevent flapping by specifying the stabilization window, so that the number of replicas is not set instantly, instead, the safest value from the stabilization window is chosen.

##### Type

**object**

Property	Type	Description
<b>policies</b>	<b>array</b>	policies is a list of potential scaling polices which can be used during scaling. At least one policy must be specified, otherwise the HPAScalingRules will be discarded as invalid
<b>policies[]</b>	<b>object</b>	HPAScalingPolicy is a single policy which must hold true for a specified past interval.
<b>selectPolicy</b>	<b>string</b>	selectPolicy is used to specify which policy should be used. If not set, the default value Max is used.

Property	Type	Description
<b>stabilizationWindowSeconds</b>	<b>integer</b>	<p>stabilizationWindowSeconds is the number of seconds for which past recommendations should be considered while scaling up or scaling down.</p> <p>StabilizationWindowSeconds must be greater than or equal to zero and less than or equal to 3600 (one hour). If not set, use the default values: - For scale up: 0 (i.e. no stabilization is done). - For scale down: 300 (i.e. the stabilization window is 300 seconds long).</p>

### 10.2.1.7. .spec.behavior.scaleUp.policies

#### Description

policies is a list of potential scaling polices which can be used during scaling. At least one policy must be specified, otherwise the HPAScalingRules will be discarded as invalid

#### Type

**array**

### 10.2.1.8. .spec.behavior.scaleUp.policies[]

#### Description

HPAScalingPolicy is a single policy which must hold true for a specified past interval.

#### Type

**object**

#### Required

- **type**
- **value**
- **periodSeconds**

Property	Type	Description
<b>periodSeconds</b>	<b>integer</b>	<p>periodSeconds specifies the window of time for which the policy should hold true.</p> <p>PeriodSeconds must be greater than zero and less than or equal to 1800 (30 min).</p>

Property	Type	Description
<b>type</b>	<b>string</b>	type is used to specify the scaling policy.
<b>value</b>	<b>integer</b>	value contains the amount of change which is permitted by the policy. It must be greater than zero

### 10.2.1.9. .spec.metrics

#### Description

metrics contains the specifications for which to use to calculate the desired replica count (the maximum replica count across all metrics will be used). The desired replica count is calculated multiplying the ratio between the target value and the current value by the current number of pods. Ergo, metrics used must decrease as the pod count is increased, and vice-versa. See the individual metric source types for more information about how each type of metric must respond. If not set, the default metric will be set to 80% average CPU utilization.

#### Type

**array**

### 10.2.1.10. .spec.metrics[]

#### Description

MetricSpec specifies how to scale based on a single metric (only **type** and one other matching field should be set at once).

#### Type

**object**

#### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>containerResource</b>	<b>object</b>	ContainerResourceMetricSource indicates how to scale on a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or memory). The values will be averaged together before being compared to the target. Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source. Only one "target" type should be set.
<b>external</b>	<b>object</b>	ExternalMetricSource indicates how to scale on a metric not associated with any Kubernetes object (for example length of queue in cloud messaging service, or QPS from loadbalancer running outside of cluster).
<b>object</b>	<b>object</b>	ObjectMetricSource indicates how to scale on a metric describing a kubernetes object (for example, hits-per-second on an Ingress object).
<b>pods</b>	<b>object</b>	PodsMetricSource indicates how to scale on a metric describing each pod in the current scale target (for example, transactions-processed-per-second). The values will be averaged together before being compared to the target value.

Property	Type	Description
<b>resource</b>	<b>object</b>	ResourceMetricSource indicates how to scale on a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or memory). The values will be averaged together before being compared to the target. Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source. Only one "target" type should be set.
<b>type</b>	<b>string</b>	type is the type of metric source. It should be one of "ContainerResource", "External", "Object", "Pods" or "Resource", each mapping to a matching field in the object. Note: "ContainerResource" type is available on when the feature-gate HPAContainerMetrics is enabled

### 10.2.1.11. .spec.metrics[].containerResource

#### Description

ContainerResourceMetricSource indicates how to scale on a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or memory). The values will be averaged together before being compared to the target. Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source. Only one "target" type should be set.

#### Type

**object**

#### Required

- **name**
- **target**
- **container**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>container</b>	<b>string</b>	container is the name of the container in the pods of the scaling target
<b>name</b>	<b>string</b>	name is the name of the resource in question.
<b>target</b>	<b>object</b>	MetricTarget defines the target value, average value, or average utilization of a specific metric

### 10.2.1.12. .spec.metrics[].containerResource.target

#### Description

MetricTarget defines the target value, average value, or average utilization of a specific metric

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	averageUtilization is the target value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods. Currently only valid for Resource metric source type
<b>averageValue</b>	<b>Quantity</b>	averageValue is the target value of the average of the metric across all relevant pods (as a quantity)
<b>type</b>	<b>string</b>	type represents whether the metric type is Utilization, Value, or AverageValue
<b>value</b>	<b>Quantity</b>	value is the target value of the metric (as a quantity).

### 10.2.1.13. .spec.metrics[].external

#### Description

ExternalMetricSource indicates how to scale on a metric not associated with any Kubernetes object (for example length of queue in cloud messaging service, or QPS from loadbalancer running outside of cluster).

#### Type

**object**

#### Required

- **metric**
- **target**

Property	Type	Description
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric
<b>target</b>	<b>object</b>	MetricTarget defines the target value, average value, or average utilization of a specific metric

### 10.2.1.14. .spec.metrics[].external.metric

#### Description

MetricIdentifier defines the name and optionally selector for a metric

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric
<b>selector</b>	<b>LabelSelector</b>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

### 10.2.1.15. .spec.metrics[].external.target

#### Description

MetricTarget defines the target value, average value, or average utilization of a specific metric

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	averageUtilization is the target value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods. Currently only valid for Resource metric source type
<b>averageValue</b>	<b>Quantity</b>	averageValue is the target value of the average of the metric across all relevant pods (as a quantity)
<b>type</b>	<b>string</b>	type represents whether the metric type is Utilization, Value, or AverageValue
<b>value</b>	<b>Quantity</b>	value is the target value of the metric (as a quantity).

### 10.2.1.16. .spec.metrics[].object

#### Description

ObjectMetricSource indicates how to scale on a metric describing a kubernetes object (for example, hits-per-second on an Ingress object).

#### Type

**object**

#### Required

- **describedObject**
- **target**
- **metric**

Property	Type	Description
<b>describedObject</b>	<b>object</b>	CrossVersionObjectReference contains enough information to let you identify the referred resource.
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric
<b>target</b>	<b>object</b>	MetricTarget defines the target value, average value, or average utilization of a specific metric

### 10.2.1.17. .spec.metrics[].object.describedObject

#### Description

CrossVersionObjectReference contains enough information to let you identify the referred resource.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	apiVersion is the API version of the referent
<b>kind</b>	<b>string</b>	kind is the kind of the referent; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	name is the name of the referent; More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 10.2.1.18. .spec.metrics[].object.metric

#### Description

MetricIdentifier defines the name and optionally selector for a metric

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric
<b>selector</b>	<a href="#">LabelSelector</a>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

#### 10.2.1.19. .spec.metrics[].object.target

#### Description

MetricTarget defines the target value, average value, or average utilization of a specific metric

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	averageUtilization is the target value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods. Currently only valid for Resource metric source type
<b>averageValue</b>	<a href="#">Quantity</a>	averageValue is the target value of the average of the metric across all relevant pods (as a quantity)

Property	Type	Description
<b>type</b>	<b>string</b>	type represents whether the metric type is Utilization, Value, or AverageValue
<b>value</b>	<b>Quantity</b>	value is the target value of the metric (as a quantity).

### 10.2.1.20. .spec.metrics[].pods

#### Description

PodsMetricSource indicates how to scale on a metric describing each pod in the current scale target (for example, transactions-processed-per-second). The values will be averaged together before being compared to the target value.

#### Type

**object**

#### Required

- **metric**
- **target**

Property	Type	Description
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric
<b>target</b>	<b>object</b>	MetricTarget defines the target value, average value, or average utilization of a specific metric

### 10.2.1.21. .spec.metrics[].pods.metric

#### Description

MetricIdentifier defines the name and optionally selector for a metric

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric
<b>selector</b>	<b>LabelSelector</b>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

### 10.2.1.22. .spec.metrics[].pods.target

#### Description

MetricTarget defines the target value, average value, or average utilization of a specific metric

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	averageUtilization is the target value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods. Currently only valid for Resource metric source type
<b>averageValue</b>	<b>Quantity</b>	averageValue is the target value of the average of the metric across all relevant pods (as a quantity)
<b>type</b>	<b>string</b>	type represents whether the metric type is Utilization, Value, or AverageValue
<b>value</b>	<b>Quantity</b>	value is the target value of the metric (as a quantity).

### 10.2.1.23. .spec.metrics[].resource

#### Description

ResourceMetricSource indicates how to scale on a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or memory). The values will be averaged together before being compared to the target. Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source. Only one "target" type should be set.

#### Type

**object**

#### Required

- **name**
- **target**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the resource in question.
<b>target</b>	<b>object</b>	MetricTarget defines the target value, average value, or average utilization of a specific metric

### 10.2.1.24. .spec.metrics[].resource.target

#### Description

MetricTarget defines the target value, average value, or average utilization of a specific metric

#### Type

**object**

#### Required

- **type**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	averageUtilization is the target value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods. Currently only valid for Resource metric source type

Property	Type	Description
<b>averageValue</b>	<b>Quantity</b>	averageValue is the target value of the average of the metric across all relevant pods (as a quantity)
<b>type</b>	<b>string</b>	type represents whether the metric type is Utilization, Value, or AverageValue
<b>value</b>	<b>Quantity</b>	value is the target value of the metric (as a quantity).

### 10.2.1.25. .spec.scaleTargetRef

#### Description

CrossVersionObjectReference contains enough information to let you identify the referred resource.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	apiVersion is the API version of the referent
<b>kind</b>	<b>string</b>	kind is the kind of the referent; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	name is the name of the referent; More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

### 10.2.1.26. .status

#### Description

HorizontalPodAutoscalerStatus describes the current status of a horizontal pod autoscaler.

Type

object

Required

- `desiredReplicas`

Property	Type	Description
<code>conditions</code>	array	<code>conditions</code> is the set of conditions required for this autoscaler to scale its target, and indicates whether or not those conditions are met.
<code>conditions[]</code>	object	<code>HorizontalPodAutoscalerCondition</code> describes the state of a <code>HorizontalPodAutoscaler</code> at a certain point.
<code>currentMetrics</code>	array	<code>currentMetrics</code> is the last read state of the metrics used by this autoscaler.
<code>currentMetrics[]</code>	object	<code>MetricStatus</code> describes the last-read state of a single metric.
<code>currentReplicas</code>	integer	<code>currentReplicas</code> is current number of replicas of pods managed by this autoscaler, as last seen by the autoscaler.
<code>desiredReplicas</code>	integer	<code>desiredReplicas</code> is the desired number of replicas of pods managed by this autoscaler, as last calculated by the autoscaler.
<code>lastScaleTime</code>	Time	<code>lastScaleTime</code> is the last time the <code>HorizontalPodAutoscaler</code> scaled the number of pods, used by the autoscaler to control how often the number of pods is changed.
<code>observedGeneration</code>	integer	<code>observedGeneration</code> is the most recent generation observed by this autoscaler.

### 10.2.1.27. `.status.conditions`

Description

HorizontalPodAutoscalerStatus conditions is an array of HorizontalPodAutoscalerCondition objects.

conditions is the set of conditions required for this autoscaler to scale its target, and indicates whether or not those conditions are met.

#### Type

**array**

### 10.2.1.28. .status.conditions[]

#### Description

HorizontalPodAutoscalerCondition describes the state of a HorizontalPodAutoscaler at a certain point.

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime is the last time the condition transitioned from one status to another
<b>message</b>	<b>string</b>	message is a human-readable explanation containing details about the transition
<b>reason</b>	<b>string</b>	reason is the reason for the condition's last transition.
<b>status</b>	<b>string</b>	status is the status of the condition (True, False, Unknown)
<b>type</b>	<b>string</b>	type describes the current condition

### 10.2.1.29. .status.currentMetrics

#### Description

currentMetrics is the last read state of the metrics used by this autoscaler.

#### Type

**array**

### 10.2.1.30. .status.currentMetrics[]

#### Description

MetricStatus describes the last-read state of a single metric.

Type

**object**

Required

- **type**

Property	Type	Description
<b>containerResource</b>	<b>object</b>	ContainerResourceMetricStatus indicates the current value of a resource metric known to Kubernetes, as specified in requests and limits, describing a single container in each pod in the current scale target (e.g. CPU or memory). Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source.
<b>external</b>	<b>object</b>	ExternalMetricStatus indicates the current value of a global metric not associated with any Kubernetes object.
<b>object</b>	<b>object</b>	ObjectMetricStatus indicates the current value of a metric describing a kubernetes object (for example, hits-per-second on an Ingress object).
<b>Pods</b>	<b>object</b>	PodsMetricStatus indicates the current value of a metric describing each pod in the current scale target (for example, transactions-processed-per-second).
<b>resource</b>	<b>object</b>	ResourceMetricStatus indicates the current value of a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or memory). Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source.

Property	Type	Description
<b>type</b>	<b>string</b>	type is the type of metric source. It will be one of "ContainerResource", "External", "Object", "Pods" or "Resource", each corresponds to a matching field in the object. Note: "ContainerResource" type is available on when the feature-gate HPAContainerMetrics is enabled

### 10.2.1.31. `.status.currentMetrics[].containerResource`

#### Description

ContainerResourceMetricStatus indicates the current value of a resource metric known to Kubernetes, as specified in requests and limits, describing a single container in each pod in the current scale target (e.g. CPU or memory). Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source.

#### Type

**object**

#### Required

- **name**
- **current**
- **container**

Property	Type	Description
<b>container</b>	<b>string</b>	container is the name of the container in the pods of the scaling target
<b>current</b>	<b>object</b>	MetricValueStatus holds the current value for a metric
<b>name</b>	<b>string</b>	name is the name of the resource in question.

### 10.2.1.32. `.status.currentMetrics[].containerResource.current`

#### Description

MetricValueStatus holds the current value for a metric

#### Type

**object**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	currentAverageUtilization is the current value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods.
<b>averageValue</b>	<b>Quantity</b>	averageValue is the current value of the average of the metric across all relevant pods (as a quantity)
<b>value</b>	<b>Quantity</b>	value is the current value of the metric (as a quantity).

**10.2.1.33. .status.currentMetrics[].external****Description**

ExternalMetricStatus indicates the current value of a global metric not associated with any Kubernetes object.

**Type****object****Required**

- **metric**
- **current**

Property	Type	Description
<b>current</b>	<b>object</b>	MetricValueStatus holds the current value for a metric
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric

**10.2.1.34. .status.currentMetrics[].external.current****Description**

MetricValueStatus holds the current value for a metric

**Type****object**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	currentAverageUtilization is the current value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods.
<b>averageValue</b>	<b>Quantity</b>	averageValue is the current value of the average of the metric across all relevant pods (as a quantity)
<b>value</b>	<b>Quantity</b>	value is the current value of the metric (as a quantity).

### 10.2.1.35. .status.currentMetrics[.external.metric

#### Description

MetricIdentifier defines the name and optionally selector for a metric

#### Type

**object**

#### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric
<b>selector</b>	<b>LabelSelector</b>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

### 10.2.1.36. .status.currentMetrics[.object

#### Description

ObjectMetricStatus indicates the current value of a metric describing a kubernetes object (for example, hits-per-second on an Ingress object).

#### Type

**object**

## Required

- **metric**
- **current**
- **describedObject**

Property	Type	Description
<b>current</b>	<b>object</b>	MetricValueStatus holds the current value for a metric
<b>describedObject</b>	<b>object</b>	CrossVersionObjectReference contains enough information to let you identify the referred resource.
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric

10.2.1.37. `.status.currentMetrics[].object.current`

## Description

MetricValueStatus holds the current value for a metric

## Type

**object**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	currentAverageUtilization is the current value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods.
<b>averageValue</b>	<b>Quantity</b>	averageValue is the current value of the average of the metric across all relevant pods (as a quantity)
<b>value</b>	<b>Quantity</b>	value is the current value of the metric (as a quantity).

10.2.1.38. `.status.currentMetrics[].object.describedObject`

**Description**

CrossVersionObjectReference contains enough information to let you identify the referred resource.

**Type**

**object**

**Required**

- **kind**
- **name**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	apiVersion is the API version of the referent
<b>kind</b>	<b>string</b>	kind is the kind of the referent; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	name is the name of the referent; More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**10.2.1.39. .status.currentMetrics[].object.metric****Description**

MetricIdentifier defines the name and optionally selector for a metric

**Type**

**object**

**Required**

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric

Property	Type	Description
<b>selector</b>	<a href="#">LabelSelector</a>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

#### 10.2.1.40. .status.currentMetrics[].pods

##### Description

PodsMetricStatus indicates the current value of a metric describing each pod in the current scale target (for example, transactions-processed-per-second).

##### Type

**object**

##### Required

- **metric**
- **current**

Property	Type	Description
<b>current</b>	<b>object</b>	MetricValueStatus holds the current value for a metric
<b>metric</b>	<b>object</b>	MetricIdentifier defines the name and optionally selector for a metric

#### 10.2.1.41. .status.currentMetrics[].pods.current

##### Description

MetricValueStatus holds the current value for a metric

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	currentAverageUtilization is the current value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods.
<b>averageValue</b>	<b>Quantity</b>	averageValue is the current value of the average of the metric across all relevant pods (as a quantity)
<b>value</b>	<b>Quantity</b>	value is the current value of the metric (as a quantity).

#### 10.2.1.42. `.status.currentMetrics[].pods.metric`

##### Description

MetricIdentifier defines the name and optionally selector for a metric

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	name is the name of the given metric
<b>selector</b>	<b>LabelSelector</b>	selector is the string-encoded form of a standard kubernetes label selector for the given metric. When set, it is passed as an additional parameter to the metrics server for more specific metrics scoping. When unset, just the metricName will be used to gather metrics.

#### 10.2.1.43. `.status.currentMetrics[].resource`

##### Description

ResourceMetricStatus indicates the current value of a resource metric known to Kubernetes, as specified in requests and limits, describing each pod in the current scale target (e.g. CPU or

memory). Such metrics are built in to Kubernetes, and have special scaling options on top of those available to normal per-pod metrics using the "pods" source.

#### Type

**object**

#### Required

- **name**
- **current**

Property	Type	Description
<b>current</b>	<b>object</b>	MetricValueStatus holds the current value for a metric
<b>name</b>	<b>string</b>	name is the name of the resource in question.

#### 10.2.1.44. .status.currentMetrics[].resource.current

#### Description

MetricValueStatus holds the current value for a metric

#### Type

**object**

Property	Type	Description
<b>averageUtilization</b>	<b>integer</b>	currentAverageUtilization is the current value of the average of the resource metric across all relevant pods, represented as a percentage of the requested value of the resource for the pods.
<b>averageValue</b>	<b>Quantity</b>	averageValue is the current value of the average of the metric across all relevant pods (as a quantity)
<b>value</b>	<b>Quantity</b>	value is the current value of the metric (as a quantity).

#### 10.2.2. API endpoints

The following API endpoints are available:

- **/apis/autoscaling/v2/horizontalpodautoscalers**

- **GET**: list or watch objects of kind HorizontalPodAutoscaler
- **/apis/autoscaling/v2/watch/horizontalpodautoscalers**
  - **GET**: watch individual changes to a list of HorizontalPodAutoscaler. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/autoscaling/v2/namespaces/{namespace}/horizontalpodautoscalers**
  - **DELETE**: delete collection of HorizontalPodAutoscaler
  - **GET**: list or watch objects of kind HorizontalPodAutoscaler
  - **POST**: create a HorizontalPodAutoscaler
- **/apis/autoscaling/v2/watch/namespaces/{namespace}/horizontalpodautoscalers**
  - **GET**: watch individual changes to a list of HorizontalPodAutoscaler. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/autoscaling/v2/namespaces/{namespace}/horizontalpodautoscalers/{name}**
  - **DELETE**: delete a HorizontalPodAutoscaler
  - **GET**: read the specified HorizontalPodAutoscaler
  - **PATCH**: partially update the specified HorizontalPodAutoscaler
  - **PUT**: replace the specified HorizontalPodAutoscaler
- **/apis/autoscaling/v2/watch/namespaces/{namespace}/horizontalpodautoscalers/{name}**
  - **GET**: watch changes to an object of kind HorizontalPodAutoscaler. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/autoscaling/v2/namespaces/{namespace}/horizontalpodautoscalers/{name}/status**
  - **GET**: read status of the specified HorizontalPodAutoscaler
  - **PATCH**: partially update status of the specified HorizontalPodAutoscaler
  - **PUT**: replace status of the specified HorizontalPodAutoscaler

#### 10.2.2.1. /apis/autoscaling/v2/horizontalpodautoscalers

Table 10.1. Global query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind HorizontalPodAutoscaler

**Table 10.2. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">HorizontalPodAutoscalerList</a> schema
401 - Unauthorized	Empty

### 10.2.2.2. /apis/autoscaling/v2/watch/horizontalpodautoscalers

Table 10.3. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue`</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

create a HorizontalPodAutoscaler

**Table 10.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

### 10.2.2.6. /apis/autoscaling/v2/watch/namespaces/{namespace}/horizontalpodautoscalers/{

Table 10.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the HorizontalPodAutoscaler
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 10.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind HorizontalPodAutoscaler. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 10.32. HTTP responses**

HTTP code	Reponse body

## 10.3. SCALE [AUTOSCALING/V1]

### Description

Scale represents a scaling request for a resource.

### Type

**object**

### 10.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
<b>spec</b>	<b>object</b>	ScaleSpec describes the attributes of a scale subresource.
<b>status</b>	<b>object</b>	ScaleStatus represents the current status of a scale subresource.

### 10.3.1.1. .spec

#### Description

ScaleSpec describes the attributes of a scale subresource.

#### Type

**object**

Property	Type	Description
<b>replicas</b>	<b>integer</b>	replicas is the desired number of instances for the scaled object.

### 10.3.1.2. .status

#### Description

ScaleStatus represents the current status of a scale subresource.

#### Type

**object**

#### Required

- **replicas**

Property	Type	Description
<b>replicas</b>	<b>integer</b>	replicas is the actual number of observed instances of the scaled object.

Property	Type	Description
<b>selector</b>	<b>string</b>	selector is the label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/</a>

### 10.3.2. API endpoints

The following API endpoints are available:

- **/apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale**
  - **GET**: read scale of the specified Deployment
  - **PATCH**: partially update scale of the specified Deployment
  - **PUT**: replace scale of the specified Deployment
- **/apis/apps/v1/namespaces/{namespace}/replicasets/{name}/scale**
  - **GET**: read scale of the specified ReplicaSet
  - **PATCH**: partially update scale of the specified ReplicaSet
  - **PUT**: replace scale of the specified ReplicaSet
- **/apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/scale**
  - **GET**: read scale of the specified StatefulSet
  - **PATCH**: partially update scale of the specified StatefulSet
  - **PUT**: replace scale of the specified StatefulSet
- **/api/v1/namespaces/{namespace}/replicationcontrollers/{name}/scale**
  - **GET**: read scale of the specified ReplicationController
  - **PATCH**: partially update scale of the specified ReplicationController
  - **PUT**: replace scale of the specified ReplicationController

#### 10.3.2.1. /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale

This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 10.64. Body parameters

Parameter	Type	Description
<b>body</b>	<b>Patch</b> schema	

Table 10.65. HTTP responses

HTTP code	Response body
200 - OK	<b>Scale</b> schema
201 - Created	<b>Scale</b> schema
401 - Unauthorized	Empty

**HTTP method****PUT****Description**

replace scale of the specified StatefulSet

Table 10.66. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 10.67. Body parameters

Parameter	Type	Description
<b>body</b>	<b>Scale</b> schema	

Table 10.68. HTTP responses

HTTP code	Response body
200 - OK	<b>Scale</b> schema
201 - Created	<b>Scale</b> schema
401 - Unauthorized	Empty

## 10.3.2.4. /api/v1/namespaces/{namespace}/replicationcontrollers/{name}/scale

Table 10.69. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Scale
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 10.70. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**GET**

## Description

read scale of the specified ReplicationController

Table 10.71. HTTP responses

HTTP code	Response body
200 - OK	<b>Scale</b> schema
401 - Unauthorized	Empty

## HTTP method

**PATCH**

## Description

partially update scale of the specified ReplicationController

Table 10.72. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. ## CHAPTER 11. BATCH APIS

### 11.1. BATCH APIS

#### 11.1.1. CronJob [batch/v1]

##### Description

CronJob represents the configuration of a single cron job.

##### Type

**object**

#### 11.1.2. Job [batch/v1]

##### Description

Job represents the configuration of a single job.

##### Type

**object**

### 11.2. CRONJOB [BATCH/V1]

##### Description

CronJob represents the configuration of a single cron job.

##### Type

**object**

#### 11.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	CronJobSpec describes how the job execution will look like and when it will actually run.
<b>status</b>	<b>object</b>	CronJobStatus represents the current state of a cron job.

### 11.2.1.1. .spec

#### Description

CronJobSpec describes how the job execution will look like and when it will actually run.

#### Type

**object**

#### Required

- **schedule**
- **jobTemplate**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>concurrencyPolicy</b>	<b>string</b>	<p>Specifies how to treat concurrent executions of a Job. Valid values are:</p> <ul style="list-style-type: none"> <li>- "Allow" (default): allows CronJobs to run concurrently;</li> <li>- "Forbid": forbids concurrent runs, skipping next run if previous run hasn't finished yet;</li> <li>- "Replace": cancels currently running job and replaces it with a new one</li> </ul> <p>Possible enum values: - <b>"Allow"</b> allows CronJobs to run concurrently. - <b>"Forbid"</b> forbids concurrent runs, skipping next run if previous hasn't finished yet. - <b>"Replace"</b> cancels currently running job and replaces it with a new one.</p>
<b>failedJobsHistoryLimit</b>	<b>integer</b>	The number of failed finished jobs to retain. Value must be non-negative integer. Defaults to 1.
<b>jobTemplate</b>	<b>object</b>	JobTemplateSpec describes the data a Job should have when created from a template
<b>schedule</b>	<b>string</b>	The schedule in Cron format, see <a href="https://en.wikipedia.org/wiki/Cron">https://en.wikipedia.org/wiki/Cron</a> .
<b>startingDeadlineSeconds</b>	<b>integer</b>	Optional deadline in seconds for starting the job if it misses scheduled time for any reason. Missed jobs executions will be counted as failed ones.
<b>successfulJobsHistoryLimit</b>	<b>integer</b>	The number of successful finished jobs to retain. Value must be non-negative integer. Defaults to 3.
<b>suspend</b>	<b>boolean</b>	This flag tells the controller to suspend subsequent executions, it does not apply to already started executions. Defaults to false.

Property	Type	Description
<b>timeZone</b>	<b>string</b>	The time zone name for the given schedule, see <a href="https://en.wikipedia.org/wiki/List_of_tz_database_time_zones">https://en.wikipedia.org/wiki/List_of_tz_database_time_zones</a> . If not specified, this will default to the time zone of the kube-controller-manager process. The set of valid time zone names and the time zone offset is loaded from the system-wide time zone database by the API server during CronJob validation and the controller manager during execution. If no system-wide time zone database can be found a bundled version of the database is used instead. If the time zone name becomes invalid during the lifetime of a CronJob or due to a change in host configuration, the controller will stop creating new new Jobs and will create a system event with the reason UnknownTimeZone. More information can be found in <a href="https://kubernetes.io/docs/concepts/workloads/controllers/cron-jobs/#time-zones">https://kubernetes.io/docs/concepts/workloads/controllers/cron-jobs/#time-zones</a>

### 11.2.1.2. .spec.jobTemplate

#### Description

JobTemplateSpec describes the data a Job should have when created from a template

#### Type

**object**

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata of the jobs created from this template. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	JobSpec describes how the job execution will look like.

### 11.2.1.3. .spec.jobTemplate.spec

#### Description

JobSpec describes how the job execution will look like.

#### Type

**object**

#### Required

- **template**

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Specifies the duration in seconds relative to the startTime that the job may be continuously active before the system tries to terminate it; value must be positive integer. If a Job is suspended (at creation or through an update), this timer will effectively be stopped and reset when the Job is resumed again.
<b>backoffLimit</b>	<b>integer</b>	Specifies the number of retries before marking this job failed. Defaults to 6
<b>completionMode</b>	<b>string</b>	<p>completionMode specifies how Pod completions are tracked. It can be <b>NonIndexed</b> (default) or <b>Indexed</b>.</p> <p><b>NonIndexed</b> means that the Job is considered complete when there have been .spec.completions successfully completed Pods. Each Pod completion is homologous to each other.</p> <p><b>Indexed</b> means that the Pods of a Job get an associated completion index from 0 to (.spec.completions - 1), available in the annotation batch.kubernetes.io/job-completion-index. The Job is considered complete when there is one successfully completed Pod for each index. When value is <b>Indexed</b>, .spec.completions must be specified and <b>.spec.parallelism</b> must be less</p>

Property	Type	Description
		<p>than or equal to 10<sup>5</sup>. In addition, The Pod name takes the form <b>\$(job-name)-\$(index)-\$(random-string)</b>, the Pod hostname takes the form <b>\$(job-name)-\$(index)</b>.</p> <p>More completion modes can be added in the future. If the Job controller observes a mode that it doesn't recognize, which is possible during upgrades due to version skew, the controller skips updates for the Job.</p> <p>Possible enum values: -  <b>"Indexed"</b> is a Job completion mode. In this mode, the Pods of a Job get an associated completion index from 0 to (.spec.completions - 1). The Job is considered complete when a Pod completes for each completion index. - <b>"NonIndexed"</b> is a Job completion mode. In this mode, the Job is considered complete when there have been .spec.completions successfully completed Pods. Pod completions are homologous to each other.</p>
<b>completions</b>	<b>integer</b>	<p>Specifies the desired number of successfully finished pods the job should be run with. Setting to null means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job.</p> <p>More info:  <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a></p>

Property	Type	Description
<b>manualSelector</b>	<b>boolean</b>	<p>manualSelector controls generation of pod labels and pod selectors. Leave <b>manualSelector</b> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <b>manualSelector=true</b> in jobs that were created with the old <b>extensions/v1beta1</b> API. More info:  <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector</a></p>
<b>parallelism</b>	<b>integer</b>	<p>Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when <math>((\text{.spec.completions} - \text{.status.successful}) &lt; \text{.spec.parallelism})</math>, i.e. when the work left to do is less than max parallelism. More info:  <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a></p>
<b>podFailurePolicy</b>	<b>object</b>	<p>PodFailurePolicy describes how failed pods influence the backoffLimit.</p>
<b>selector</b>	<b>LabelSelector</b>	<p>A label query over pods that should match the pod count. Normally, the system sets this field for you. More info:  <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a></p>

Property	Type	Description
<b>suspend</b>	<b>boolean</b>	suspend specifies whether the Job controller should create Pods or not. If a Job is created with suspend set to true, no Pods are created by the Job controller. If a Job is suspended after creation (i.e. the flag goes from false to true), the Job controller will delete all active Pods associated with this Job. Users must design their workload to gracefully handle this. Suspending a Job will reset the StartTime field of the Job, effectively resetting the ActiveDeadlineSeconds timer too. Defaults to false.
<b>template</b>	<b>PodTemplateSpec</b>	Describes the pod that will be created when executing a job. The only allowed template.spec.restartPolicy values are "Never" or "OnFailure". More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
<b>ttlSecondsAfterFinished</b>	<b>integer</b>	ttlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, ttlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes.

#### 11.2.1.4. .spec.jobTemplate.spec.podFailurePolicy

##### Description

PodFailurePolicy describes how failed pods influence the backoffLimit.

##### Type

**object****Required**

- **rules**

Property	Type	Description
<b>rules</b>	<b>array</b>	A list of pod failure policy rules. The rules are evaluated in order. Once a rule matches a Pod failure, the remaining of the rules are ignored. When no rule matches the Pod failure, the default handling applies - the counter of pod failures is incremented and it is checked against the backoffLimit. At most 20 elements are allowed.
<b>rules[]</b>	<b>object</b>	PodFailurePolicyRule describes how a pod failure is handled when the requirements are met. One of onExitCodes and onPodConditions, but not both, can be used in each rule.

**11.2.1.5. .spec.jobTemplate.spec.podFailurePolicy.rules****Description**

A list of pod failure policy rules. The rules are evaluated in order. Once a rule matches a Pod failure, the remaining of the rules are ignored. When no rule matches the Pod failure, the default handling applies - the counter of pod failures is incremented and it is checked against the backoffLimit. At most 20 elements are allowed.

**Type**

**array**

**11.2.1.6. .spec.jobTemplate.spec.podFailurePolicy.rules[]****Description**

PodFailurePolicyRule describes how a pod failure is handled when the requirements are met. One of onExitCodes and onPodConditions, but not both, can be used in each rule.

**Type**

**object**

**Required**

- **action**
- **onPodConditions**

Property	Type	Description
<b>action</b>	<b>string</b>	<p>Specifies the action taken on a pod failure when the requirements are satisfied. Possible values are:</p> <ul style="list-style-type: none"> <li>- FailJob: indicates that the pod's job is marked as Failed and all running pods are terminated.</li> <li>- Ignore: indicates that the counter towards the .backoffLimit is not incremented and a replacement pod is created.</li> <li>- Count: indicates that the pod is handled in the default way - the counter towards the .backoffLimit is incremented.</li> </ul> <p>Additional values are considered to be added in the future. Clients should react to an unknown action by skipping the rule.</p> <p>Possible enum values: - <b>"Count"</b> This is an action which might be taken on a pod failure - the pod failure is handled in the default way - the counter towards .backoffLimit, represented by the job's .status.failed field, is incremented. - <b>"FailJob"</b> This is an action which might be taken on a pod failure - mark the pod's job as Failed and terminate all running pods. - <b>"Ignore"</b> This is an action which might be taken on a pod failure - the counter towards .backoffLimit, represented by the job's .status.failed field, is not incremented and a replacement pod is created.</p>

Property	Type	Description
<b>onExitCodes</b>	<b>object</b>	PodFailurePolicyOnExitCodesRequirement describes the requirement for handling a failed pod based on its container exit codes. In particular, it lookups the <code>.state.terminated.exitCode</code> for each app container and init container status, represented by the <code>.status.containerStatuses</code> and <code>.status.initContainerStatuses</code> fields in the Pod status, respectively. Containers completed with success (exit code 0) are excluded from the requirement check.
<b>onPodConditions</b>	<b>array</b>	Represents the requirement on the pod conditions. The requirement is represented as a list of pod condition patterns. The requirement is satisfied if at least one pattern matches an actual pod condition. At most 20 elements are allowed.
<b>onPodConditions[]</b>	<b>object</b>	PodFailurePolicyOnPodConditionPattern describes a pattern for matching an actual pod condition type.

### 11.2.1.7. `.spec.jobTemplate.spec.podFailurePolicy.rules[].onExitCodes`

#### Description

PodFailurePolicyOnExitCodesRequirement describes the requirement for handling a failed pod based on its container exit codes. In particular, it lookups the `.state.terminated.exitCode` for each app container and init container status, represented by the `.status.containerStatuses` and `.status.initContainerStatuses` fields in the Pod status, respectively. Containers completed with success (exit code 0) are excluded from the requirement check.

#### Type

**object**

#### Required

- **operator**
- **values**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Restricts the check for exit codes to the container with the specified name. When null, the rule applies to all containers. When specified, it should match one the container or initContainer names in the pod template.
<b>operator</b>	<b>string</b>	<p>Represents the relationship between the container exit code(s) and the specified values. Containers completed with success (exit code 0) are excluded from the requirement check. Possible values are:</p> <ul style="list-style-type: none"> <li>- In: the requirement is satisfied if at least one container exit code (might be multiple if there are multiple containers not restricted by the 'containerName' field) is in the set of specified values.</li> <li>- NotIn: the requirement is satisfied if at least one container exit code (might be multiple if there are multiple containers not restricted by the 'containerName' field) is not in the set of specified values. Additional values are considered to be added in the future. Clients should react to an unknown operator by assuming the requirement is not satisfied.</li> </ul> <p>Possible enum values: - <b>"In"</b> - <b>"NotIn"</b></p>
<b>values</b>	<b>array (integer)</b>	Specifies the set of values. Each returned container exit code (might be multiple in case of multiple containers) is checked against this set of values with respect to the operator. The list of values must be ordered and must not contain duplicates. Value '0' cannot be used for the In operator. At least one element is required. At most 255 elements are allowed.

### 11.2.1.8. .spec.jobTemplate.spec.podFailurePolicy.rules[].onPodConditions

**Description**

Represents the requirement on the pod conditions. The requirement is represented as a list of pod condition patterns. The requirement is satisfied if at least one pattern matches an actual pod condition. At most 20 elements are allowed.

**Type**

**array**

**11.2.1.9. .spec.jobTemplate.spec.podFailurePolicy.rules[].onPodConditions[]****Description**

PodFailurePolicyOnPodConditionsPattern describes a pattern for matching an actual pod condition type.

**Type**

**object**

**Required**

- **type**
- **status**

Property	Type	Description
<b>status</b>	<b>string</b>	Specifies the required Pod condition status. To match a pod condition it is required that the specified status equals the pod condition status. Defaults to True.
<b>type</b>	<b>string</b>	Specifies the required Pod condition type. To match a pod condition it is required that specified type equals the pod condition type.

**11.2.1.10. .status****Description**

CronJobStatus represents the current state of a cron job.

**Type**

**object**

Property	Type	Description
<b>active</b>	<b>array (ObjectReference)</b>	A list of pointers to currently running jobs.

Property	Type	Description
<b>lastScheduleTime</b>	<b>Time</b>	Information when was the last time the job was successfully scheduled.
<b>lastSuccessfulTime</b>	<b>Time</b>	Information when was the last time the job successfully completed.

### 11.2.2. API endpoints

The following API endpoints are available:

- **/apis/batch/v1/cronjobs**
  - **GET**: list or watch objects of kind CronJob
- **/apis/batch/v1/watch/cronjobs**
  - **GET**: watch individual changes to a list of CronJob. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/batch/v1/namespaces/{namespace}/cronjobs**
  - **DELETE**: delete collection of CronJob
  - **GET**: list or watch objects of kind CronJob
  - **POST**: create a CronJob
- **/apis/batch/v1/watch/namespaces/{namespace}/cronjobs**
  - **GET**: watch individual changes to a list of CronJob. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/batch/v1/namespaces/{namespace}/cronjobs/{name}**
  - **DELETE**: delete a CronJob
  - **GET**: read the specified CronJob
  - **PATCH**: partially update the specified CronJob
  - **PUT**: replace the specified CronJob
- **/apis/batch/v1/watch/namespaces/{namespace}/cronjobs/{name}**
  - **GET**: watch changes to an object of kind CronJob. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/batch/v1/namespaces/{namespace}/cronjobs/{name}/status**

- **GET**: read status of the specified CronJob
- **PATCH**: partially update status of the specified CronJob
- **PUT**: replace status of the specified CronJob

### 11.2.2.1. /apis/batch/v1/cronjobs

Table 11.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind CronJob

Table 11.2. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">CronJobList</a> schema
401 - Unauthorized	Empty

### 11.2.2.2. /apis/batch/v1/watch/cronjobs

Table 11.3. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

delete collection of CronJob

Table 11.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. create a CronJob

**Table 11.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

delete a CronJob

Table 11.20. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 11.22. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
202 - Accepted	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

read the specified CronJob

Table 11.23. HTTP responses

HTTP code	Response body
200 - OK	<b>CronJob</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified CronJob

**Table 11.24. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

### 11.2.2.6. /apis/batch/v1/watch/namespaces/{namespace}/cronjobs/{name}

Table 11.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the CronJob
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 11.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CronJob. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## 11.3. JOB [BATCH/V1]

### Description

Job represents the configuration of a single job.

### Type

**object**

### 11.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	JobSpec describes how the job execution will look like.
<b>status</b>	<b>object</b>	JobStatus represents the current state of a Job.

### 11.3.1.1. .spec

#### Description

JobSpec describes how the job execution will look like.

#### Type

**object**

#### Required

- **template**

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Specifies the duration in seconds relative to the startTime that the job may be continuously active before the system tries to terminate it; value must be positive integer. If a Job is suspended (at creation or through an update), this timer will effectively be stopped and reset when the Job is resumed again.
<b>backoffLimit</b>	<b>integer</b>	Specifies the number of retries before marking this job failed. Defaults to 6
<b>completionMode</b>	<b>string</b>	completionMode specifies how Pod completions are tracked. It can be <b>NonIndexed</b> (default) or <b>Indexed</b> .  <b>NonIndexed</b> means that the

Property	Type	Description
		<p>Job is considered complete when there have been <code>.spec.completions</code> successfully completed Pods. Each Pod completion is homologous to each other.</p> <p><b>Indexed</b> means that the Pods of a Job get an associated completion index from 0 to <math>(.spec.completions - 1)</math>, available in the annotation <code>batch.kubernetes.io/job-completion-index</code>. The Job is considered complete when there is one successfully completed Pod for each index. When value is <b>Indexed</b>, <code>.spec.completions</code> must be specified and <code>.spec.parallelism</code> must be less than or equal to <math>10^5</math>. In addition, The Pod name takes the form <b><code>\$(job-name)-\$(index)-\$(random-string)</code></b>, the Pod hostname takes the form <b><code>\$(job-name)-\$(index)</code></b>.</p> <p>More completion modes can be added in the future. If the Job controller observes a mode that it doesn't recognize, which is possible during upgrades due to version skew, the controller skips updates for the Job.</p> <p>Possible enum values: -  <b>"Indexed"</b> is a Job completion mode. In this mode, the Pods of a Job get an associated completion index from 0 to <math>(.spec.completions - 1)</math>. The Job is considered complete when a Pod completes for each completion index. - <b>"NonIndexed"</b> is a Job completion mode. In this mode, the Job is considered complete when there have been <code>.spec.completions</code> successfully completed Pods. Pod completions are homologous to each other.</p>

Property	Type	Description
<b>completions</b>	<b>integer</b>	<p>Specifies the desired number of successfully finished pods the job should be run with. Setting to null means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job.</p> <p>More info:  <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a></p>
<b>manualSelector</b>	<b>boolean</b>	<p><code>manualSelector</code> controls generation of pod labels and pod selectors. Leave <b><code>manualSelector</code></b> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <b><code>manualSelector=true</code></b> in jobs that were created with the old <b><code>extensions/v1beta1</code></b> API. More info:  <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector</a></p>

Property	Type	Description
<b>parallelism</b>	<b>integer</b>	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $(.spec.completions - .status.successful) < .spec.parallelism$ , i.e. when the work left to do is less than max parallelism. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
<b>podFailurePolicy</b>	<b>object</b>	PodFailurePolicy describes how failed pods influence the backoffLimit.
<b>selector</b>	<b>LabelSelector</b>	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
<b>suspend</b>	<b>boolean</b>	suspend specifies whether the Job controller should create Pods or not. If a Job is created with suspend set to true, no Pods are created by the Job controller. If a Job is suspended after creation (i.e. the flag goes from false to true), the Job controller will delete all active Pods associated with this Job. Users must design their workload to gracefully handle this. Suspending a Job will reset the StartTime field of the Job, effectively resetting the ActiveDeadlineSeconds timer too. Defaults to false.

Property	Type	Description
<b>template</b>	<b>PodTemplateSpec</b>	Describes the pod that will be created when executing a job. The only allowed <code>template.spec.restartPolicy</code> values are "Never" or "OnFailure". More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
<b>ttlSecondsAfterFinished</b>	<b>integer</b>	<code>ttlSecondsAfterFinished</code> limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, <code>ttlSecondsAfterFinished</code> after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes.

### 11.3.1.2. .spec.podFailurePolicy

#### Description

`PodFailurePolicy` describes how failed pods influence the `backoffLimit`.

#### Type

**object**

#### Required

- **rules**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>rules</b>	<b>array</b>	A list of pod failure policy rules. The rules are evaluated in order. Once a rule matches a Pod failure, the remaining of the rules are ignored. When no rule matches the Pod failure, the default handling applies - the counter of pod failures is incremented and it is checked against the backoffLimit. At most 20 elements are allowed.
<b>rules[]</b>	<b>object</b>	PodFailurePolicyRule describes how a pod failure is handled when the requirements are met. One of onExitCodes and onPodConditions, but not both, can be used in each rule.

### 11.3.1.3. .spec.podFailurePolicy.rules

#### Description

A list of pod failure policy rules. The rules are evaluated in order. Once a rule matches a Pod failure, the remaining of the rules are ignored. When no rule matches the Pod failure, the default handling applies - the counter of pod failures is incremented and it is checked against the backoffLimit. At most 20 elements are allowed.

#### Type

**array**

### 11.3.1.4. .spec.podFailurePolicy.rules[]

#### Description

PodFailurePolicyRule describes how a pod failure is handled when the requirements are met. One of onExitCodes and onPodConditions, but not both, can be used in each rule.

#### Type

**object**

#### Required

- **action**
- **onPodConditions**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>action</b>	<b>string</b>	<p>Specifies the action taken on a pod failure when the requirements are satisfied. Possible values are:</p> <ul style="list-style-type: none"> <li>- FailJob: indicates that the pod's job is marked as Failed and all running pods are terminated.</li> <li>- Ignore: indicates that the counter towards the .backoffLimit is not incremented and a replacement pod is created.</li> <li>- Count: indicates that the pod is handled in the default way - the counter towards the .backoffLimit is incremented.</li> </ul> <p>Additional values are considered to be added in the future. Clients should react to an unknown action by skipping the rule.</p> <p>Possible enum values: - <b>"Count"</b> This is an action which might be taken on a pod failure - the pod failure is handled in the default way - the counter towards .backoffLimit, represented by the job's .status.failed field, is incremented. - <b>"FailJob"</b> This is an action which might be taken on a pod failure - mark the pod's job as Failed and terminate all running pods. - <b>"Ignore"</b> This is an action which might be taken on a pod failure - the counter towards .backoffLimit, represented by the job's .status.failed field, is not incremented and a replacement pod is created.</p>

Property	Type	Description
<b>onExitCodes</b>	<b>object</b>	PodFailurePolicyOnExitCodesRequirement describes the requirement for handling a failed pod based on its container exit codes. In particular, it lookups the <code>.state.terminated.exitCode</code> for each app container and init container status, represented by the <code>.status.containerStatuses</code> and <code>.status.initContainerStatuses</code> fields in the Pod status, respectively. Containers completed with success (exit code 0) are excluded from the requirement check.
<b>onPodConditions</b>	<b>array</b>	Represents the requirement on the pod conditions. The requirement is represented as a list of pod condition patterns. The requirement is satisfied if at least one pattern matches an actual pod condition. At most 20 elements are allowed.
<b>onPodConditions[]</b>	<b>object</b>	PodFailurePolicyOnPodConditionPattern describes a pattern for matching an actual pod condition type.

### 11.3.1.5. `.spec.podFailurePolicy.rules[].onExitCodes`

#### Description

PodFailurePolicyOnExitCodesRequirement describes the requirement for handling a failed pod based on its container exit codes. In particular, it lookups the `.state.terminated.exitCode` for each app container and init container status, represented by the `.status.containerStatuses` and `.status.initContainerStatuses` fields in the Pod status, respectively. Containers completed with success (exit code 0) are excluded from the requirement check.

#### Type

**object**

#### Required

- **operator**
- **values**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Restricts the check for exit codes to the container with the specified name. When null, the rule applies to all containers. When specified, it should match one the container or initContainer names in the pod template.
<b>operator</b>	<b>string</b>	<p>Represents the relationship between the container exit code(s) and the specified values. Containers completed with success (exit code 0) are excluded from the requirement check. Possible values are:</p> <ul style="list-style-type: none"> <li>- In: the requirement is satisfied if at least one container exit code (might be multiple if there are multiple containers not restricted by the 'containerName' field) is in the set of specified values.</li> <li>- NotIn: the requirement is satisfied if at least one container exit code (might be multiple if there are multiple containers not restricted by the 'containerName' field) is not in the set of specified values. Additional values are considered to be added in the future. Clients should react to an unknown operator by assuming the requirement is not satisfied.</li> </ul> <p>Possible enum values: - <b>"In"</b> - <b>"NotIn"</b></p>
<b>values</b>	<b>array (integer)</b>	Specifies the set of values. Each returned container exit code (might be multiple in case of multiple containers) is checked against this set of values with respect to the operator. The list of values must be ordered and must not contain duplicates. Value '0' cannot be used for the In operator. At least one element is required. At most 255 elements are allowed.

### 11.3.1.6. .spec.podFailurePolicy.rules[].onPodConditions

**Description**

Represents the requirement on the pod conditions. The requirement is represented as a list of pod condition patterns. The requirement is satisfied if at least one pattern matches an actual pod condition. At most 20 elements are allowed.

**Type**

**array**

**11.3.1.7. .spec.podFailurePolicy.rules[].onPodConditions[]****Description**

PodFailurePolicyOnPodConditionsPattern describes a pattern for matching an actual pod condition type.

**Type**

**object**

**Required**

- **type**
- **status**

Property	Type	Description
<b>status</b>	<b>string</b>	Specifies the required Pod condition status. To match a pod condition it is required that the specified status equals the pod condition status. Defaults to True.
<b>type</b>	<b>string</b>	Specifies the required Pod condition type. To match a pod condition it is required that specified type equals the pod condition type.

**11.3.1.8. .status****Description**

JobStatus represents the current state of a Job.

**Type**

**object**

Property	Type	Description
<b>active</b>	<b>integer</b>	The number of pending and running pods.

Property	Type	Description
<b>completedIndexes</b>	<b>string</b>	completedIndexes holds the completed indexes when <code>.spec.completionMode = "Indexed"</code> in a text format. The indexes are represented as decimal integers separated by commas. The numbers are listed in increasing order. Three or more consecutive numbers are compressed and represented by the first and last element of the series, separated by a hyphen. For example, if the completed indexes are 1, 3, 4, 5 and 7, they are represented as "1,3-5,7".
<b>completionTime</b>	<b>Time</b>	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC. The completion time is only set when the job finishes successfully.
<b>conditions</b>	<b>array</b>	The latest available observations of an object's current state. When a Job fails, one of the conditions will have type "Failed" and status true. When a Job is suspended, one of the conditions will have type "Suspended" and status true; when the Job is resumed, the status of this condition will become false. When a Job is completed, one of the conditions will have type "Complete" and status true. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
<b>conditions[]</b>	<b>object</b>	JobCondition describes current state of a job.
<b>failed</b>	<b>integer</b>	The number of pods which reached phase Failed.

Property	Type	Description
<b>ready</b>	<b>integer</b>	The number of pods which have a Ready condition.  This field is beta-level. The job controller populates the field when the feature gate JobReadyPods is enabled (enabled by default).
<b>startTime</b>	<b>Time</b>	Represents time when the job controller started processing a job. When a Job is created in the suspended state, this field is not set until the first time it is resumed. This field is reset every time a Job is resumed from suspension. It is represented in RFC3339 form and is in UTC.
<b>succeeded</b>	<b>integer</b>	The number of pods which reached phase Succeeded.
<b>uncountedTerminatedPods</b>	<b>object</b>	UncountedTerminatedPods holds UIDs of Pods that have terminated but haven't been accounted in Job status counters.

### 11.3.1.9. .status.conditions

#### Description

The latest available observations of an object's current state. When a Job fails, one of the conditions will have type "Failed" and status true. When a Job is suspended, one of the conditions will have type "Suspended" and status true; when the Job is resumed, the status of this condition will become false. When a Job is completed, one of the conditions will have type "Complete" and status true. More info: <https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/>

#### Type

**array**

### 11.3.1.10. .status.conditions[]

#### Description

JobCondition describes current state of a job.

#### Type

**object**

#### Required

- **type**

- **status**

Property	Type	Description
<b>lastProbeTime</b>	<b>Time</b>	Last time the condition was checked.
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transit from one status to another.
<b>message</b>	<b>string</b>	Human readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	(brief) reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of job condition, Complete or Failed.

### 11.3.1.11. .status.uncountedTerminatedPods

#### Description

UncountedTerminatedPods holds UIDs of Pods that have terminated but haven't been accounted in Job status counters.

#### Type

**object**

Property	Type	Description
<b>failed</b>	<b>array (string)</b>	failed holds UIDs of failed Pods.
<b>succeeded</b>	<b>array (string)</b>	succeeded holds UIDs of succeeded Pods.

### 11.3.2. API endpoints

The following API endpoints are available:

- **/apis/batch/v1/jobs**
  - **GET**: list or watch objects of kind Job
- **/apis/batch/v1/watch/jobs**

- **GET**: watch individual changes to a list of Job. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/batch/v1/namespaces/{namespace}/jobs**
  - **DELETE**: delete collection of Job
  - **GET**: list or watch objects of kind Job
  - **POST**: create a Job
- **/apis/batch/v1/watch/namespaces/{namespace}/jobs**
  - **GET**: watch individual changes to a list of Job. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/batch/v1/namespaces/{namespace}/jobs/{name}**
  - **DELETE**: delete a Job
  - **GET**: read the specified Job
  - **PATCH**: partially update the specified Job
  - **PUT**: replace the specified Job
- **/apis/batch/v1/watch/namespaces/{namespace}/jobs/{name}**
  - **GET**: watch changes to an object of kind Job. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/batch/v1/namespaces/{namespace}/jobs/{name}/status**
  - **GET**: read status of the specified Job
  - **PATCH**: partially update status of the specified Job
  - **PUT**: replace status of the specified Job

### 11.3.2.1. /apis/batch/v1/jobs

Table 11.42. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind Job

HTTP code	Response body
200 - OK	<b>JobList</b> schema
401 - Unauthorized	Empty

### 11.3.2.2. /apis/batch/v1/watch/jobs

Table 11.44. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. #### HTTP method

#### **DELETE**

#### Description

delete collection of Job

Table 11.48. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

**HTTP method****GET****Description**

list or watch objects of kind Job

Table 11.51. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 11.52. HTTP responses

HTTP code	Response body
200 - OK	<b>JobList</b> schema
401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a Job

**Table 11.53. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 11.54. Body parameters**

Parameter	Type	Description
<b>body</b>	<b>Job</b> schema	

**Table 11.55. HTTP responses**

HTTP code	Reponse body
200 - OK	<b>Job</b> schema

HTTP code	Response body
201 - Created	<b>Job</b> schema
202 - Accepted	<b>Job</b> schema
401 - Unauthorized	Empty

#### 11.3.2.4. /apis/batch/v1/watch/namespaces/{namespace}/jobs

Table 11.56. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 11.57. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Job. deprecated: use the 'watch' parameter with a list operation instead.

Table 11.58. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

### 11.3.2.5. /apis/batch/v1/namespaces/{namespace}/jobs/{name}

Table 11.59. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Job
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 11.60. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

#### **DELETE**

#### Description

delete a Job

Table 11.61. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 11.62. Body parameters

Parameter	Type	Description
<b>body</b>	<b>DeleteOptions</b> schema	

Table 11.63. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema

HTTP code	Response body
200 - OK	<b>Job</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified Job

**Table 11.65. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## CHAPTER 12. CERTIFICATES APIS

### 12.1. CERTIFICATES APIS

#### 12.1.1. CertificateSigningRequest [certificates.k8s.io/v1]

##### Description

CertificateSigningRequest objects provide a mechanism to obtain x509 certificates by submitting a certificate signing request, and having it asynchronously approved and issued.

Kubelets use this API to obtain: 1. client certificates to authenticate to kube-apiserver (with the "kubernetes.io/kube-apiserver-client-kubelet" signerName). 2. serving certificates for TLS endpoints kube-apiserver can connect to securely (with the "kubernetes.io/kubelet-serving" signerName).

This API can be used to request client certificates to authenticate to kube-apiserver (with the "kubernetes.io/kube-apiserver-client" signerName), or to obtain certificates from custom non-Kubernetes signers.

##### Type

**object**

### 12.2. CERTIFICATESIGNINGREQUEST [CERTIFICATES.K8S.IO/V1]

##### Description

CertificateSigningRequest objects provide a mechanism to obtain x509 certificates by submitting a certificate signing request, and having it asynchronously approved and issued.

Kubelets use this API to obtain: 1. client certificates to authenticate to kube-apiserver (with the "kubernetes.io/kube-apiserver-client-kubelet" signerName). 2. serving certificates for TLS endpoints kube-apiserver can connect to securely (with the "kubernetes.io/kubelet-serving" signerName).

This API can be used to request client certificates to authenticate to kube-apiserver (with the "kubernetes.io/kube-apiserver-client" signerName), or to obtain certificates from custom non-Kubernetes signers.

##### Type

**object**

##### Required

- **spec**

#### 12.2.1. Specification

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	
<b>spec</b>	<b>object</b>	CertificateSigningRequestSpec contains the certificate request.
<b>status</b>	<b>object</b>	CertificateSigningRequestStatus contains conditions used to indicate approved/denied/failed status of the request, and the issued certificate.

### 12.2.1.1. .spec

#### Description

CertificateSigningRequestSpec contains the certificate request.

#### Type

**object**

#### Required

- **request**
- **signerName**

Property	Type	Description
<b>expirationSeconds</b>	<b>integer</b>	<p>expirationSeconds is the requested duration of validity of the issued certificate. The certificate signer may issue a certificate with a different validity duration so a client must check the delta between the notBefore and and notAfter fields in the issued certificate to determine the actual duration.</p> <p>The v1.22+ in-tree implementations of the well-known Kubernetes signers will honor this field as long as the requested duration is not greater than the maximum duration they will honor per the --cluster-signing-duration CLI flag to the Kubernetes controller manager.</p> <p>Certificate signers may not honor this field for various reasons:</p> <ol style="list-style-type: none"> <li>1. Old signer that is unaware of the field (such as the in-tree implementations prior to v1.22)</li> <li>2. Signer whose configured maximum is shorter than the requested duration</li> <li>3. Signer whose configured minimum is longer than the requested duration</li> </ol> <p>The minimum valid value for expirationSeconds is 600, i.e. 10 minutes.</p>
<b>extra</b>	<b>object</b>	<p>extra contains extra attributes of the user that created the CertificateSigningRequest. Populated by the API server on creation and immutable.</p>
<b>extra{}</b>	<b>array (string)</b>	
<b>groups</b>	<b>array (string)</b>	<p>groups contains group membership of the user that created the CertificateSigningRequest. Populated by the API server on creation and immutable.</p>

Property	Type	Description
<b>request</b>	<b>string</b>	request contains an x509 certificate signing request encoded in a "CERTIFICATE REQUEST" PEM block. When serialized as JSON or YAML, the data is additionally base64-encoded.
<b>signerName</b>	<b>string</b>	<p>signerName indicates the requested signer, and is a qualified name.</p> <p>List/watch requests for CertificateSigningRequests can filter on this field using a "spec.signerName=NAME" fieldSelector.</p> <p>Well-known Kubernetes signers are: 1. "kubernetes.io/kube-apiserver-client": issues client certificates that can be used to authenticate to kube-apiserver. Requests for this signer are never auto-approved by kube-controller-manager, can be issued by the "csrsigning" controller in kube-controller-manager. 2. "kubernetes.io/kube-apiserver-client-kubelet": issues client certificates that kubelets use to authenticate to kube-apiserver. Requests for this signer can be auto-approved by the "csrapproving" controller in kube-controller-manager, and can be issued by the "csrsigning" controller in kube-controller-manager. 3. "kubernetes.io/kubelet-serving" issues serving certificates that kubelets use to serve TLS endpoints, which kube-apiserver can connect to securely. Requests for this signer are never auto-approved by kube-controller-manager, and can be issued by the "csrsigning" controller in kube-controller-manager.</p> <p>More details are available at</p>

Property	Type	Description
		<p><a href="https://k8s.io/docs/reference/access-authorization/certificate-signing-requests/#kubernetes-signers">https://k8s.io/docs/reference/access-authorization/certificate-signing-requests/#kubernetes-signers</a></p> <p>Custom signerNames can also be specified. The signer defines:</p> <ol style="list-style-type: none"> <li>Trust distribution: how trust (CA bundles) are distributed.</li> <li>Permitted subjects: and behavior when a disallowed subject is requested.</li> <li>Required, permitted, or forbidden x509 extensions in the request (including whether subjectAltNames are allowed, which types, restrictions on allowed values) and behavior when a disallowed extension is requested.</li> <li>Required, permitted, or forbidden key usages / extended key usages.</li> <li>Expiration/certificate lifetime: whether it is fixed by the signer, configurable by the admin.</li> <li>Whether or not requests for CA certificates are allowed.</li> </ol>
<b>uid</b>	<b>string</b>	<p>uid contains the uid of the user that created the CertificateSigningRequest. Populated by the API server on creation and immutable.</p>

Property	Type	Description
<b>usages</b>	<b>array (string)</b>	<p>usages specifies a set of key usages requested in the issued certificate.</p> <p>Requests for TLS client certificates typically request: "digital signature", "key encipherment", "client auth".</p> <p>Requests for TLS serving certificates typically request: "key encipherment", "digital signature", "server auth".</p> <p>Valid values are: "signing", "digital signature", "content commitment", "key encipherment", "key agreement", "data encipherment", "cert sign", "crl sign", "encipher only", "decipher only", "any", "server auth", "client auth", "code signing", "email protection", "s/mime", "ipsec end system", "ipsec tunnel", "ipsec user", "timestamping", "ocsp signing", "microsoft sgc", "netscape sgc"</p>
<b>username</b>	<b>string</b>	<p>username contains the name of the user that created the CertificateSigningRequest. Populated by the API server on creation and immutable.</p>

### 12.2.1.2. .spec.extra

#### Description

extra contains extra attributes of the user that created the CertificateSigningRequest. Populated by the API server on creation and immutable.

#### Type

**object**

### 12.2.1.3. .status

#### Description

CertificateSigningRequestStatus contains conditions used to indicate approved/denied/failed status of the request, and the issued certificate.

#### Type

**object**

Property	Type	Description
<b>certificate</b>	<b>string</b>	<p>certificate is populated with an issued certificate by the signer after an Approved condition is present. This field is set via the /status subresource. Once populated, this field is immutable.</p> <p>If the certificate signing request is denied, a condition of type "Denied" is added and this field remains empty. If the signer cannot issue the certificate, a condition of type "Failed" is added and this field remains empty.</p> <p>Validation requirements: 1. certificate must contain one or more PEM blocks. 2. All PEM blocks must have the "CERTIFICATE" label, contain no headers, and the encoded data must be a BER-encoded ASN.1 Certificate structure as described in section 4 of RFC5280. 3. Non-PEM content may appear before or after the "CERTIFICATE" PEM blocks and is unvalidated, to allow for explanatory text as described in section 5.2 of RFC7468.</p> <p>If more than one PEM block is present, and the definition of the requested spec.signerName does not indicate otherwise, the first block is the issued certificate, and subsequent blocks should be treated as intermediate certificates and presented in TLS handshakes.</p> <p>The certificate is encoded in PEM format.</p> <p>When serialized as JSON or YAML, the data is additionally base64-encoded, so it consists of:</p> <pre>base64( -----BEGIN CERTIFICATE----- ... -----END CERTIFICATE----- )</pre>

Property	Type	Description
<b>conditions</b>	<b>array</b>	conditions applied to the request. Known conditions are "Approved", "Denied", and "Failed".
<b>conditions[]</b>	<b>object</b>	CertificateSigningRequestCondition describes a condition of a CertificateSigningRequest object

#### 12.2.1.4. .status.conditions

##### Description

conditions applied to the request. Known conditions are "Approved", "Denied", and "Failed".

##### Type

**array**

#### 12.2.1.5. .status.conditions[]

##### Description

CertificateSigningRequestCondition describes a condition of a CertificateSigningRequest object

##### Type

**object**

##### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime is the time the condition last transitioned from one status to another. If unset, when a new condition type is added or an existing condition's status is changed, the server defaults this to the current time.
<b>lastUpdateTime</b>	<b>Time</b>	lastUpdateTime is the time of the last update to this condition
<b>message</b>	<b>string</b>	message contains a human readable message with details about the request state

Property	Type	Description
<b>reason</b>	<b>string</b>	reason indicates a brief reason for the request state
<b>status</b>	<b>string</b>	status of the condition, one of True, False, Unknown. Approved, Denied, and Failed conditions may not be "False" or "Unknown".
<b>type</b>	<b>string</b>	<p>type of the condition. Known conditions are "Approved", "Denied", and "Failed".</p> <p>An "Approved" condition is added via the /approval subresource, indicating the request was approved and should be issued by the signer.</p> <p>A "Denied" condition is added via the /approval subresource, indicating the request was denied and should not be issued by the signer.</p> <p>A "Failed" condition is added via the /status subresource, indicating the signer failed to issue the certificate.</p> <p>Approved and Denied conditions are mutually exclusive. Approved, Denied, and Failed conditions cannot be removed once added.</p> <p>Only one condition of a given type is allowed.</p>

### 12.2.2. API endpoints

The following API endpoints are available:

- **/apis/certificates.k8s.io/v1/certificatesigningrequests**
  - **DELETE**: delete collection of CertificateSigningRequest
  - **GET**: list or watch objects of kind CertificateSigningRequest
  - **POST**: create a CertificateSigningRequest
- **/apis/certificates.k8s.io/v1/watch/certificatesigningrequests**
  - **GET**: watch individual changes to a list of CertificateSigningRequest. deprecated: use the 'watch' parameter with a list operation instead

`watch` parameter with a list operation instead.

- **/apis/certificates.k8s.io/v1/certificatesigningrequests/{name}**
  - **DELETE:** delete a CertificateSigningRequest
  - **GET:** read the specified CertificateSigningRequest
  - **PATCH:** partially update the specified CertificateSigningRequest
  - **PUT:** replace the specified CertificateSigningRequest
- **/apis/certificates.k8s.io/v1/watch/certificatesigningrequests/{name}**
  - **GET:** watch changes to an object of kind CertificateSigningRequest. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/apis/certificates.k8s.io/v1/certificatesigningrequests/{name}/status**
  - **GET:** read status of the specified CertificateSigningRequest
  - **PATCH:** partially update status of the specified CertificateSigningRequest
  - **PUT:** replace status of the specified CertificateSigningRequest
- **/apis/certificates.k8s.io/v1/certificatesigningrequests/{name}/approval**
  - **GET:** read approval of the specified CertificateSigningRequest
  - **PATCH:** partially update approval of the specified CertificateSigningRequest
  - **PUT:** replace approval of the specified CertificateSigningRequest

### 12.2.2.1. /apis/certificates.k8s.io/v1/certificatesigningrequests

Table 12.1. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**DELETE**

Description

delete collection of CertificateSigningRequest

Table 12.2. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Table 12.3. Body parameters

Parameter	Type	Description
<b>body</b>	<b>DeleteOptions</b> schema	

Table 12.4. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind CertificateSigningRequest

Table 12.5. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 12.6. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">CertificateSigningRequestList</a> schema
401 - Unauthorized	Empty

HTTP method  
**POST**

**Description**

create a CertificateSigningRequest

**Table 12.7. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 12.2.2.4. /apis/certificates.k8s.io/v1/watch/certificatesigningrequests/{name}

Table 12.24. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the CertificateSigningRequest

Table 12.25. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind CertificateSigningRequest. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

## CHAPTER 13. COORDINATION APIS

### 13.1. COORDINATION APIS

#### 13.1.1. Lease [coordination.k8s.io/v1]

##### Description

Lease defines a lease concept.

##### Type

**object**

### 13.2. LEASE [COORDINATION.K8S.IO/V1]

##### Description

Lease defines a lease concept.

##### Type

**object**

#### 13.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	LeaseSpec is a specification of a Lease.

### 13.2.1.1. .spec

#### Description

LeaseSpec is a specification of a Lease.

#### Type

**object**

Property	Type	Description
<b>acquireTime</b>	<b>MicroTime</b>	acquireTime is a time when the current lease was acquired.
<b>holderIdentity</b>	<b>string</b>	holderIdentity contains the identity of the holder of a current lease.
<b>leaseDurationSeconds</b>	<b>integer</b>	leaseDurationSeconds is a duration that candidates for a lease need to wait to force acquire it. This is measure against time of last observed renewTime.
<b>leaseTransitions</b>	<b>integer</b>	leaseTransitions is the number of transitions of a lease between holders.
<b>renewTime</b>	<b>MicroTime</b>	renewTime is a time when the current holder of a lease has last updated the lease.

### 13.2.2. API endpoints

The following API endpoints are available:

- **/apis/coordination.k8s.io/v1/leases**
  - **GET**: list or watch objects of kind Lease
- **/apis/coordination.k8s.io/v1/watch/leases**

- **GET**: watch individual changes to a list of Lease. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/coordination.k8s.io/v1/namespaces/{namespace}/leases**
  - **DELETE**: delete collection of Lease
  - **GET**: list or watch objects of kind Lease
  - **POST**: create a Lease
- **/apis/coordination.k8s.io/v1/watch/namespaces/{namespace}/leases**
  - **GET**: watch individual changes to a list of Lease. deprecated: use the 'watch' parameter with a list operation instead.
- **/apis/coordination.k8s.io/v1/namespaces/{namespace}/leases/{name}**
  - **DELETE**: delete a Lease
  - **GET**: read the specified Lease
  - **PATCH**: partially update the specified Lease
  - **PUT**: replace the specified Lease
- **/apis/coordination.k8s.io/v1/watch/namespaces/{namespace}/leases/{name}**
  - **GET**: watch changes to an object of kind Lease. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 13.2.2.1. /apis/coordination.k8s.io/v1/leases

Table 13.1. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`"k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind Lease

### 13.2.2.2. /apis/coordination.k8s.io/v1/watch/leases

Table 13.3. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Lease. deprecated: use the 'watch' parameter with a list operation instead.

#### **DELETE**

#### Description

delete collection of Lease

Table 13.7. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. list or watch objects of kind Lease

Table 13.10. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end": "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

create a Lease

**Table 13.12. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .

Parameter	Type	Description
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>

Table 13.28. Body parameters

Parameter	Type	Description
<b>body</b>	<b>Lease</b> schema	

Table 13.29. HTTP responses

HTTP code	Response body
200 - OK	<b>Lease</b> schema
201 - Created	<b>Lease</b> schema
401 - Unauthorized	Empty

### 13.2.2.6. /apis/coordination.k8s.io/v1/watch/namespaces/{namespace}/leases/{name}

Table 13.30. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Lease
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 13.31. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Lease. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 13.32. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## CHAPTER 14. CORE APIS

### 14.1. CORE APIS

#### 14.1.1. Binding [v1]

##### Description

Binding ties one object to another; for example, a pod is bound to a node by a scheduler. Deprecated in 1.7, please use the bindings subresource of pods instead.

##### Type

**object**

#### 14.1.2. ComponentStatus [v1]

##### Description

ComponentStatus (and ComponentStatusList) holds the cluster validation info. Deprecated: This API is deprecated in v1.19+

##### Type

**object**

#### 14.1.3. ConfigMap [v1]

##### Description

ConfigMap holds configuration data for pods to consume.

##### Type

**object**

#### 14.1.4. Endpoints [v1]

##### Description

Endpoints is a collection of endpoints that implement the actual service. Example:

```
Name: "mysvc",
Subsets: [
  {
    Addresses: [{"ip": "10.10.1.1"}, {"ip": "10.10.2.2"}],
    Ports: [{"name": "a", "port": 8675}, {"name": "b", "port": 309}]
  },
  {
    Addresses: [{"ip": "10.10.3.3"}],
    Ports: [{"name": "a", "port": 93}, {"name": "b", "port": 76}]
  },
]
```

##### Type

**object**

#### 14.1.5. Event [v1]

**Description**

Event is a report of an event somewhere in the cluster. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

**Type**

**object**

**14.1.6. LimitRange [v1]****Description**

LimitRange sets resource usage limits for each kind of resource in a Namespace.

**Type**

**object**

**14.1.7. Namespace [v1]****Description**

Namespace provides a scope for Names. Use of multiple namespaces is optional.

**Type**

**object**

**14.1.8. Node [v1]****Description**

Node is a worker node in Kubernetes. Each node will have a unique identifier in the cache (i.e. in etcd).

**Type**

**object**

**14.1.9. PersistentVolume [v1]****Description**

PersistentVolume (PV) is a storage resource provisioned by an administrator. It is analogous to a node. More info: <https://kubernetes.io/docs/concepts/storage/persistent-volumes>

**Type**

**object**

**14.1.10. PersistentVolumeClaim [v1]****Description**

PersistentVolumeClaim is a user's request for and claim to a persistent volume

**Type**

**object**

**14.1.11. Pod [v1]****Description**

Pod is a collection of containers that can run on a host. This resource is created by clients and scheduled onto hosts.

**Type****object****14.1.12. PodTemplate [v1]****Description**

PodTemplate describes a template for creating copies of a predefined pod.

**Type****object****14.1.13. ReplicationController [v1]****Description**

ReplicationController represents the configuration of a replication controller.

**Type****object****14.1.14. ResourceQuota [v1]****Description**

ResourceQuota sets aggregate quota restrictions enforced per namespace

**Type****object****14.1.15. Secret [v1]****Description**

Secret holds secret data of a certain type. The total bytes of the values in the Data field must be less than MaxSecretSize bytes.

**Type****object****14.1.16. Service [v1]****Description**

Service is a named abstraction of software service (for example, mysql) consisting of local port (for example 3306) that the proxy listens on, and the selector that determines which pods will answer requests sent through the proxy.

**Type****object****14.1.17. ServiceAccount [v1]****Description**

ServiceAccount binds together: \* a name, understood by users, and perhaps by peripheral systems, for an identity \* a principal that can be authenticated and authorized \* a set of secrets

**Type****object**

## 14.2. BINDING [V1]

**Description**

Binding ties one object to another; for example, a pod is bound to a node by a scheduler. Deprecated in 1.7, please use the bindings subresource of pods instead.

**Type****object****Required**

- **target**

### 14.2.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>target</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.

#### 14.2.1.1. .target

##### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

##### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Property	Type	Description
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

## 14.2.2. API endpoints

The following API endpoints are available:

- **/api/v1/namespaces/{namespace}/bindings**
  - **POST**: create a Binding
- **/api/v1/namespaces/{namespace}/pods/{name}/binding**
  - **POST**: create binding of a Pod

### 14.2.2.1. /api/v1/namespaces/{namespace}/bindings

Table 14.1. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.2. Global query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

HTTP method

**POST**

Description

create a Binding

Table 14.3. Body parameters

**14.3. COMPONENTSTATUS [V1]**

## Description

ComponentStatus (and ComponentStatusList) holds the cluster validation info. Deprecated: This API is deprecated in v1.19+

## Type

**object**

### 14.3.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>conditions</b>	<b>array</b>	List of component conditions observed
<b>conditions[]</b>	<b>object</b>	Information about the condition of a component.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 14.3.1.1. .conditions

## Description

List of component conditions observed

Type

**array**

### 14.3.1.2. .conditions[]

Description

Information about the condition of a component.

Type

**object**

Required

- **type**
- **status**

Property	Type	Description
<b>error</b>	<b>string</b>	Condition error code for a component. For example, a health check error code.
<b>message</b>	<b>string</b>	Message about the condition for a component. For example, information about a health check.
<b>status</b>	<b>string</b>	Status of the condition for a component. Valid values for "Healthy": "True", "False", or "Unknown".
<b>type</b>	<b>string</b>	Type of condition for a component. Valid value: "Healthy"

### 14.3.2. API endpoints

The following API endpoints are available:

- **/api/v1/componentstatuses**
  - **GET**: list objects of kind ComponentStatus
- **/api/v1/componentstatuses/{name}**
  - **GET**: read the specified ComponentStatus

#### 14.3.2.1. /api/v1/componentstatuses

Table 14.9. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

## 14.4. CONFIGMAP [V1]

#### Description

ConfigMap holds configuration data for pods to consume.

#### Type

**object**

### 14.4.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>binaryData</b>	<b>object (string)</b>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '.'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.
<b>data</b>	<b>object (string)</b>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '.'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
<b>immutable</b>	<b>boolean</b>	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil.

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

#### 14.4.2. API endpoints

The following API endpoints are available:

- **/api/v1/configmaps**
  - **GET**: list or watch objects of kind ConfigMap
- **/api/v1/watch/configmaps**
  - **GET**: watch individual changes to a list of ConfigMap. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/configmaps**
  - **DELETE**: delete collection of ConfigMap
  - **GET**: list or watch objects of kind ConfigMap
  - **POST**: create a ConfigMap
- **/api/v1/watch/namespaces/{namespace}/configmaps**
  - **GET**: watch individual changes to a list of ConfigMap. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/configmaps/{name}**
  - **DELETE**: delete a ConfigMap
  - **GET**: read the specified ConfigMap

- **PATCH**: partially update the specified ConfigMap
- **PUT**: replace the specified ConfigMap
- **/api/v1/watch/namespaces/{namespace}/configmaps/{name}**
  - **GET**: watch changes to an object of kind ConfigMap. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.4.2.1. /api/v1/configmaps

Table 14.14. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

#### HTTP method

#### **DELETE**

#### Description

delete collection of ConfigMap

Table 14.20. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.24. HTTP responses

HTTP code	Response body
200 - OK	<b>ConfigMapList</b> schema
401 - Unauthorized	Empty

HTTP method  
**POST**

**Description**

create a ConfigMap

**Table 14.25. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Table 14.28. Global path parameters

Parameter	Type	Description
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.29. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of ConfigMap. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.30. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.4.2.5. /api/v1/namespaces/{namespace}/configmaps/{name}

Table 14.31. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ConfigMap
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.32. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete a ConfigMap

Table 14.33. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

Table 14.35. HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
202 - Accepted	<b>Status</b> schema
401 - Unauthorized	Empty

**HTTP method****GET****Description**

read the specified ConfigMap

Table 14.36. HTTP responses

HTTP code	Response body
200 - OK	<b>ConfigMap</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified ConfigMap

**Table 14.37. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 14.38. Body parameters

#### 14.4.2.6. /api/v1/watch/namespaces/{namespace}/configmaps/{name}

Table 14.43. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the ConfigMap
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.44. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind ConfigMap. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 14.45. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

## 14.5. ENDPOINTS [V1]

### Description

Endpoints is a collection of endpoints that implement the actual service. Example:

```
Name: "mysvc",
Subsets: [
  {
    Addresses: [{"ip": "10.10.1.1"}, {"ip": "10.10.2.2"}],
    Ports: [{"name": "a", "port": 8675}, {"name": "b", "port": 309}]
  },
  {
    Addresses: [{"ip": "10.10.3.3"}],
    Ports: [{"name": "a", "port": 93}, {"name": "b", "port": 76}]
  },
]
```

### Type

**object**

### 14.5.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>subsets</b>	<b>array</b>	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

Property	Type	Description
<b>subsets[]</b>	<b>object</b>	<p>EndpointSubset is a group of addresses with a common set of ports. The expanded set of endpoints is the Cartesian product of Addresses x Ports. For example, given:</p> <pre>{ Addresses: [{"ip": "10.10.1.1"}, {"ip": "10.10.2.2"}], Ports: [{"name": "a", "port": 8675}, {"name": "b", "port": 309}] }</pre> <p>The resulting set of endpoints can be viewed as:</p> <pre>a: [ 10.10.1.1:8675, 10.10.2.2:8675 ], b: [ 10.10.1.1:309, 10.10.2.2:309 ]</pre>

### 14.5.1.1. .subsets

#### Description

The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

#### Type

**array**

### 14.5.1.2. .subsets[]

#### Description

EndpointSubset is a group of addresses with a common set of ports. The expanded set of endpoints is the Cartesian product of Addresses x Ports. For example, given:

```
{
  Addresses: [{"ip": "10.10.1.1"}, {"ip": "10.10.2.2"}],
  Ports:    [{"name": "a", "port": 8675}, {"name": "b", "port": 309}]
}
```

The resulting set of endpoints can be viewed as:

```
a: [ 10.10.1.1:8675, 10.10.2.2:8675 ],
b: [ 10.10.1.1:309, 10.10.2.2:309 ]
```

#### Type

**object**

Property	Type	Description
<b>addresses</b>	<b>array</b>	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.
<b>addresses[]</b>	<b>object</b>	EndpointAddress is a tuple that describes single IP address.
<b>notReadyAddresses</b>	<b>array</b>	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
<b>notReadyAddresses[]</b>	<b>object</b>	EndpointAddress is a tuple that describes single IP address.
<b>ports</b>	<b>array</b>	Port numbers available on the related IP addresses.
<b>ports[]</b>	<b>object</b>	EndpointPort is a tuple that describes a single port.

#### 14.5.1.3. .subsets[].addresses

##### Description

IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

##### Type

**array**

#### 14.5.1.4. .subsets[].addresses[]

##### Description

EndpointAddress is a tuple that describes single IP address.

##### Type

**object**

##### Required

- **ip**

Property	Type	Description
<b>hostname</b>	<b>string</b>	The Hostname of this endpoint
<b>ip</b>	<b>string</b>	The IP of this endpoint. May not be loopback (127.0.0.0/8 or ::1), link-local (169.254.0.0/16 or fe80::/10), or link-local multicast (224.0.0.0/24 or ff02::/16).
<b>nodeName</b>	<b>string</b>	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
<b>targetRef</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.

#### 14.5.1.5. .subsets[].addresses[].targetRef

##### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

##### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

### 14.5.1.6. .subsets[].notReadyAddresses

#### Description

IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.

#### Type

**array**

### 14.5.1.7. .subsets[].notReadyAddresses[]

#### Description

EndpointAddress is a tuple that describes single IP address.

#### Type

**object**

#### Required

- **ip**

Property	Type	Description
<b>hostname</b>	<b>string</b>	The Hostname of this endpoint
<b>ip</b>	<b>string</b>	The IP of this endpoint. May not be loopback (127.0.0.0/8 or ::1), link-local (169.254.0.0/16 or fe80::/10), or link-local multicast (224.0.0.0/24 or ff02::/16).
<b>nodeName</b>	<b>string</b>	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
<b>targetRef</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.

### 14.5.1.8. .subsets[].notReadyAddresses[].targetRef

#### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

#### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>

Property	Type	Description
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 14.5.1.9. .subsets[].ports

##### Description

Port numbers available on the related IP addresses.

##### Type

**array**

#### 14.5.1.10. .subsets[].ports[]

##### Description

EndpointPort is a tuple that describes a single port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>appProtocol</b>	<b>string</b>	<p>The application protocol for this port. This is used as a hint for implementations to offer richer behavior for protocols that they understand. This field follows standard Kubernetes label syntax. Valid values are either:</p> <ul style="list-style-type: none"> <li>* Un-prefixed protocol names - reserved for IANA standard service names (as per RFC-6335 and <a href="https://www.iana.org/assignments/service-names">https://www.iana.org/assignments/service-names</a>).</li> <li>* Kubernetes-defined prefixed names: * 'kubernetes.io/h2c' - HTTP/2 over cleartext as described in <a href="https://www.rfc-editor.org/rfc/rfc7540">https://www.rfc-editor.org/rfc/rfc7540</a></li> <li>* Other protocols should use implementation-defined prefixed names such as mycompany.com/my-custom-protocol.</li> </ul>
<b>name</b>	<b>string</b>	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
<b>port</b>	<b>integer</b>	The port number of the endpoint.
<b>protocol</b>	<b>string</b>	<p>The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.</p> <p>Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.</p>

### 14.5.2. API endpoints

The following API endpoints are available:

- **/api/v1/endpoints**
  - **GET**: list or watch objects of kind Endpoints

- **/api/v1/watch/endpoints**
  - **GET**: watch individual changes to a list of Endpoints. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/endpoints**
  - **DELETE**: delete collection of Endpoints
  - **GET**: list or watch objects of kind Endpoints
  - **POST**: create Endpoints
- **/api/v1/watch/namespaces/{namespace}/endpoints**
  - **GET**: watch individual changes to a list of Endpoints. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/endpoints/{name}**
  - **DELETE**: delete Endpoints
  - **GET**: read the specified Endpoints
  - **PATCH**: partially update the specified Endpoints
  - **PUT**: replace the specified Endpoints
- **/api/v1/watch/namespaces/{namespace}/endpoints/{name}**
  - **GET**: watch changes to an object of kind Endpoints. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.5.2.1. /api/v1/endpoints

Table 14.46. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the <code>continue</code> field to determine whether more results are available. Servers may choose not to support the <code>limit</code> argument and will return all of the available results. If <code>limit</code> is specified and the <code>continue</code> field is empty, clients may assume that no more results are available. This field is not supported if <code>watch</code> is true.</p> <p>The server guarantees that the objects returned when using <code>continue</code> will be identical to issuing a single list call without a <code>limit</code> - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using <code>limit</code> to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p><code>resourceVersion</code> sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p><code>resourceVersionMatch</code> determines how <code>resourceVersion</code> is applied to list calls. It is highly recommended that <code>resourceVersionMatch</code> be set for list calls where <code>resourceVersion</code> is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

### 14.5.2.2. /api/v1/watch/endpoints

Table 14.48. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. #### Description

delete collection of Endpoints

Table 14.52. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.56. HTTP responses

create Endpoints

**Table 14.57. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of Endpoints. deprecated: use the 'watch' parameter with a list operation instead.

Table 14.62. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.5.2.5. /api/v1/namespaces/{namespace}/endpoints/{name}

Table 14.63. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Endpoints
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.64. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### DELETE

#### Description

delete Endpoints

Table 14.65. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

read the specified Endpoints

Table 14.68. HTTP responses

HTTP code	Response body
200 - OK	<b>Endpoints</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified Endpoints

**Table 14.69. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Endpoints. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 14.77. HTTP responses**

HTTP code	Reponse body
200 - OK	<b>WatchEvent</b> schema
401 - Unauthorized	Empty

## 14.6. EVENT [V1]

### Description

Event is a report of an event somewhere in the cluster. Events have a limited retention time and triggers and messages may evolve with time. Event consumers should not rely on the timing of an event with a given Reason reflecting a consistent underlying trigger, or the continued existence of events with that Reason. Events should be treated as informative, best-effort, supplemental data.

### Type

**object**

### Required

- **metadata**
- **involvedObject**

### 14.6.1. Specification

Property	Type	Description
<b>action</b>	<b>string</b>	What action was taken/failed regarding to the Regarding object.
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>count</b>	<b>integer</b>	The number of times this event has occurred.
<b>eventTime</b>	<b>MicroTime</b>	Time when this Event was first observed.

Property	Type	Description
<b>firstTimestamp</b>	<b>Time</b>	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
<b>involvedObject</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>lastTimestamp</b>	<b>Time</b>	The time at which the most recent occurrence of this event was recorded.
<b>message</b>	<b>string</b>	A human-readable description of the status of this operation.
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>reason</b>	<b>string</b>	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
<b>related</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.
<b>reportingComponent</b>	<b>string</b>	Name of the controller that emitted this Event, e.g. <b>kubernetes.io/kubelet</b> .

Property	Type	Description
<b>reportingInstance</b>	<b>string</b>	ID of the controller instance, e.g. <b>kubelet-xyzf</b> .
<b>series</b>	<b>object</b>	EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time.
<b>source</b>	<b>object</b>	EventSource contains information for an event.
<b>type</b>	<b>string</b>	Type of this event (Normal, Warning), new types could be added in the future

#### 14.6.1.1. `.involvedObject`

##### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

##### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 14.6.1.2. .related

##### Description

ObjectReference contains enough information to let you inspect or modify the referred object.

##### Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.

Property	Type	Description
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

### 14.6.1.3. .series

#### Description

EventSeries contain information on series of events, i.e. thing that was/is happening continuously for some time.

#### Type

**object**

Property	Type	Description
<b>count</b>	<b>integer</b>	Number of occurrences in this series up to the last heartbeat time
<b>lastObservedTime</b>	<b>MicroTime</b>	Time of the last occurrence observed

### 14.6.1.4. .source

#### Description

EventSource contains information for an event.

#### Type

**object**

Property	Type	Description
<b>component</b>	<b>string</b>	Component from which the event is generated.
<b>host</b>	<b>string</b>	Node name on which the event is generated.

## 14.6.2. API endpoints

The following API endpoints are available:

- **/api/v1/events**
  - **GET**: list or watch objects of kind Event
- **/api/v1/watch/events**
  - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/events**
  - **DELETE**: delete collection of Event
  - **GET**: list or watch objects of kind Event

- **POST**: create an Event
- **/api/v1/watch/namespaces/{namespace}/events**
  - **GET**: watch individual changes to a list of Event. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/events/{name}**
  - **DELETE**: delete an Event
  - **GET**: read the specified Event
  - **PATCH**: partially update the specified Event
  - **PUT**: replace the specified Event
- **/api/v1/watch/namespaces/{namespace}/events/{name}**
  - **GET**: watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.6.2.1. /api/v1/events

Table 14.78. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind Event

200 - OK	<b>EventList</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

### 14.6.2.2. /api/v1/watch/events

Table 14.80. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

**Table 14.89. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

200 - OK	<b>Event</b> schema

HTTP code	Response body
401 - Unauthorized	Empty

**HTTP method****PATCH****Description**

partially update the specified Event

**Table 14.101. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Parameter	Type	Description
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

#### 14.6.2.6. /api/v1/watch/namespaces/{namespace}/events/{name}

Table 14.107. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Event
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.108. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Event. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

## 14.7. LIMITRANGE [V1]

### Description

LimitRange sets resource usage limits for each kind of resource in a Namespace.

### Type

**object**

### 14.7.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Property	Type	Description
<b>spec</b>	<b>object</b>	LimitRangeSpec defines a min/max usage limit for resources that match on kind.

#### 14.7.1.1. .spec

##### Description

LimitRangeSpec defines a min/max usage limit for resources that match on kind.

##### Type

**object**

##### Required

- **limits**

Property	Type	Description
<b>limits</b>	<b>array</b>	Limits is the list of LimitRangeItem objects that are enforced.
<b>limits[]</b>	<b>object</b>	LimitRangeItem defines a min/max usage limit for any resource that matches on kind.

#### 14.7.1.2. .spec.limits

##### Description

Limits is the list of LimitRangeItem objects that are enforced.

##### Type

**array**

#### 14.7.1.3. .spec.limits[]

##### Description

LimitRangeItem defines a min/max usage limit for any resource that matches on kind.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
<b>default</b>	<b>object (Quantity)</b>	Default resource requirement limit value by resource name if resource limit is omitted.
<b>defaultRequest</b>	<b>object (Quantity)</b>	DefaultRequest is the default resource requirement request value by resource name if resource request is omitted.
<b>max</b>	<b>object (Quantity)</b>	Max usage constraints on this kind by resource name.
<b>maxLimitRequestRatio</b>	<b>object (Quantity)</b>	MaxLimitRequestRatio if specified, the named resource must have a request and limit that are both non-zero where limit divided by request is less than or equal to the enumerated value; this represents the max burst for the named resource.
<b>min</b>	<b>object (Quantity)</b>	Min usage constraints on this kind by resource name.
<b>type</b>	<b>string</b>	Type of resource that this limit applies to.

### 14.7.2. API endpoints

The following API endpoints are available:

- **/api/v1/limitranges**
  - **GET**: list or watch objects of kind LimitRange
- **/api/v1/watch/limitranges**
  - **GET**: watch individual changes to a list of LimitRange. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/limitranges**
  - **DELETE**: delete collection of LimitRange
  - **GET**: list or watch objects of kind LimitRange
  - **POST**: create a LimitRange
- **/api/v1/watch/namespaces/{namespace}/limitranges**
  - **GET**: watch individual changes to a list of LimitRange. deprecated: use the 'watch' parameter with a list operation instead.

- **/api/v1/namespaces/{namespace}/limitranges/{name}**
  - **DELETE:** delete a LimitRange
  - **GET:** read the specified LimitRange
  - **PATCH:** partially update the specified LimitRange
  - **PUT:** replace the specified LimitRange
- **/api/v1/watch/namespaces/{namespace}/limitranges/{name}**
  - **GET:** watch changes to an object of kind LimitRange. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

#### 14.7.2.1. /api/v1/limitranges

Table 14.110. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>

401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind LimitRange

Table 14.119. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the <code>continue</code> field to determine whether more results are available. Servers may choose not to support the <code>limit</code> argument and will return all of the available results. If <code>limit</code> is specified and the <code>continue</code> field is empty, clients may assume that no more results are available. This field is not supported if <code>watch</code> is true.</p> <p>The server guarantees that the objects returned when using <code>continue</code> will be identical to issuing a single list call without a <code>limit</code> - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using <code>limit</code> to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p><code>resourceVersion</code> sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p><code>resourceVersionMatch</code> determines how <code>resourceVersion</code> is applied to list calls. It is highly recommended that <code>resourceVersionMatch</code> be set for list calls where <code>resourceVersion</code> is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**Description**

create a `LimitRange`

**Table 14.121. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized <code>dryRun</code> directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	<code>fieldManager</code> is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	<code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a <code>BadRequest</code> error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Table 14.140. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind LimitRange. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

### 14.8.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	NamespaceSpec describes the attributes on a Namespace.

Property	Type	Description
<b>status</b>	<b>object</b>	NamespaceStatus is information about the current status of a Namespace.

#### 14.8.1.1. .spec

##### Description

NamespaceSpec describes the attributes on a Namespace.

##### Type

**object**

Property	Type	Description
<b>finalizers</b>	<b>array (string)</b>	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

#### 14.8.1.2. .status

##### Description

NamespaceStatus is information about the current status of a Namespace.

##### Type

**object**

Property	Type	Description
<b>conditions</b>	<b>array</b>	Represents the latest available observations of a namespace's current state.
<b>conditions[]</b>	<b>object</b>	NamespaceCondition contains details about state of namespace.

Property	Type	Description
<b>phase</b>	<b>string</b>	<p>Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a></p> <p>Possible enum values: - <b>"Active"</b> means the namespace is available for use in the system - <b>"Terminating"</b> means the namespace is undergoing graceful termination</p>

#### 14.8.1.3. .status.conditions

##### Description

Represents the latest available observations of a namespace's current state.

##### Type

**array**

#### 14.8.1.4. .status.conditions[]

##### Description

NamespaceCondition contains details about state of namespace.

##### Type

**object**

##### Required

- **type**
- **status**

Property	Type	Description
<b>lastTransitionTime</b>	<b>Time</b>	
<b>message</b>	<b>string</b>	
<b>reason</b>	<b>string</b>	
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.

Property	Type	Description
<b>type</b>	<b>string</b>	Type of namespace controller condition.

## 14.8.2. API endpoints

The following API endpoints are available:

- **/api/v1/namespaces**
  - **GET**: list or watch objects of kind Namespace
  - **POST**: create a Namespace
- **/api/v1/watch/namespaces**
  - **GET**: watch individual changes to a list of Namespace. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{name}**
  - **DELETE**: delete a Namespace
  - **GET**: read the specified Namespace
  - **PATCH**: partially update the specified Namespace
  - **PUT**: replace the specified Namespace
- **/api/v1/watch/namespaces/{name}**
  - **GET**: watch changes to an object of kind Namespace. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{name}/status**
  - **GET**: read status of the specified Namespace
  - **PATCH**: partially update status of the specified Namespace
  - **PUT**: replace status of the specified Namespace
- **/api/v1/namespaces/{name}/finalize**
  - **PUT**: replace finalize of the specified Namespace

### 14.8.2.1. /api/v1/namespaces

Table 14.142. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

## HTTP method

**GET**

## Description

list or watch objects of kind Namespace

Table 14.143. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.144. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">NamespaceList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a Namespace

**Table 14.145. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

**Table 14.146. Body parameters**

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****DELETE****Description**

delete a Namespace

**Table 14.152. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

401 - Unauthorized	Empty

#### 14.8.2.5. /api/v1/namespaces/{name}/status

Table 14.165. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Namespace

Table 14.166. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### GET

#### Description

read status of the specified Namespace

Table 14.167. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">Namespace</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified Namespace

Table 14.168. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

Table 14.169. Body parameters

Parameter	Type	Description
<b>body</b>	<b>Patch</b> schema	

Table 14.170. HTTP responses

HTTP code	Response body
200 - OK	<b>Namespace</b> schema
201 - Created	<b>Namespace</b> schema
401 - Unauthorized	Empty

**HTTP method****PUT****Description**

replace status of the specified Namespace

**Table 14.171. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

401 - Unauthorized	Empty

**14.9. NODE [V1]****Description**

Node is a worker node in Kubernetes. Each node will have a unique identifier in the cache (i.e. in etcd).

## Type

**object**

### 14.9.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	NodeSpec describes the attributes that a node is created with.
<b>status</b>	<b>object</b>	NodeStatus is information about the current status of a node.

#### 14.9.1.1. .spec

##### Description

NodeSpec describes the attributes that a node is created with.

##### Type

**object**

Property	Type	Description
<b>configSource</b>	<b>object</b>	NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22
<b>externalID</b>	<b>string</b>	Deprecated. Not all kubelets will set this field. Remove field after 1.13. see: <a href="https://issues.k8s.io/61966">https://issues.k8s.io/61966</a>
<b>podCIDR</b>	<b>string</b>	PodCIDR represents the pod IP range assigned to the node.
<b>podCIDRs</b>	<b>array (string)</b>	podCIDRs represents the IP ranges assigned to the node for usage by Pods on that node. If this field is specified, the 0th entry must match the podCIDR field. It may contain at most 1 value for each of IPv4 and IPv6.
<b>providerID</b>	<b>string</b>	ID of the node assigned by the cloud provider in the format: <ProviderName>://<ProviderSpecificNodeID>
<b>taints</b>	<b>array</b>	If specified, the node's taints.
<b>taints[]</b>	<b>object</b>	The node this Taint is attached to has the "effect" on any pod that does not tolerate the Taint.
<b>unschedulable</b>	<b>boolean</b>	Unschedulable controls node schedulability of new pods. By default, node is schedulable. More info: <a href="https://kubernetes.io/docs/concepts/nodes/node/#manual-node-administration">https://kubernetes.io/docs/concepts/nodes/node/#manual-node-administration</a>

**14.9.1.2. .spec.configSource****Description**

NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22

**Type**

**object**

Property	Type	Description
<b>configMap</b>	<b>object</b>	ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <a href="https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration">https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration</a>

**14.9.1.3. .spec.configSource.configMap****Description**

ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration>

**Type****object****Required**

- **namespace**
- **name**
- **kubeletConfigKey**

Property	Type	Description
<b>kubeletConfigKey</b>	<b>string</b>	KubeletConfigKey declares which key of the referenced ConfigMap corresponds to the KubeletConfiguration structure. This field is required in all cases.
<b>name</b>	<b>string</b>	Name is the metadata.name of the referenced ConfigMap. This field is required in all cases.
<b>namespace</b>	<b>string</b>	Namespace is the metadata.namespace of the referenced ConfigMap. This field is required in all cases.

Property	Type	Description
<b>resourceVersion</b>	<b>string</b>	ResourceVersion is the metadata.ResourceVersion of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.
<b>uid</b>	<b>string</b>	UID is the metadata.UID of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.

#### 14.9.1.4. .spec.taints

##### Description

If specified, the node's taints.

##### Type

**array**

#### 14.9.1.5. .spec.taints[]

##### Description

The node this Taint is attached to has the "effect" on any pod that does not tolerate the Taint.

##### Type

**object**

##### Required

- **key**
- **effect**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>effect</b>	<b>string</b>	<p>Required. The effect of the taint on pods that do not tolerate the taint. Valid effects are NoSchedule, PreferNoSchedule and NoExecute.</p> <p>Possible enum values: -  <b>"NoExecute"</b> Evict any already-running pods that do not tolerate the taint. Currently enforced by NodeController. -  <b>"NoSchedule"</b> Do not allow new pods to schedule onto the node unless they tolerate the taint, but allow all pods submitted to Kubelet without going through the scheduler to start, and allow all already-running pods to continue running. Enforced by the scheduler. -  <b>"PreferNoSchedule"</b> Like TaintEffectNoSchedule, but the scheduler tries not to schedule new pods onto the node, rather than prohibiting new pods from scheduling onto the node entirely. Enforced by the scheduler.</p>
<b>key</b>	<b>string</b>	Required. The taint key to be applied to a node.
<b>timeAdded</b>	<b>Time</b>	TimeAdded represents the time at which the taint was added. It is only written for NoExecute taints.
<b>value</b>	<b>string</b>	The taint value corresponding to the taint key.

#### 14.9.1.6. .status

##### Description

NodeStatus is information about the current status of a node.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>addresses</b>	<b>array</b>	List of addresses reachable to the node. Queried from cloud provider, if available. More info: <a href="https://kubernetes.io/docs/concepts/nodes/node/#addresses">https://kubernetes.io/docs/concepts/nodes/node/#addresses</a> Note: This field is declared as mergeable, but the merge key is not sufficiently unique, which can cause data corruption when it is merged. Callers should instead use a full-replacement patch. See <a href="https://pr.k8s.io/79391">https://pr.k8s.io/79391</a> for an example. Consumers should assume that addresses can change during the lifetime of a Node. However, there are some exceptions where this may not be possible, such as Pods that inherit a Node's address in its own status or consumers of the downward API (status.hostIP).
<b>addresses[]</b>	<b>object</b>	NodeAddress contains information for the node's address.
<b>allocatable</b>	<b>object (Quantity)</b>	Allocatable represents the resources of a node that are available for scheduling. Defaults to Capacity.
<b>capacity</b>	<b>object (Quantity)</b>	Capacity represents the total resources of a node. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity">https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity</a>
<b>conditions</b>	<b>array</b>	Conditions is an array of current observed node conditions. More info: <a href="https://kubernetes.io/docs/concepts/nodes/node/#condition">https://kubernetes.io/docs/concepts/nodes/node/#condition</a>
<b>conditions[]</b>	<b>object</b>	NodeCondition contains condition information for a node.

Property	Type	Description
<b>config</b>	<b>object</b>	NodeConfigStatus describes the status of the config assigned by Node.Spec.ConfigSource.
<b>daemonEndpoints</b>	<b>object</b>	NodeDaemonEndpoints lists ports opened by daemons running on the Node.
<b>images</b>	<b>array</b>	List of container images on this node
<b>images[]</b>	<b>object</b>	Describe a container image
<b>nodeInfo</b>	<b>object</b>	NodeSystemInfo is a set of ids/uuids to uniquely identify the node.
<b>phase</b>	<b>string</b>	<p>NodePhase is the recently observed lifecycle phase of the node. More info: <a href="https://kubernetes.io/docs/concepts/nodes/node/#phase">https://kubernetes.io/docs/concepts/nodes/node/#phase</a> The field is never populated, and now is deprecated.</p> <p>Possible enum values: - <b>"Pending"</b> means the node has been created/added by the system, but not configured. - <b>"Running"</b> means the node has been configured and has Kubernetes components running. - <b>"Terminated"</b> means the node has been removed from the cluster.</p>
<b>volumesAttached</b>	<b>array</b>	List of volumes that are attached to the node.
<b>volumesAttached[]</b>	<b>object</b>	AttachedVolume describes a volume attached to a node
<b>volumesInUse</b>	<b>array (string)</b>	List of attachable volumes in use (mounted) by the node.

#### 14.9.1.7. .status.addresses

##### Description

List of addresses reachable to the node. Queried from cloud provider, if available. More info:

<https://kubernetes.io/docs/concepts/nodes/node/#addresses> Note: This field is declared as mergeable, but the merge key is not sufficiently unique, which can cause data corruption when it is merged. Callers should instead use a full-replacement patch. See <https://pr.k8s.io/79391> for an example. Consumers should assume that addresses can change during the lifetime of a Node. However, there are some exceptions where this may not be possible, such as Pods that inherit a Node's address in its own status or consumers of the downward API (status.hostIP).

**Type****array****14.9.1.8. .status.addresses[]****Description**

NodeAddress contains information for the node's address.

**Type****object****Required**

- **type**
- **address**

Property	Type	Description
<b>address</b>	<b>string</b>	The node address.
<b>type</b>	<b>string</b>	Node address type, one of Hostname, ExternallIP or InternallIP.

**14.9.1.9. .status.conditions****Description**

Conditions is an array of current observed node conditions. More info: <https://kubernetes.io/docs/concepts/nodes/node/#condition>

**Type****array****14.9.1.10. .status.conditions[]****Description**

NodeCondition contains condition information for a node.

**Type****object****Required**

- **type**
- **status**

Property	Type	Description
<b>lastHeartbeatTime</b>	<b>Time</b>	Last time we got an update on a given condition.
<b>lastTransitionTime</b>	<b>Time</b>	Last time the condition transit from one status to another.
<b>message</b>	<b>string</b>	Human readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	(brief) reason for the condition's last transition.
<b>status</b>	<b>string</b>	Status of the condition, one of True, False, Unknown.
<b>type</b>	<b>string</b>	Type of node condition.

#### 14.9.1.11. .status.config

##### Description

NodeConfigStatus describes the status of the config assigned by Node.Spec.ConfigSource.

##### Type

**object**

Property	Type	Description
<b>active</b>	<b>object</b>	NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22
<b>assigned</b>	<b>object</b>	NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22

Property	Type	Description
<b>error</b>	<b>string</b>	Error describes any problems reconciling the Spec.ConfigSource to the Active config. Errors may occur, for example, attempting to checkpoint Spec.ConfigSource to the local Assigned record, attempting to checkpoint the payload associated with Spec.ConfigSource, attempting to load or validate the Assigned config, etc. Errors may occur at different points while syncing config. Earlier errors (e.g. download or checkpointing errors) will not result in a rollback to LastKnownGood, and may resolve across Kubelet retries. Later errors (e.g. loading or validating a checkpointed config) will result in a rollback to LastKnownGood. In the latter case, it is usually possible to resolve the error by fixing the config assigned in Spec.ConfigSource. You can find additional information for debugging by searching the error message in the Kubelet log. Error is a human-readable description of the error state; machines can check whether or not Error is empty, but should not rely on the stability of the Error text across Kubelet versions.
<b>lastKnownGood</b>	<b>object</b>	NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22

#### 14.9.1.12. .status.config.active

##### Description

NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22

##### Type

**object**

Property	Type	Description
<b>configMap</b>	<b>object</b>	ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <a href="https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration">https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration</a>

#### 14.9.1.13. .status.config.active.configMap

##### Description

ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration>

##### Type

**object**

##### Required

- **namespace**
- **name**
- **kubeletConfigKey**

Property	Type	Description
<b>kubeletConfigKey</b>	<b>string</b>	KubeletConfigKey declares which key of the referenced ConfigMap corresponds to the KubeletConfiguration structure. This field is required in all cases.
<b>name</b>	<b>string</b>	Name is the metadata.name of the referenced ConfigMap. This field is required in all cases.
<b>namespace</b>	<b>string</b>	Namespace is the metadata.namespace of the referenced ConfigMap. This field is required in all cases.
<b>resourceVersion</b>	<b>string</b>	ResourceVersion is the metadata.ResourceVersion of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.

Property	Type	Description
<b>uid</b>	<b>string</b>	UID is the metadata.UID of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.

#### 14.9.1.14. .status.config.assigned

##### Description

NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22

##### Type

**object**

Property	Type	Description
<b>configMap</b>	<b>object</b>	ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <a href="https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration">https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration</a>

#### 14.9.1.15. .status.config.assigned.configMap

##### Description

ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration>

##### Type

**object**

##### Required

- **namespace**
- **name**
- **kubeletConfigKey**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>kubeletConfigKey</b>	<b>string</b>	KubeletConfigKey declares which key of the referenced ConfigMap corresponds to the KubeletConfiguration structure. This field is required in all cases.
<b>name</b>	<b>string</b>	Name is the metadata.name of the referenced ConfigMap. This field is required in all cases.
<b>namespace</b>	<b>string</b>	Namespace is the metadata.namespace of the referenced ConfigMap. This field is required in all cases.
<b>resourceVersion</b>	<b>string</b>	ResourceVersion is the metadata.ResourceVersion of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.
<b>uid</b>	<b>string</b>	UID is the metadata.UID of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.

#### 14.9.1.16. .status.config.lastKnownGood

##### Description

NodeConfigSource specifies a source of node configuration. Exactly one subfield (excluding metadata) must be non-nil. This API is deprecated since 1.22.

##### Type

**object**

Property	Type	Description
<b>configMap</b>	<b>object</b>	ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <a href="https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration">https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration</a>

#### 14.9.1.17. .status.config.lastKnownGood.configMap

**Description**

ConfigMapNodeConfigSource contains the information to reference a ConfigMap as a config source for the Node. This API is deprecated since 1.22: <https://git.k8s.io/enhancements/keps/sig-node/281-dynamic-kubelet-configuration>

**Type**

**object**

**Required**

- **namespace**
- **name**
- **kubeletConfigKey**

Property	Type	Description
<b>kubeletConfigKey</b>	<b>string</b>	KubeletConfigKey declares which key of the referenced ConfigMap corresponds to the KubeletConfiguration structure. This field is required in all cases.
<b>name</b>	<b>string</b>	Name is the metadata.name of the referenced ConfigMap. This field is required in all cases.
<b>namespace</b>	<b>string</b>	Namespace is the metadata.namespace of the referenced ConfigMap. This field is required in all cases.
<b>resourceVersion</b>	<b>string</b>	ResourceVersion is the metadata.ResourceVersion of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.
<b>uid</b>	<b>string</b>	UID is the metadata.UID of the referenced ConfigMap. This field is forbidden in Node.Spec, and required in Node.Status.

**14.9.1.18. .status.daemonEndpoints****Description**

NodeDaemonEndpoints lists ports opened by daemons running on the Node.

**Type**

**object**

Property	Type	Description
<b>kubeletEndpoint</b>	<b>object</b>	DaemonEndpoint contains information about a single Daemon endpoint.

#### 14.9.1.19. .status.daemonEndpoints.kubeletEndpoint

##### Description

DaemonEndpoint contains information about a single Daemon endpoint.

##### Type

**object**

##### Required

- **Port**

Property	Type	Description
<b>Port</b>	<b>integer</b>	Port number of the given endpoint.

#### 14.9.1.20. .status.images

##### Description

List of container images on this node

##### Type

**array**

#### 14.9.1.21. .status.images[]

##### Description

Describe a container image

##### Type

**object**

Property	Type	Description
<b>names</b>	<b>array (string)</b>	Names by which this image is known. e.g. ["kubernetes.example/hyperkube:v1.0.7", "cloud-vendor.registry.example/cloud-vendor/hyperkube:v1.0.7"]
<b>sizeBytes</b>	<b>integer</b>	The size of the image in bytes.

14.9.1.22. `.status.nodeInfo`

## Description

NodeSystemInfo is a set of ids/uuids to uniquely identify the node.

## Type

**object**

## Required

- **machineID**
- **systemUUID**
- **bootID**
- **kernelVersion**
- **osImage**
- **containerRuntimeVersion**
- **kubeletVersion**
- **kubeProxyVersion**
- **operatingSystem**
- **architecture**

Property	Type	Description
<b>architecture</b>	<b>string</b>	The Architecture reported by the node
<b>bootID</b>	<b>string</b>	Boot ID reported by the node.
<b>containerRuntimeVersion</b>	<b>string</b>	ContainerRuntime Version reported by the node through runtime remote API (e.g. containerd://1.4.2).
<b>kernelVersion</b>	<b>string</b>	Kernel Version reported by the node from 'uname -r' (e.g. 3.16.0-0.bpo.4-amd64).
<b>kubeProxyVersion</b>	<b>string</b>	KubeProxy Version reported by the node.
<b>kubeletVersion</b>	<b>string</b>	Kubelet Version reported by the node.

Property	Type	Description
<b>machineID</b>	<b>string</b>	MachineID reported by the node. For unique machine identification in the cluster this field is preferred. Learn more from man(5) machine-id: <a href="http://man7.org/linux/man-pages/man5/machine-id.5.html">http://man7.org/linux/man-pages/man5/machine-id.5.html</a>
<b>operatingSystem</b>	<b>string</b>	The Operating System reported by the node
<b>osImage</b>	<b>string</b>	OS Image reported by the node from /etc/os-release (e.g. Debian GNU/Linux 7 (wheezy)).
<b>systemUUID</b>	<b>string</b>	SystemUUID reported by the node. For unique machine identification MachineID is preferred. This field is specific to Red Hat hosts <a href="https://access.redhat.com/documentation/en-us/red_hat_subscription_management/1/html/rhsm/uuid">https://access.redhat.com/documentation/en-us/red_hat_subscription_management/1/html/rhsm/uuid</a>

#### 14.9.1.23. .status.volumesAttached

##### Description

List of volumes that are attached to the node.

##### Type

**array**

#### 14.9.1.24. .status.volumesAttached[]

##### Description

AttachedVolume describes a volume attached to a node

##### Type

**object**

##### Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	DevicePath represents the device path where the volume should be available
<b>name</b>	<b>string</b>	Name of the attached volume

## 14.9.2. API endpoints

The following API endpoints are available:

- **/api/v1/nodes**
  - **DELETE**: delete collection of Node
  - **GET**: list or watch objects of kind Node
  - **POST**: create a Node
- **/api/v1/watch/nodes**
  - **GET**: watch individual changes to a list of Node. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/nodes/{name}**
  - **DELETE**: delete a Node
  - **GET**: read the specified Node
  - **PATCH**: partially update the specified Node
  - **PUT**: replace the specified Node
- **/api/v1/watch/nodes/{name}**
  - **GET**: watch changes to an object of kind Node. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/nodes/{name}/status**
  - **GET**: read status of the specified Node
  - **PATCH**: partially update status of the specified Node
  - **PUT**: replace status of the specified Node

### 14.9.2.1. /api/v1/nodes

Table 14.178. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

**HTTP method****DELETE****Description**

delete collection of Node

**Table 14.179. Query parameters**

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Type	Description
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
<b>resourceVersion</b>	<b>string</b>	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset
<b>resourceVersionMatch</b>	<b>string</b>	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.  Defaults to unset

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind Node

**Table 14.182. Query parameters**

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.

Parameter	Type	Description
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.183. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">NodeList</a> schema
401 - Unauthorized	Empty

**POST**

**Description**

create a Node

**Table 14.184. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

### 14.9.2.2. /api/v1/watch/nodes

Table 14.187. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Type	Description
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

HTTP method

GET

**Description**

watch individual changes to a list of Node. deprecated: use the 'watch' parameter with a list operation instead.

**Table 14.188. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

**HTTP method****DELETE****Description**

delete a Node

**Table 14.191. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

#### 14.9.2.4. /api/v1/watch/nodes/{name}

Table 14.201. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Node

Table 14.202. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind Node. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 14.203. HTTP responses**

HTTP code	Reponse body
200 - OK	<a href="#">WatchEvent</a> schema
401 - Unauthorized	Empty

#### 14.9.2.5. /api/v1/nodes/{name}/status

Table 14.204. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the Node

Table 14.205. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### GET

#### Description

read status of the specified Node

Table 14.206. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">Node</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified Node

Table 14.207. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## 14.10. PERSISTENTVOLUME [V1]

### Description

PersistentVolume (PV) is a storage resource provisioned by an administrator. It is analogous to a node. More info: <https://kubernetes.io/docs/concepts/storage/persistent-volumes>

### Type

**object**

### 14.10.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PersistentVolumeSpec is the specification of a persistent volume.
<b>status</b>	<b>object</b>	PersistentVolumeStatus is the current status of a persistent volume.

#### 14.10.1.1. .spec

##### Description

PersistentVolumeSpec is the specification of a persistent volume.

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains all ways the volume can be mounted. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes</a>
<b>awsElasticBlockStore</b>	<b>object</b>	Represents a Persistent Disk resource in AWS.  An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.
<b>azureDisk</b>	<b>object</b>	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

Property	Type	Description
<b>azureFile</b>	<b>object</b>	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
<b>capacity</b>	<b>object (Quantity)</b>	capacity is the description of the persistent volume's resources and capacity. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity">https://kubernetes.io/docs/concepts/storage/persistent-volumes#capacity</a>
<b>cephfs</b>	<b>object</b>	Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.
<b>cinder</b>	<b>object</b>	Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.
<b>claimRef</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.
<b>csi</b>	<b>object</b>	Represents storage that is managed by an external CSI volume driver (Beta feature)
<b>fc</b>	<b>object</b>	Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.
<b>flexVolume</b>	<b>object</b>	FlexPersistentVolumeSource represents a generic persistent volume resource that is provisioned/attached using an exec based plugin.

Property	Type	Description
<b>flocker</b>	<b>object</b>	Represents a Flocker volume mounted by the Flocker agent. One and only one of <code>datasetName</code> and <code>datasetUUID</code> should be set. Flocker volumes do not support ownership management or SELinux relabeling.
<b>gcePersistentDisk</b>	<b>object</b>	Represents a Persistent Disk resource in Google Compute Engine.  A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.
<b>glusterfs</b>	<b>object</b>	Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.
<b>hostPath</b>	<b>object</b>	Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.
<b>iscsi</b>	<b>object</b>	<code>ISCSIPersistentVolumeSource</code> represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.
<b>local</b>	<b>object</b>	Local represents directly-attached storage with node affinity (Beta feature)

Property	Type	Description
<b>mountOptions</b>	<b>array (string)</b>	mountOptions is the list of mount options, e.g. ["ro", "soft"]. Not validated - mount will simply fail if one is invalid. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes/#mount-options">https://kubernetes.io/docs/concepts/storage/persistent-volumes/#mount-options</a>
<b>nfs</b>	<b>object</b>	Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.
<b>nodeAffinity</b>	<b>object</b>	VolumeNodeAffinity defines constraints that limit what nodes this volume can be accessed from.
<b>persistentVolumeReclaimPolicy</b>	<b>string</b>	<p>persistentVolumeReclaimPolicy defines what happens to a persistent volume when released from its claim. Valid options are Retain (default for manually created PersistentVolumes), Delete (default for dynamically provisioned PersistentVolumes), and Recycle (deprecated). Recycle must be supported by the volume plugin underlying this PersistentVolume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#reclaiming">https://kubernetes.io/docs/concepts/storage/persistent-volumes#reclaiming</a></p> <p>Possible enum values: - <b>"Delete"</b> means the volume will be deleted from Kubernetes on release from its claim. The volume plugin must support Deletion. - <b>"Recycle"</b> means the volume will be recycled back into the pool of unbound persistent volumes on release from its claim. The volume plugin must support Recycling. - <b>"Retain"</b> means the volume will be left in its current phase (Released) for manual reclamation by the administrator. The default policy is Retain.</p>

Property	Type	Description
<b>photonPersistentDisk</b>	<b>object</b>	Represents a Photon Controller persistent disk resource.
<b>portworxVolume</b>	<b>object</b>	PortworxVolumeSource represents a Portworx volume resource.
<b>quobyte</b>	<b>object</b>	Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.
<b>rbd</b>	<b>object</b>	Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.
<b>scaleIO</b>	<b>object</b>	ScaleIOPersistentVolumeSource represents a persistent ScaleIO volume
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of StorageClass to which this persistent volume belongs. Empty value means that this volume does not belong to any StorageClass.
<b>storageos</b>	<b>object</b>	Represents a StorageOS persistent volume resource.
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines if a volume is intended to be used with a formatted filesystem or to remain in raw block state. Value of Filesystem is implied when not included in spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>

Property	Type	Description
<b>vsphereVolume</b>	<b>object</b>	Represents a vSphere volume resource.

### 14.10.1.2. .spec.awsElasticBlockStore

#### Description

Represents a Persistent Disk resource in AWS.

An AWS EBS disk must exist before mounting to a container. The disk must also be in the same AWS zone as the kubelet. An AWS EBS disk can only be mounted as read/write once. AWS EBS volumes support ownership management and SELinux relabeling.

#### Type

**object**

#### Required

- **volumeID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
<b>readOnly</b>	<b>boolean</b>	readOnly value true will force the readOnly setting in VolumeMounts. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Property	Type	Description
<b>volumelD</b>	<b>string</b>	volumelD is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

### 14.10.1.3. .spec.azureDisk

#### Description

AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

#### Type

**object**

#### Required

- **diskName**
- **diskURI**

Property	Type	Description
<b>cachingMode</b>	<b>string</b>	cachingMode is the Host Caching mode: None, Read Only, Read Write.  Possible enum values: - <b>"None"</b> - <b>"ReadOnly"</b> - <b>"ReadWrite"</b>
<b>diskName</b>	<b>string</b>	diskName is the Name of the data disk in the blob storage
<b>diskURI</b>	<b>string</b>	diskURI is the URI of data disk in the blob storage
<b>fsType</b>	<b>string</b>	fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Property	Type	Description
<b>kind</b>	<b>string</b>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared  Possible enum values: - <b>"Dedicated"</b> - <b>"Managed"</b> - <b>"Shared"</b>
<b>readOnly</b>	<b>boolean</b>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

#### 14.10.1.4. .spec.azureFile

##### Description

AzureFile represents an Azure File Service mount on the host and bind mount to the pod.

##### Type

**object**

##### Required

- **secretName**
- **shareName**

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretName</b>	<b>string</b>	secretName is the name of secret that contains Azure Storage Account Name and Key
<b>secretNamespace</b>	<b>string</b>	secretNamespace is the namespace of the secret that contains Azure Storage Account Name and Key default is the same as the Pod

Property	Type	Description
<b>shareName</b>	<b>string</b>	shareName is the azure Share Name

### 14.10.1.5. .spec.cephfs

#### Description

Represents a Ceph Filesystem mount that lasts the lifetime of a pod Cephfs volumes do not support ownership management or SELinux relabeling.

#### Type

**object**

#### Required

- **monitors**

Property	Type	Description
<b>monitors</b>	<b>array (string)</b>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>path</b>	<b>string</b>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretFile</b>	<b>string</b>	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

Property	Type	Description
<b>user</b>	<b>string</b>	user is Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

#### 14.10.1.6. .spec.cephfs.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.7. .spec.cinder

##### Description

Represents a cinder volume resource in Openstack. A Cinder volume must exist before mounting to a container. The volume must also be in the same region as the kubelet. Cinder volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **volumeID**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>volumeID</b>	<b>string</b>	volumeID used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

#### 14.10.1.8. .spec.cinder.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.9. .spec.claimRef

## Description

ObjectReference contains enough information to let you inspect or modify the referred object.

## Type

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>

Property	Type	Description
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 14.10.1.10. .spec.csi

##### Description

Represents storage that is managed by an external CSI volume driver (Beta feature)

##### Type

**object**

##### Required

- **driver**
- **volumeHandle**

Property	Type	Description
<b>controllerExpandSecretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>controllerPublishSecretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume. Required.
<b>fsType</b>	<b>string</b>	fsType to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs".

Property	Type	Description
<b>nodeExpandSecretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>nodePublishSecretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>nodeStageSecretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>readOnly</b>	<b>boolean</b>	readOnly value to pass to ControllerPublishVolumeRequest. Defaults to false (read/write).
<b>volumeAttributes</b>	<b>object (string)</b>	volumeAttributes of the volume to publish.
<b>volumeHandle</b>	<b>string</b>	volumeHandle is the unique volume name returned by the CSI volume plugin's CreateVolume to refer to the volume on all subsequent calls. Required.

#### 14.10.1.11. .spec.csi.controllerExpandSecretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

### 14.10.1.12. .spec.csi.controllerPublishSecretRef

#### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

### 14.10.1.13. .spec.csi.nodeExpandSecretRef

#### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

### 14.10.1.14. .spec.csi.nodePublishSecretRef

#### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

#### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.15. .spec.csi.nodeStageSecretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.16. .spec.fc

##### Description

Represents a Fibre Channel volume. Fibre Channel volumes can only be mounted as read/write once. Fibre Channel volumes support ownership management and SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Property	Type	Description
<b>lun</b>	<b>integer</b>	lun is Optional: FC target lun number
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>targetWWNs</b>	<b>array (string)</b>	targetWWNs is Optional: FC target worldwide names (WWNs)
<b>wwids</b>	<b>array (string)</b>	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

#### 14.10.1.17. .spec.flexVolume

##### Description

FlexPersistentVolumeSource represents a generic persistent volume resource that is provisioned/attached using an exec based plugin.

##### Type

**object**

##### Required

- **driver**

Property	Type	Description
<b>driver</b>	<b>string</b>	driver is the name of the driver to use for this volume.
<b>fsType</b>	<b>string</b>	fsType is the Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
<b>options</b>	<b>object (string)</b>	options is Optional: this field holds extra command options if any.

Property	Type	Description
<b>readOnly</b>	<b>boolean</b>	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

#### 14.10.1.18. .spec.flexVolume.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.19. .spec.flocker

##### Description

Represents a Flocker volume mounted by the Flocker agent. One and only one of datasetName and datasetUUID should be set. Flocker volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

Property	Type	Description
<b>datasetName</b>	<b>string</b>	datasetName is Name of the dataset stored as metadata → name on the dataset for Flocker should be considered as deprecated

Property	Type	Description
<b>datasetUUID</b>	<b>string</b>	datasetUUID is the UUID of the dataset. This is unique identifier of a Flocker dataset

#### 14.10.1.20. .spec.gcePersistentDisk

##### Description

Represents a Persistent Disk resource in Google Compute Engine.

A GCE PD must exist before mounting to a container. The disk must also be in the same GCE project and zone as the kubelet. A GCE PD can only be mounted as read/write once or read-only many times. GCE PDs support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **pdName**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>partition</b>	<b>integer</b>	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Property	Type	Description
<b>pdName</b>	<b>string</b>	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

#### 14.10.1.21. .spec.glusterfs

##### Description

Represents a Glusterfs mount that lasts the lifetime of a pod. Glusterfs volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **endpoints**
- **path**

Property	Type	Description
<b>endpoints</b>	<b>string</b>	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

Property	Type	Description
<b>endpointsNamespace</b>	<b>string</b>	endpointsNamespace is the namespace that contains Glusterfs endpoint. If this field is empty, the EndpointNamespace defaults to the same namespace as the bound PVC. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>path</b>	<b>string</b>	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

#### 14.10.1.22. .spec.hostPath

##### Description

Represents a host path mapped into a pod. Host path volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Property	Type	Description
<b>type</b>	<b>string</b>	<p>type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p> <p>Possible enum values: - "" For backwards compatible, leave it empty if unset - <b>"BlockDevice"</b> A block device must exist at the given path - <b>"CharDevice"</b> A character device must exist at the given path - <b>"Directory"</b> A directory must exist at the given path - <b>"DirectoryOrCreate"</b> If nothing exists at the given path, an empty directory will be created there as needed with file mode 0755, having the same group and ownership with Kubelet. - <b>"File"</b> A file must exist at the given path - <b>"FileOrCreate"</b> If nothing exists at the given path, an empty file will be created there as needed with file mode 0644, having the same group and ownership with Kubelet. - <b>"Socket"</b> A UNIX socket must exist at the given path</p>

### 14.10.1.23. .spec.iscsi

#### Description

ISCSIPersistentVolumeSource represents an iSCSI disk. iSCSI volumes can only be mounted as read/write once. iSCSI volumes support ownership management and SELinux relabeling.

#### Type

**object**

#### Required

- **targetPortal**
- **iqn**
- **lun**

Property	Type	Description
<b>chapAuthDiscovery</b>	<b>boolean</b>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication

Property	Type	Description
<b>chapAuthSession</b>	<b>boolean</b>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
<b>initiatorName</b>	<b>string</b>	initiatorName is the custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <target portal>:<volume name> will be created for the connection.
<b>iqn</b>	<b>string</b>	iqn is Target iSCSI Qualified Name.
<b>iscsiInterface</b>	<b>string</b>	iscsiInterface is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<b>lun</b>	<b>integer</b>	lun is iSCSI Target Lun number.
<b>portals</b>	<b>array (string)</b>	portals is the iSCSI Target Portal List. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

Property	Type	Description
<b>targetPortal</b>	<b>string</b>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

#### 14.10.1.24. .spec.iscsi.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.25. .spec.local

##### Description

Local represents directly-attached storage with node affinity (Beta feature)

##### Type

**object**

##### Required

- **path**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. It applies only when the Path is a block device. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default value is to auto-select a filesystem if unspecified.

Property	Type	Description
<b>path</b>	<b>string</b>	path of the full path to the volume on the node. It can be either a directory or block device (disk, partition, ...).

#### 14.10.1.26. .spec.nfs

##### Description

Represents an NFS mount that lasts the lifetime of a pod. NFS volumes do not support ownership management or SELinux relabeling.

##### Type

**object**

##### Required

- **server**
- **path**

Property	Type	Description
<b>path</b>	<b>string</b>	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
<b>server</b>	<b>string</b>	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

#### 14.10.1.27. .spec.nodeAffinity

##### Description

VolumeNodeAffinity defines constraints that limit what nodes this volume can be accessed from.

##### Type

**object**

Property	Type	Description
<b>required</b>	<b>object</b>	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### 14.10.1.28. .spec.nodeAffinity.required

##### Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

##### Type

**object**

##### Required

- **nodeSelectorTerms**

Property	Type	Description
<b>nodeSelectorTerms</b>	<b>array</b>	Required. A list of node selector terms. The terms are ORed.
<b>nodeSelectorTerms[]</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

#### 14.10.1.29. .spec.nodeAffinity.required.nodeSelectorTerms

##### Description

Required. A list of node selector terms. The terms are ORed.

##### Type

**array**

#### 14.10.1.30. .spec.nodeAffinity.required.nodeSelectorTerms[]

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.10.1.31. `.spec.nodeAffinity.required.nodeSelectorTerms[].matchExpressions`

##### Description

A list of node selector requirements by node's labels.

##### Type

**array**

#### 14.10.1.32. `.spec.nodeAffinity.required.nodeSelectorTerms[].matchExpressions[]`

##### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

##### Type

**object**

##### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.

Property	Type	Description
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.10.1.33. .spec.nodeAffinity.required.nodeSelectorTerms[].matchFields

##### Description

A list of node selector requirements by node's fields.

##### Type

**array**

#### 14.10.1.34. .spec.nodeAffinity.required.nodeSelectorTerms[].matchFields[]

##### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

##### Type

**object**

##### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.

Property	Type	Description
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.10.1.35. .spec.photonPersistentDisk

##### Description

Represents a Photon Controller persistent disk resource.

##### Type

**object**

##### Required

- **pdID**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>pdID</b>	<b>string</b>	pdID is the ID that identifies Photon Controller persistent disk

#### 14.10.1.36. .spec.portworxVolume

##### Description

PortworxVolumeSource represents a Portworx volume resource.

#### Type

**object**

#### Required

- **volumelD**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>volumelD</b>	<b>string</b>	volumelD uniquely identifies a Portworx volume

#### 14.10.1.37. .spec.quobyte

#### Description

Represents a Quobyte mount that lasts the lifetime of a pod. Quobyte volumes do not support ownership management or SELinux relabeling.

#### Type

**object**

#### Required

- **registry**
- **volume**

Property	Type	Description
<b>group</b>	<b>string</b>	group to map volume access to. Default is no group
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.

Property	Type	Description
<b>registry</b>	<b>string</b>	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
<b>tenant</b>	<b>string</b>	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
<b>user</b>	<b>string</b>	user to map volume access to Defaults to serviceaccount user
<b>volume</b>	<b>string</b>	volume is a string that references an already created Quobyte volume by name.

#### 14.10.1.38. .spec.rbd

##### Description

Represents a Rados Block Device mount that lasts the lifetime of a pod. RBD volumes support ownership management and SELinux relabeling.

##### Type

**object**

##### Required

- **monitors**
- **image**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>

Property	Type	Description
<b>image</b>	<b>string</b>	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>keyring</b>	<b>string</b>	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>monitors</b>	<b>array (string)</b>	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>pool</b>	<b>string</b>	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>readOnly</b>	<b>boolean</b>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace
<b>user</b>	<b>string</b>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

#### 14.10.1.39. .spec.rbd.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.40. .spec.scaleIO

##### Description

ScaleIOPersistentVolumeSource represents a persistent ScaleIO volume

##### Type

**object**

##### Required

- **gateway**
- **system**
- **secretRef**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs"
<b>gateway</b>	<b>string</b>	gateway is the host address of the ScaleIO API Gateway.
<b>protectionDomain</b>	<b>string</b>	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

Property	Type	Description
<b>sslEnabled</b>	<b>boolean</b>	sslEnabled is the flag to enable/disable SSL communication with Gateway, default false
<b>storageMode</b>	<b>string</b>	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
<b>storagePool</b>	<b>string</b>	storagePool is the ScaleIO Storage Pool associated with the protection domain.
<b>system</b>	<b>string</b>	system is the name of the storage system as configured in ScaleIO.
<b>volumeName</b>	<b>string</b>	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

#### 14.10.1.41. .spec.scaleIO.secretRef

##### Description

SecretReference represents a Secret Reference. It has enough information to retrieve secret in any namespace

##### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	name is unique within a namespace to reference a secret resource.
<b>namespace</b>	<b>string</b>	namespace defines the space within which the secret name must be unique.

#### 14.10.1.42. .spec.storageeos

##### Description

Represents a StorageOS persistent volume resource.

##### Type

**object**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>readOnly</b>	<b>boolean</b>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<b>secretRef</b>	<b>object</b>	ObjectReference contains enough information to let you inspect or modify the referred object.
<b>volumeName</b>	<b>string</b>	volumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<b>volumeNamespace</b>	<b>string</b>	volumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**14.10.1.43. .spec.storageos.secretRef****Description**

ObjectReference contains enough information to let you inspect or modify the referred object.

**Type**

**object**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	API version of the referent.
<b>fieldPath</b>	<b>string</b>	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
<b>kind</b>	<b>string</b>	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>namespace</b>	<b>string</b>	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
<b>resourceVersion</b>	<b>string</b>	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>

Property	Type	Description
<b>uid</b>	<b>string</b>	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

#### 14.10.1.44. .spec.vsphereVolume

##### Description

Represents a vSphere volume resource.

##### Type

**object**

##### Required

- **volumePath**

Property	Type	Description
<b>fsType</b>	<b>string</b>	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
<b>storagePolicyID</b>	<b>string</b>	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
<b>storagePolicyName</b>	<b>string</b>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<b>volumePath</b>	<b>string</b>	volumePath is the path that identifies vSphere volume vmdk

#### 14.10.1.45. .status

##### Description

PersistentVolumeStatus is the current status of a persistent volume.

##### Type

**object**

Property	Type	Description
<b>message</b>	<b>string</b>	message is a human-readable message indicating details about why the volume is in this state.
<b>phase</b>	<b>string</b>	<p>phase indicates if a volume is available, bound to a claim, or released by a claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#phase">https://kubernetes.io/docs/concepts/storage/persistent-volumes#phase</a></p> <p>Possible enum values: -  <b>"Available"</b> used for PersistentVolumes that are not yet bound Available volumes are held by the binder and matched to PersistentVolumeClaims -  <b>"Bound"</b> used for PersistentVolumes that are bound - <b>"Failed"</b> used for PersistentVolumes that failed to be correctly recycled or deleted after being released from a claim - <b>"Pending"</b> used for PersistentVolumes that are not available - <b>"Released"</b> used for PersistentVolumes where the bound PersistentVolumeClaim was deleted released volumes must be recycled before becoming available again this phase is used by the persistent volume claim binder to signal to another process to reclaim the resource</p>
<b>reason</b>	<b>string</b>	reason is a brief CamelCase string that describes any failure and is meant for machine parsing and tidy display in the CLI.

### 14.10.2. API endpoints

The following API endpoints are available:

- **/api/v1/persistentvolumes**
  - **DELETE:** delete collection of PersistentVolume
  - **GET:** list or watch objects of kind PersistentVolume

- **POST**: create a PersistentVolume
- **/api/v1/watch/persistentvolumes**
  - **GET**: watch individual changes to a list of PersistentVolume. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/persistentvolumes/{name}**
  - **DELETE**: delete a PersistentVolume
  - **GET**: read the specified PersistentVolume
  - **PATCH**: partially update the specified PersistentVolume
  - **PUT**: replace the specified PersistentVolume
- **/api/v1/watch/persistentvolumes/{name}**
  - **GET**: watch changes to an object of kind PersistentVolume. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/persistentvolumes/{name}/status**
  - **GET**: read status of the specified PersistentVolume
  - **PATCH**: partially update status of the specified PersistentVolume
  - **PUT**: replace status of the specified PersistentVolume

#### 14.10.2.1. /api/v1/persistentvolumes

Table 14.213. Global query parameters

Parameter	Type	Description
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.

#### HTTP method

##### **DELETE**

#### Description

delete collection of PersistentVolume

Table 14.214. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>orphanDependents</b>	<b>boolean</b>	<p>Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.</p>
<b>propagationPolicy</b>	<b>string</b>	<p>Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.</p>

Parameter	Type	Description
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>sendInitialEvents=true</code> may be set together with <code>watch=true</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>k8s.io/initial-events-end: "true"</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>sendInitialEvents</code> option is set, we require <code>resourceVersionMatch</code> option to also be set. The semantic of the watch request is as following: - <code>resourceVersionMatch = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>resourceVersion</code>" and the bookmark event is send when the state is synced to a <code>resourceVersion</code> at least as fresh as the one provided by the ListOptions. If <code>resourceVersion</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>resourceVersionMatch</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>resourceVersion=""</code> or <code>resourceVersion="0"</code> (for backward compatibility reasons) and to false otherwise.</p>

Parameter	Type	Description
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

401 - Unauthorized	Empty

**HTTP method****GET****Description**

list or watch objects of kind PersistentVolume

Table 14.217. Query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

Table 14.218. HTTP responses

HTTP code	Response body
200 - OK	<a href="#">PersistentVolumeList</a> schema
401 - Unauthorized	Empty

HTTP method

**POST**

**Description**

create a PersistentVolume

**Table 14.219. Query parameters**

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

#### HTTP method

#### DELETE

#### Description

delete a PersistentVolume

Table 14.226. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>gracePeriodSeconds</b>	<b>integer</b>	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Type	Description
<b>orphanDependents</b>	<b>boolean</b>	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
<b>propagationPolicy</b>	<b>string</b>	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

#### 14.10.2.4. /api/v1/watch/persistentvolumes/{name}

Table 14.236. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PersistentVolume

Table 14.237. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PersistentVolume. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified PersistentVolume

Table 14.242. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## 14.11. PERSISTENTVOLUMECLAIM [V1]

### Description

PersistentVolumeClaim is a user's request for and claim to a persistent volume

### Type

**object**

### 14.11.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes
<b>status</b>	<b>object</b>	PersistentVolumeClaimStatus is the current status of a persistent volume claim.

#### 14.11.1.1. .spec

##### Description

PersistentVolumeClaimSpec describes the common attributes of storage devices and allows a Source for provider-specific attributes

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	accessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>dataSource</b>	<b>object</b>	TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

Property	Type	Description
<b>dataSourceRef</b>	<b>object</b>	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: * While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. * While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. * While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</p>

Property	Type	Description
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>selector</b>	<b>LabelSelector</b>	selector is a label query over volumes to consider for binding.
<b>storageClassName</b>	<b>string</b>	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
<b>volumeMode</b>	<b>string</b>	<p>volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.</p> <p>Possible enum values: - <b>"Block"</b> means the volume will not be formatted with a filesystem and will remain a raw block device. - <b>"Filesystem"</b> means the volume will be or is formatted with a filesystem.</p>
<b>volumeName</b>	<b>string</b>	volumeName is the binding reference to the PersistentVolume backing this claim.

#### 14.11.1.2. .spec.dataSource

##### Description

TypedLocalObjectReference contains enough information to let you locate the typed referenced object inside the same namespace.

##### Type

**object**

##### Required

- **kind**
- **name**

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced

### 14.11.1.3. .spec.dataSourceRef

#### Description

`dataSourceRef` specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a `PersistentVolumeClaim` object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the `dataSource` field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in `dataSourceRef`, both fields (`dataSource` and `dataSourceRef`) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in `dataSourceRef`, `dataSource` isn't set to the same value and must be empty. There are three important differences between `dataSource` and `dataSourceRef`: \* While `dataSource` only allows two specific types of objects, `dataSourceRef` allows any non-core object, as well as `PersistentVolumeClaim` objects. \* While `dataSource` ignores disallowed values (dropping them), `dataSourceRef` preserves all values, and generates an error if a disallowed value is specified. \* While `dataSource` only allows local objects, `dataSourceRef` allows objects in any namespaces. (Beta) Using this field requires the `AnyVolumeDataSource` feature gate to be enabled. (Alpha) Using the namespace field of `dataSourceRef` requires the `CrossNamespaceVolumeDataSource` feature gate to be enabled.

#### Type

**object**

#### Required

- **kind**
- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>apiGroup</b>	<b>string</b>	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
<b>kind</b>	<b>string</b>	Kind is the type of resource being referenced
<b>name</b>	<b>string</b>	Name is the name of resource being referenced
<b>namespace</b>	<b>string</b>	Namespace is the namespace of resource being referenced Note that when a namespace is specified, a gateway.networking.k8s.io/ReferenceGrant object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

#### 14.11.1.4. .spec.resources

##### Description

ResourceRequirements describes the compute resource requirements.

##### Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	<p>Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.</p> <p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>

Property	Type	Description
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.11.1.5. .spec.resources.claims

##### Description

Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container. This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.11.1.6. .spec.resources.claims[]

##### Description

ResourceClaim references one entry in PodSpec.ResourceClaims.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.11.1.7. .status

##### Description

`PersistentVolumeClaimStatus` is the current status of a persistent volume claim.

##### Type

**object**

Property	Type	Description
<b>accessModes</b>	<b>array (string)</b>	<code>accessModes</code> contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
<b>allocatedResources</b>	<b>object (Quantity)</b>	<code>allocatedResources</code> is the storage resource within <code>AllocatedResources</code> tracks the capacity allocated to a PVC. It may be larger than the actual capacity when a volume expansion operation is requested. For storage quota, the larger value from <code>allocatedResources</code> and <code>PVC.spec.resources</code> is used. If <code>allocatedResources</code> is not set, <code>PVC.spec.resources</code> alone is used for quota calculation. If a volume expansion capacity request is lowered, <code>allocatedResources</code> is only lowered if there are no expansion operations in progress and if the actual volume capacity is equal or lower than the requested capacity. This is an alpha field and requires enabling <code>RecoverVolumeExpansionFailure</code> feature.

Property	Type	Description
<b>capacity</b>	<b>object (Quantity)</b>	capacity represents the actual resources of the underlying volume.
<b>conditions</b>	<b>array</b>	conditions is the current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
<b>conditions[]</b>	<b>object</b>	PersistentVolumeClaimCondition contains details about state of pvc
<b>phase</b>	<b>string</b>	phase represents the current phase of PersistentVolumeClaim.  Possible enum values: - <b>"Bound"</b> used for PersistentVolumeClaims that are bound - <b>"Lost"</b> used for PersistentVolumeClaims that lost their underlying PersistentVolume. The claim was bound to a PersistentVolume and this volume does not exist any longer and all data on it was lost. - <b>"Pending"</b> used for PersistentVolumeClaims that are not yet bound

Property	Type	Description
<b>resizeStatus</b>	<b>string</b>	<p>resizeStatus stores status of resize operation. ResizeStatus is not set by default but when expansion is complete resizeStatus is set to empty string by resize controller or kubelet. This is an alpha field and requires enabling RecoverVolumeExpansionFailure feature.</p> <p>Possible enum values: - "" When expansion is complete, the empty string is set by resize controller or kubelet. - <b>"ControllerExpansionFailed"</b> State set when expansion has failed in resize controller with a terminal error. Transient errors such as timeout should not set this status and should leave ResizeStatus unmodified, so as resize controller can resume the volume expansion. - <b>"ControllerExpansionInProgress"</b> State set when resize controller starts expanding the volume in control-plane - <b>"NodeExpansionFailed"</b> State set when expansion has failed in kubelet with a terminal error. Transient errors don't set NodeExpansionFailed. - <b>"NodeExpansionInProgress"</b> State set when kubelet starts expanding the volume. - <b>"NodeExpansionPending"</b> State set when resize controller has finished expanding the volume but further expansion is needed on the node.</p>

#### 14.11.1.8. .status.conditions

##### Description

conditions is the current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.

##### Type

**array**

### 14.11.1.9. .status.conditions[]

#### Description

PersistentVolumeClaimCondition contains details about state of pvc

#### Type

**object**

#### Required

- **type**
- **status**

Property	Type	Description
<b>lastProbeTime</b>	<b>Time</b>	lastProbeTime is the time we probed the condition.
<b>lastTransitionTime</b>	<b>Time</b>	lastTransitionTime is the time the condition transitioned from one status to another.
<b>message</b>	<b>string</b>	message is the human-readable message indicating details about last transition.
<b>reason</b>	<b>string</b>	reason is a unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
<b>status</b>	<b>string</b>	
<b>type</b>	<b>string</b>	

### 14.11.2. API endpoints

The following API endpoints are available:

- **/api/v1/persistentvolumeclaims**
  - **GET**: list or watch objects of kind PersistentVolumeClaim
- **/api/v1/watch/persistentvolumeclaims**
  - **GET**: watch individual changes to a list of PersistentVolumeClaim. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/persistentvolumeclaims**

- **DELETE:** delete collection of PersistentVolumeClaim
- **GET:** list or watch objects of kind PersistentVolumeClaim
- **POST:** create a PersistentVolumeClaim
- **/api/v1/watch/namespaces/{namespace}/persistentvolumeclaims**
  - **GET:** watch individual changes to a list of PersistentVolumeClaim. deprecated: use the 'watch' parameter with a list operation instead.
- **/api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}**
  - **DELETE:** delete a PersistentVolumeClaim
  - **GET:** read the specified PersistentVolumeClaim
  - **PATCH:** partially update the specified PersistentVolumeClaim
  - **PUT:** replace the specified PersistentVolumeClaim
- **/api/v1/watch/namespaces/{namespace}/persistentvolumeclaims/{name}**
  - **GET:** watch changes to an object of kind PersistentVolumeClaim. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.
- **/api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}/status**
  - **GET:** read status of the specified PersistentVolumeClaim
  - **PATCH:** partially update status of the specified PersistentVolumeClaim
  - **PUT:** replace status of the specified PersistentVolumeClaim

#### 14.11.2.1. /api/v1/persistentvolumeclaims

Table 14.248. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end`: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

list or watch objects of kind PersistentVolumeClaim

**Table 14.249. HTTP responses**

HTTP code	Response body
200 - OK	<a href="#">PersistentVolumeClaimList</a> schema

HTTP code	Response body
401 - Unauthorized	Empty

### 14.11.2.2. /api/v1/watch/persistentvolumeclaims

Table 14.250. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch individual changes to a list of PersistentVolumeClaim. deprecated: use the 'watch' parameter with a list operation instead.

#### HTTP method

#### **DELETE**

#### Description

delete collection of PersistentVolumeClaim

Table 14.254. Query parameters

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>dryRun</b>	<b>string</b>	<p>When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed</p>
<b>fieldSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their fields. Defaults to everything.</p>
<b>gracePeriodSeconds</b>	<b>integer</b>	<p>The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.</p>
<b>labelSelector</b>	<b>string</b>	<p>A selector to restrict the list of returned objects by their labels. Defaults to everything.</p>

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the `continue` field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23.</li> <li>- Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+</li> <li>- Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.</li> </ul>

401 - Unauthorized	Empty

#### 14.11.2.6. /api/v1/watch/namespaces/{namespace}/persistentvolumeclaims/{name}

Table 14.277. Global path parameters

Parameter	Type	Description
<b>name</b>	<b>string</b>	name of the PersistentVolumeClaim
<b>namespace</b>	<b>string</b>	object name and auth scope, such as for teams and projects

Parameter	Type	Description
-----------	------	-------------

Table 14.278. Global query parameters

Parameter	Type	Description
<b>allowWatchBookmarks</b>	<b>boolean</b>	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored.
<b>continue</b>	<b>string</b>	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
<b>fieldSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their fields. Defaults to everything.
<b>labelSelector</b>	<b>string</b>	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Type	Description
<b>limit</b>	<b>integer</b>	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <code>continue</code> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
<b>pretty</b>	<b>string</b>	If 'true', then the output is pretty printed.
<b>resourceVersion</b>	<b>string</b>	<p>resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>
<b>resourceVersionMatch</b>	<b>string</b>	<p>resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details.</p> <p>Defaults to unset</p>

Parameter	Type	Description
<b>sendInitialEvents</b>	<b>boolean</b>	<p><code>`sendInitialEvents=true`</code> may be set together with <code>`watch=true`</code>. In that case, the watch stream will begin with synthetic events to produce the current state of objects in the collection. Once all such events have been sent, a synthetic "Bookmark" event will be sent. The bookmark will report the ResourceVersion (RV) corresponding to the set of objects, and be marked with <code>`k8s.io/initial-events-end: "true"`</code> annotation. Afterwards, the watch stream will proceed as usual, sending watch events corresponding to changes (subsequent to the RV) to objects watched.</p> <p>When <code>`sendInitialEvents`</code> option is set, we require <code>`resourceVersionMatch`</code> option to also be set. The semantic of the watch request is as following: - <code>`resourceVersionMatch` = NotOlderThan</code> is interpreted as "data at least as new as the provided <code>`resourceVersion`</code>" and the bookmark event is send when the state is synced to a <code>`resourceVersion`</code> at least as fresh as the one provided by the ListOptions. If <code>`resourceVersion`</code> is unset, this is interpreted as "consistent read" and the bookmark event is send when the state is synced at least to the moment when request started being processed. - <code>`resourceVersionMatch`</code> set to any other value or unset Invalid error is returned.</p> <p>Defaults to true if <code>`resourceVersion=""`</code> or <code>`resourceVersion="0"`</code> (for backward compatibility reasons) and to false otherwise.</p>
<b>timeoutSeconds</b>	<b>integer</b>	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
<b>watch</b>	<b>boolean</b>	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

**HTTP method****GET****Description**

watch changes to an object of kind PersistentVolumeClaim. deprecated: use the 'watch' parameter with a list operation instead, filtered to a single item with the 'fieldSelector' parameter.

**Table 14.279. HTTP responses**

#### Description

read status of the specified PersistentVolumeClaim

Table 14.282. HTTP responses

HTTP code	Reponse body
200 - OK	<a href="#">PersistentVolumeClaim</a> schema
401 - Unauthorized	Empty

#### HTTP method

##### PATCH

#### Description

partially update status of the specified PersistentVolumeClaim

Table 14.283. Query parameters

Parameter	Type	Description
<b>dryRun</b>	<b>string</b>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<b>fieldManager</b>	<b>string</b>	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
<b>fieldValidation</b>	<b>string</b>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.
<b>force</b>	<b>boolean</b>	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.

## 14.12. POD [V1]

### Description

Pod is a collection of containers that can run on a host. This resource is created by clients and scheduled onto hosts.

### Type

**object**

### 14.12.1. Specification

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Property	Type	Description
<b>kind</b>	<b>string</b>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
<b>metadata</b>	<b>ObjectMeta</b>	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
<b>spec</b>	<b>object</b>	PodSpec is a description of a pod.
<b>status</b>	<b>object</b>	PodStatus represents information about the status of a pod. Status may trail the actual state of a system, especially if the node that hosts the pod cannot contact the control plane.

#### 14.12.1.1. .spec

##### Description

PodSpec is a description of a pod.

##### Type

**object**

##### Required

- **containers**

Property	Type	Description
<b>activeDeadlineSeconds</b>	<b>integer</b>	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.

Property	Type	Description
<b>affinity</b>	<b>object</b>	Affinity is a group of affinity scheduling rules.
<b>automountServiceAccountToken</b>	<b>boolean</b>	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
<b>containers</b>	<b>array</b>	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
<b>containers[]</b>	<b>object</b>	A single application container that you want to run within a pod.
<b>dnsConfig</b>	<b>object</b>	PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

Property	Type	Description
<b>dnsPolicy</b>	<b>string</b>	<p>Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.</p> <p>Possible enum values: - <b>"ClusterFirst"</b> indicates that the pod should use cluster DNS first unless hostNetwork is true, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"ClusterFirstWithHostNet"</b> indicates that the pod should use cluster DNS first, if it is available, then fall back on the default (as determined by kubelet) DNS settings. - <b>"Default"</b> indicates that the pod should use the default (as determined by kubelet) DNS settings. - <b>"None"</b> indicates that the pod should use empty DNS settings. DNS parameters such as nameservers and search paths should be defined via DNSConfig.</p>
<b>enableServiceLinks</b>	<b>boolean</b>	<p>EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.</p>

Property	Type	Description
<b>ephemeralContainers</b>	<b>array</b>	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's <code>ephemeralcontainers</code> subresource.
<b>ephemeralContainers[]</b>	<b>object</b>	<p>An <code>EphemeralContainer</code> is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation.</p> <p>To add an ephemeral container, use the <code>ephemeralcontainers</code> subresource of an existing Pod. Ephemeral containers may not be removed or restarted.</p>
<b>hostAliases</b>	<b>array</b>	<code>HostAliases</code> is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non- <code>hostNetwork</code> pods.
<b>hostAliases[]</b>	<b>object</b>	<code>HostAlias</code> holds the mapping between IP and hostnames that will be injected as an entry in the pod's hosts file.
<b>hostIPC</b>	<b>boolean</b>	Use the host's <code>ipc</code> namespace. Optional: Default to false.

Property	Type	Description
<b>hostNetwork</b>	<b>boolean</b>	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
<b>hostPID</b>	<b>boolean</b>	Use the host's pid namespace. Optional: Default to false.
<b>hostUsers</b>	<b>boolean</b>	Use the host's user namespace. Optional: Default to true. If set to true or not present, the pod will be run in the host user namespace, useful for when the pod needs a feature only available to the host user namespace, such as loading a kernel module with CAP_SYS_MODULE. When set to false, a new users is created for the pod. Setting false is useful for mitigating container breakout vulnerabilities even allowing users to run their containers as root without actually having root privileges on the host. This field is alpha-level and is only honored by servers that enable the UserNamespacesSupport feature.
<b>hostname</b>	<b>string</b>	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
<b>imagePullSecrets</b>	<b>array</b>	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
<b>imagePullSecrets[]</b>	<b>object</b>	LocalObjectReference contains enough information to let you locate the referenced object inside the same namespace.

Property	Type	Description
<b>initContainers</b>	<b>array</b>	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
<b>initContainers[]</b>	<b>object</b>	A single application container that you want to run within a pod.
<b>nodeName</b>	<b>string</b>	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
<b>nodeSelector</b>	<b>object (string)</b>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Property	Type	Description
<b>os</b>	<b>object</b>	PodOS defines the OS parameters of a pod.
<b>overhead</b>	<b>object (Quantity)</b>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md">https://git.k8s.io/enhancements/keps/sig-node/688-pod-overhead/README.md</a>
<b>preemptionPolicy</b>	<b>string</b>	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset.  Possible enum values: - <b>"Never"</b> means that pod never preempts other pods with lower priority. - <b>"PreemptLowerPriority"</b> means that pod can preempt other pods with lower priority.
<b>priority</b>	<b>integer</b>	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Property	Type	Description
<b>priorityClassName</b>	<b>string</b>	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
<b>readinessGates</b>	<b>array</b>	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates">https://git.k8s.io/enhancements/keps/sig-network/580-pod-readiness-gates</a>
<b>readinessGates[]</b>	<b>object</b>	PodReadinessGate contains the reference to a pod condition
<b>resourceClaims</b>	<b>array</b>	ResourceClaims defines which ResourceClaims must be allocated and reserved before the Pod is allowed to start. The resources will be made available to those containers which consume them by name.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable.

Property	Type	Description
<b>resourceClaims[]</b>	<b>object</b>	PodResourceClaim references exactly one ResourceClaim through a ClaimSource. It adds a name to it that uniquely identifies the ResourceClaim inside the Pod. Containers that need access to the ResourceClaim reference it with this name.
<b>restartPolicy</b>	<b>string</b>	Restart policy for all containers within the pod. One of Always, OnFailure, Never. In some contexts, only a subset of those values may be permitted. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>  Possible enum values: - <b>"Always"</b> - <b>"Never"</b> - <b>"OnFailure"</b>
<b>runtimeClassName</b>	<b>string</b>	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class">https://git.k8s.io/enhancements/keps/sig-node/585-runtime-class</a>
<b>schedulerName</b>	<b>string</b>	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.

Property	Type	Description
<b>schedulingGates</b>	<b>array</b>	<p>SchedulingGates is an opaque list of values that if specified will block scheduling the pod. If schedulingGates is not empty, the pod will stay in the SchedulingGated state and the scheduler will not attempt to schedule the pod.</p> <p>SchedulingGates can only be set at pod creation time, and be removed only afterwards.</p> <p>This is a beta feature enabled by the PodSchedulingReadiness feature gate.</p>
<b>schedulingGates[]</b>	<b>object</b>	PodSchedulingGate is associated to a Pod to guard its scheduling.
<b>securityContext</b>	<b>object</b>	PodSecurityContext holds pod-level security attributes and common container settings. Some fields are also present in container.securityContext. Field values of container.securityContext take precedence over field values of PodSecurityContext.
<b>serviceAccount</b>	<b>string</b>	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
<b>serviceAccountName</b>	<b>string</b>	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Property	Type	Description
<b>setHostnameAsFQDN</b>	<b>boolean</b>	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
<b>shareProcessNamespace</b>	<b>boolean</b>	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
<b>subdomain</b>	<b>string</b>	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc.<cluster domain>". If not specified, the pod will not have a domainname at all.

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
<b>tolerations</b>	<b>array</b>	If specified, the pod's tolerations.
<b>tolerations[]</b>	<b>object</b>	The pod this Tolerant is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.
<b>topologySpreadConstraints</b>	<b>array</b>	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
<b>topologySpreadConstraints[]</b>	<b>object</b>	TopologySpreadConstraint specifies how to spread matching pods among the given topology.
<b>volumes</b>	<b>array</b>	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>
<b>volumes[]</b>	<b>object</b>	Volume represents a named volume in a pod that may be accessed by any container in the pod.

### 14.12.1.2. .spec.affinity

#### Description

Affinity is a group of affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>nodeAffinity</b>	<b>object</b>	Node affinity is a group of node affinity scheduling rules.
<b>podAffinity</b>	<b>object</b>	Pod affinity is a group of inter pod affinity scheduling rules.
<b>podAntiAffinity</b>	<b>object</b>	Pod anti affinity is a group of inter pod anti affinity scheduling rules.

### 14.12.1.3. .spec.affinity.nodeAffinity

#### Description

Node affinity is a group of node affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>object</b>	A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### 14.12.1.4. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding `matchExpressions`; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.12.1.5. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[]`

##### Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

##### Type

**object**

##### Required

- **weight**
- **preference**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preference</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.
<b>weight</b>	<b>integer</b>	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

#### 14.12.1.6. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pre`

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.12.1.7. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pre`

##### Description

A list of node selector requirements by node's labels.

##### Type

**array**

### 14.12.1.8. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pre`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.12.1.9. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pre`

#### Description

A list of node selector requirements by node's fields.

#### Type

**array**

### 14.12.1.10. `.spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pr`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

#### 14.12.1.11. .spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution

##### Description

A node selector represents the union of the results of one or more label queries over a set of nodes; that is, it represents the OR of the selectors represented by the node selector terms.

#### Type

**object**

#### Required

- **nodeSelectorTerms**

Property	Type	Description
<b>nodeSelectorTerms</b>	<b>array</b>	Required. A list of node selector terms. The terms are ORed.
<b>nodeSelectorTerms[]</b>	<b>object</b>	A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

#### 14.12.1.12. .spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms

##### Description

Required. A list of node selector terms. The terms are ORed.

##### Type

**array**

#### 14.12.1.13. .spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms[]

##### Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

##### Type

**object**

Property	Type	Description
<b>matchExpressions</b>	<b>array</b>	A list of node selector requirements by node's labels.
<b>matchExpressions[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.
<b>matchFields</b>	<b>array</b>	A list of node selector requirements by node's fields.
<b>matchFields[]</b>	<b>object</b>	A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### 14.12.1.14. .spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms[]

##### Description

A list of node selector requirements by node's labels.

#### Type

**array**

### 14.12.1.15. `.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.node`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.12.1.16. `.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.node`

#### Description

A list of node selector requirements by node's fields.

#### Type

**array**

### 14.12.1.17. `.spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.node`

#### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

#### Type

**object**

#### Required

- **key**
- **operator**

Property	Type	Description
<b>key</b>	<b>string</b>	The label key that the selector applies to.
<b>operator</b>	<b>string</b>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.  Possible enum values: - <b>"DoesNotExist"</b> - <b>"Exists"</b> - <b>"Gt"</b> - <b>"In"</b> - <b>"Lt"</b> - <b>"NotIn"</b>
<b>values</b>	<b>array (string)</b>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### 14.12.1.18. `.spec.affinity.podAffinity`

#### Description

Pod affinity is a group of inter pod affinity scheduling rules.

#### Type

**object**

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.12.1.19. .spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.12.1.20. .spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution[]

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.12.1.21. .spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution[].pod

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.12.1.22. `.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution`

##### Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.12.1.23. `.spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[]`

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.12.1.24. .spec.affinity.podAntiAffinity

##### Description

Pod anti affinity is a group of inter pod anti affinity scheduling rules.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>preferredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
<b>preferredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)
<b>requiredDuringSchedulingIgnoredDuringExecution</b>	<b>array</b>	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

Property	Type	Description
<b>requiredDuringSchedulingIgnoredDuringExecution[]</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

#### 14.12.1.25. .spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution

##### Description

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

##### Type

**array**

#### 14.12.1.26. .spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[]

##### Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

##### Type

**object**

##### Required

- **weight**
- **podAffinityTerm**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>podAffinityTerm</b>	<b>object</b>	Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running
<b>weight</b>	<b>integer</b>	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

#### 14.12.1.27. .spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[]

##### Description

Defines a set of pods (namely those matching the labelSelector relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key <topologyKey> matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.

Property	Type	Description
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.12.1.28. `.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringExecution`

##### Description

If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each `podAffinityTerm` are intersected, i.e. all terms must be satisfied.

##### Type

**array**

#### 14.12.1.29. `.spec.affinity.podAntiAffinity.requiredDuringSchedulingIgnoredDuringExecution[]`

##### Description

Defines a set of pods (namely those matching the `labelSelector` relative to the given namespace(s)) that this pod should be co-located (affinity) or not co-located (anti-affinity) with, where co-located is defined as running on a node whose value of the label with key `<topologyKey>` matches that of any node on which a pod of the set of pods is running

##### Type

**object**

##### Required

- **topologyKey**

Property	Type	Description
<b>labelSelector</b>	<b>LabelSelector</b>	A label query over a set of resources, in this case pods.
<b>namespaceSelector</b>	<b>LabelSelector</b>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} ) matches all namespaces.
<b>namespaces</b>	<b>array (string)</b>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<b>topologyKey</b>	<b>string</b>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

#### 14.12.1.30. .spec.containers

##### Description

List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.

##### Type

**array**

#### 14.12.1.31. .spec.containers[]

##### Description

A single application container that you want to run within a pod.

Type

**object**

Required

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	Arguments to the entrypoint. The container image's CMD is used if this is not provided. Variable references <code>\$(VAR_NAME)</code> are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>\$</code> are reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. " <code>\$(VAR_NAME)</code> " will produce the string literal " <code>\$(VAR_NAME)</code> ". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Entrypoint array. Not executed within a shell. The container image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
<b>env</b>	<b>array</b>	List of environment variables to set in the container. Cannot be updated.
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps

Property	Type	Description
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
<b>imagePullPolicy</b>	<b>string</b>	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>  Possible enum values: - <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail if the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
<b>ports</b>	<b>array</b>	List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <a href="https://github.com/kubernetes/kubernetes/issues/108255">https://github.com/kubernetes/kubernetes/issues/108255</a> . Cannot be updated.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

Property	Type	Description
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
<b>terminationMessagePath</b>	<b>string</b>	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.12.1.32. .spec.containers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.12.1.33. .spec.containers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.12.1.34. `.spec.containers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.12.1.35. `.spec.containers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.12.1.36. `.spec.containers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.12.1.37. `.spec.containers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.12.1.38. .spec.containers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.12.1.39. .spec.containers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.12.1.40. .spec.containers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.12.1.41. .spec.containers[].envFrom[].configMapRef

### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with. The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.12.1.42. .spec.containers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

### 14.12.1.43. .spec.containers[].lifecycle

## Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

## Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### 14.12.1.44. .spec.containers[].lifecycle.postStart

## Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.12.1.45. .spec.containers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.12.1.46. .spec.containers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.47. .spec.containers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.48. .spec.containers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.49. `..spec.containers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.50. `..spec.containers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.12.1.51. .spec.containers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.52. .spec.containers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.53. .spec.containers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.54. .spec.containers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.55. .spec.containers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.56. .spec.containers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.57. .spec.containers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.58. .spec.containers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.59. .spec.containers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.12.1.60. .spec.containers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.12.1.61. .spec.containers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.62. `.spec.containers[].livenessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.63. `.spec.containers[].ports`

##### Description

List of ports to expose from the container. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Modifying this array with strategic merge patch may corrupt the data. For more information See <https://github.com/kubernetes/kubernetes/issues/108255>. Cannot be updated.

##### Type

**array**

#### 14.12.1.64. `.spec.containers[].ports[]`

**Description**

ContainerPort represents a network port in a single container.

**Type**

**object**

**Required**

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - " <b>SCTP</b> " is the SCTP protocol. - " <b>TCP</b> " is the TCP protocol. - " <b>UDP</b> " is the UDP protocol.

**14.12.1.65. .spec.containers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type**

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's <code>terminationGracePeriodSeconds</code> will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling <code>ProbeTerminationGracePeriod</code> feature gate. Minimum value is 1. <code>spec.terminationGracePeriodSeconds</code> is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.66. `.spec.containers[].readinessProbe.exec`

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.67. .spec.containers[].readinessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.68. .spec.containers[].readinessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.12.1.69. `..spec.containers[].readinessProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.12.1.70. `..spec.containers[].readinessProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.71. `.spec.containers[].readinessProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.72. `.spec.containers[].resizePolicy`

##### Description

Resources resize policy for the container.

##### Type

**array**

#### 14.12.1.73. `.spec.containers[].resizePolicy[]`

##### Description

ContainerResizePolicy represents resource resize policy for the container.

##### Type

**object**

## Required

- **resourceName**
- **restartPolicy**

Property	Type	Description
<b>resourceName</b>	<b>string</b>	Name of the resource to which this resource resize policy applies. Supported values: cpu, memory.
<b>restartPolicy</b>	<b>string</b>	Restart policy to apply when specified resource is resized. If not specified, it defaults to NotRequired.

**14.12.1.74. .spec.containers[].resources**

## Description

ResourceRequirements describes the compute resource requirements.

## Type

**object**

Property	Type	Description
<b>claims</b>	<b>array</b>	Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.  This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.  This field is immutable. It can only be set for containers.
<b>claims[]</b>	<b>object</b>	ResourceClaim references one entry in PodSpec.ResourceClaims.
<b>limits</b>	<b>object (Quantity)</b>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

Property	Type	Description
<b>requests</b>	<b>object (Quantity)</b>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

#### 14.12.1.75. `.spec.containers[].resources.claims`

##### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate.

This field is immutable. It can only be set for containers.

##### Type

**array**

#### 14.12.1.76. `.spec.containers[].resources.claims[]`

##### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

#### 14.12.1.77. `.spec.containers[].securityContext`

##### Description

SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.

**Type****object**

Property	Type	Description
<b>allowPrivilegeEscalation</b>	<b>boolean</b>	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN Note that this field cannot be set when spec.os.name is windows.
<b>capabilities</b>	<b>object</b>	Adds and removes POSIX capabilities from running containers.
<b>privileged</b>	<b>boolean</b>	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>procMount</b>	<b>string</b>	<p>procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.</p> <p>Possible enum values: -  <b>"Default"</b> uses the container runtime defaults for readonly and masked paths for /proc. Most container runtimes mask certain paths in /proc to avoid accidental security exposure of special devices or information. -  <b>"Unmasked"</b> bypasses the default masking behavior of the container runtime and ensures the newly created /proc the container stays in tact with no modifications.</p>
<b>readOnlyRootFilesystem</b>	<b>boolean</b>	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
<b>runAsGroup</b>	<b>integer</b>	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

Property	Type	Description
<b>runAsNonRoot</b>	<b>boolean</b>	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<b>runAsUser</b>	<b>integer</b>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<b>seLinuxOptions</b>	<b>object</b>	SELinuxOptions are the labels to be applied to the container
<b>seccompProfile</b>	<b>object</b>	SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.
<b>windowsOptions</b>	<b>object</b>	WindowsSecurityContextOptions contain Windows-specific options and credentials.

#### 14.12.1.78. .spec.containers[].securityContext.capabilities

##### Description

Adds and removes POSIX capabilities from running containers.

##### Type

**object**

Property	Type	Description
<b>add</b>	<b>array (string)</b>	Added capabilities

Property	Type	Description
<b>drop</b>	<b>array (string)</b>	Removed capabilities

#### 14.12.1.79. `.spec.containers[].securityContext.seLinuxOptions`

##### Description

SELinuxOptions are the labels to be applied to the container

##### Type

**object**

Property	Type	Description
<b>level</b>	<b>string</b>	Level is SELinux level label that applies to the container.
<b>role</b>	<b>string</b>	Role is a SELinux role label that applies to the container.
<b>type</b>	<b>string</b>	Type is a SELinux type label that applies to the container.
<b>user</b>	<b>string</b>	User is a SELinux user label that applies to the container.

#### 14.12.1.80. `.spec.containers[].securityContext.seccompProfile`

##### Description

SeccompProfile defines a pod/container's seccomp profile settings. Only one profile source may be set.

##### Type

**object**

##### Required

- **type**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>localhostProfile</b>	<b>string</b>	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
<b>type</b>	<b>string</b>	<p>type indicates which kind of seccomp profile will be applied. Valid options are:</p> <p>Localhost - a profile defined in a file on the node should be used.  RuntimeDefault - the container runtime default profile should be used.  Unconfined - no profile should be applied.</p> <p>Possible enum values: -  <b>"Localhost"</b> indicates a profile defined in a file on the node should be used. The file's location relative to &lt;kubelet-root-dir&gt;/seccomp. -  <b>"RuntimeDefault"</b> represents the default container runtime seccomp profile. -  <b>"Unconfined"</b> indicates no seccomp profile is applied (A.K.A. unconfined).</p>

#### 14.12.1.81. .spec.containers[].securityContext.windowsOptions

##### Description

WindowsSecurityContextOptions contain Windows-specific options and credentials.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>gmsaCredentialSpec</b>	<b>string</b>	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
<b>gmsaCredentialSpecName</b>	<b>string</b>	GMSACredentialSpecName is the name of the GMSA credential spec to use.
<b>hostProcess</b>	<b>boolean</b>	HostProcess determines if a container should be run as a 'Host Process' container. This field is alpha-level and will only be honored by components that enable the WindowsHostProcessContainers feature flag. Setting this field without the feature flag will result in errors when validating the Pod. All of a Pod's containers must have the same effective HostProcess value (it is not allowed to have a mix of HostProcess containers and non-HostProcess containers). In addition, if HostProcess is true then HostNetwork must also be set to true.
<b>runAsUserName</b>	<b>string</b>	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

#### 14.12.1.82. .spec.containers[].startupProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.83. .spec.containers[].startupProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.84. .spec.containers[].startupProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.85. .spec.containers[].startupProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

14.12.1.86. `.spec.containers[].startupProbe.httpGet.httpHeaders`

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

14.12.1.87. `.spec.containers[].startupProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.88. `.spec.containers[].startupProbe.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.89. `.spec.containers[].volumeDevices`

##### Description

volumeDevices is the list of block devices to be used by the container.

##### Type

**array**

#### 14.12.1.90. `.spec.containers[].volumeDevices[]`

##### Description

volumeDevice describes a mapping of a raw block device within a container.

##### Type

**object**

## Required

- **name**
- **devicePath**

Property	Type	Description
<b>devicePath</b>	<b>string</b>	devicePath is the path inside of the container that the device will be mapped to.
<b>name</b>	<b>string</b>	name must match the name of a persistentVolumeClaim in the pod

**14.12.1.91. .spec.containers[].volumeMounts**

## Description

Pod volumes to mount into the container's filesystem. Cannot be updated.

## Type

**array**

**14.12.1.92. .spec.containers[].volumeMounts[]**

## Description

VolumeMount describes a mounting of a Volume within a container.

## Type

**object**

## Required

- **name**
- **mountPath**

Property	Type	Description
<b>mountPath</b>	<b>string</b>	Path within the container at which the volume should be mounted. Must not contain '!'.

Property	Type	Description
<b>mountPropagation</b>	<b>string</b>	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.</p> <p>Possible enum values: -  <b>"Bidirectional"</b> means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology). -  <b>"HostToContainer"</b> means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology). -  <b>"None"</b> means that the volume in a container will not receive new mounts from the host or other containers, and filesystems mounted inside the container won't be propagated to the host or other containers. Note that this mode corresponds to "private" in Linux terminology.</p>
<b>name</b>	<b>string</b>	This must match the Name of a Volume.
<b>readOnly</b>	<b>boolean</b>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<b>subPath</b>	<b>string</b>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

Property	Type	Description
<b>subPathExpr</b>	<b>string</b>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

### 14.12.1.93. .spec.dnsConfig

#### Description

PodDNSConfig defines the DNS parameters of a pod in addition to those generated from DNSPolicy.

#### Type

**object**

Property	Type	Description
<b>nameservers</b>	<b>array (string)</b>	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
<b>options</b>	<b>array</b>	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
<b>options[]</b>	<b>object</b>	PodDNSConfigOption defines DNS resolver options of a pod.
<b>searches</b>	<b>array (string)</b>	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

### 14.12.1.94. .spec.dnsConfig.options

**Description**

A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

**Type**

**array**

**14.12.1.95. .spec.dnsConfig.options[]****Description**

PodDNSConfigOption defines DNS resolver options of a pod.

**Type**

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Required.
<b>value</b>	<b>string</b>	

**14.12.1.96. .spec.ephemeralContainers****Description**

List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource.

**Type**

**array**

**14.12.1.97. .spec.ephemeralContainers[]****Description**

An EphemeralContainer is a temporary container that you may add to an existing Pod for user-initiated activities such as debugging. Ephemeral containers have no resource or scheduling guarantees, and they will not be restarted when they exit or when a Pod is removed or restarted. The kubelet may evict a Pod if an ephemeral container causes the Pod to exceed its resource allocation. To add an ephemeral container, use the ephemeralcontainers subresource of an existing Pod. Ephemeral containers may not be removed or restarted.

**Type**

**object**

**Required**

- **name**

Property	Type	Description
<b>args</b>	<b>array (string)</b>	<p>Arguments to the endpoint. The image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>command</b>	<b>array (string)</b>	<p>Endpoint array. Not executed within a shell. The image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. Double are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a></p>
<b>env</b>	<b>array</b>	List of environment variables to set in the container. Cannot be updated.

Property	Type	Description
<b>env[]</b>	<b>object</b>	EnvVar represents an environment variable present in a Container.
<b>envFrom</b>	<b>array</b>	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
<b>envFrom[]</b>	<b>object</b>	EnvFromSource represents the source of a set of ConfigMaps
<b>image</b>	<b>string</b>	Container image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
<b>imagePullPolicy</b>	<b>string</b>	<p>Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a></p> <p>Possible enum values: -  <b>"Always"</b> means that kubelet always attempts to pull the latest image. Container will fail If the pull fails. - <b>"IfNotPresent"</b> means that kubelet pulls if the image isn't present on disk. Container will fail if the image isn't present and the pull fails. - <b>"Never"</b> means that kubelet never pulls an image, but only uses a local image. Container will fail if the image isn't present</p>

Property	Type	Description
<b>lifecycle</b>	<b>object</b>	Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.
<b>livenessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>name</b>	<b>string</b>	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
<b>ports</b>	<b>array</b>	Ports are not allowed for ephemeral containers.
<b>ports[]</b>	<b>object</b>	ContainerPort represents a network port in a single container.
<b>readinessProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>resizePolicy</b>	<b>array</b>	Resources resize policy for the container.
<b>resizePolicy[]</b>	<b>object</b>	ContainerResizePolicy represents resource resize policy for the container.
<b>resources</b>	<b>object</b>	ResourceRequirements describes the compute resource requirements.

Property	Type	Description
<b>securityContext</b>	<b>object</b>	SecurityContext holds security configuration that will be applied to a container. Some fields are present in both SecurityContext and PodSecurityContext. When both are set, the values in SecurityContext take precedence.
<b>startupProbe</b>	<b>object</b>	Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.
<b>stdin</b>	<b>boolean</b>	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
<b>stdinOnce</b>	<b>boolean</b>	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Property	Type	Description
<b>targetContainerName</b>	<b>string</b>	<p>If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container uses the namespaces configured in the Pod spec.</p> <p>The container runtime must implement support for this feature. If the runtime does not support namespace targeting then the result of setting this field is undefined.</p>
<b>terminationMessagePath</b>	<b>string</b>	<p>Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to <code>/dev/termination-log</code>. Cannot be updated.</p>

Property	Type	Description
<b>terminationMessagePolicy</b>	<b>string</b>	<p>Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.</p> <p>Possible enum values: - <b>"FallbackToLogsOnError"</b> will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents. - <b>"File"</b> is the default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits.</p>
<b>tty</b>	<b>boolean</b>	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
<b>volumeDevices</b>	<b>array</b>	volumeDevices is the list of block devices to be used by the container.
<b>volumeDevices[]</b>	<b>object</b>	volumeDevice describes a mapping of a raw block device within a container.
<b>volumeMounts</b>	<b>array</b>	Pod volumes to mount into the container's filesystem. Subpath mounts are not allowed for ephemeral containers. Cannot be updated.

Property	Type	Description
<b>volumeMounts[]</b>	<b>object</b>	VolumeMount describes a mounting of a Volume within a container.
<b>workingDir</b>	<b>string</b>	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

#### 14.12.1.98. .spec.ephemeralContainers[].env

##### Description

List of environment variables to set in the container. Cannot be updated.

##### Type

**array**

#### 14.12.1.99. .spec.ephemeralContainers[].env[]

##### Description

EnvVar represents an environment variable present in a Container.

##### Type

**object**

##### Required

- **name**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the environment variable. Must be a C_IDENTIFIER.

Property	Type	Description
<b>value</b>	<b>string</b>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. Double <code>are</code> reduced to a single <code>\$</code> , which allows for escaping the <code>\$(VAR_NAME)</code> syntax: i.e. <code>"(VAR_NAME)"</code> will produce the string literal <code>"\$(VAR_NAME)"</code> . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to <code>""</code> .
<b>valueFrom</b>	<b>object</b>	<code>EnvVarSource</code> represents a source for the value of an <code>EnvVar</code> .

#### 14.12.1.100. `.spec.ephemeralContainers[].env[].valueFrom`

##### Description

`EnvVarSource` represents a source for the value of an `EnvVar`.

##### Type

**object**

Property	Type	Description
<b>configMapKeyRef</b>	<b>object</b>	Selects a key from a <code>ConfigMap</code> .
<b>fieldRef</b>	<b>object</b>	<code>ObjectFieldSelector</code> selects an <code>APIVersioned</code> field of an object.
<b>resourceFieldRef</b>	<b>object</b>	<code>ResourceFieldSelector</code> represents container resources ( <code>cpu</code> , <code>memory</code> ) and their output format
<b>secretKeyRef</b>	<b>object</b>	<code>SecretKeySelector</code> selects a key of a <code>Secret</code> .

#### 14.12.1.101. `.spec.ephemeralContainers[].env[].valueFrom.configMapKeyRef`

##### Description

Selects a key from a `ConfigMap`.

Type

**object**

Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key to select.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap or its key must be defined

#### 14.12.1.102. `.spec.ephemeralContainers[].env[].valueFrom.fieldRef`

Description

ObjectFieldSelector selects an APIVersioned field of an object.

Type

**object**

Required

- **fieldPath**

Property	Type	Description
<b>apiVersion</b>	<b>string</b>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<b>fieldPath</b>	<b>string</b>	Path of the field to select in the specified API version.

#### 14.12.1.103. `.spec.ephemeralContainers[].env[].valueFrom.resourceFieldRef`

Description

ResourceFieldSelector represents container resources (cpu, memory) and their output format

Type

**object**

Required

- **resource**

Property	Type	Description
<b>containerName</b>	<b>string</b>	Container name: required for volumes, optional for env vars
<b>divisor</b>	<b>Quantity</b>	Specifies the output format of the exposed resources, defaults to "1"
<b>resource</b>	<b>string</b>	Required: resource to select

#### 14.12.1.104. .spec.ephemeralContainers[].env[].valueFrom.secretKeyRef

##### Description

SecretKeySelector selects a key of a Secret.

##### Type

**object**

##### Required

- **key**

Property	Type	Description
<b>key</b>	<b>string</b>	The key of the secret to select from. Must be a valid secret key.
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret or its key must be defined

#### 14.12.1.105. .spec.ephemeralContainers[].envFrom

##### Description

List of sources to populate environment variables in the container. The keys defined within a source must be a C\_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

##### Type

**array**

#### 14.12.1.106. .spec.ephemeralContainers[].envFrom[]

##### Description

EnvFromSource represents the source of a set of ConfigMaps

#### Type

**object**

Property	Type	Description
<b>configMapRef</b>	<b>object</b>	ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.
<b>prefix</b>	<b>string</b>	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
<b>secretRef</b>	<b>object</b>	SecretEnvSource selects a Secret to populate the environment variables with.  The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

#### 14.12.1.107. .spec.ephemeralContainers[].envFrom[].configMapRef

##### Description

ConfigMapEnvSource selects a ConfigMap to populate the environment variables with.  
The contents of the target ConfigMap's Data field will represent the key-value pairs as environment variables.

#### Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the ConfigMap must be defined

#### 14.12.1.108. .spec.ephemeralContainers[].envFrom[].secretRef

## Description

SecretEnvSource selects a Secret to populate the environment variables with.

The contents of the target Secret's Data field will represent the key-value pairs as environment variables.

## Type

**object**

Property	Type	Description
<b>name</b>	<b>string</b>	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
<b>optional</b>	<b>boolean</b>	Specify whether the Secret must be defined

## 14.12.1.109. .spec.ephemeralContainers[].lifecycle

### Description

Lifecycle describes actions that the management system should take in response to container lifecycle events. For the PostStart and PreStop lifecycle handlers, management of the container blocks until the action is complete, unless the container process fails, in which case the handler is aborted.

### Type

**object**

Property	Type	Description
<b>postStart</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.
<b>preStop</b>	<b>object</b>	LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

## 14.12.1.110. .spec.ephemeralContainers[].lifecycle.postStart

### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPSocket must be specified.

### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

**14.12.1.111. .spec.ephemeralContainers[].lifecycle.postStart.exec****Description**

ExecAction describes a "run in container" action.

**Type**

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**14.12.1.112. .spec.ephemeralContainers[].lifecycle.postStart.httpGet****Description**

HTTPGetAction describes an action based on HTTP Get requests.

**Type**

**object**

**Required**

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.113. .spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.114. .spec.ephemeralContainers[].lifecycle.postStart.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.115. `..spec.ephemeralContainers[].lifecycle.postStart.tcpSocket`

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.116. `..spec.ephemeralContainers[].lifecycle.preStop`

##### Description

LifecycleHandler defines a specific action that should be taken in a lifecycle hook. One and only one of the fields, except TCPocket must be specified.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.

Property	Type	Description
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

#### 14.12.1.117. .spec.ephemeralContainers[].lifecycle.preStop.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.118. .spec.ephemeralContainers[].lifecycle.preStop.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

#### 14.12.1.119. .spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders

##### Description

Custom headers to set in the request. HTTP allows repeated headers.

##### Type

**array**

#### 14.12.1.120. .spec.ephemeralContainers[].lifecycle.preStop.httpGet.httpHeaders[]

##### Description

HTTPHeader describes a custom header to be used in HTTP probes

##### Type

**object**

##### Required

- **name**
- **value**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.121. .spec.ephemeralContainers[].lifecycle.preStop.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.122. .spec.ephemeralContainers[].livenessProbe

##### Description

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

##### Type

**object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.123. .spec.ephemeralContainers[].livenessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
<b>command</b>	<b>array (string)</b>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

#### 14.12.1.124. .spec.ephemeralContainers[].livenessProbe.grpc

##### Description

GRPC specifies an action involving a GRPC port.

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>port</b>	<b>integer</b>	Port number of the gRPC service. Number must be in the range 1 to 65535.
<b>service</b>	<b>string</b>	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ).  If this is not specified, the default behavior is defined by gRPC.

#### 14.12.1.125. .spec.ephemeralContainers[].livenessProbe.httpGet

##### Description

HTTPGetAction describes an action based on HTTP Get requests.

##### Type

**object**

## Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
<b>httpHeaders</b>	<b>array</b>	Custom headers to set in the request. HTTP allows repeated headers.
<b>httpHeaders[]</b>	<b>object</b>	HTTPHeader describes a custom header to be used in HTTP probes
<b>path</b>	<b>string</b>	Path to access on the HTTP server.
<b>port</b>	<b>IntOrString</b>	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<b>scheme</b>	<b>string</b>	Scheme to use for connecting to the host. Defaults to HTTP.  Possible enum values: - <b>"HTTP"</b> means that the scheme used will be http:// - <b>"HTTPS"</b> means that the scheme used will be https://

## 14.12.1.126. .spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders

## Description

Custom headers to set in the request. HTTP allows repeated headers.

## Type

**array**

## 14.12.1.127. .spec.ephemeralContainers[].livenessProbe.httpGet.httpHeaders[]

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

**object**

## Required

- **name**
- **value**

Property	Type	Description
<b>name</b>	<b>string</b>	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
<b>value</b>	<b>string</b>	The header field value

#### 14.12.1.128. .spec.ephemeralContainers[].livenessProbe.tcpSocket

##### Description

TCPSocketAction describes an action based on opening a socket

##### Type

**object**

##### Required

- **port**

Property	Type	Description
<b>host</b>	<b>string</b>	Optional: Host name to connect to, defaults to the pod IP.
<b>port</b>	<b>IntOrString</b>	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

#### 14.12.1.129. .spec.ephemeralContainers[].ports

##### Description

Ports are not allowed for ephemeral containers.

##### Type

**array**

#### 14.12.1.130. .spec.ephemeralContainers[].ports[]

##### Description

ContainerPort represents a network port in a single container.

##### Type

**object**

## Required

- **containerPort**

Property	Type	Description
<b>containerPort</b>	<b>integer</b>	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
<b>hostIP</b>	<b>string</b>	What host IP to bind the external port to.
<b>hostPort</b>	<b>integer</b>	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
<b>name</b>	<b>string</b>	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
<b>protocol</b>	<b>string</b>	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".  Possible enum values: - <b>"SCTP"</b> is the SCTP protocol. - <b>"TCP"</b> is the TCP protocol. - <b>"UDP"</b> is the UDP protocol.

**14.12.1.131. .spec.ephemeralContainers[].readinessProbe****Description**

Probe describes a health check to be performed against a container to determine whether it is alive or ready to receive traffic.

**Type****object**

Property	Type	Description
<b>exec</b>	<b>object</b>	ExecAction describes a "run in container" action.

Property	Type	Description
<b>failureThreshold</b>	<b>integer</b>	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
<b>grpc</b>	<b>object</b>	GRPC specifies an action involving a GRPC port.
<b>httpGet</b>	<b>object</b>	HTTPGetAction describes an action based on HTTP Get requests.
<b>initialDelaySeconds</b>	<b>integer</b>	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
<b>periodSeconds</b>	<b>integer</b>	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
<b>successThreshold</b>	<b>integer</b>	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
<b>tcpSocket</b>	<b>object</b>	TCPSocketAction describes an action based on opening a socket

Property	Type	Description
<b>terminationGracePeriodSeconds</b>	<b>integer</b>	Optional duration in seconds the pod needs to terminate gracefully upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. The value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta field and requires enabling ProbeTerminationGracePeriod feature gate. Minimum value is 1. spec.terminationGracePeriodSeconds is used if unset.
<b>timeoutSeconds</b>	<b>integer</b>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

#### 14.12.1.132. .spec.ephemeralContainers[].readinessProbe.exec

##### Description

ExecAction describes a "run in container" action.

##### Type

**object**

Property	Type	Description
----------	------	-------------

Property	Type	Description
